School Fare to Continue Throughout Vacation Period—All school children under sixteen years of age will be able to go on using school tokens on the cars and buses of the Seattle Municipal Railway, Seattle, Wash., after school is out for the summer, paying their way to parks, playgrounds and bathing beaches with them, under an ordinance approved by Mayor Edwards. The ordinance was backed by George B. Avery, superintendent of utilities. It passed the Council without opposition.

Digitized by Google

Right-of-Way Bought—The Oregon Electric Railway has purchased property near Lebanon, Ore., adjoining the Southern Pacific tracks which is to be followed by further purchases along the line of survey recently made for an electric logging road from Lebanon to Foster.

Labor Favors Fare Advance—Central Labor Council at Portland, Ore., has unanimously indorsed the petition of the Portland Electric Power Company now pending before the Public Service Commission for an increase from an 8 to a 10-cent fare.

Reading Awards First of Electrification Contracts — The first tangible step in the Reading Railroad's $20,000,000 electrification program at Philadelphia has been taken by the awarding of a contract for 4,000 tons of steel for catenary supporting structures and signal bridges to the Bethlehem Steel Company.

Terminable Permit Bill Passed — The Missouri Senate on May 15 passed the bill authorizing St. Louis to grant terminable permits to public utilities.

Electrification Predicted—The eventual electrification of the Oregon-Washington Railway & Navigation lines is predicted in a newspaper report from Lewiston, Idaho.

Wage Agreement in Davenport Renewed—The Tri-City Railway, Davenport, Iowa, has executed contracts with its trainmen, bus operators and shop employees for the year beginning May 31, 1929, continuing the present wage scales.

Louisville Railway Broadcasting — The Louisville Railway, Louisville, Ky., has gone on the air over WHAS, the station of the Louisville *Courier Journal* and Louisville *Times*. It is planned to have programs each Thursday, starting at 8:30 in the evening, Central Standard Time.

Lake Burien Plea Renewed—The city of Seattle, Wash., has asked the Department of Public Works to refuse to grant the application of the Suburban Transportation Company for an extension of its route to compete with the Lake Burien railway, now a part of the Seattle municipal system, or authorize the city to abandon this branch. On April 10 the department refused to grant a similar request to discontinue the Lake Burien line.

A City Planning Move—The City Planning Commission of Portland, Ore., has suggested that the Southern Pacific Railway vacate Fourth Street, along which its Red Electric trains now operate, and that they arrange to use the tracks of the Oregon Electric Railway. This is to clear Fourth Street for use as a main traffic thoroughfare even before action can be taken on the municipal belt line terminal under which all trains, both electric and steam, will be removed to the water front district.

Facilities Expanded—Rates Reduced—Noon express freight and a reduction of almost 10 per cent in livestock rates have been announced by the Indianapolis & Southeastern Railroad as a result of increased business between Indianapolis and Connersville and Greensburg. The railroad has been authorized by the Public Service Commission to give motor freight transportation service between Greensburg and Batesville, Ind., serving Napoleon, Osgood, Versailles and New Point.

Membership Drive Makes Record—Chicago Elevated Post No. 184, recent winner of the American Legion Certificate of Meritorious Service, continues to set a fast pace in the 1929 membership drive. The latest report shows that 693 veterans have been enrolled in "L" Post this year. This is almost a 300 per cent increase over the total number of veterans enrolled in 1928. This remarkable record was celebrated on the evening of May 7 with an "Open House Night."

Franchise Vote on June 18.—June 18 has been fixed as the day on which the proposed 30-year franchise for the Jacksonville Traction Company will go before the electors. The proposed new operating grant has been passed by the City Council and approved by the company. Substitution of buses for street car service on certain lines is proposed.

Foreign Notes

Bus Anniversary Celebration in London

For the first time in history, July 4 is to be celebrated in London, England, this year. That date will mark the hundreth anniversary of the London bus. George Shillibeer, a coach-builder and ex-midshipman of the Royal Navy, started the system with two horse buses which he operated between Paddington and the Bank of England. Because they reminded the public of hearses, these buses were shunned for some time. Finally Shillibeer employed as conductors two sons of British Naval officers, who had had bus experience in France, With the spread of this news, poke-bonnetted young ladies demurely decided to improve their French and proceeded to take regular bus rides for educational purposes, with perhaps a discreet flirtation on the side. Free newspapers and magazines were distributed to the riders, and the buses became so popular Shillibeer decided to extend the service. This necessitated the employment of paid conductors, but since no method was then known for checking up the number of passengers, Shillibeer finally retired bankrupt. Later he became an undertaker.

In the meantime two other rival buses were in operation, and in 1855, the Compagnie Generale des Omnibus de Londres, a French company, began operation with 27 buses. Again Londoners refused to ride the buses and protested the "foreign innovation" so strenuously that the police were forced to intervene. When the company agreed to buy all the old bus routes and employ the same English drivers and conductors the opposition ceased.

The present London omnibus system accommodates more than 6,000,000 passengers daily.

Subway Building Hurried in Buenos Aires

With 40,000 new people in 1928 added to its more than 2,000,000 population, Buenos Aires, Argentina, finds it necessary to hurry the extension of its underground transit facilities.

To that end, construction is now in full swing in excavating and building the east and west subway line, while contracts on north and south side line extensions have been awarded to one of the city's well-known corporations.

Present activity is centered on the section of work comprised between Federico Lacroze Station and Callao Street. As the excavation from this street is to a point near the river front or port section of Buenos Aires, the authorities are taking three months' time for consideration of the plans, which are expected to be approved within a few weeks.

The company holding the concession for the link from Retiro Station to Plaza Constitucion, which will cross the city in a north and south direction, has completed its drawings, which are in the hands of municipal authorities for approval.

The original unit of the underground transit system in Buenos Aires was constructed by the same corporation that holds the franchise for operating the electric surface cars.

The original line is that now in operation between Plaza de Mayo and Plaza Once de Septiembre. This route passes largely under the great business thoroughfare, Calle Mayo, whose overflowing streets are to some extent relieved as thousands descend to the subway.

Conspicuous sights that catch the stranger's eye in Buenos Aires subways are the color schemes adopted for stations; one of these may be yellow, another green, another blue, etc. Such colors, together with striking signs, greatly aid the stranger's trip.

Air Transport Powers Granted British Railways

Powers to add air transport to their existing facilities were granted the British main line railway companies in bills recently sanctioned by a joint committee of both Houses of Parliament. In every case where a railway applies for a license to establish an airdrome, the Air Council, a government department, must hold a local inquiry. Services to and from Ireland, the Hebrides, the Isle of Man, and the Channel Islands are contemplated, as well as services to and from the Continent of Europe.

Subway to Be Built in Osaka—Plans are under way to begin subway construction in Osaka, Japan, probably within the next few weeks. The first section of the subway will connect Mina-katamachi and Abiko, but the construction work will be started in four sections simultaneously, the most important being the work at the Osaka station of the Government Railway. The boring at this point will be to a depth of 55 ft. The tube will run underneath the Dojima-gawa, Oye-bashi and Yodoya-bashi Rivers at a depth of about 25 ft. below the river-beds.

Recent Bus Developments

Long-Distance Lines Merge

Bus lines operating in all sections of the United States are to be included in a proposed consolidation intended to unify long distance motor transportaton operation so that a dependable service may be maintained in the nation-wide system of bus travel which has recently been developed. The three principal companies involved are the Greyhound Lines, the Yelloway System, and the Pickwick Stages. Merging with these companies are the bus lines of the Southern Pacific Motor Transport Company, owned by the Southern Pacific Railway. These systems stretch from the Atlantic to the Pacific Coast. They constitute the only system of passenger transportation of the kind which extends entirely across the United States.

Operations on the Pacific Coast will be under Pacific Transportation Securities, Inc., and cover Oregon and California, routes of the Yelloway, Pickwick Stages, Southern Pacific Motor Transport Company, Oregon Stages, and Pacific Stages. In addition there are the lines run by the Pickwick Stages from Los Angeles through Arizona and New Mexico to El Paso, and the line from San Francisco to Salt Lake City by way of Reno. Ownership will be vested equally among the Motor Transit Corporation, the Pickwick Corporation and the Southern Pacific Company.

Pickwick and Yelloway operation between Los Angeles and Chicago, Kansas City, Omaha, and St. Louis will be under the Pickwick-Greyhound Corporation with ownership divided between the Pickwick Corporation and the Motor Transit Corporation.

Greyhound Lines east of the Mississippi River will remain undisturbed by the merger; they are owned entirely by the Motor Transit Corporation.

The merged operations represent a capital investment of about $30,000,000. More than 1,000 buses will be operated 200,000 miles a day over 25,000 miles of routes. The number of passengers carried annually will exceed 10,000,000.

The chairman of the board of the Pacific Coast Corporation will be C. E. Wickman of Minneapolis. The president will be T. B. Wilson, formerly head of the Southern Pacific Motor Transport operations and the chairman of the executive committee will be C. F. Wren, president of the Pickwick Corporation.

No change is being made in the personnel of the Motor Transit Corporation except that W. E. Travis has been made chairman of the board. He has been president and manager of the Yelloway systems.

All of the companies concerned have played an important part in long distance bus transportation, and represent the chief elements of this form of passenger service.

People's Necessity Outweighs Traction Loss in Ohio

The Scioto Valley Railway & Power Company has lost its long-time fight to prevent the Cannonball Transportation Company from extending its bus line from Chillicothe, Ohio, to Columbus. By way of Portsmouth the bus company operates a line from Ironton to Chillicothe. In a majority opinion, the State Public Utilities Commission held that the necessity of the people of southern Ohio to have a direct method of transportation into Columbus outweighed the fact that the electric railway company would lose money if the Cannonball's request were granted.

The opinion restricts the Cannonball to service over state route 104 from Chillicothe to Columbus, and Cannonball buses must not carry Chillicothe and Circleville passengers, but only through-passengers both ways out of Columbus. The opinion left open the way for the railway, which sought to operate supplemental bus service itself, to amend its own application and protest so that it may be able to operate buses over state route 23 from Chillicothe to Columbus.

Judge William Klinger, Lima, dissented from the majority opinion, holding that the Supreme Court had said the commission could not give a certificate to another utility when the utility at present operating in that territory was willing to give extra service if needed.

Substitution in Savannah—Authority has been granted the Savannah Electric & Power Company, Savannah, Ga., by the Council to substitute bus service for the present railway service on the Daffin Park line.

Over the Berkshire Trail—The Northampton Street Railway plans to project a bus service from Northampton to Pittsfield, Mass., over the Berkshire Trail. Permits have been obtained from Northampton, Williamsburg, Goshen and Cummington, but action is still pending in Dalton and Pittsfield.

Would Stop Buses in Santa Ana—The Pacific Electric Railway has asked the Railroad Commission for permission to discontinue its bus lines in Santa Ana.

Substitution in Davenport—Tracks of the Gaines Street or Mercy hospital line will be abandoned and buses installed to give the same service over the route, if present plans of the Tri-City Railway, Davenport, Ia., meet the approval of the City Council. General Manager R. J. Smith of the company says that lack of sufficient income from the Gaines Street line prompted the company to adopt the plan to replace street cars with buses.

Substitution in Fitchburg Opposed—Opposition developed to the proposal of the Fitchburg & Leominster Street Railway to substitute bus service for trolleys over the Merriam Avenue route between Fitchburg and Leominster, Mass., when the hearing was held before the license board of the latter city. The Lovell Bus Lines, Inc., which operates in Leominster, including the West Street line, which runs parallel with Merriam Avenue, asked to be protected from the competition it said would result if the railway received the permission it sought. E. W. Baker, president of the railway, explained that the outlay to improve the roadway would not be justified by the revenue.

Pacific Electric Adds to Bus Service—A certificate of public convenience and necessity has been granted by the California Railroad Commission to the Pacific Electric Railway, Los Angeles, to operate an auto stage service between Hollywood and Girard, Cal.

Petition for Indiana Curtailment—The Chicago, South Bend & Northern Indiana Railway has asked authority to discontinue all local bus service on the south side of the city of Elkhart, Ind. The company also wants to be permitted to discontinue service on lines operating to the north section of the city after 9 p.m. and to eliminate all bus service in the city on Sundays and holidays. Expenses of bus operation in Elkhart exceeded revenue by more than $6,264 in 1928. The principal business district and residential sections of the city are served by the company

Mayors Favor Chehalis - Centralia Change—After a hearing in Chehalis, Wash., on May 13, of an application of W. E. Brown, to establish inter-city bus service between Chehalis and Centralia to replace the interurban service of the Puget Sound Power & Light Company, the Mayors of both cities favored the change and, with others, urged that the franchise be granted.

Buses Unprofitable — The Illinois Power & Light Corporation has applied to the Illinois Commerce Commission for permission to discontinue bus service in Hillsboro, Schram City and Taylor Springs on the grounds that the route is unprofitable. The buses were substituted for street cars several years ago. City officials have been advised of the plans for the abandonment of bus service.

Buses for Ashmont Under Special Bill—Governor Allen of Massachusetts has signed the bill to settle the dispute over a proposed bus line in the Ashmont section of Greater Boston. The Boston City Council has refused to grant the necessary permit for construction of part of this line. The bill signed by the Governor authorizes the Department of Public Works to issue the license notwithstanding the disapproval of the City Council. The route to be followed is from the corner of Hilltop Street and Granite Avenue to the Ashmont station of the Elevated and thence into Milton. The bill provides further that after a public hearing the Utilities Department will grant the certificate of public convenience and necessity.

Another Bus Substitution at Framingham—The Middlesex & Boston Street Railway is planning the early substitution of bus service on its line between Framingham, Mass., and the Newton, Mass., boundary. The substitution of bus service leaves only one electric railway operating out of Framingham, Mass., the Boston, Worcester & New York Street Railway.

Patrons Expect Something for Nothing—Suspension of the Arlington, Belmont & Watertown bus line by the Boston Elevated Railway, Boston, Mass., has been followed by a statement by the company that the discontinuance was necessary because it was clearly apparent there was an insufficient demand for the service. The trustees give the cost per revenue-mile as 32 cents against receipts of 12 cents. Those who oppose the suspension contend it is immaterial whether the line is profitable since it is a feeder for other lines.

Financial and Corporate

Des Moines Sale June 22

Property of the Des Moines City Railway, Des Moines, Ia., operated under a receivership since Nov. 11, 1927, will be sold at public auction on June 22. The receivership was instituted when the Harris Trust & Saving Bank, Chicago, brought action in the federal court after the railway had defaulted in payment of $700,000 of bonds for which the bank acted as trustee. Under the decree the sale is subject to a first mortgage of $5,762,000.

The decree of sale authorizes the master, if dissatisfied with bids, to set a new date upon his own authority and to postpone the actual sale "from time to time." He is empowered to convey the property to the highest bidder, subject to approval of the court.

Local interest centered upon the inclusion in the decree of an order authorizing the master to sell the system either with or without the two-man car operation agreement entered into in 1915 between the company and the union—a contract which runs until 1940. A Polk County District Court held that the contract is binding. Officials of the company say they could save $200,000 annually by the operation of one-man cars.

Michigan Interurban Curtails Service

J. F. Collins, vice-president and general manager of the Michigan Electric Railway, announced that all electric interurban passenger service on the Jackson and Lansing division of the company would cease after midnight May 18 and that electric passenger service between Lansing and St. Johns and intermediate points would be discontinued on and after midnight May 16. This move leaves the northern division entirely operated by motor vehicles—electric service on that division having been terminated some time ago. Disposition of the right-of-way will be determined later. Interurban freight service on lines connecting Jackson, Kalamazoo and Grand Rapids will be continued. Interurban passenger traffic on this branch was discontinued some months ago.

$734,242 Premium on New York Stock

The city of New York obtained a premium of $734,242 on the sale of $52,000,000 four-year, rapid transit 5¼ per cent corporate stock to Kuhn, Loeb & Company and to Henry G. Schneider, an individual bidder. The effect of the premium above the face value of the bonds is to reduce the net interest cost of the financing to the city from 5.25 per cent to approximately 4.81 per cent.

The first issue of $52,000,000 corporate stock for rapid transit construction was sold in February, 1928, to the National City Company syndicate at a premium of $254,784 on 4 per cent coupon basis, or a 3.86 per cent net cost basis. The offering made on May 7 was scheduled originally for last November, when $55.000,000 in bonds was sold, but because of the unfavorable condition of the municipal market the sale of the stock was postponed. The stock sale last year was made during the most favorable period of the municipal bond market.

Offer Made for Muskegon Railway

Negotiations have been started for the purchase of the railway lines of the Muskegon Traction & Lighting Company, Muskegon, Mich., by the officials of the Peoples Transport Company, which plans to operate the street car lines in conjunction with its bus lines. If all goes well with these plans the city will retain transportation facilities that were to have been abandoned early in the fall.

With negotiations started for the purchase of the lines, the Muskegon Parent-Teachers' Association announces it will withdraw the petition just filed asking for a vote on the question of municipal ownership.

The Peoples Transport Company wants to issue $500,000 of capital stock divided into 50,000 shares with a par value of $10. The president is E. J. Bouwsma; vice-president and treasurer, M. J. Britzen; secretary, Willard G. Turner, Jr.

Supreme Court Decides O'Fallon Case

Holds that Congress has directed that values shall be fixed upon a consideration of present costs—that element one of many factors

THE long awaited decision in the action of the St. Louis & O'Fallon Railway and the Manufacturers' Railway against the Interstate Commerce Commission was handed down by the Supreme Court on May 20. The majority held that in this instance the commission had not given due consideration, as required by law, to the principle of reproduction cost new in fixing the valuation of the carriers for rate-making and recapture purposes under the provisions of the transportation act of 1920.

The majority opinion said:

"We hold, that the basis on all calculations as to the reasonableness of rates to be charged must be the fair value of the property being used by it for the convenience of the public.

"In order to ascertain that value, the original cost of construction, the amount expended in permanent improvements, the amount and market value of the bonds and stock, the present as compared with the original cost of construction, the probable earning capacity of the property under particular rates prescribed by statute, and the sum required to meet operating expenses, are all matters for consideration, and are to be given such weight as may be just and right in each case.

"We do not say that there may not be other matters to be regarded in estimating the value of the property. What the company is entitled to ask is a fair return upon the value of that which it employs for the public convenience. On the other hand, what the public is entitled to demand is that no more be exacted from it for the use of a public highway than the services rendered by it are reasonably worth."

BASIS OF "INTELLIGENT FORECAST"

"In Southwestern Bell Telephone vs. Public Service Commission (287) we said:

" 'It is impossible to ascertain what will amount to a fair return upon properties devoted to public service without giving consideration to the cost of labor, supplies, etc., at the time the investigation is made. An honest and intelligent forecast of probable future values, made upon a view of all the relevant circumstances, is essential. If the highly important element of present costs is wholly disregarded such forecast becomes impossible. Estimates for tomorrow cannot ignore prices today.'

"The doctrine above stated has been consistently adhered to by this court. The report of the commission is long and argumentative. Much of it is devoted to general observations relative to the method and purpose of making valuations; many objections are urged to the doctrine approved by us; and the superiority of another view is stoutly asserted.

"It carefully refrains from stating that any consideration whatever was given to present or reproduction costs in estimating the value of the carrier's property. Four dissenting commissioners declare that reproduction costs were not considered; and the report itself confirms their view. Two of the majority avow a like understanding of the course pursued."

QUOTES COMMISSIONER HALL

"The following from the dissenting opinion of Commissioner Hall, concurred in by three others, accurately describes the action of the commission:

"In order to determine the value of the O'Fallon property devoted to carrier service during the recapture periods, ten months in the year 1920 and the years 1921, 1922 and 1923, we start with a valuation or inventory date of June 30, 1919. The units in existence on that date are known. Original cost of the entire property cannot be ascertained.

" 'As to the man-made units we estimate the cost of reproducing them in their condition on that date. In so doing we apply to the units installed prior to June 30, 1914, the unit prices of 1914, the unit prices of 1914, representing a fairly consistent price level for the preceding five or ten years. To like units, installed after June 30, 1924, and prior to June 30, 1919, we apply the same prices, but add a sum representing price increases on those units during that period. For the third period, from June 30, 1919, down to each recapture date, we abandon estimate and turn to recorded net cost of additions less retirements.

" 'On this composite, made up of estimated value for two periods and ascer-

Digitized by Google

tained net cost for the third period, the majority base a conclusion as to value at recapture date of the man-made items. Land goes in at its current value as measured by that of neighboring lands.

"'Without summarizing the other processes, all clearly stated in the majority report, it will be observed that the rate-making value arrived at for the successive recapture periods, as for example the year 1923, rests upon 1923 market value of lands; costs of other property installed since June 30, 1919; unit prices of 1914, enhanced by allowance for increased cost of units installed during June 30, 1914-1919; and for the units installed prior to June 30, 1914, constituting by far the major part of the property; unit prices of 1914 without any enhancement whatever.

"'As to this major part of the carrier's property devoted to carrier purposes in 1923, no consideration is given to costs and prices then obtaining or to increase therein since 1914.'

"The question on which the commission divided is this:

"When seeking to ascertain the value of railroad property for recapture purposes must it give consideration to current, or reproduction, costs? The weight to be accorded thereto is not the matter before us. No doubt there are some, perhaps many, railroads the ultimate value of which should be placed far below the sum necessary for reproduction. But Congress has directed that values shall be fixed upon a consideration of present costs, along with all other pertinent facts; and this mandate must be obeyed."

In his dissent Associate Justice Stone began by stating that he desired to add a word by way of emphasis of those aspects of the case "which appeared to me sufficient, apart from all considerations, to sustain the finding of the commission." He added:

"This court has said that present reproduction costs must be considered in ascertaining value for rate-making purposes. But it has not said that such evidence, when fairly considered, may not be outweighed by other considerations affecting value, or that any evidence of present reproduction costs, when compared with all the other factors affecting value, must be given a weight to which it is not entitled in the judgment of the tribunal 'informed by experience' and 'appointed by law' to deal with the problem now presented.

"But if 'weight in the legal sense' must be given to evidence of present construction costs by the judgment now given, we do not lay down any legal rule which will inform the commission how much weight, short of its full effect, to the exclusion of all other considerations, is to be given to the evidence of synthetic costs of construction in valuing a railroad property.

Sees an "Economic Paradox"

"If full effect were to be given to it in all cases, then, as the commission points out in its report, the railroads of the country having in 1919 a reproduction cost of value of $19,000,000,000 would now have a value of $40,000,000,000, and we would arrive at the economic paradox that the present value of railroads is far in excess of any amount on which they could earn a return.

"If less than full effect may be given, it is difficult for me to see how, without departure from established principles, the commission could be asked to do more than it has already done—to weigh the evidence guided by all the proper considerations—or how, if there is evidence upon which its findings may rest, we can substitute our judgment for that of the commission.

"Such, I believe, is the 'due consideration' which the statute requires of 'all the elements of value recognized by the law for rate-making purposes.'"

Justice Brandeis' Opinion

In the dissenting opinion prepared by Associate Justice Brandeis, the minority takes issue with the majority decision that in valuing railroad property in the O'Fallon case the Interstate Commerce Commission failed to give weight to the cost of "'reproduction new.'"

The Justice contended that, while current reproduction cost may be said to be an element in the present value of property, it was clear "that current cost of reproduction higher than the original cost does not necessarily tend to prove a present higher value."

In this connection he added:

"Often the fact of higher reconstruction cost is without any influence on present values. It is common knowledge that the current market value of many office buildings and residences constructed prior to the World War have failed to reflect the greatly increased building costs of recent years, although the need of new buildings of like character was being demonstrated by the large volume of construction at the higher price level.

"Many railroads built before the World War have never been worth as much as their original cost, because high construction cost, combined with adverse operating conditions and limited traffic, have at all times prevented their earning, despite reasonable rates, a fair return on the original cost.

"* * * If it had been the intention of Congress to compel the commission to increase values for rate making purposes because the price level had risen, it would naturally have incorporated such a direction in the paragraph.

"It is inconceivable that Congress, after rejecting property investment account as excessive, intended by Section 15A to make mandatory on the commission the consideration of elements which would give a valuation double that which had been rejected."

Conspectus of Indexes for May, 1929

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Changes in United Traction Directors—Arthur R. Kleeman, Edward J. Crummey, and Bruce Gamley, directors of the United Traction Company, Albany, N. Y., placed on the board by the Ellis I. Phillips' interests, have been displaced by representatives of the Associated Gas & Electric Company interests, including John Mange, president of Associated. James Hamilton, Ernest Murphy, General manager of United Traction, and Harry B. Weatherwax, vice-president, continue as directors.

Virginia Road Sold—Purchase of the Petersburg, Hopewell & City Point Electric Railway, Petersburg, Va., has been made by Roy H. Morris and associates of Chicago, at a reported cost of $330,000, the transfer to be made by June 15, the date of the expiration of an option held by the Chicago interests.

Receivership Ended—The Receivership of Manhattan & Queens Traction Corporation, New York, has been terminated, according to B. Waller Duncan, manager for the receivers, by order of the federal court. The company operates between Manhattan and Jamaica via the Queensborough Bridge and Queens Boulevard.

Men of the Industry

Frank R. Phillips, Philadelphia Company Executive

Becomes chief executive officer of organization controlling the Pittsburgh Railways and other utilities in Pittsburgh

STOCKHOLDERS of the Philadelphia Company, Pittsburgh, Pa., at a meeting on May 14, elected John J. O'Brien president of the company and Frank R. Phillips, a director. It was announced that at the next meeting of the directors Mr. Phillips would be elected vice-president and general manager. Since the resignation of A. W. Robertson, formerly president of the Philadelphia Company, to become chairman of the board of the Westinghouse Electric & Manufacturing Company some months ago, the presidency of the Philadelphia Company has been vacant. Mr. Phillips, who has been vice-president and general manager of the Duquesne Light Company and vice-president of the Equitable Gas Company, in his new position becomes chief executive officer of the Philadelphia Company and subsidiaries. In this capacity it is understood that he will exercise all of the operating duties heretofore devolving upon the president. The principal subsidiaries of the Philadelphia Company are the Duquesne Light Company, Pittsburgh Railways, Equitable Gas Company, Pittsburgh Motor Coach Company and Allegheny Steam Heating Company.

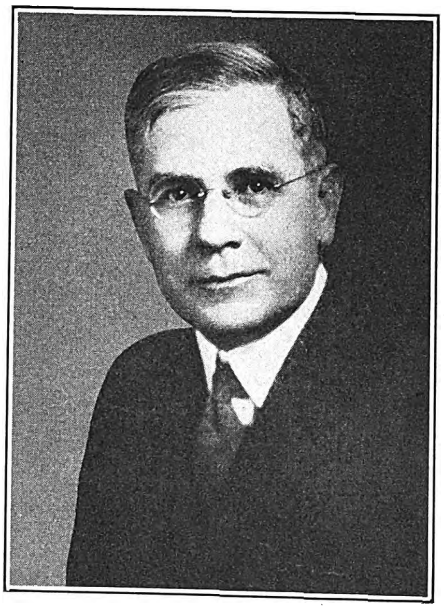
John J. O'Brien, the new president of the Philadelphia Company resides in Chicago and is president of the Standard Gas & Electric Company, the utility system of which the Pittsburgh companies are a part.

Mr. Phillips is a nationally known figure in the public utility field. He has been connected with the utilities in Pittsburgh for the past nineteen years. After completing his education in Cleveland in 1894, Mr. Phillips became master mechanic of the Cleveland Railway. Following this he served as mechanical and electrical engineer for the Union Light, Heat & Power Company of Covington, Ky., the Bellevue Water Company of Bellevue, Ky., and the South Covington & Cincinnati Street Railway also of Covington, Ky. He went to Pittsburgh in the fall of 1909 to assist in the development of the railways in that city. His first achievement was the low-floor, steel car operated with pony trucks and so-called baby motors which went into service in 1910, but was followed a year later by a low-floor steel trolley car, both of which proved less costly in construction and more economical in operation than the types which had preceded them.

In 1910 he was made superintendent of equipment of the Pittsburgh Railways, a position he filled until July, 1923, when he was made acting general manager for the receivers following the death of the late P. M. Jones. Upon the lifting of the receivership on February 1, 1924, Mr. Phillips was made mechanical and electrical engineer and was also appointed the representative of the company to the Traction Conference Board.

Mr. Phillips was active in designing the double-deck motor car placed in service in Pittsburgh in 1917. About the same time he designed a low-floor, high-speed, all steel interurban car of a type which has since been made standard on the Pittsburgh Railways lines. Mr. Phillips was also active in the construction of the new cars which have recently been placed in service on the Pittsburgh Railways lines, including the one-man cars and those used in multiple-unit operation.

He has become nationally known through his activities in behalf of the American Electric Railway Association, in which he has served on many important committees. He is a past-president of the Pennsylvania Street Railway Association, and is now president of the Pennsylvania Electric Association.



Frank R. Phillips

On Sept. 1, 1926, Mr. Phillips was elected vice-president and general manager of the Duquesne Light Company and subsidiaries, and in April, 1928, was elected vice-president of the Equitable Gas Company and its subsidiaries.

G. J. Marott Heads New Indianapolis District

George J. Marott, Indianapolis, has just been named by Mayor Slack of that city as a member of the board of trustees of the city's new utility district. His term of office is for three years. For many years Mr. Marott was president of the former Indiana Railways & Light Company. A public utilities district was created for Indianapolis by the last Legislature. Under the law, the utilities district will have control of all city-owned utilities, none of which are so owned at present. The idea back of the formation was the acquirement of the local gas company. In the future, if it is deemed necessary to create or acquire any further utilities, the district under the law will have charge.

Major T. J. Strickler, president of the Kansas City Gas Company, Kansas City, Mo., on May 18 was elected president of the Missouri Association of Public Utilites at the closing session of the three-day meeting of that body at Sedalia, Mo. Mayor Strickler succeeds A. E. Reynolds, Springfield.

L. S. Storrs Honored

His Work Is Lauded and Resolutions Passed Formally Acknowledging His Signal Service

LUCIUS S. STORRS, who resigned on April 1 as managing director of the American Electric Railway Association to accept the post as executive chairman of the board of the United Railways & Electric Company of Baltimore, was tendered a dinner at the Mayflower Hotel, Washington, on the evening of May 1 during the meeting of the United States Chamber of Commerce. Members of the Advisory Council, the American Electric Railway Association executive committee, and many other prominent executives of the industry joined in this tribute to the service which Mr. Storrs has rendered the industry during his four years as managing director.

J. N. Shannahan, chairman of the Advisory Council, was toastmaster. The speakers included B. C. Cobb, J. P. Barnes, Thomas N. McCarter, James H. McGraw, Paul Shoup, A. W. Robertson, Homer Ferguson, W. H. Sawyer, R. P. Stevens and Mr. Storrs.

Mr. McCarter commented on the period of readjustment for the industry during which Mr. Storrs helped to bring about more collective thinking and a broadened perspective in the industry. He expressed the conviction that an industry which renders a service so vital to modern communities can be put upon a sound financial basis and declared emphatically that the problems of the local transportation industry must be solved in the interest of those who have invested in them in good faith and of the country itself.

President Barnes extolled the guest for his persistent confidence in the industry, and lauded the qualities of patience and tact through which Mr. Storrs had brought about closer co-operation among properties in working for the solution of collective problems.

Mr. McGraw attributed the present difficulties of the industry to its failure to anticipate the condition which all but overwhelmed it. "The time has come," declared Mr. McGraw, "to look forward, not backward. During the last four years Mr. Storrs as managing director has helped us to understand the factors which caused our difficulty and has aided us in looking toward the future instead of the past."

Mr. Storrs Deeply Moved

Mr. Storrs protested his total inability to express adequately his feelings of gratification. He declared, however, that one of life's principal accomplishments is the accumulation of warm friends, and that this testimonial from those with whom he had worked so closely during his service as managing director would constitute a cherished memory during the remainder of his days.

The executive committee of the association tendered Mr. Storrs a unanimous vote of appreciation for the outstanding service which he has rendered during an exceedingly difficult period of readjustment. The resolution to this effect said in part:

"His confidence in the basic soundness of the business of local transportation has never wavered. He has aided in bringing about a better public understanding of the problems of the industry and of the essential and indispensable part which public transportation plays in the life of the modern community.

"He has been both a counsellor and friend to the executives of the entire industry. Through his genial personality and unusual qualities of tact and judgment, he

Digitized by Google

has brought about increased co-operation between operating companies and now leaves the American Electric Railway Association better organized and functioning at the highest state of efficiency and effectiveness in its history. Due to his enthusiasm, keen interest and wide grasp of local transportation fundamentals, he has stimulated the work of committees of both the American Association and its several affiliated organizations. Through his contact with other industries and associations, and with the several agencies of government, he has brought about a better public understanding of the problems of local transportation, accompanied by increased good will.

"Mr. Storrs leaves the position of managing director to assume again the direction of the destinies of an individual operating property, for which position of responsibility he is pre-eminently qualified. The executive committee of the American Electric Railway Association accepts his resignation with deep regret. It extends to him the good wishes of the entire industry for his continued success in his new position and congratulates the directors of the United Railways & Electric Company and the public of Baltimore upon having enlisted the services of so eminent and well qualified a local transportation executive and so delightful and genial a citizen and gentleman."

George Stokes in Charge of Equipment on Insull Line

George Stokes has been appointed general inspector of cars and equipment of the Chicago, South Shore & South Bend Railway, the Chicago, North Shore & Milwaukee Railroad, the Chicago, Aurora & Elgin Railroad and the Chicago Rapid Transit Company. Mr. Stokes has been with the North Shore Line for the past seven years. Starting with the transportation department in May, 1922, as collector, he was made conductor the following year, in the Chicago-Millwaukee service. Before joining the North Shore Line, Mr. Stokes was connected with the Pullman Company.

Former Senator Heads Commission's Legal Staff

William Cabell Bruce, former United States Senator from Maryland, has been appointed general counsel to the Maryland Public Service Commission by Gov. Albert C. Ritchie, who at the same time announced that John H. Lewin, a prominent Baltimore lawyer, would become people's counsel to the commission.

Mr. Bruce was general counsel to the commission from the time the commission was organized in 1910 until 1922, when he resigned to become a candidate for the United States Senate. Later the post of general counsel was abolished, but it was revived in 1927 by an act of the General Assembly. No appointment was made, however; Raymond S. Williams, a Baltimore lawyer, serving as special counsel in some cases. It has been announced that Mr. Williams will continue to serve in the cases in which he has been interested and which are still pending. The most important of these is the car fare case of the United Railways & Electric Company, which is to be argued before the United States Supreme Court in the fall.

Mr. Lewin, who formerly was assistant city solicitor of Baltimore, will succeed Thomas J. Tingley, resigned.

D. L. Turner Resigns

Consulting engineer to New York Commission will go into private practice Sept. 1 after thirty years of city service

DANIEL L. TURNER, consulting engineer to the New York Transit Commission and the Board of Transportation, and for nearly thirty years intimately associated with the planning and developing of the city's rapid transit lines, will retire from public service on Sept. 1. Mr. Turner will make a trip around the world and will then resume private engineering practice.

It has truthfully been said that in his entire career Mr. Turner's first allegiance has been to the city of New York. Not content with merely performing his duties as an engineer, Mr. Turner enlarged the fields of his work by studying the trends of traffic and investigating the results of

D. L. Turner

local transportation extensions upon the outlying districts of the city and upon the community as a whole. By this work he made himself an expert on urban transit and acquired a reputation which attracted the attention of the nation.

The extent to which this is true is instanced by his work on the joint vehicular and rapid transit highway in Detroit, his service as consulting engineer on rapid transit in that city, his work since 1924 as consulting engineer for the Pittsburgh Transit Commission and for the North Jersey Commission, and his retention as consultant in other similar projects.

Mr. Turner served in New York with the Rapid Transit Board, the Public Service Commission, the Rapid Transit Construction Commission, the Rapid Transit Commission and the Board of Transportation. His first post was that of assistant to William Barclay Parsons, chief engineer in charge of construction of the first subway. In 1918 he became chief engineer of the Public Service Commission, and in 1921 was named consulting engineer to the Transit Commission. When the Board of Transportation was organized in 1924 he was designated as its engineering consultant.

As a matter of fact his first connection with rapid transit in this city was in December, 1900, when subways were unknown. He left the Lawrence Scientific School at Harvard University, where he was an instructor in surveying and hydraulics, to become an aide of the Board of Rapid Transit Railroad Commissioners. He drew the plans for draining the new subway lines here and later conducted surveys for Brooklyn extensions.

He served for many years on the New York State Commission of Fine Arts, and since 1927 has headed the Suburban Transit Engineering Board, acting under the direction of the Port of New York Authority.

He was born Oct. 25, 1869, in Portsmouth, Va., and his retirement will come a few weeks before his sixtieth birthday. He received his engineering training at the Rensselaer Polytechnic Institute. While an instructor at Harvard, he drew plans for improving and draining Soldiers Field, the university athletic ground.

Mr. Turner is a member of many engineering societies and organizations concerned with city planning and civic welfare.

Changes in District Commission

It is expected that the Senate soon will confirm President Hoover's nomination of Maj. Gen. Mason M. Patrick and Harleigh H. Hartman to be members of the Public Service Commission of the District of Columbia, but the reorganization of the commission cannot be completed before June 1, as the resignation of John W. Childress, the present chairman, does not become effective until May 31. General Patrick, successor to Mr. Childress, therefore, cannot take office before that date. Mr. Hartman, who was appointed to succeed Col. Harrison Brand, Jr., however, is expected to be inducted into office soon after Senate confirmation.

Messrs. Parry and Thomas in New Salt Lake Posts

P. M. Parry, since 1920 commercial manager for the Utah Power & Light Company, Salt Lake City, has been elected vice-president and commercial manager of that company, and George B. Thomas, formerly secretary and treasurer, has been elected vice-president and secretary.

Both of these men have had long experience in the public utility field. Mr. Parry was connected with the Utah Power & Light Company's predecessor in Ogden for many years. He was made manager of its Ogden division in 1912, at the time of the consolidation of several companies into the present organization, and held that position until he was made commercial manager of the company in 1920.

Mr. Thomas was auditor of the Telluride Power Company prior to the organization of the Utah Power & Light Company, and was named auditor and assistant treasurer of the latter company in 1912, later becoming secretary and treasurer. He is also secretary and treasurer of the Utah Light & Traction Company and holds similar offices with the Western Colorado Power Company, Durango.

O. C. Gettinger Promoted by Elgin Road

O. C. Gettinger, trainmaster for the Chicago, Aurora & Elgin Railroad for the past nine years, has just been appointed superintendent of transportation in direct charge of all train movements of the railroad, both passenger and freight.

In October, 1908, he entered railroad service as a conductor on the Aurora City lines. By the end of the following year he qualified as a motorman and shortly thereafter began working for the Chicago, Aurora & Elgin Railroad. In 1912 he was made train dispatcher at Wheaton, from which post he was promoted to train master in 1920.

W. J. McCarter and P. W. Ogden in New Cleveland Posts

Walter J. McCarter has been appointed superintendent of training of the Cleveland Railway, Cleveland, Ohio, reporting to Clinton D. Smith, superintendent of the department of personnel.

Mr. McCarter is a graduate of the Class of 1921, Purdue University, where he was awarded the degree of bachelor of science in electrical engineering and was elected to several honorary fraternities. He joined the Milwaukee Electric Railway & Light Company in the fall of 1921, and as a student engineer and during the course of his practical training, he served as motorman, conductor, lineman, shop man, tester and substation operator, supplementing his special training with the study of industrial relations.

In 1922 and 1923 he served as instructor of engineering subjects in the industrial relation or industrial department, and in the fall of 1923 was made principal assistant to Dr. A. J. Rowland, educational director.

In January, 1926, Mr. McCarter was appointed supervisor of training in the transportation department of the Milwaukee Company, and as such supervised the training of all new employees, and the follow-up training of the employees after their permanent assignment. His success in this work culminated in his appointment as assistant educational director on Jan. 1, 1929. In this latter capacity he has served all departments of the company.

Mr. McCarter knows the efficiency of the motorman selection tests used in recent years at Milwaukee as an effective means for selecting suitable employees for the transportation service. He has also been instrumental in the development of one of the most complete employee training programs that may be found among public utility companies.

As superintendent of training of the Cleveland Railway Mr. McCarter will head a new division which will include the employment or selection of employees, the training and educational program for new and older employees, and accident prevention activities, all according to the general program of the personnel department as outlined in the ELECTRIC RAILWAY JOURNAL for July 2, 1927, at the time of the announcement of the appointment of Clinton D. Smith as superintendent of personnel.

The new division of training has been formed in conformity to the convictions of President J. H. Alexander that transportation can be merchandised, and that increased sales will be obtained from specific instruction or training of the employees. The program of the division includes the mechanical or psychological test for new employees, and the correlation of such tests with individual studies of accident-prone men. This specialization of training concentrates on the individual development and accepts general education as supplemental to the major task. It will be applicable to all transportation service employees.

Effective also as of May 1 Mr. Philip W. Ogden was appointed supervisor of employment, reporting to Mr. McCarter.

Mr. Ogden matriculated at East High School, Rochester, N. Y., in 1911, and then attended Mechanics Institute, Rochester, where he pursued the co-operative engineering course. In 1916 he was graduated from Cornell University. Prior to the World War, in which he served as Second Lieutenant in the Quartermaster's Corps, Mr. Ogden was associated with T. H. Symington Company, Rochester, N. Y., and after the Armistice was connected with the Eastman Kodak Company, Rochester.

He joined the Cleveland Railway in 1922, and for a period of three years carried on research activities under the direction of Mr. Alexander, then vice-president of the company. Since 1925, and until his appointment, Mr. Ogden has been associated with M. W. Rew, superintendent of the motor coach department, in which post he was responsible for personnel activities, including employment.

W. J. Stanton Heads Metropolitan Section A.E.R.A.

To fill the unexpired term of A. LeRoy Hodges, recently resigned, W. J. Stanton was recently chosen president of the Metropolitan Section, A.E.R.A. Mr. Stanton has taken an active interest in the affairs

W. J. Stanton

of the section ever since its organization, and has figured prominently in the activities of the supply men's group in New York City for many years.

"Jerry," as he is known to his host of friends, was born in Schenectady, March 7, 1884. He secured his early education in that city and upon completing high school work joined the General Electric Company. After a few years in the testing department, he entered the railway engineering department and in 1910 was transferred to the railway sales department under J. G. Barry with headquarters in New York City. This work took him to all parts of the United States.

He resigned from the General Electric Company in 1918 to accept a position as sales manager for the Railway Improvement Company in New York City. The following year found him associated as sales manager with the National Railway Appliance Company, and shortly afterward he went with the Ohio Brass Company, with which he remained for eight years, working out of the New York office. On June 1, 1928, he resigned to accept a position as vice-president and treasurer of the Cuban-American Manganese Corporation, which position he holds at the present time.

D. E. Watson Acting Vice-President in Indianapolis

At a meeting of the directors of the Indianapolis Street Railway, Indianapolis, Ind., on May 16, 1929, the following officers were elected: D. E. Watson, active vice-president, L. T. Hixson, secretary and treasurer, J. P. Tretton, general manager, T. L. Fox, second assistant secretary and treasurer.

Marshall S. Morgan resigned from the board. This left two vacancies which were filled by the election of D. E. Watson and J. P. Frenzel, Jr.

E. L. Bodge at Ottawa.

E. L. Bodge, formerly assistant freight traffic manager of the Illinois Terminal Railroad, has been appointed traffic manager of the Chicago & Illinois Valley Railroad, at Ottawa, Ill., succeeding R. G. Near, resigned.

Mr. Bodge was traffic manager of the St. Louis, Troy & Eastern Railroad at St. Louis, Mo., for several years, and after this line was consolidated with the Illinois Traction System was made coal traffic manager of the latter road. Upon the merging of the Illinois Traction System with the Illinois Terminal Railroad, he was appointed assistant freight traffic manager, in which capacity he served until he was made traffic manager last month of the Chicago & Illinois Valley, a subsidiary.

G. A. Burnham Heads American Brown Boveri

George A. Burnham, president of Condit Electrical Manufacturing Corporation, has accepted the presidency of American Brown Boveri Company, Inc., of Camden, N. J., a newly formed subsidiary of the American Brown Boveri Electric Corporation, created for the purpose of placing all electrical and mechanical operations, exclusive of ship building, under one management.

Mr. Burnham has been granted patents on many inventions pertaining to the control and protection of electric circuits. He is actively interested in the American Institute of Electrical Engineers and the National Electrical Manufacturers' Association. During the last nine months, in addition to his duties as president of Condit Electrical Manufacturing Corporation, he has been assistant to the president of American Brown Boveri Electric Corporation, and general manager of the electrical-mechanical division, activities now included in American Brown Boveri Company, Inc.

He was born in Essex, Mass., 1882, and was graduated from Tufts College, B.S. in Engineering 1908, M.S. 1910. Prior to attending college he was engaged in the construction and operation of power plants. Soon after graduation he was employed by the Condit Electrical Manufacturing Company finally being elected president of the Condit Electrical Manufacturing Corporation, successor to the Condit Electrical Manufacturing Company, in 1926.

Traffic Officials of Indiana Service Promoted

The transportation department of the Indiana Service Corporation, Ft. Wayne, Ind., has announced the promotion of the following employees:

Newton Archer promoted to accounting department from passenger and freight agent, Lafayette, Indiana.

George Garvin promoted to agent at Lafayette from assistant agent at Wabash.

Clyde Root transferred from agent at Peru passenger station to passenger and freight agent at Marion.

Merle McKee promoted from assistant agent at Peru passenger station to agent.

Paul Wire promoted from clerk at Huntington to assistant agent at Peru passenger station.

Henry W. Blake

Veteran editor of *Electric Railway Journal* dies. Had served industry thirty-eight years. Author and authority on American and foreign practice

HENRY W. BLAKE, senior editor of the ELECTRIC RAILWAY JOURNAL, died at his home in Englewood, N. J., on May 20. Until a few months ago, Mr. Blake had been in his accustomed good health, but at that time, at the suggestion of his physician, he postponed a contemplated trip to Europe, during which he had expected to gather additional material for the notable series of articles on European electric railway and bus practice which have been appearing since a similar trip made by him about two years ago. Despite this decision to forego the trip to Europe, the condition of his health did not appear to warrant special concern on the part of his physician, family or associates. Late last week, however, he suffered a severe attack of nervous exhaustion which did not respond to the treatments usually efficacious in offsetting attacks of this kind.

AN UNUSUAL CULTURAL BACKGROUND

Henry W. Blake was in many respects a great technical editor. He brought to his task as a young man an unusual equipment. He was learned not only in engineering, which he had studied at Yale University and the Massachusetts Institute of Technology, but in the liberal arts and in the humanities. Added to this background was the cultural influence of a period spent in Europe at the conclusion of his academic studies. If destiny did not decree that he be an editor, certainly there have been few men in the history of technical journalism better fitted than was he for the work to which he was to dedicate his life. Aside from his cultural and technical attainments he brought to his career as an editor a carefully poised judicial mind, wholehearted devotion to his task and a sense of the verities that seemed at times almost uncanny.

During the thirty-eight years Mr. Blake served the ELECTRIC RAILWAY JOURNAL and its predecessors many revolutionary changes were effected in the methods of mass transportation. In 1891 when he came to the JOURNAL, the argument between cable and electric advocates was at its height. In addition there loomed as possibilities the compressed air car, the storage battery car, and other forms of motive power. He served actively as editor during the period of the rapid expansion of the electric railway in city, suburban and interurban service and finally during the period in which the bus appeared—first, as a competitor and, then, as an adjunct to the already established transportation agencies. In the interval between these major movements came the development of electricity for use in heavy traction with its so-called battle of the systems, during which Mr. Blake kept his readers apprised of the progress being made, while at the same time he maintained the editorial balance without which no paper truly serves its readers. Not content with that, and while still carrying full editorial responsibility, he prepared for publication in book form, in collaboration with Walter Jackson, "Electric Railway Transportation."

As was indicated at the time he was honored by his associates on the occasion of the completion by him in 1921 of thirty years of service as editor, Mr. Blake made and held hundreds of friends in the industry, partly through the charm of his personality and partly through his willingness always to share his amazing knowledge of mass transportation methods and practices which embraced the entire period from the horse-bus and horse-car to their modern automotive and electric successors. Certainly, as one of his associates once said of him he "wrote his very life into the columns of the ELECTRIC RAILWAY JOURNAL." In so doing he wielded an influence that cannot possibly be measured, but has been felt and is today reflected on almost every electric railway in the country.

Henry W. Blake

So far as the chronological history of Mr. Blake's connection with the paper goes, it dates from his appointment to the staff in 1891 and covers the subsequent periods of his selection as editor in 1894, his sharing of the editorial responsibilities with Edward E. Higgins for several years before the turn of the century and his carrying the full editorial responsibility from 1899 to 1922, when he again shared the editorial responsibilities with another—Harold V. Bozell. He was appointed senior editor in 1925 in which post, after many years, he was relieved of direct responsibility for the paper and at that time relinquished active administration of editorial work in accordance with his own plan of devoting more and more time to his personal activities and of engaging in only such editorial duties as best fitted into his plan of allowing himself more leisure.

HAD KEEN SENSE OF OBLIGATION

Mr. Blake was graduated from Yale in the civil engineering course in 1886 and then took the course in electrical engineering at the Massachusetts Institute of Technology, after which he became connected with the Sprague Electric Railway & Motor Company, at that time engaged in the construction of electric railways in various cities in the United States. Like his father before him and like the New Englander that he was, Mr. Blake had a keen sense of his obligations, including his obligation to his alma mater. That he was held in high esteem by his fellow classmates is attested to by the fact that for many years he had been Alumni Fund Agent for his class, an office of special honor and distinction.

Mr. Blake was born in New Haven on Dec. 7, 1865. He is survived by his wife, one daughter and one son.

He was a member of the American Institute of Electrical Engineers, a member of the International Railway & Tramway Association, and during the formative years of the American Electric Railway Association he contributed abundantly of his time and influence to the work of the association, particularly that of the affiliated bodies, participating in the development of the standard classification of accounts.

APPRECIATION BY JAMES H. MCGRAW

James H. McGraw, publisher of the ELECTRIC RAILWAY JOURNAL, with whom Mr. Blake had been continuously associated during his thirty-eight years of service with the paper, said of him:

"Henry W. Blake was a great editor. His name will go down in the history of industrial journalism with the names of those other great editors of the past: Col. Henry G. Prout of *Railway Gazette*, W. D. Weaver of *Electrical World*, Arthur M. Wellington of *Engineering News*, Charles Kirchhoff of *Iron Age*, John M. Goodell of *Engineering Record* and Frank Wight of *Engineering News-Record*. For thirty-eight years he was intimately associated with the upbuilding of the ELECTRIC RAILWAY JOURNAL and of the McGraw-Hill Publishing Company. Very early in his career he grasped the ideal of editorial service and leadership upon which this institution was founded.

"In the early days *Street Railway Journal* was devoted to the interests of the horse, its care and its car. But electric propulsion was being promoted by men who saw the limitations of the horse and cable, and the possibilities of electricity. Convinced with me of the fundamental principle of technical and business journalism, that industry is always ready for real leadership, Henry Blake took hold of the helm of his paper firmly. In recognizing that the editor's responsibility is not merely to present current news and opinion, but to provide a vehicle for advancing thought, he stamped the imprint of his mind and personality indelibly upon the paper and the industry to which his life was devoted."

Joseph A. McGowan

Joseph A. McGowan, 69 years old, veteran railway executive of Indianapolis, died on May 13. He had been acting president of the Indianapolis Street Railway and the Terre Haute, Indianapolis & Eastern Traction Company since the death of Robert I. Todd last July. Mr. McGowan had been ill for several days prior to his death. Strain due to increase in work upon assuming the presidency of both companies is believed to have aggravated the heart condition from which he suffered and which really caused his death.

Mr. McGowan went to Indianapolis in 1903 at the instance of his cousin, the late Hugh J. McGowan, who was then developing the Indianapolis Street Railway and the old Indianapolis Traction & Terminal Company, of which he was president.

Joseph A. McGowan became auditor and later secretary and treasurer, serving in the latter position until his death, in addition to his duties as acting president of both companies.

Mr. McGowan was born in Ireland.

169 Exhibitors Take 96,196 Sq. Ft. of Space

Assignments made for Atlantic City convention, Sept. 28 to Oct. 4, as result of two days of deliberation by committee. Another impressive display assured

FREDERICK C. J. DELL, director of exhibits of the American Electric Railway Association, reported at the second meeting of the exhibit committee held at Atlantic City, N. J., on May 16 the following comparative results of space applications for the meeting Sept. 28 to Oct. 4:

Year	Number of Space Requests	Approximate Number of Square Feet
1923	89	43,594
1924	141	60,865
1925	172	98,293
1926	183	95,001
1927	216	104,143
1928	177	98,840
1929	169	96,196

When the convention opened last year there had actually been sold 109,420 sq.ft. to 251 exhibitors. Of this 109,420 sq.ft. 38,212 sq.ft., or approximately 29 per cent, was occupied by buses, trucks and body manufacturers, this space having been assigned to 23 companies.

This year so far sixteen bus, truck and body manufacturers have applied to the electric railway association for 32,734 sq.ft., or 32 per cent, of the total space available, which amounts to 102,498 sq.ft.

As a result of two days of deliberation on the part of the committee these assignments were made:

Exhibitors at the 48th Annual A.E.R.A. Convention, Together With Spaces to Be Occupied by Each Company

Company	Space Number
Adams & Westlake Co.	E-619
Ahlberg Bearing Co.	C-341-342
Aluminum Co. of America	E-628
American Brake Materials Corp.	E-602-603
American Brake Shoe & Foundry Co.	E-562-563
American Brass Co.	E-600-601
American Car & Foundry Motors Co.	C-308
American Fork & Hoe Co.	D-402
American Steel & Wire Co.	D-428-430
Anaconda Wire & Cable Co.	E-599
Anderson Body Co.	Portion of C-302
Anderson Brake Adjuster Co.	E-546
Aqua Oil Service, Inc.	E-523
Arco Co.	C-334-335-336
Baldwin Locomotive Works	Portion of E-617
Bender Body Co.	C-306
Bendix Brake Co.	Portion of C-303
Bethlehem Steel Co.	E-610-611-612-613-614-615-616
Bosch Magneto Co., Robert	E-532
Bragg-Kliesrath Corp.	Portion of C-305
Bridgeport Brass Co.	E-579
Brill Co., J. G.	E-513

Track space on Convention Hall Plaza, immediately in front of the Atlantic City Auditorium, has been assigned to the following companies for the display of street cars: The J. G. Brill Co., Cincinnati Car Co., Consolidated Car Heating Co., Osgood Bradley Car Co., Safety Car Heating Co., St. Louis Car Co., Twin Coach Co.

Third Avenue Railway May Use Trackless Trolleys

Following an investigation of the operation of trackless trolleys in Salt Lake City, as well as experiments made locally, officials of the Third Avenue Railway System, operating in New York City and Westchester County, are understood to favor their adoption for service between White Plains and Tarrytown as soon as the necessary permission can be obtained from the local authorities. An application to operate the new vehicles has been filed with the City Council of White Plains as well as with the authorities in Tarrytown, Greenburgh and Elmsford, where local officials have tentatively given their consent. Official approval is expected within thirty days. If the trackless trolleys are adopted a new carhouse for service and storage will have to be erected in White Plains, as the old carhouse was abandoned when trolley service was suspended several years ago. The present garage is of insufficient size to accommodate any considerable number of new conveyances.

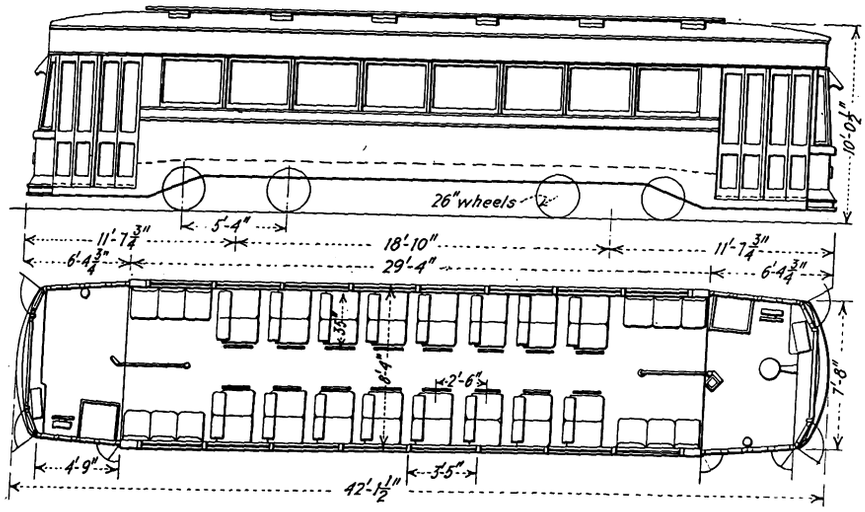
Specifications of Recent Car Orders

Details regarding a number of recent car orders placed with the J. G. Brill Company, as previously told in this paper, are now available. The ten one-man cars ordered for city service by the Delaware Electric Power Company, of Wilmington, Del., are to seat 44 passengers and will weigh complete with equipment, 35,740 lb. They are of the low platform stepless type in general use on that property and embody in their equipment and fixtures an extensive use of aluminum. Five of the cars will be provided with General Electric No. 265 motors, inside hung, four to the car, and five will have Westinghouse No. 510 motors. Air brake equipment is also to be divided between Westinghouse and the General Electric Company. The accompanying plans and specifications show further details regarding the new cars. Delivery is expected to be made during the early part of July.



Elevation and floor plan of Wilmington cars

SPECIFICATIONS FOR DELAWARE ELECTRIC POWER COMPANY CARS

Name of railway	Delaware Electric Power Company
City and state	Wilmington, Del.
Number of units	10
Type of unit	One-man, motor, passenger, city, double-end, double-truck
Number of seats	44
Builder of car body	J. G. Brill Company
City and state	Philadelphia, Pa.
Date of order	April 15, 1929
Date of delivery	July 1, 1929
Weights:	
Car body	16,600 lb.
Trucks	10,000 lb.
Equipment	9,140 lb.
Total	35,740 lb.
Bolster centers	18 ft. 10 in.
Length over all	42 ft. 1½ in.
Length over body posts	29 ft. 1½ in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 4 in.
Height, rail to trolley base	10 ft. 2¾ in.
Window post spacing	41 in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Five cars General Electric; Five cars Westinghouse
Armature bearings	Plain
Axles	Brill A.S.T.M. spec., A-20-21
Car signal system	Faraday high voltage
Compressors	Five cars-G. E. Co-27; Five cars Westinghouse DH-27
Conduit	Flexible Duratube
Control	K-35
Door mechanism	National Pneumatic
Doors	Folding
Fare boxes	Cleveland
Finish	Enamel
Floor covering	Flexolith
Glass	Non-shatterable
Hand brakes	Peacock staffless
Hand straps	White, porcelain enamel
Heaters	Consolidated Car Heating Co.
Headlights	Electric Service Supply Co., Keystone
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	Plain-Brill
Journal boxes	Brill M.C.B.
Lamp fixtures	Ivanhoe dome lights
Motors	Five cars G. E.-265; Five cars Westinghouse 510, inside hung
Painting scheme	Orange, cream and red
Roof material	Haskelite
Sash fixtures	Curtain Supply Company
Seats	Brill reversible 201-D type
Seat spacing	30 in.
Seating material	Leather
Slack adjusters	Brill mechanical
Step treads	Kass
Trolley catchers	Earll
Trolley base	Ohio Brass Company
Trolley wheels	Feist, Ohio Brass Company
Trucks	Brill 177-E-1
Ventilators	Brill exhaust type
Wheels, type	Rolled steel 26 in. diameter
Wheelguards or fenders	Parmenter

The five double-truck cars for interurban service on the lines of the Philadelphia & Western Railway will have a seating capacity of 51 passengers and will weigh complete, about 63,000 lb. They will be equipped for two-man operation, and will have both center and end doors. Additional data are supplied in the accompanying table.

SPECIFICATIONS FOR PHILADELPHIA & WESTERN RAILWAY CARS

Name of railway	Philadelphia & Western Railway
City and state	Norristown, Pa.
Number of units	5
Type of unit	Two-man, motor, passenger, interurban, double-end, double-truck
Number of seats	51
Builder of car body	The J. G. Brill Co.
City and state	Philadelphia, Pa.
Date of order	March 25, 1929
Weights:	
Car body	26,070 lb.
Trucks	19,030 lb.
Equipment	17,985 lb.
Total	63,085 lb.
Bolster centers	31 ft. 4 in.
Length over all	50 ft. 6 in.
Length over body posts	40 ft. 8 in.
Truck wheelbase	6 ft. 4 in.
Width over all	9 ft. 7 in.
Height, rail to trolley base	13 ft. 0¼ in.
Window post spacing	32 in.
Body	All steel
Roof	Arch
Doors	Center and end
Air brakes	Westinghouse—AMM
Armature bearings	Plain
Axles	Brill, heat treated
Car signal system	Faraday buzzer
Compressors	Westinghouse DH 25
Conduit	Metal
Control	Westinghouse ALMPC
Couplers	Tomlinson Form 16
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Door mechanism	National Pneumatic
Doors	Sliding
Energy saving device	Economy meter
Finish	Lacquer
Floor covering	Flexolith
Gears and pinions	Nuttall, forged steel
Hand brakes	Peacock staffless
Heaters	Railway Utility Company
Headlights	Golden Glow
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Brill M.C.B.
Lamp fixtures	E. S. S. Co's Ivanhoe domes
Motors	Westinghouse 535-B-1 inside hung
Painting scheme	Moss green
Registers	Ohmer
Roof type	Arch
Roof material	Poplar, canvas covered
Seats	Brill reversible 202-B type
Seat spacing	32 in.
Seating material	Genuine leather
Slack adjusters	Truck—Brill mechanical; Car—American Brake Co's
Steps	Folding and stationary
Step treads	Irving
Trolley base	U.S.—20
Trolley wheels	Westinghouse 60-B
Trucks	Brill M.C.B.-2X
Ventilators	Railway Utility Company
Wheels	Standard Steel Works, 30 in. diameter

The two cars recently ordered by the Newell Bridge & Railway Company of Newell, W. Va., are being built by the Kuhlman Car Company, Cleveland, Ohio. They are intended for city use, and will seat 42 passengers each. The accompanying table contains additional information as to dimensions and equipment.

SPECIFICATIONS FOR NEWELL BRIDGE & RAILWAY COMPANY CARS

Name of railway	Newell Bridge & Railway Company
City and state	Newell, W. Va.
Number of units	2
Type of unit	Two-man, motor, passenger, city, double-end, double-truck
Number of seats	46
Builder of car body	Kuhlman Car Company
City and state	Cleveland, Ohio
Date of order	April 11, 1929
Weights:	
Car body	16,760 lb.
Trucks	8,600 lb.
Equipment	6,640 lb.
Total	32,000 lb.
Bolster centers	23 ft. 4 in.
Length over all	45 ft. 3 in.
Length over body posts	33 ft. 3 in.
Truck wheelbase	4 ft. 10 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	10 ft. 5 in.
Window post spacing	42 in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Westinghouse straight air
Armature bearings	Plain
Axles	Brill standard
Car signal system	Consolidated
Compressors	D.H. 16
Conduit	Flexible
Control	K 35 KK
Door mechanism	National Pneumatic Company
Doors	Folding
Fare boxes	Cleveland
Finish	Enamel
Floor covering	Wood mat. strips
Gears and pinions	Western Elec. & Mfg. Company
Glass	D. S. A. selected
Hand brakes	Peacock staffless
Hand straps	Electric Service Supply Company sanitary grip
Heat insulating material	Celotex
Heaters	Consolidated Car Heating Company
Headlights	Crouse-Hinds portable
Headlining	Agosote
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Brill 3¼x6 in.
Lamp fixtures	Westinghouse
Motors	Westinghouse 508-A, inside hung
Roof material	Wood and canvas
Sash fixtures	Adams & Westlake
Seats	Brill
Seat spacing	Longitudinal
Seating material	Rattan
Steps	One folding; one stationary
Step treads	Kass
Trolley catchers	Knutson
Trolley base	Westinghouse
Trolley wheels	Westinghouse
Trucks	Brill 177-E-1-X
Ventilators	Brill
Wheels, type	Rolled steel, 26 in. diameter

J. G. Brill Company, Philadelphia, Pa., has brought out an attractive catalog on Brill master unit cars. Features maintained for the cars are light weight, quick acceleration, riding comfort, low-level platforms and floors, passenger appeal, maximum safety and circulating passenger load. These unit cars will be either single end or double end, double truck or single truck.

Electric Terminal Development Gets Underway in St. Louis

Preliminary work of clearing away buildings on the site of the proposed electric passenger and freight terminal in the downtown section of St. Louis, Mo., which is proceeding under the direction of engineers of the St. Louis Electric Terminal Railway, sets in motion a development that will ultimately involve the investment of millions of dollars in that vicinity in warehousing, shipping and transportation facilities.

The elevated and subway tracks included in this improvement, together with the terminal warehouse which is to be constructed on High Street north of Lucas Avenue, will, it is estimated, cost approximately $5,000,000. Other commercial developments and improvements sponsored by private interests are expected to call for the expenditure of an equal amount, and a considerable section of St. Louis, which has made little progress in recent years, will undergo extensive development.

Plans call for the establishment of a subway area under and east of High Street and between Washington and O'Fallon Streets in which will be located a terminal yard. The proposed passenger station will be built at the Washington Street end of this area, and from this point through trains will be operated over the lines of the Illinois Traction System to Venice, Granite City and other points in central Illinois. North of the passenger station development and over the subway area it is proposed to erect a terminal warehouse approximately twelve stories in height in which industries and wholesale organizations will be housed, thus affording direct freight trackage facilities over the Illinois Traction System and its steam railroad connections. The subway will also permit of a similar service to other warehouses and buildings which can be constructed over the air rights thus created.

The entire plan owes its conception to the necessity, long recognized, of providing additional freight facilities for the several carriers operated by the Illinois Terminal Railroad System.

Brown Boveri Organizes New Subsidiary

For the purpose of placing all electrical and mechanical operations exclusive of shipbuilding under one management the American Brown Boveri Electric Corporation has organized a subsidiary corporation to be known as American Brown Boveri. Company, Inc. At the company's plant at Camden, N. J., are produced steam turbines, blowers, compressors, transformers, mercury arc rectifiers, electric locomotives and railway equipment, under designs, processes and patents of Brown Boveri & Company, Ltd., of Switzerland.

American Brown Boveri Company, Inc., owns the entire capital stock of the Condit Electrical Manufacturing Corporation, which company will continue the manufacture and sale of its electrical control and protective equipment, through its own organization. Officers of the company are George A. Burnham, president; Maurice L. Sindeband, vice-president; Joseph T. Graham, secretary and treasurer, and William S. Edsall, general sales manager. Directors, in addition to Messrs. Burnham and Sindeband, are William M. Flook, Allen Curtis, Edward N. Goodwin, William F. Ingold and Theodore G. Smith.

In addition to his duties as president of Condit Electrical Manufacturing Corporation, Mr. Burnham has, during the last nine months, been assistant to the president of the American Brown Boveri Electric Corporation.

Toronto Contemplates Purchase of 110 Cars

Specifications have been prepared and bids will be asked on 110 new cars for city service in Toronto, according to Commissioner E. J. Lennox of the Toronto Transportation Commission. Recommendations will be laid before the Board of Control as soon as the necessary data as to prices, time of delivery, etc., have been assembled and considered. The new cars are expected to cost more than $1,600,000, and payment will be made from the rehabilitation fund which has been accumulated for this purpose.

Operating revenue has shown a consistent increase in the Canadian city over a period of years, and the new equipment will be provided to meet growing requirements and to provide necessary replacements. Practically all of the 950 cars owned by the Toronto Transportation Commission are in service during the morning and evening rush hours. While no details regarding the design of the proposed cars have been made available, it is understood that a number of them will be motor trail cars.

New Trail Cars for Service Between Baltimore and Annapolis

Plans involving the expenditure of over $250,000 to improve its passenger service on its North and South Shore divisions have been announced by Herbert A. Wagner, president, the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md. Contracts have been placed with the J. G. Brill Company to build nine new trail cars which will embody many novel features making for passenger comfort and luxury. The new trailers will be constructed of steel and mounted on Brill 27 M.C.B. trailer trucks. The cars will be 58 ft. 1 in. long and will weigh about 60,000 lb. Windows will be of plate glass encased in metal sash. Seats will be provided for 38 passengers in the main compartment and 20 in the smoker. The seats will have double spring cushions, upholstered in brown Spanish leather. Cars will be electrically heated, with thermostatic control, and will be provided with a lavatory. Floor covering will be interlocking rubber tile of buff and green. Exterior finish will be the W.B.&A. standard green with gold lettering; interior trim will be in mahogany finish with ivory ceilings. Delivery is scheduled for July.

Plans also call for the complete renovation of seventeen of the present motor cars so that they will conform in general design with the new trailers.

Seattle Plans Work on Elevated Street Railway Trestle

With the ordinance passed and signed by the Mayor of Seattle providing for the removal of a large portion of the Whatcom Avenue elevated street railway trestle, the reconstruction of the existing section along West Spokane Street and rebuilding of a new section from East Marginal Way to First Avenue South, will proceed within the next few weeks. The trestle in its present state is considered unsafe, and approximately $100,000 would have to be expended in repairs if its use is to be continued, street railway officials have advised.

A. E. Pierce, chief engineer of the Municipal Railway estimates that the cost for reconstructing the existing section along West Spokane Street and the rebuilding of a new section from East Marginal Way to First Avenue South will be approximately $100,000. The work will require about 215 tons of rail and 660,000 bd.ft. of lumber. The paving of First Avenue South, which will require 182 tons of rail, will cost approximately $80,000.

New Shops for Cleveland Union Terminal

In anticipation of the opening of the Van Sweringens' new Union Terminal, which is scheduled for January, 1930, bids are being received by the Cleveland Union Terminals Company for the construction of an electric locomotive repair shop and two inspection sheds for electric locomotives. The repair shop and one inspection shed will be located in the Collinwood yards of the New York Central Railroad, where electric operation of the lines running into the terminal will begin. The other inspection shed will be located in the Linndale yards of the Big Four, where electrification is to end.

The repair shop building is to be of concrete, brick and steel construction, with oil proof wood floor and will be 223 ft. long and 171 ft. wide. It will contain one large room, with a balcony running around all four sides. Five tracks will run the entire length of the building; three of these will be repair tracks, with pits beneath, one will be an oil wiping track, and the other a storage track for wheels and trucks. The shop will be equipped to handle work on ten locomotives. The balcony will contain rooms for a blacksmith shop, air compressor room, electric repair shop, offices, battery room, tool room, air brake room, motor generator and storage and locker rooms.

Each inspection shed will be steel and concrete, 198 ft. long and 39 ft. wide, with single tracks running through each side. The pits will be equipped with heating coils to thaw out locomotives during the winter.

Studebaker Makes Commercial Car Appointments

Appointment of three division commercial car representatives has just been announced by C. H. Wondries, manager of the Studebaker commercial car division. Each man has been assigned a specific territory and will work with the branch organizations in their respective territories in promoting commercial car business.

J. L. Engels, formerly sales promotion manager for the commercial car division, has been appointed the Western division commercial car representative. His headquarters will be at San Francisco and his territory that under the jurisdiction of the Portland, San Francisco and Los Angeles branches.

C. H. Miller has the Eastern territory with headquarters at Philadelphia. His territory includes the Boston, New York, Buffalo, Philadelphia, Washington, Pittsburgh and Cleveland branches. He was formerly the commercial car representative for the Philadelphia branch.

T. E. Connor, formerly commercial car representative for the St. Louis branch, has the Middle Western division. His territory includes the Detroit, South Bend, Cincinnati, Kansas City, St. Louis, Omaha, Chicago and St. Paul branches.

An Outstanding Contribution Toward Orderly Civic Development

WITH the presentation of the final report of the Regional Plan of New York and Its Environs a long forward step has been taken in American civic progress. This is the first time in history that so comprehensive a plan has been prepared to guide the future development of a large urban and suburban district. All previous city planning projects fade into insignificance beside the remarkable undertaking just completed. When Major L'Enfant prepared a plan more than 100 years ago for the future development of the city of Washington, he was thinking of a Capital District of 100 square miles, which he believed might some day have as many as 500,000 inhabitants. The area covered by the Regional Plan of New York embraces more than 5,500 square miles with an estimated population of 20,000,000 by 1965.

The significance of the Reginal Plan, however, lies not in size alone, but rather in its broad conception of all phases of civic development. The provision of adequate public transportation facilities occupies a prominent place. In the past, surprisingly little consideration has been given to transit facilities by city planners. Highways, parks, playgrounds, water supply, etc., have been recognized as important factors, but transportation needs usually have been overlooked. This mistake has not been repeated by the Regional Plan of New York. In fact, the entire plan is built upon a network of rapid transit lines, electrified railroads and high-speed motor highways.

The projects outlined in the report are so colossal that their full magnitude is difficult to grasp. Tremendous obstacles lie in the path of some of these proposals. For example, it is planned to connect railroads entering the district, and operate through service over electrified distributing loops. The railroads which have already been electrified, however, have adopted different systems and installed them on hundreds of miles of track. To standardize their equipment for joint operation over common track would involve so many difficulties that the practicability of this feature of the plan seems extremely doubtful. Nothing could illustrate better than this the need for community planning. Had the Regional Plan of New York been adopted 25 years ago, the present confusion of systems probably would not have occurred.

With certain details of the proposed plan not everyone will agree. Modifications of various features probably will be found necessary in the future. The important point, however, is that a comprehensive program has been prepared for the development of the entire metropolitan area comprising many political subdivisions, but closely related socially and economically. Its execution will require the outlay of enormous sums, but by considering the problem in its entirety, it is estimated that the cost will be considerably less than that of meeting one by one the needs of this growing region. Other communities might well follow the lead of New York in this endeavor to approach the problem of regional planning on a broad and comprehensive basis.

Car Survey Provides Striking Evidence

SO many advantages may be found in the replacement of old cars with new ones that it seems remarkable that car purchases have not been more widespread. Wherever new cars of the modern, lightweight type have been substituted for old, heavy, slow, dilapidated rolling stock, the resulting economy, improvement of public relations, and effect upon earnings have in practically every instance more than justified the investment. The survey of new car experience, of which the third and concluding article is published in this issue, summarizes these results for many properties representing a wide range of local conditions.

Far too much emphasis has been placed on the savings possible with modern equipment, and too little attention has been given to the possibilities for providing an improved service to meet the competition of other forms of transportation. The new cars that have been built are in general equipped with greater motor capacity in proportion to their weight than those they replace, and should be able to make considerably higher schedule speeds than the average maintained by most properties. Yet few companies show any material increase in speed with their new equipment. In many instances the new cars are placed on the same lines with old ones that cannot maintain the pace. Where full advantage has been taken of the possibilities of the new equipment, better service and reduced labor cost have been added to the savings made in power and maintenance.

Perhaps the most surprising result of the survey is that, even with the limitations that have surrounded the use of new equipment purchased during the past several years, the results on most of these properties have been uniformly favorable. It is no mere chance that those companies which have been most prominently identified during recent years as purchasers of new cars have shown better results, both in revenue and in expenses, than comparable properties that are clinging to obsolete equipment. Nor can the financial improvement be laid to the size of the cities in which these railways operate, for the gains are well distributed among small, medium, and large properties. When it is shown on the basis of these returns that a new car will save $1,268 in power and equipment maintenance alone, disregarding for the moment track and transportation savings, and greater attractiveness and earning power, it is apparent that the investment in new cars is not only justified, but is demanded as a matter of sound business policy.

A Worthy Rival of the Automobile

LAST year the Pittsburgh Railways received from the Osgood-Bradley Car Company two experimental cars that were designed to appeal to the riders through better performance and greater attractiveness. Graceful lines and proportions, high acceleration and braking rates, smooth and quiet operation, comfortable seats, ample aisle room for rush-hour travel, low step heights and economical operation were the major objectives sought in these cars. The new cars were frankly experimental. They included practically every innovation in car design tried up to that time, with the possible exception of the substitution of aluminum in the body framing. The purpose was to study in actual operation those factors that were likely to appeal to the passengers and to determine the practicability of many equipment features proposed for the improvement of car performance.

Now, after a year's trial of the two cars the railway has secured a third experimental car. It differs from the two previous cars principally in that aluminum was used in place of steel for the car body framing and was substituted wherever possible in the various equipment items. It is also equipped with the latest development of worm-drive trucks and high-speed, spring-suspended motors. The floor plan was changed a little and a center exit door was used instead of a rear door exit. It is worthy of particular note that this third car is again equipped with electro-pneumatic control and dynamic brakes. The designers went further this time by providing foot operation of the control and dynamic brakes, a feature that is expected to prove helpful in one-man operation.

In the attempt to insure maximum operating speed, this unit seems to go the limit with four 50-hp. motors on a car which only weighs 27,000 lb. Aluminum was used to such an extent that the car body with its equipment is reported to weigh only 14,000 lb. The use of four 50-hp. motors on so light a car makes it a worthy rival of the automobile. With its pedal-operated control and brakes it is capable of getting away to a fast start in traffic, with brakes designed for quick and smooth retardation.

The question of first cost still remains as an important consideration in the design. The many automatic devices incorporated, and the aluminum construction must justify themselves economically before the trend of future cars can be predicted. To this fact the Pittsburgh management is keenly alert, and it is rendering a distinct contribution to the industry in its pioneering effort to work out in the laboratory of experience the type of equipment best adapted to meet the competition of the automobile.

Far West Leads in Pick-up and Delivery

EVER since the advent of the motor truck the electric railways engaged in freight service have been struggling with the pick-up and delivery problem. Most executives have leaned toward the opinion that this service is a natural corollary of the business, but they have hesitated to embark upon the enterprise for fear that the shippers would not support the necessary extra charges. Others have maintained that this is a service outside of their province; that the larger shippers do not expect it and would not pay for it, and that where pick-up and delivery are desired the function should be left to independent truckers.

Last year a committee of the Central Electric Railway Association went on record in favor of the establishment of pick-up and delivery throughout the territory served by the Central Electric properties. While some progress has been made, the suggestion has not been generally adopted as yet. Apparently, individual roads hesitate to adopt this innovation until a general program for all of the carriers in the territory is worked out and agreed upon. Taking the industry as a whole, comparatively little has been done in the way of providing pick-up and delivery, although the subject has been under active discussion for several years.

In contrast to the general situation, the Pacific Electric Railway, of Los Angeles, Cal., recently instituted extensive store-door collection and delivery service as part of its freight business. This was undertaken for the dual purpose of meeting competition and supplying better service to the shipper. The necessary arrangements were effected by the company through contracts with reliable truckmen in the various communities along its lines. The better class of truck operators have been quick to see the advantage of an arrangement which promised to broaden considerably their sources of revenue. So satisfactory has the arrangement proved that the privilege of becoming allied with the railway in this progressive enterprise is eagerly sought. Thus have the two agencies of transportation been drawn together in mutually satisfactory co-operation.

All doubt as to the reception that the new service would meet at the hands of the shippers and the public, was soon dissipated. The original list of 24 stations has been expanded to 44, with further expansion in prospect. It is also significant that some 200 industries not previously served by the Pacific Electric Railway have become shippers over the line due to the increased convenience of the new service. Announcement of its expansion to meet growing requirements indicates that this commendable initiative on the part of the Pacific Electric Railway is meeting with the measure of success which it deserves.

A New Outlook in Toledo

TOLEDO has written into its history for the past two years some very interesting chapters. At the beginning of 1928 the transit situation in that community was a rather delicate one. The railway and the city had taken issue on a number of questions and it seemed as though events were leading from bad to worse. But this condition was suddenly reversed with the signing of an agreement which proved to be the turning point in the affairs of the Community Traction Company. Under the terms of this agreement, a supplemental ordinance to the Milner franchise of 1920, the city agreed to prohibit all competing transportation lines within a quarter mile of any of the company's street car or bus lines, giving the railway a virtual monopoly of all transportation service in the city. In return the company agreed to pay for a traffic survey, to set up a five-year reconstruction program amounting to $560,000, to purchase new buses, to set up a replacement fund of $230,000 and to re-route its existing lines and expand its service into new areas.

Further, the company agreed to advance $900,000 without interest for ten years to cover the accrued debts in the stabilizing fund. It invested in a number of new

Digitized by Google

buses, abandoned superfluous routes, established new routes in districts previously unserved, increased the motor capacity on a number of its cars, re-spaced car stops to reduce the running time, re-scheduled its service for higher speeds, instituted a safety drive and in several other ways attempted to give better service to more people. None of these moves were particularly spectacular, but each contributed to the betterment of the whole system.

Results have been most encouraging. Up to the first part of 1928 the riding had been steadily falling off and earnings had been constantly decreasing. Soon after the improvements outlined had been well started, however, more people began to patronize the system. In the succeeding months a number of records were established, consistently showing more passengers than in the corresponding months of the previous years. Operating expenses were also reduced by substituting buses on unprofitable lines and effecting numerous economy measures, so that net earnings show large increases for the periods. Increases in riding are expected to continue. The company is not stopping with the improvements it has already made; in fact, it is only beginning its track rehabilitation and equipment replacement programs. In view of the results accomplished in so short a period, the outlook in Toledo is bright indeed.

San Francisco Needs a Transit Policy

SAN FRANCISCO is squirming under the lash of the whip laid upon it by its own city engineer, M. M. O'Shaughnessy, in his report on the street railway requirements of the city with special consideration to the unification of existing facilities. Mr. O'Shaughnessy does not mince his words. He never has. He stands high in his profession, and San Francisco has confidence in him that almost amounts to veneration.

Mr. O'Shaughnessy has laid down many fundamentals for which electric railways have long been contending. He is for improved routing. He is against parking. He is against the jitney. He is against the imposition on the railway of paving requirements except those incidental to making track repairs, and any additional cost of street paving occasioned by the presence of tracks. He is for the skip stop.

Moreover, he declares that it is axiomatic that, from the standpoint of the riding public, the best service can be provided by a unified street railway system with universal transfers. He says without equivocation that a continuation of the operation on the 5-cent fare under private ownership means that both the quality of the service and the condition of the property will become poorer and poorer year by year. If Mr. O'Shaughnessy had set about writing the terms of Magna Charter for the electric railways, he could hardly have done better.

The report reviews the entire situation courageously and is fundamentally sound in demanding that the city adopt a policy and do something about it. The seriousness of the situation is reflected in comment by the *Chronicle* stressing the fact that the city does not yet know what it is going to do when the franchises of the private companies expire. That is both lamentable and inexcusable. The same commentator adds that Mr. O'Shaughnessy's report furnishes a mass of information useful in helping the city make up its mind. Certainly that is true. As the report says, the city should either carry out the charter mandate by taking over and operating the systems of the private companies, or adopt a plan whereby the private organizations can continue to render service of a character necessary for the progress and development of the community. In the light of that statement it is no wonder San Francisco squirms under the lash Mr. OShaughnessy has laid upon it.

Subsidy by General Taxation Is Unsound

IN THE REPORT on San Francisco's transportation problems by M. M. O'Shaughnessy, city engineer, he assumes that the city stands committed to the policy of municipal ownership and operation of its street railways and thereupon develops a proposal for the retention of a 5-cent fare, frankly recognizing the deficits that will accrue thereunder, and proposing to make up the deficiency from general tax funds.

There ELECTRIC RAILWAY JOURNAL differs with the report radically and emphatically. It is bad enough for San Francisco to stand committed to a policy of public ownership. The answer to that is to reverse the policy before the city gets further into that bottomless cesspool of constant financial and political turmoil. But above all things, it is a fundamental mistake to put an operating management—whoever it might be—into the dilemma of attempting to provide efficient transportation service that will keep pace with the city's growing requirements, handicapped with a 5-cent fare accompanied by a deficit to be made up from general taxation. That just can't be done, and it is flying in the face of public psychology to attempt it. Under such a plan, the whole weight of public opinion presses toward keeping the deficit and the tax rate at a minimum, with the inevitable result that service will seek the level of bare necessity with the maximum crowding and inconvenience that the public will tolerate.

Mr. O'Shaughnessy justifies this recommendation on the ground that a portion of the burden of maintaining a high grade transportation service should fall on the taxpayers whose properties and business are directly benefited, as well as on the rider who uses the service. The JOURNAL has little quarrel with that reasoning. In fact, the proposal to put a readiness-to-serve charge upon the benefited property is merely another step toward establishing an equitable distribution of the costs of transportation service between car riders and property owners that is so strongly advocated and clearly explained by the city's engineer in discussing the unfairness of present paving charges borne by the railways. But the report proposes that all property and business carry the burden of the operating deficit instead of the property specially benefited by the location of street railway lines. Rather than permit the deficit to recur year after year to plague the operating management, it should be wiped out through proper distribution of capital charges. The only available method of accomplishing the result sought would be to distribute a portion of the capital cost of the system as a benefit assessment against the property affected, in proportion to the benefits received, thereby wiping out a substantial portion of the fixed charges. This would represent application to a street railway system of the plan suggested for rapid transit in several cities. It would with one stroke distribute the costs of transportation service equitably and at the same time avoid that bothersome deficit that would be a constant bone of contention and a continual obstacle to good service—just as it has proved to be in New York.

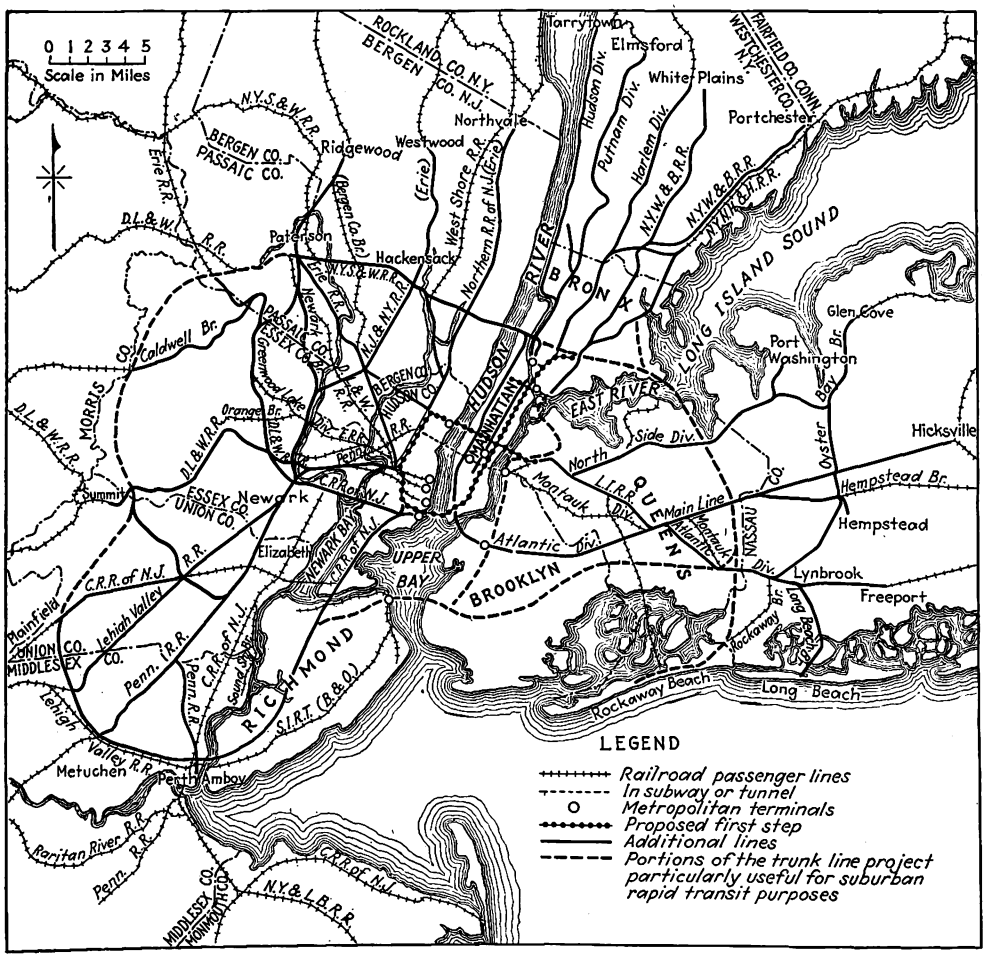
Transportation

Future requirements of this Metropolitan District analyzed in reports made by the Regional Plan of New York and Its Environs. Separate rapid transit system for commuters and co-ordination of trunk line railroad terminal operations proposed. Highways, parkways, bridges, tunnels and airports also included in comprehensive recommendations.



Interstate loop rapid transit system with extensions to the north and east is proposed as a first step in the solution of the commuter problem of the New York metropolitan district. The ultimate plan includes the utilization of a considerable mileage of trunk line railroads as well as the construction of numerous additions and connections, as shown on the lower map

WITH the object of securing better distribution of population, providing improved means of transportation, reducing congestion, and generally making the metropolitan district a more desirable place in which to live, an elaborate report has been prepared by the Regional Plan of New York and Its Environs. The proposed plan is the result of seven years work, carried out by engineers, economists and other experts at an expense of more than $1,000,000. It covers not only New York City but all of Long Island, and territory in the states of New York, Connecticut and New Jersey lying within 40 to 50 miles of the New York City Hall and dependent upon the metropolis for shopping, working and recreation. This area includes 421 separate communities and contains 5,528 square miles.

Over this vast region, which is so closely bound together by common interests that it must be treated as a unit, the new plan spreads a network of many miles of highways, parkways, trunk line extensions, and rapid transit lines, tying them together with new bridges and tunnels wherever necessary and interspersing them with new parks, playgrounds and aviation fields. These enterprises, it is proposed, shall be scheduled for completion prior to 1965. They are part of a program under which it is expected that 20,000,000 people will be able to live more comfortably in the region than 10,000,000 do at the present time.

The general appearance of the plan, as laid down on the map, is of a series of concentric circles, barred like a gridiron, but with the grids large enough so as not to impose a close rectangular system of layout. These represent the highways, parkways, railways and rapid transit systems. They are laid out with the idea of enabling residents to go from one outlying section to another without passing through the congested portions of the city, as well as to give easy access to the central sections.

The plan assumes that Manhattan will remain the population center of the region, but that it will be closely rivaled by the western tip of Long Island and the communities on the west bank of the Hudson River. It is expected that New Jersey will grow with great rapidity when its transportation facilities are developed

Digitized by Google

Facilities Planned *for* 20,000,000 People

and its waste lands, prominent among which are the Hackensack Meadows, are reclaimed.

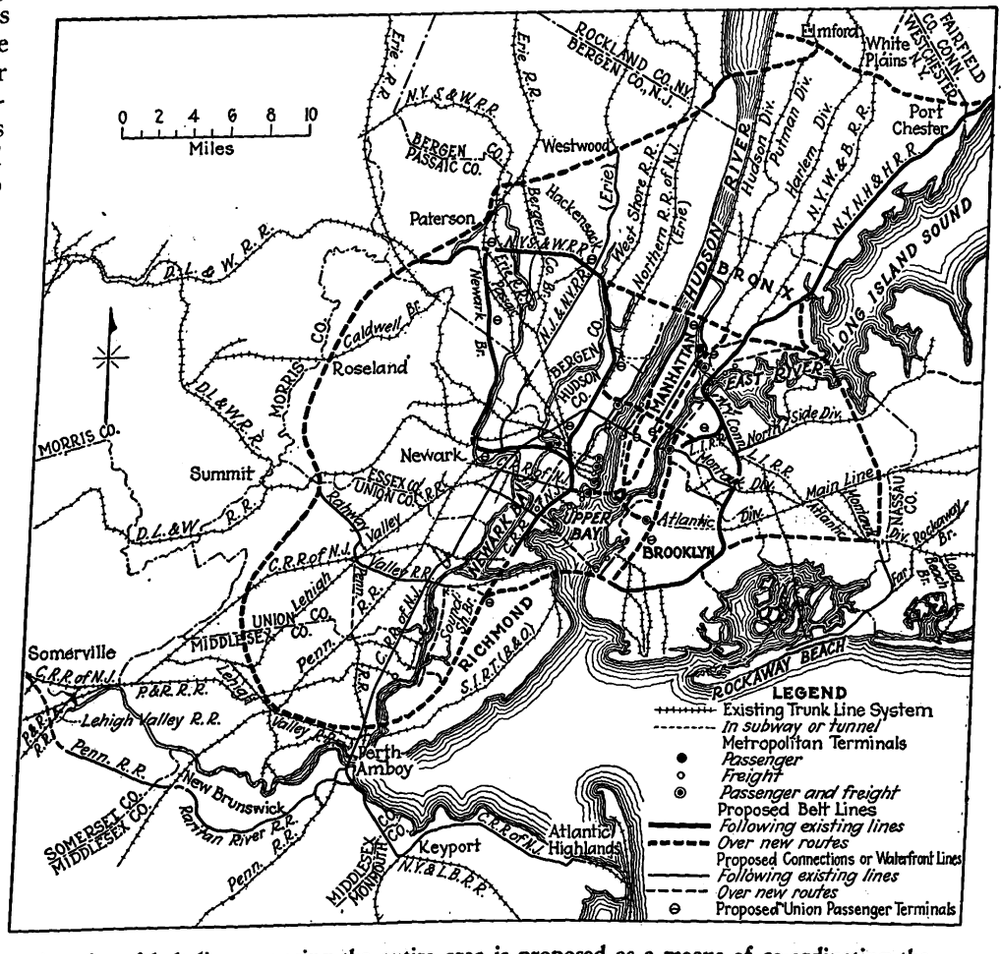
Studies show that about two-thirds of the railroad passengers brought into the city are commuters. The remaining third, numbering at the present time nearly 100,000,000 annually, will have increased to about 270,000,000 by 1965. Suburban rapid transit facilities are now furnished entirely by the trunk-line railroads in trains operated over the same tracks that are used for other types of railroad business. Commuter traffic has been increasing at a rapid rate and now presents so serious a problem for the railroads that it is generally admitted that special facilities for it must be created within the central part of the region. If the special suburban rapid transit facilities proposed within the central areas are carried out to tap the railroad lines beyond these terminals the latter would be enabled to deal adequately with the needs of long-distance travel, which was originally their primary function.

The proposed suburban rapid transit system has been developed with regard for its relationship to the other features of the Regional Plan, especially the existing and proposed trunk-line railroad and city rapid transit systems. The locations of existing and future sub-centers, the proposed highway system, and the best utilization of land have all had an important influence on the selection of routes.

The first step proposed is a loop connecting Manhattan and New Jersey, hooked up on the east with the Long Island Railroad and on the north with the New Haven and the New York, Westchester & Boston, as shown on the map on page 696. This will require tunnels under the Hudson at 57th Street and at a point near the Battery, and other tunnels under the East and Harlem Rivers, as well as a deep level subway in Manhattan.

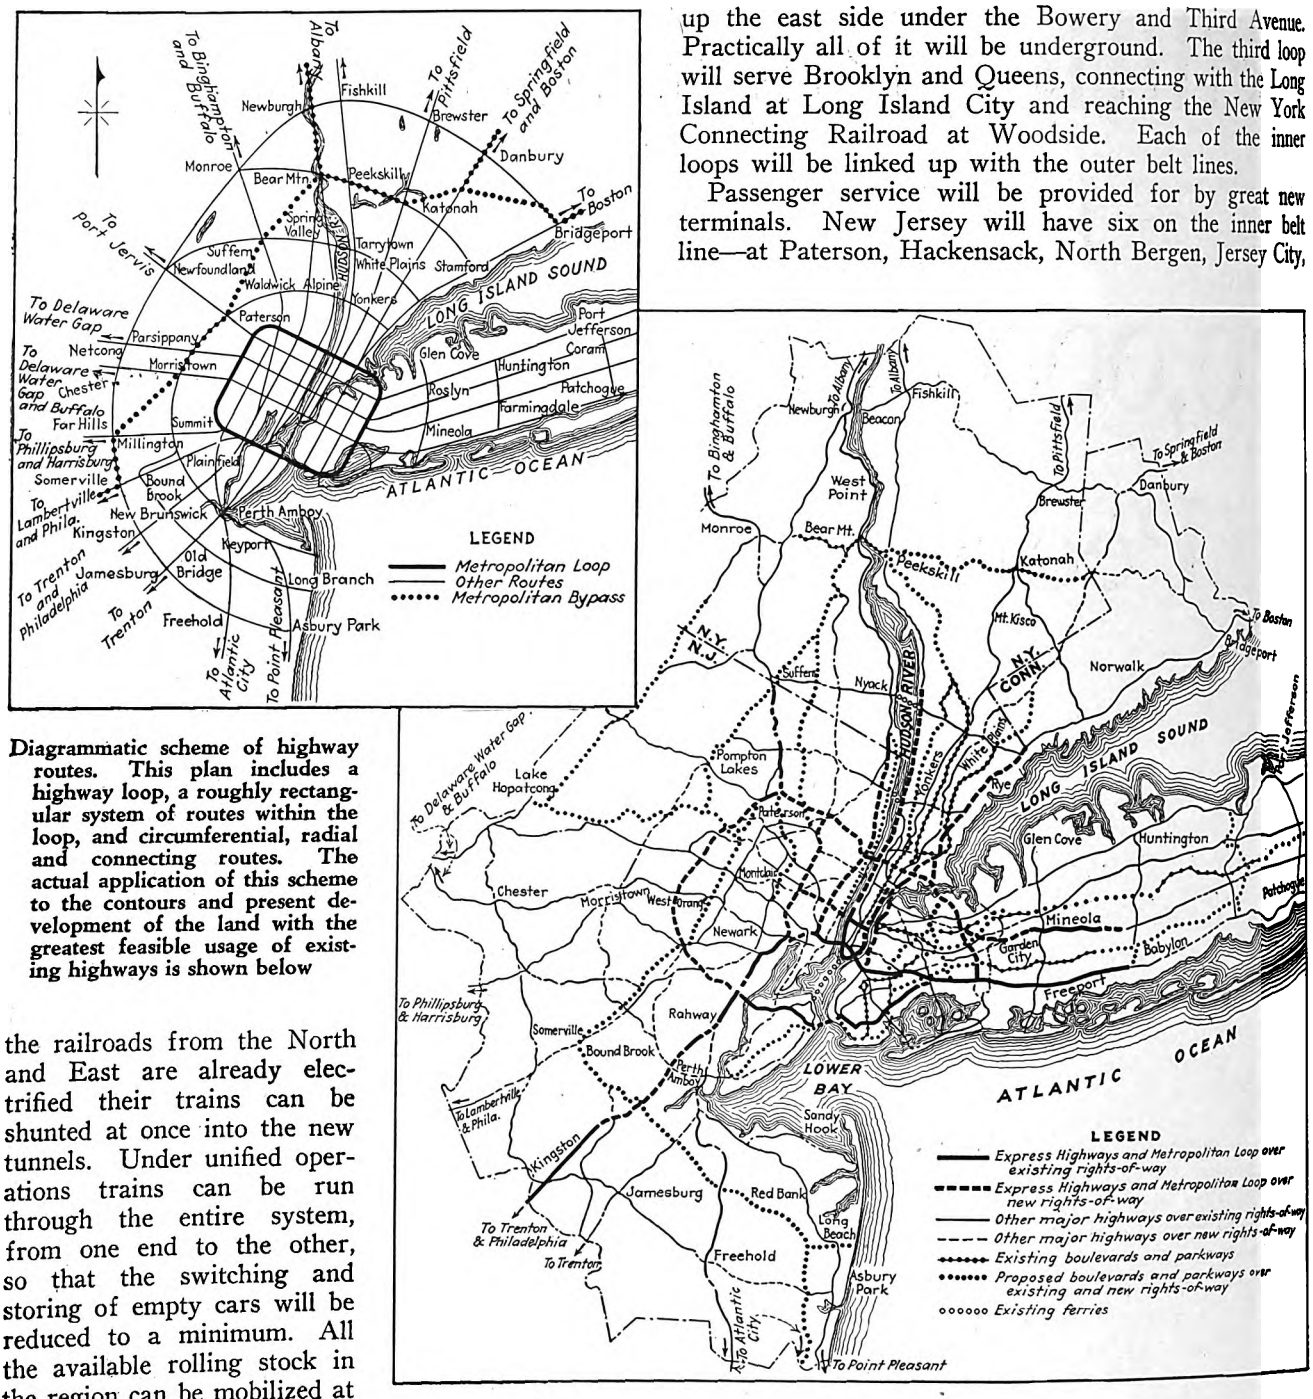
The ultimate plan presupposes the electrification of most of the railroads handling commuter traffic or the substitution of additional trackage for electrical operation, either under, over, or adjacent to the existing railroad rights-of-way. In New Jersey it would include an area within a radius of about 20 miles from the New York City Hall and in Westchester and Nassau Counties in New York an area within a 25-mile radius from the City Hall.

At the beginning commuters coming in from New Jersey on existing railroads not yet electrified will have to change cars in order to enter the main system, but as



A series of belt lines covering the entire area is proposed as a means of co-ordinating the terminal operations of the trunk line railroads

Digitized by Google



Diagrammatic scheme of highway routes. This plan includes a highway loop, a roughly rectangular system of routes within the loop, and circumferential, radial and connecting routes. The actual application of this scheme to the contours and present development of the land with the greatest feasible usage of existing highways is shown below

the railroads from the North and East are already electrified their trains can be shunted at once into the new tunnels. Under unified operations trains can be run through the entire system, from one end to the other, so that the switching and storing of empty cars will be reduced to a minimum. All the available rolling stock in the region can be mobilized at any time where it is most needed. These proposals coincide in general with plans previously advocated by the North Jersey Transit Commission and the Port of New York Authority.

To meet the growing needs of trunk-line railroad freight traffic the plan begins by laying down an outer belt line, passing around the heart of the region, through New Jersey, Long Island, Westchester County and a corner of Connecticut, at an average distance of about 20 miles from the City Hall. All railroads entering the region will be connected with this belt line, which will be partly new construction and partly along existing railway routes. By means of this belt line and its connections any car from any railway can be switched to any point along the outer rim of the region. Car ferries will become obsolete.

Three inner loops are proposed. One will circle the Jersey shore opposite Manhattan. A second will run down the west side of Manhattan to the Battery and up the east side under the Bowery and Third Avenue. Practically all of it will be underground. The third loop will serve Brooklyn and Queens, connecting with the Long Island at Long Island City and reaching the New York Connecting Railroad at Woodside. Each of the inner loops will be linked up with the outer belt lines.

Passenger service will be provided for by great new terminals. New Jersey will have six on the inner belt line—at Paterson, Hackensack, North Bergen, Jersey City, Newark, and a point in Clifton southwest of Passaic. Manhattan will have a new terminal in the neighborhood of 178th Street and Amsterdam Avenue and probably another at 60th Street and the Hudson River. The Bronx will have a terminal at 149th Street and Mott Avenue. Queens will have one near Queens Plaza, Brooklyn will have one near Prospect Park Plaza, and one is planned south of Port Richmond.

By the aid of these terminals and the lines which will serve them, a passenger coming into the region by trunk-line railroad will be taken directly without change of his means of conveyance, to any community in the 50-mile radius.

Like the railway and rapid transit systems, the proposed highway system for the region is based upon a loop, or series of loops. The principal one of these will run at an average distance of about 12 miles from the New York City Hall. Three inner routes will sup-

Digitized by Google

plement the loops. Nine north-and-south routes are indicated. Two of these will traverse Manhattan, following the lines of the west side elevated speedway, already authorized, and the proposed east side boulevard. Five will run through New Jersey. One, starting in Richmond Borough, will pass through Bayonne and run close to the west bank to the Fort Lee Bridge. Others will roughly parallel it further to the west, giving New Jersey cities convenient north-and-south connections. The remaining two routes will be on Long Island.

Twenty "radial routes," extending outward from the loop, will tap Long Island, Westchester County, parts of Connecticut, the upper Hudson along both banks, Western and Southern New Jersey, and the Interstate park and other recreation areas. The main routes will be devoted to express traffic, and taken as a whole will enable through travel to bypass the points of greatest congestion.

In addition to the new highways the report proposes a chain of parkways and boulevards encircles the entire region. Thirty-nine major routes are suggested, connecting the important outlying parks and swinging in a great circle around New York City from Long Branch, N. J., to the south shore of Long Island. These are so planned as to take advantage of the existing scenic opportunities, following river and shore lines wherever possible and traversing the Watchung and Ramapo Mountain chains and the rolling country of Westchester and Long Island.

The proposals include an almost continuous ring of open spaces, encircling the region. The recommendations for the more congested centers of the region are limited by the prohibitive expense of the land in most cases. The report also suggests that the value of water reservations, private golf courses and even cemeteries as "lungs" for the city population be taken into consideration.

A further source of breathing space, as well as an adjunct to the transportation system, will be the airplane landing field. The report advocates the purchase, as soon as possible, of sufficient land for sixteen civil airports, in addition to the 22 airports of all kinds now existing in the region.

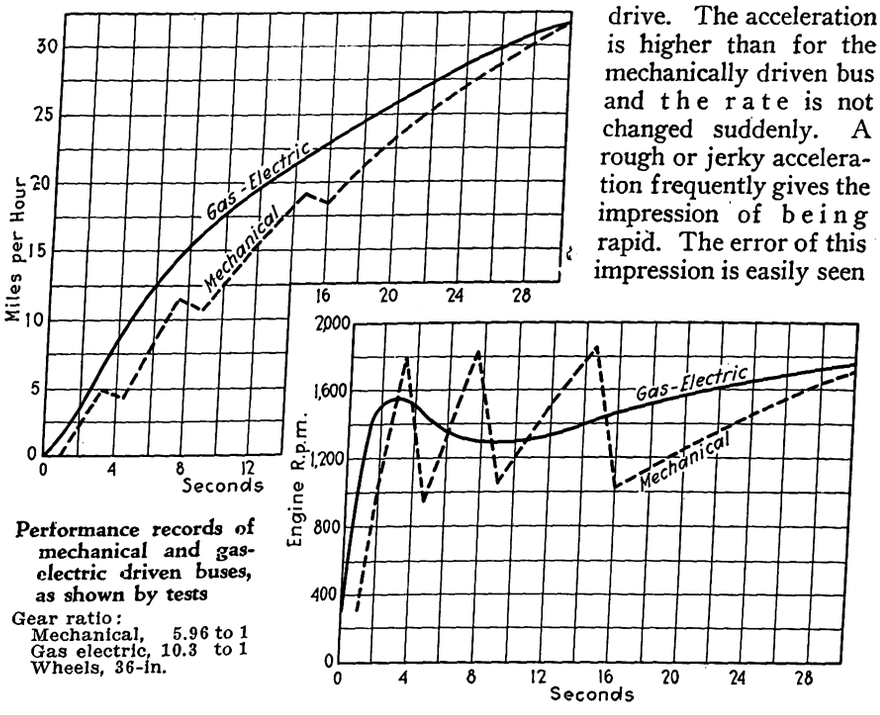
Though no figures were given out as to the cost of carrying out the plan, it is believed that they will run into the billions. The total expense, however, probably would not exceed the cost of emergency measures which would have to be taken to meet the needs of the growing city if no general plan existed, and in the long run the plan would undoubtedly result in large economies for the region as a whole and for every community affected.

Acceleration Rates Compared for Gas-Electric and Mechanical Drive Buses

By W. H. McLaughlin
General Engineer Westinghouse Electric & Manufacturing Company

IN ORDER to compare the advantages of electrically driven and mechanically driven buses, tests were made by the Westinghouse Electric & Manufacturing Company on a chassis equipped first with one type of drive and later with the other. The results are thus entirely comparable because the same engine was used throughout and the difference in the total weight represents the fundamental difference between the conditions of the tests. A graphic picture of what occurred during the acceleration of the two buses, is given in accompanying curves, in which the results of the test have been summarized. These show the performance of the mechanical drive using the four speeds of a standard transmission and portray the average initial delay as actually measured. The various "steps" in the acceleration are due to the loss of bus speed while the operator is shifting gears. The curve clearly indicates the changes in the acceleration rate during the gear-shifting operations, and also the manner in which the engine speed varies during acceleration. The engine speed reaches a maximum of approximately 1,800 r.p.m. and falls to about 1,000 r.p.m. each time the gears are shifted. During this period the engine is disconnected from its load about 25 per cent of the time in order to shift the gears. This loss of power causes a corresponding loss of bus speed.

An average gas-electric test with this engine has also been plotted. The data were taken from comparable tests conducted by the same men over the same course as for the mechanical drive. The acceleration is higher than for the mechanically driven bus and the rate is not changed suddenly. A rough or jerky acceleration frequently gives the impression of being rapid. The error of this impression is easily seen



Performance records of mechanical and gas-electric driven buses, as shown by tests

Gear ratio:
Mechanical, 5.96 to 1
Gas electric, 10.3 to 1
Wheels, 36-in.

Digitized by Google

when a comparison is made of distance covered by the two drives at definite times after starting. This is shown by the following table:

Time in Seconds	Distance Traveled in Feet—Gas-Electric	Distance Traveled in Feet—Mechanical
10	144	93
20	468	365
25	671	552
30	900	772

The engine revolutions per unit of distance traveled are fewer for the gas-electric than for the mechanical bus. The data in the following table were taken from the curve:

Time in Seconds	Engine Revolutions for 100 Ft.—Gas-Electric	Engine Revolutions for 100 Ft.—Mechanical
10	154	220
20	98	120
25	88	110
30	82	89

The difference in engine revolutions per mile increases as the stops per mile increase. This is due to two factors. The engine on the mechanical bus is usually raced while shifting gears. The engine in the gas-electric is idling during coasting and braking, while in the mechanical it operates at a speed proportional to bus speed, unless the clutch is released or the gear shifted to neutral.

A bus equipped with gas-electric drive will weigh from 10 to 15 per cent more, and cost from 15 to 20 per cent more, than a similar mechanical job. To offset this increase in cost and weight, however, the advantages previously mentioned are obtained.

Traffic Problems Topic of New York State Meeting

LIVELY discussion of the problems of traffic and transportation in city streets occupied the greater part of the sessions of the 47th annual meeting of the New York Electric Railway Association held at the Hotel Champlain, Bluff Point, N. Y., June 21-22. This subject was introduced by the first speaker, Ernest Murphy, general manager, United Traction Company of Albany. After emphasizing the seriousness of the traffic problem as it exists today, he pointed out that the passengers in public transportation vehicles are not organized as are the majority of riders in private vehicles, the retail merchants, and other interests. Moreover, city officials ordinarily are not qualified by experience to act as representatives of the street car and bus riders. Hence, the railway manager must assume the duty of acting as representative of the riding public in the solution of traffic problems. Vehicular congestion, as it effects the street car rider, was discussed by E. K. Miles, superintendent of transportation, New York State Railways, Syracuse. He brought out the fact that parking and improperly arranged traffic signal lights are the greatest causes of congestion and delay. To secure relief, it is essential that the solutions proposed have the approval of both the general public and the city officials.

Advantages of the electric railway over other means of transportation were emphasized by J. Rowland Bibbins, consulting engineer, Washington, D. C. He pointed out that the transportation problem is essentially a rush-hour problem. At present buses are handling only a comparatively small portion of the total traffic of the large cities in this country. In New York, Chicago, and Philadelphia, they carry about 5 per cent of the traffic, in Boston, 10 per cent; and in Detroit, 19 per cent. According to Mr. Bibbins, the reason for these small percentages is that the total volume of traffic is too large to be handled effectively except by rail. Roadway space is inadequate to handle rush-hour crowds of ten to fifteen thousand passengers per hour on a single route. More and wider streets would be required to handle this volume of traffic by bus. Speed is the most important element in transportation, and buses are slower loading than are street cars, according to Mr. Bibbins. Moreover, because of their greater power, street cars can accelerate faster than buses—another advantage in handling mass transportation. In conclusion, Mr. Bibbins pointed out that proper traffic signals are essential to speedy transportation, and outlined some of the principles to be followed in designing signal systems.

John McLean, attorney, United Traction Company of Albany, spoke on the subject of rights of street cars, and urged the railway men to make greater efforts to put their case before the public. Bus operation in Buffalo was described by J. C. McCollum, executive assistant, International Railway.

That the present condition of the local transportation industry is a challenge to private management was the opinion expressed by Miles B. Lambert, Westinghouse Electric & Manufacturing Company. He said that the problems of today are exceedingly complex in character and, in many instances, are not thoroughly understood. Further scientific research is needed to solve them satisfactorily. He advocated wider use of technical experts by the railways in meeting these problems.

Contributions made by the manufacturers to the efficiency of the street car were discussed by Cornell S. Hawley, president, Consolidated Car Heating Company, R. H. Sjoberg, General Electric Company, and Raymond Boiselle, Westinghouse Traction Brake Company. Passenger safety was the subject discussed by W. H. Hyland, claim agent, Fonda, Johnstown and Gloversville Railroad, the last speaker on the program.

Officers for the coming year were elected as follows: President, Ernest Murphy, general manager, United Traction Company of Albany; first vice-president, R. R. Hadsell, general manager, Schenectady Railway; second vice-president, G. W. Jones, vice-president, Brooklyn and Queens Transit Corporation; third vice-president, B. J. Youngbluth, president, International Railway; secretary and treasurer, W. S. Stanton, Rochester.

The meeting concluded with a banquet, Saturday evening, at which the speaker was James B. Rice, representing Mayor Houde of Montreal.

Coming—An interesting analysis of the relation between the length of traffic signal cycles and the efficiency of street use.

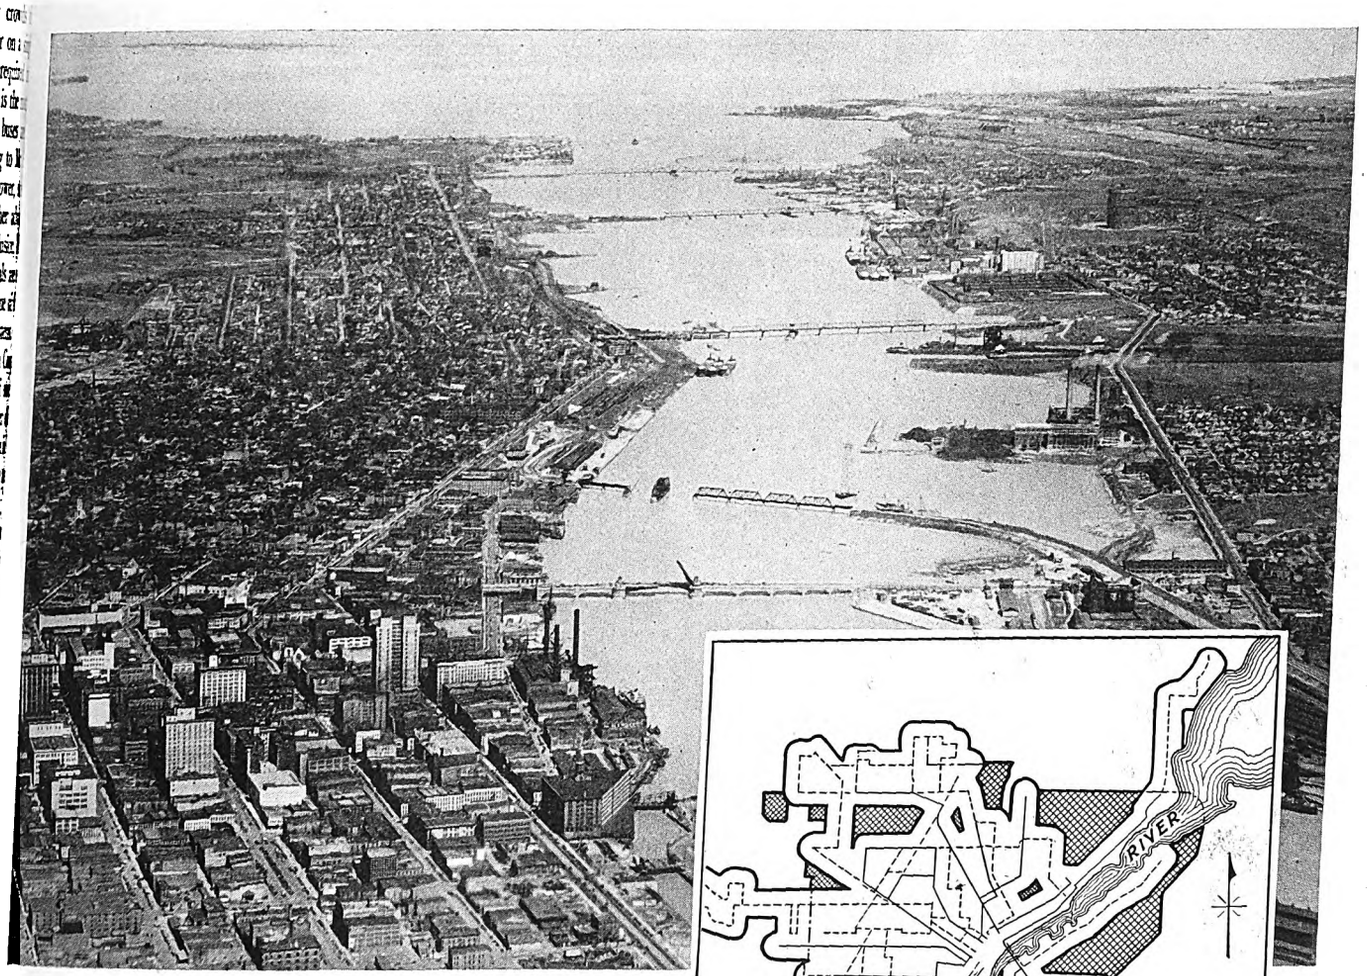
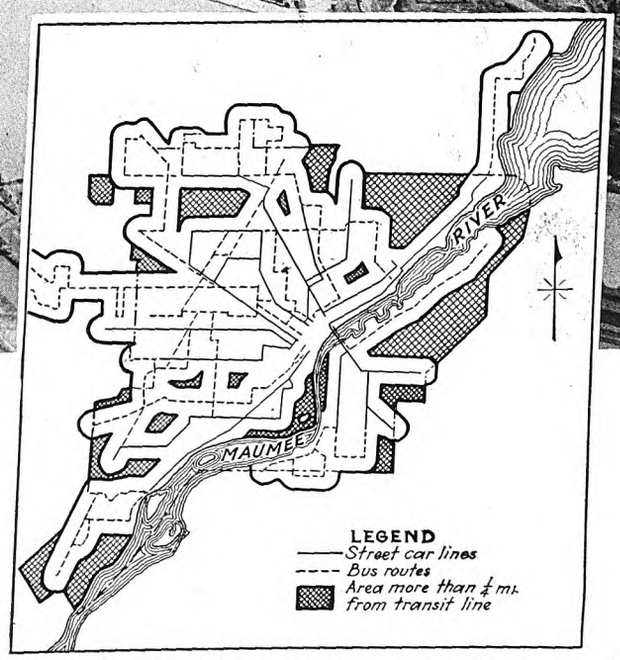
Modernized Toledo System Making Real PROGRESS



Aerial view of Toledo's downtown business section and the north end residential district. The Maumee River, which divides the city, flows into Maumee Bay on the north, an inlet of Lake Erie



By abandoning certain lines, rerouting others and extending the bus system, the Community Traction Company has covered all but a few areas within the city limits by its service

Co-ordination of street cars and buses, extensions of routes to parts of city previously unserved, improvement in railway equipment, acquisition of new buses, and elimination of competition responsible for large **increases in revenue**

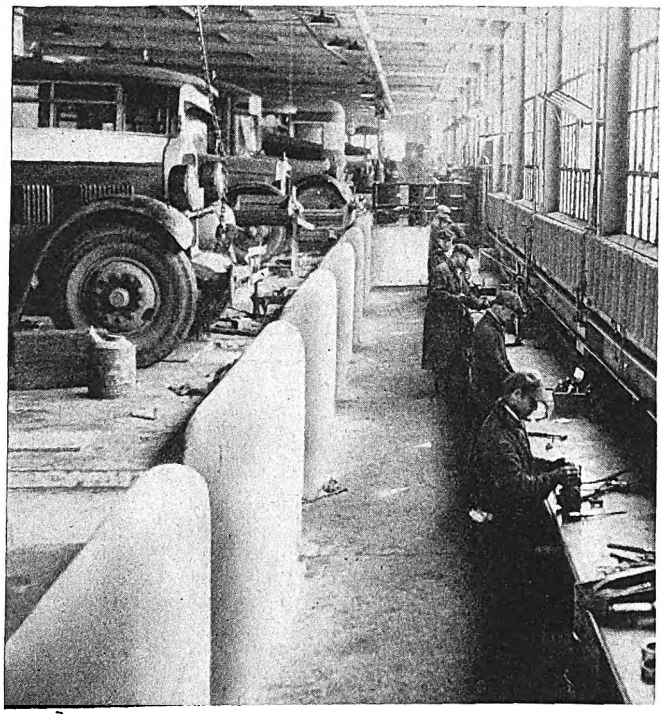
TOLEDO'S transportation outlook, rather gloomy for a long period of years, is now beginning to appear unusually bright. At least it must be assumed to be brightening when the figures month after month show large increases and continue to establish new records. And that is just what the figures of the Community Traction Company are doing.

The actual "proof of the pudding," of course, lies in the figures as they are shown in the company's reports. Passenger revenue for 1928 was $3,479,628, compared with $3,251,198 for the previous year, and revenue passengers totaled 48,230,315, compared with 45,503,270 in 1927. Total revenue from all sources showed an increase of $259,288 over the previous year. The most remarkable increase was in bus patronage which soared from 2,795,052 in 1927 to 6,150,851 in 1928. For the

Digitized by Google

twelve months ended April 30, 1929, the total passenger revenue was $3,360,797, or 12.9 per cent higher than the year before, and the total revenue passengers carried was 50,685,350 or 11.8 per cent higher. These figures are the more encouraging when the percentages for the twelve months ended April 30, 1929, are compared with the per cent increases for the first four months of 1929. Passenger revenue for the four months combined shows an increase of 16.31 per cent over the corresponding period in 1928, while revenue passengers show a 15.01 per cent increase. The company has expanded its service steadily since the middle of 1928, but in spite of this has managed to keep its operating expenses down. In fact, during 1928, the operating costs were reduced from $2,044,191, the 1927 figure, to $2,018,119, while the company made an increase in service of 10 per cent.

As a result of the increased revenue and decreased operating expenses there has been an appreciable increase in earnings. The turning tide has changed the figures from red to black, and the company, with its financial set-up again adjusted, is getting back to a sound basis. A net surplus of $64,234 was realized for the first quarter of 1929, after meeting all obligations, while for the similar period in 1928 the company was faced with a deficit of $5,254. For the entire year of 1928, the surplus, after all operating expenses, taxes, and charges had been deducted, was $125,150, which compares with a deficit of $361,825 for the previous year. Present indications are that this progress is not temporary, but that it will continue in the future.



Part of the new $150,000 garage, where the bus maintenance and servicing activities for the company's large fleet are centralized

Perhaps the greatest accomplishment has been the restoration of the faith of the city officials and the public, and the conversion of a strongly antagonistic feeling into a friendly one toward the company. The public is now interested in its transportation system and is responding heartily to the railway's expansion and modernization program.

The upward trend in revenue passengers is the answer of the public of Toledo to the railway's endeavor to give better service. Of the many steps taken by the railway, the most important ones were the abandonment of superfluous routes, the establishment of new routes in districts previously unserved, the expansion of its bus system, a complete co-ordination of the entire rail and bus system, the installation of extra motors on the street cars, re-scheduling service, and the reconstruction of a large amount of track. Along with these major moves the company arranged for special bus service, established owl service with buses, repaired bridges, eliminated grades, built a large garage and centered its bus activities in it, lowered its accident claims and resulting charges by instituting a safety drive, reduced its operating expenses, designed new transfers, rearranged car stops, marked the new stops with bright orange bands, and provided safety zones. Every effort was made to offer the maximum of service to the greatest number of people in Toledo.

New Agreement Made with City

The general rehabilitation program, sponsored by the railway, followed the passage of an ordinance in June, 1928, supplementing the Milner service-at-cost franchise and giving the Community Traction Company a virtual monopoly of all local transportation facilities in the city. The new ordinance settled a number of issues which had been discussed without success for years. The original Milner service-at-cost ordinance, adopted by the electors on Nov. 2, 1920, proved unsatisfactory in several particulars. The city asserted that the company was not willing to do its share toward its comprehensive street rebuilding program, and the company asserted that the city had been remiss in permitting bus competition free from the limitation of service-at-cost regulations.

The company found itself in the anomalous position of operating superfluous routes while unable to start routes that were needed in new areas. Again, the city maintained that the company was paying too high a rate for power, while the company felt that its yearly reconstruction program was limited too much by the ordinance provision that replacements were to be financed from a depreciation fund, accrued from earnings, amounting to not less than one-half of 1 per cent nor more than 1½ per cent of the capital value. Other differences of viewpoint complicated the whole situation. Several attempts were made previous to 1928 to amend the Milner franchise which became effective in 1920. First came the Bartholomew report, then the Riggs report, and finally the supplemental Riggs report. Although there were earnest attempts to solve the transportation difficulties, no direct results were obtained from them.

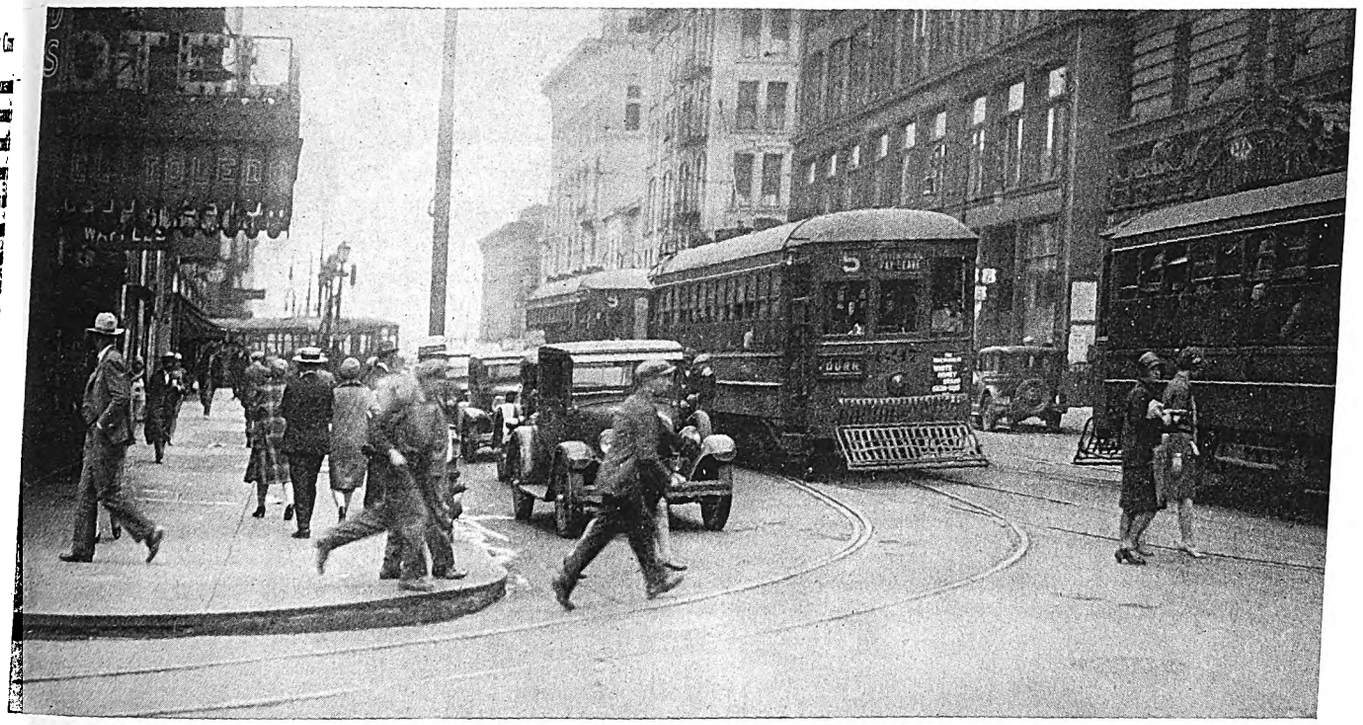
By the end of 1927, however, bickering over the Milner ordinance had to come to an end in favor of constructive measures. During the first half of 1928, a number of conferences between the city and company officials were held, and the new ordinance was formulated. It was heartily endorsed by Mayor Jackson and when submitted to the City Council was passed by a vote of 17 to 1. It was approved by the Mayor on June 5 and became effective July 5.

The ordinance is, in effect, a 5-year modification of the original Milner ordinance. It gives the railway practically a monopoly of all local transportation service in Toledo by prohibiting any transportation line within one-fourth mile of a Community Traction Company car or

Digitized by Google

bus line, and also provides for a substantial reduction in the power rate to the railway. The power rate was reduced to 1¼ cents flat per kw.-hr. and a rebate for the past power bill amounting to $150,000 was allowed. In exchange for these terms, the company agreed to pay an old pavement bill amounting to $185,241 with interest at 6 per cent, to pay for a traffic survey which cost $25,000, to set up a five-year reconstruction program amounting to $560,000, to establish a special replacement fund of $230,000 to be advanced against the depreciation fund and refunded after the third year, and to secure a loan of $30,000 for a down payment on new buses.

The Community Traction Company also agreed to a loan of approximately $900,000 for ten years without interest to cover the accrued deficit in the stabilizing fund, exclusive of the original $400,000 in the fund. It also agreed to reroute the existing lines, to abandon non-



Street scene in downtown section of Toledo. Many of the company's cars have been re-equipped with four motors, giving them ample power for rapid acceleration in traffic

essential lines and to expand its service into new areas, all at the standard fares of ten cents for a single ride, three tokens for 25 cents, and 1 cent for a transfer.

Realizing that its superfluous routes in certain districts and its lack of routes in other districts were causing an unnecessary operating expense and at the same time failing to secure the maximum of patronage, the company set as its major objective the rerouting of its lines, reaching into new territory with buses, and fully co-ordinating the two types of service.

In July, 1926, the rail routes totaled 57.43 miles while the bus lines were only 4 miles. In the ensuing twelve months the bus mileage was increased to 30.6 and the following year to 58.0 miles. Following the passage of the ordinance supplementing the Milner franchise, further extensions were made bringing the total bus mileage to 78.5. During the same period, the rail mileage was decreased 11.14 by reroutings and abandonments of lines that really could be better operated with buses. At the present time the total rail and bus mileage is 124.79 which is more than double the figure of July, 1926, of 61.43 miles.

The bus routes for the most part are feeders to the street car lines or lines which do not compete with the trolleys. The whole plan was to co-ordinate the two systems so that a maximum number of people could be served without unnecessary duplication of facilities. The accompanying map, showing the area in the city limits within a quarter of a mile of a transportation line, shows how successfully the rerouting and extensions were in covering the city. The hatched areas on the map, which are not within one-fourth mile of any line of the Community Traction Company, are for the most part parks, institutional grounds, cemeteries, etc.

In January, 1928, a total of 3,787,459 passengers were carried on the 54.1 miles of street car route, averaging 70,021 passengers per mile of route. In January of the following year the rail routes were only 46.9 miles, but 3,895,821 passengers were carried, making an average of 83,101 passengers per mile of route. The increase in passengers carried per mile of route was due to the new system of using street cars for the heavy routes of travel only and feeding them by bus with passengers from the outlying districts.

Buses Show Passenger Increase

A corresponding increase in passengers per mile of route was obtained with the buses, even during the rapid period of expansion in 1928. In January of that year buses covered 32.4 miles of route and carried 373,306 passengers, or 11,522 passengers per mile. In January, 1929, the bus mileage was 68.3, but 1,149,233 passengers were carried, or 16,826 passengers per mile.

Prior to June 30, 1928, there were six independent bus lines competing with the Community Traction Company. Under the terms of the ordinance giving the railway a monoply of the bus service, the independents were forced to sell out. The six lines were purchased

Digitized by Google

from the independents on a property valuation basis under the terms of the ordinance. A total of 40 buses were bought but only a few were serviceable.

To give the new service, the Community Traction Company purchased, during 1928, a total of 88 buses, of which 69 were new. The new buses included 3 Macks, 18 Whites, 38 Yellows and 10 Twin Coaches. These buses, which cost approximately $900,000, brought the fleet to a total of 124 at the beginning of 1929. A new garage was built at a cost of $125,000 for the purpose of centralizing maintenance and operation activities.

In addition to the numerous extensions made, the company established special services with some of its new buses. In a single month special buses operated for high school students carried 18,000 passengers and brought in a net profit of $520. The revenue of 40.074 cents per mile was the highest in the entire bus system. The buses also were substituted for street cars for owl service on certain lines, resulting in lower operating costs.

Higher Speed with Extra Motors

By adding two 35-hp. motors to 58 Peter Witt cars already equipped with two motors of the same size, the company was able to speed up its service on several lines. On the Cherry Street line the extra motors permitted the terminal schedule speeds to be raised as follows:

SCHEDULE SPEEDS IN MILES PER HOUR

	Old	New	Per Cent Increase
Morning peak	9.84	10.53	7.02
Base	10.17	11.09	9.05
Afternoon peak	8.72	10.34	18.58
Night	10.17	11.09	9.05

Incidentally, with this increase in speed came an increase of 14.3 per cent in traffic for the period from April, 1928, to February, 1929, as compared with the same period of the year previous, and a 17.5 per cent decrease in platform expenses.

Another factor in raising the speed on several lines was the rearranging of stops to give longer runs between them. When the new stops were put into effect, the schedules were announced by pamphlets. As a further aid the new stops were marked with brilliant orange stripes around nearby poles at the curbs, the color conforming to that of the cars. Two more steps to help increase the speed were the establishment of safety zones in a business district of the city and the designing of a new system of transfers. In this system colors indicate groups of parallel routes while the hour is indicated by the length of the transfer. While the new transfers shorten the time of issuance appreciably, they also have been responsible for an 8 per cent increase in purchases of the regular token fares. This is the result of the elimination of a certain amount of return riding by means of transfers.

Extensive Track Reconstruction Program

One of the most important provisions of the ordinance which went into effect in July, 1928, was the setting up of a 5-year track rehabilitation program, involving a sum of $560,000. The amounts available for this work were to be $185,000 for the first year, $181,000 for the second, $57,000 for the third, $119,000 for the fourth, and $80,000 for the fifth. These sums were to be in addition to the $230,000 appropriated for the replacement of worn out equipment in a period of three years. A great amount of street improvement work has been completed and other projects are well under way. At the end of the 5-year period, the company will have most of its track in excellent condition. Aside from actual track reconstruction the company has also eliminated a few grades and repaired some bridges.

Among the numerous steps taken by the company to move forward was the institution of a safety drive which has resulted in a very substantial reduction in accident claims and resulting charges. In the maintenance department, too, every effort has been made to lower the cost and to improve the equipment. That the equipment has been improved is best evidenced by the fact that pull-ins in 1928 were 40 per cent less than those in 1927.

Public Responds to Company's Effort

The results of the many improvements made by the Community Traction Company to better its service, reviewed at the beginning of this article, indicate that the public is responding favorably to the modernized system. The company has enjoyed increases in passengers and revenue every month since the supplemental ordinance went into effect in July, 1928, and no doubt traffic will continue to build up in the succeeding months and years.

The increased earnings and the financial readjustment provisions of the supplemental ordinance have changed this aspect of the operation materially. Prior to 1928, the earnings were falling off, riding was steadily decreasing and the deficit in the stabilizing fund, established under the terms of the Milner ordinance of 1920, was growing larger each month. In March, 1928, the company made its last sinking fund payment, retiring 20 per cent of the capital value. This sinking fund was established by the Milner ordinance to retire $1,800,000 of the 6 per cent bonds of the company and to issue an equivalent par amount of common stock to the city. The payments of 2½ per cent of the capital value amounted to approximately $28,000 each month. Relieved of this obligation the company was able to show a surplus the following month.

At the time the supplemental ordinance was passed the deficit in the stabilizing fund was approximately $1,300,000. To take care of this a provision was included for a loan to the railway amounting to approximately $900,000, representing substantially the deficit in the stabilizing fund exclusive of the $400,000 originally placed in it. Interest on this loan and payment of principal was suspended for a 10-year period subject to a shorter period should the agreement with the city be terminated. Because of the extensions of these payments it was agreed to place all surplus into a so-called "fare stabilizing fund," and to readjust the fares when this fund reaches $500,000. At the first of the year the fare stabilizing fund had reached a total of $65,032, making the actual deficit in the reserve fund $1,147,217.

The first four months of the present year showed surpluses of $18,789, $25,767, $17,634, and $20,833, respectively, raising the fare stabilizing fund to $148,055 and reducing the actual deficit in the reserve fund to $1,064,194. The lower power rate, the rebate of $150,000 for power, the lower accident charges, the lower operating expenses and steadily increasing revenue make the prospects for reducing the deficit in a comparatively short period and putting the company on a sound financial basis again, appear exceedingly bright.

Electric coaches have no difficulty in negotiating the 10 per cent grade of Capitol Hill in Salt Lake City at a speed of 17½ m.p.h.

Trackless Trolley Questions Answered from Experience

Riding has increased steadily on Salt Lake City line. Minor difficulties which were experienced have been overcome. Operating costs are lower than for motor buses or street cars of the same capacity

By

EDWARD A. WEST

General Manager
Utah Light & Traction Company
Salt Lake City, Utah

MANY interesting developments have taken place since the inauguration of trackless trolley service in Salt Lake City on a 4.3-mile route on Sept. 9, 1928. It was recognized at the outset that there would be problems to meet in pioneering this new conception of the trackless trolley and a few difficulties actuall did arise in connection with the operation of the ten original coaches. However, the troubles were all of a minor nature and were overcome one by one. No fundamental difficulties were encountered, so that no concern is felt regarding the ultimate outcome. The operation as a whole has been entirely successful and has met with favorable public and official sentiment; in fact, because of the public's attitude the company plans to operate a second line on Ninth East Street, in place of the present railway service. Permission has been granted by the City Commission of Salt Lake City and the line will be established as soon as the Public Utilities Commission of Utah approves the abandonment of the car line and the substitution of trackless trolleys.

In the Sept. 8, 1928, issue of ELECTRIC RAILWAY JOURNAL the underlying reasons for the adoption of the trackless trolley for service in Salt Lake City were discussed. In a later issue—Feb. 9, 1929—an article was published, reporting the progress of the new service and giving details of the overhead and the ten "electric coaches," manufactured by the Versare Corporation. In February, however, the company had not had sufficient experience with the coaches to discuss with certainty the many phases of operation and the results of the new service. With nine months of experience, it now feels in a position to answer the many questions which have been asked regarding the various phases. The more important of these questions with the answers follow:

Digitized by Google

Q—Do you recommend trackless trolleys for use on unpaved streets?

A.—This depends altogether on climatic conditions and the character of the roadbed. Experience in Salt Lake City indicates that operation on dirt streets is not satisfactory. During those seasons of the year when ruts are formed in the street surface from thawing and freezing, riding on the coaches is rough and vibrations are set up in the body which loosen electrical connections. A great deal of this difficulty doubtless would be eliminated by a more general method of insulating equipment from shocks, and steps taken along this line are proving effective. Of course, any type of road vehicle is subject to the same difficulties with unpaved streets.

Q—How flexible in traffic are the electric coaches? Is this flexibility an advantage?

A.—Coaches have a great amount of flexibility in traffic, giving them a decided advantage over the fixed-route vehicles. The following incidents show the desirability of flexibility in heavy traffic: At a busy intersection during the rush hour one evening an automobile became entangled with a street car, the front wheel of the automobile becoming wedged under the car. A coach was following the street car, and instead of waiting until the street car could be freed and proceed, the coach's trolley poles were pulled and it passed around the street car and continued on its way.

At another time a coach was crossing an intersection when an automobile approached it from the right at a high rate of speed. Had the coach been a street car confined to rails the automobile would have struck it head on in its midsection, with disastrous results. As it was the coach operator, because of the flexibility of the unit, was able to steer sufficiently from the path of the oncoming automobile to enable the driver to retard the speed of his car somewhat and to pull it to the right, with the result that only the front sides of the vehicles met. When it was found that the coach had been damaged slightly it was pushed over to the curb, where it did not interfere with other traffic. Just recently it was necessary to replace the special work at an intersection, necessitating a temporary rerouting of all lines. To reroute the coaches three blocks of temporary overhead trolley construction was installed in a short time and at small expense. This rerouting would have been impossible with street cars.

Q—Did you experience any difficulty negotiating Capitol Hill with its 10 to 11 per cent grade during the winter months?

A.—At the beginning of the winter season electric coach operators were recruited from street car service, and those selecting coach runs were not experienced in handling rolling stock not confined to rails. On two different days incidents occurred which, on account of the newness of this type of vehicle, were given undue and unnecessary newspaper publicity, resulting in some patrons becoming timorous. The incidents were as follows: One morning a horse-drawn milk wagon was driven slowly from a side street right into the path of a coach coming down the hill. The street was covered with ice. The operator of the coach swerved to the right to avoid hitting the milk wagon and in so doing pulled away from the trolley wires and onto a street with a very severe downgrade. He steered the coach into the curb and a barn crew had to right it and let it down to a street at a lower grade, from where it was pulled into the barn. No personal injuries resulted and the only damage to the coach was a broken corner post and a front window.

After a week of successful operation under similar street conditions, a second incident occurred. A new man, under instruction, who had driven gasoline buses in the suburbs of the city made a run for the grade but the rear wheels started spinning. To gain traction he backed up and tried it again. In each case he fed the motors too rapidly, with the result that the wheels spun. After these unsuccessful attempts to make the hill he decided to back the coach over to the curb and in so doing backed into an automobile, damaging it to the extent of $300. Very little damage was sustained by the coach itself.

Local newspapers, however, played up the incident to such an extent that a number of people were frightened. Because of this the company took the coaches off the hill for a period of 60

Trolley wires for the electric coaches, installed along the sides, are less conspicuous than wires over the center of the street

Digitized by Google

days. At the end of this time operation over the same icy streets was resumed without further trouble. The experience last winter showed that a light sprinkling of cinders or sand and salt on an icy street effectively prevents slippage. The sprinkling can be quickly and economically done by special equipment for the purpose.

Q—Of what value on grades are dynamic brakes if the trolleys leave the wires?

A.—They are of no advantage. It would be necessary to rely in such cases on air and hand brakes, which in the case of gasoline vehicles are the only brakes available anyway. Thousands of heavy trucks and buses are running over streets of cities throughout the country today equipped with brakes that are no better, if as good, as the hand and air brakes on the electric coaches. The trolley poles leave the wires so infrequently, however, that it is not worth considering.

Q—Do you prefer dynamic brakes to other forms of braking?

A.—Inasmuch as dynamic braking requires but little additional equipment and has many advantages, no reason can be seen for eliminating this method of control. Among its advantages are the following:

First, dynamic brakes are effective on grades for holding the speed of the coach at practically any rate desired. This is decidedly advantageous when streets are slippery.

Second, the heat generated in accelerating and braking is utilized to heat the interior of the coaches, thus saving power in the winter.

Third, wear and tear on brake drums is minimized.

Fourth, a coach can be brought to a sudden stop in emergencies.

Fifth, rapid acceleration and retardation give to riders the effect of speed and "getting somewhere" that is necessary nowadays.

Q—Have you experienced any equipment and operating difficulties?

A.—For a new mode of mass transportation surprisingly few equipment difficulties have been experienced. Dynamic braking introduced some strains and stresses that are not present with ordinary braking and, being performed through the springs, caused some spring trouble at first. Supporting the springs in rubber permitted a reduction of the number of leaves, which improved riding and reduced vibration in the electrical and air equipment.

Operating difficulties were due largely to trolley dewirements at the outset on account of running the coaches through overhead special work used by street cars. The trolley wheels of the coaches were of different diameter than those of the street cars, therefore it was necessary to change the grooves in the overhead special work to accommodate the coach trolleys. These difficulties cleared themselves rapidly, coach dewirements being no more frequent than with street cars at the end of two weeks. The use of mechanical and electrically-operated overhead switches permits coaches and street cars to take turnouts with equal facility, so that overhead problems, locally, are solved. At one end of the route an overhead wye is installed which is negotiated without difficulty; at the other end a loop is used. As in street car operation loops are more desirable and are favored wherever possible. Each application of trolley coaches, however, will bring up its own set of problems. In Salt Lake City, nevertheless, it is felt that operating coaches along with street cars through the busiest traffic of the city with turnouts at every corner has overcome the majority of the overhead difficulties likely to be encountered.

Q—How do coach operating costs compare with those of gasoline buses of equal seating capacity?

A.—Based on carrying capacity the operating cost of electric coaches is 63 per cent of gasoline equipment. It is felt that by the end of the first year costs will be lower than at present. There is now reflected in the costs the expense of overcoming minor difficulties always accompanying pioneering. During the first few months more inspection and supervision were given than are found necessary today. During the winter the cost of keeping the ruts out of the dirt street portion of the route was rather high. This expense is in no way chargeable to the coach operation so far as the equipment is concerned, because it was done more to improve riding than for any other purpose.

Regarding fuel and energy costs, a gasoline bus of carrying capacity equal to that of the electric coach averages about 3 miles per gallon, while the coach consumes slightly more than 2.2 kw.-hr. per mile on an average.

Carhouse pits were readily adapted at small cost to meet the needs of electric coach inspection and maintenance

Q—How do electric coach costs compare with those of street cars of equal seating capacity?

A.—It is felt that electric coach operation over a period of time will show a substantial saving over street car costs. During the first six months the electric coach costs were 80 per cent those of street cars. There are a great many hidden costs in connection with street car operation not always reflected in the figures. For example, there is the periodic rehabilitation of track and paving which is usually accomplished by retiring the original investment and charging it to depreciation reserve and capitalizing the new work. As a result of this accounting

Digitized by Google

procedure, operating accounts do not reflect the full cost of street car operation. Those companies that provide adequately for depreciation in their operating accounts are best situated to make a direct comparison between street car and electric coach operating costs. Electric coaches were introduced in Salt Lake City to avoid rehabilitating a long section of track and pavement that needed replacing. Tire expense of coaches takes the place of wheel and track and roadway street car costs. If tire expense is less than the sum of these, then there is no question that electric coach operation is cheaper.

Ten electric coaches of this type, manufactured by the Versare Corporation and equipped with Westinghouse motors and control, are operated on the Salt Lake City route

Q—What is the actual electric coach kilowatt-hour consumption per car-mile as compared with that of street cars?

A.—Energy consumption of coaches averages slightly more than 2.2 kw.-hr. as compared with approximately 4.3 kw.-hr. for street cars. This coach average is for winter operation through snow, ice and mud, and should decrease somewhat during the months of more favorable weather.

Q—Have tire troubles interfered with service?

A.—Delays on account of tire trouble have been so few as to be almost negligible.

Q—What objections, if any, were made by property owners to stringing double trolley wires on the streets in residence districts?

A. There were no difficulties connected with this installation as far as the residents on the streets were concerned; in fact, the trolley wires are less conspicuous today than they were in the middle of the streets. The foliage of the trees hides the wires and the appearance of the roadway is so much improved that this, together with the quietness of the coaches, has made this type of operation very pleasing to the property owners. It has been stated that building activity in the residential section of the city served by the coaches has been stimulated.

With respect to overhead construction in the downtown district, it has added weight to the installations already in place at intersections but is no more noticeable than the single trolley wire construction. In fact, a stranger going along the main street of the city after coming from a city having no trolley coaches would not know the difference. It requires an experienced eye to note the double overhead. At the outset there was some question by the fire department as to its ability to use tower wagons and other fire apparatus on account of two trolley wires. To overcome this an actual test was made by the line department of the street railway in company with the fire chief and his assistants. Following the test the chief withdrew all objections to the presence of two trolley wires.

Q—Can the vehicles be maneuvered about the carhouses and shops without difficulty?

A.—Fortunately it was possible to work out an overhead system in the yards which will permit increasing the number of trolley coaches to the full capacity of the carhouse without any particular overhead complications. One of the tracks in the carhouse was assigned to the electric coaches and converted for their repair. The pits were partly bridged with platforms to permit inspection of coaches, and double trolley wire was extended over the pits and track. Alemiting equipment and lines for greasing the coaches also were installed adjacent to these pits. Later on, when the number of coaches was increased, a second track was converted. The coaches enter the carhouse at the west end and leave by the east end. There is sufficient room in the building for one coach to by-pass another, to go over the pits or to leave the barn at the east end.

Q—Are electric coaches speedier on grades than street cars and gasoline buses?

A.—Yes. On the 10 to 11 per cent grade on Capitol Hill, with load of 40 or more passengers, coaches average better than 17½ m.p.h.

Q—Do electric coach accidents show an increase over street car accidents?

A.—The flexibility of the coaches permits them to deviate from a fixed path to avoid serious collisions. Their ability to stop quickly also is a safety factor of inestimable value.

Q.—Who licenses trolley coaches for operation on the streets of Salt Lake City?

A.—The tax for this operation, other than that based on property value, amounts to $25 per year per vehicle, the same as for street cars, and is payable to the city. No state license tax or vehicle registration number is required because the coaches are not self-propelled. They are confined to definite routes and obtain their energy for propulsion from an outside source, so they are classified with street cars.

Q—Has patronage on this line been affected by the introduction of electric coaches?

A.—From the outset riding on this line showed an increase over the former patronage. At first it was thought this was due to the novelty of the vehicles, but after more than nine months of operation with riding still continuing it is believed that the quiet, speedy operation of the electric coaches has brought new patrons. This is particularly interesting in view of the fact that parallel street car lines are almost a half mile distant on each side. The system as a whole shows a decrease in riding, but the electric coach route has had a substantial gain in patronage.

Monthly Financial Reports Show Improvement

Operating statistics of 31 electric railways in the United States and Canada indicate a trend toward higher gross revenue and reduced expenses

BETTER operating conditions on the electric railways of the United States and Canada are indicated by the monthly reports which are being received. While some properties, particularly in the smaller communities, still show a decline in gross revenue, many increases are seen on properties all over the country. The trend toward higher gross which has been particularly noticeable in Canada for the past year or more continues, except on some of the smaller systems.

Operating expenses, on the contrary, show a reduction on many of the properties. Even where the gross busi-

a Final revised figures. *b* Includes taxes. *c* Years ended June 30.

ness done has increased, the expenses have gone down on some of the systems. In general this is due to greater economy in operation, since in only a few instances has the increase in revenue been due to a rise in fares.

As a result of the changes in revenues and expenses, the net revenue is higher on many of the systems. In order to save space in the tables this item is not shown, but it can be obtained by subtracting the expenses from the operating revenue. Since taxes have shown only a small change, the gross income, which is the residue after deducting taxes and adding non-operating income, is up in many instances. Out of the 31 properties for which figures are given, 25 permit a comparison of the two years. Out of these 25 the gross income for the 1929 month is higher than for the 1928 in 17 companies.

Apparently there has been an increase in fixed charges and other deductions from gross income, since in only 12 reports has there been an increase in net corporate income out of 21 companies for which comparable figures are shown.

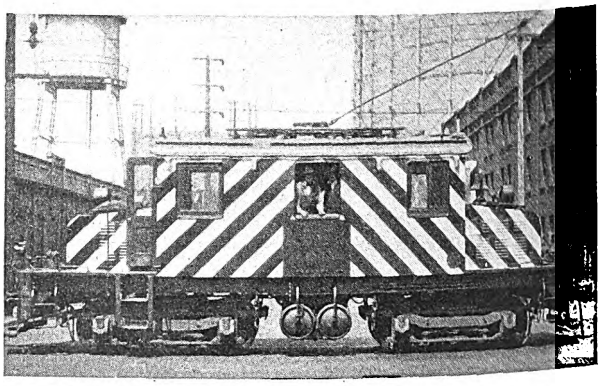
Supplementing the annual reports published in the JOURNAL for June, page 641, reports of ten companies are given herewith. These include final figures for the United Railways & Electric Company of Baltimore, and the Kansas City Public Service Company. The complete report of the Interborough Rapid Transit Company for the year ended June 30, 1928, which has just been released, is also abstracted. Additional reports will be published as they are received.

What Happens When Steel Gets Tired?

Prof. D. D. Ewing of Purdue University will tell in an interesting article appearing in the August Issue of ELECTRIC RAILWAY JOURNAL

Striped Painting Makes Locomotive Conspicuous

BY FARREN TIPTON
San Diego Electric Railway
San Diego, Cal.



Visibility of San Diego locomotive has been increased by unusual painting

AFTER the passenger cars have been pulled in for the night, freight traffic is handled over the lines of the San Diego Electric Railway. For this service a Baldwin electric locomotive is used. In order to prevent accidents, the company has painted black and white stripes on the motor car, giving it a zebra-like effect. Two series of three lamps each are mounted around the cab at intervals and connected alternately to assure illumination from all sides in case one series fails. The combination of stripes and lighting make the locomotive very conspicuous.

Midwest Association Expands Activities

Southern and central Illinois and all Iowa were taken in at St. Louis meeting. Mechanical committee formed. Papers of interest read

ENLARGEMENT of the territory of the Midwest Electric Railway Association to include southern and central Illinois and all of Iowa was voted at its convention held at the Chase Hotel in St. Louis on June 13-15. Among the more important systems that become members under this change are the East St. Louis & Suburban Railway and its affiliated companies and the Illinois Terminal Railroad. It also was voted to form a mechanical committee that will gather and disseminate data of interest to the mechanical departments of the member companies. A proposed merger of the association and the Midwest Claims Association has been deferred to determine what changes, if any, should be made in the constitution and by-laws if such a reorganization is effected.

Approximately 275 delegates attended the meeting, which in many particulars was the best ever held by the organization. The retiring president, F. G. Buffe, was highly complimented on his administration, as was the committee on arrangements, headed by B. W. Frauenthal.

Powell C. Groner, president of the Kansas City Public Service Company, in his address on "The Trend of Utility Regulation," ventured the prediction that eventually the theory of "prudent investment" will be adopted as the basis for determining the rate-base valuation of public utilities. "And I am not so sure that it wouldn't be best for us in the long run," he continued.

Still not definitely advocating the theory of "prudent investment" as the proper basis for fixing valuations, he then pointed out that it is almost impossible to obtain an up-to-date valuation on the reproduction-cost-new basis, since much time is consumed in arriving at costs, depreciation, etc., so that very often valuations are from six months to a year or more behind the date of the final decision. With the actual investment definitely known it is possible to fix a valuation for the present, he said.

Stanley Clarke, president of the St. Louis Public Service Company, who spoke on the subject, "Future of Urban Transportation in the Metropolitan Areas," would not venture a guess as to the actual future of transportation. However, he contended that in the future mass transportation will prove more and more necessary, and that if air transport comes into general use it will tend to centralize rather than decentralize metropolitan areas. This will mean more mass transportation. He expressed the belief that the street railway car is still far more economical in operation than is the bus. The cost of bus operation is 9.8 cents per passenger and would be 10.5 cents if the bus were handicapped with the same burdens of taxes, wages, etc., as is the street railway, according to Mr. Clarke.

Regarding the future treatment of street railways he said that apparently there are two schools of thought—one which seems to hold the view that the utility should be so harassed and handicapped as to make economical and profitable operation impossible, thus forcing public ownership of the utility, and the other holding that the utility should be permitted to go ahead earning a fair return on its investment until such time as it shall no longer prove necessary to the public, when it shall be forced off the job.

Touching on the possibility of public ownership being forced through the process of starvation of the private company, he said, that the period of years necessary to bring about this change would witness great losses to investors in utilities and also to merchants, other industries and real estate values.

Eugene S. Hight, chief engineer of the Illinois Terminal Railroad System, in an address on "Building for the Future" touched on the proposed subway and elevated system his company plans to construct in St. Louis. The actual building of this $5,000,000 project will get under way in the near future.

Means of Increasing Car Speed

A. J. Fink, director of transportation St. Louis Public Service Company, in his talk on "Transportation Efficiency" told how more rigid mechanical care and inspection of the St. Louis street cars has within the past year increased the number of miles each car runs before being turned in for repairs about 1,100 per cent. In June of last year pull-ins were one in every 10,342 car-miles, while in April of this year the average was one in 114,872 car-miles, he said.

"Frequent and reliable service, speed and comfort are what the general public demands of street cars," he continued, and he then pointed out that in St. Louis the average speed of the cars had been increased from 9.87 m.p.h. in January, 1928, to 10.30 in May, 1929. This was accomplished by a tightening up of schedules, fewer stops and a campaign designed to educate motorists as to the street car's traffic rights. Prior to the installation of the designated stop plan on the University-Olive line the average speed was 10.4 m.p.h., including layover, and the present average is 11.34 m.p.h. Excluding the layover, the average terminal-to-terminal run is made at the rate of 12.13 m.p.h.

He also reviewed the results obtained during a period when parking of automobiles was prohibited on important thoroughfares in the city's downtown congested district. It was found the no-parking rule had speeded up the movement of street cars as much as 47 per cent in the district east of Twelfth Boulevard.

Labert St. Clair, advertising director American Electric Railway Association, spoke on the subject, "Pack Up Your Troubles." At the annual banquet, Leslie Vickers, economist of the American Electric Railway Association, was the principal speaker. Round-table conferences at which matters of mutual interest were informally discussed featured the luncheons on Wednesday and Thursday.

At the closing session the following officers were elected: President, R. J. Lockwood, assistant general manager St. Louis Public Service Company; first vice-president, C. A. Semrad, vice-president St. Joseph Railway, Light, Heat & Power Company; secretary-treasurer, J. A. Weimer, superintendent of transportation Kansas City, Clay County & St. Joseph Railway.

Executive committee: For two-year terms—J. N. Shannahan, Omaha; S. W. Greenland, St. Louis; E. A. Roehry, St. Louis; G. W. Welsh, East St. Louis; E. B. Meissner, St. Louis, and F. O. Grayson, St. Louis. For one-year terms—O. E. Turner, St. Louis and B. W. Stemmerich, St. Louis. Under a change in the by-laws all former presidents of the association become ex-officio members of the executive committee.

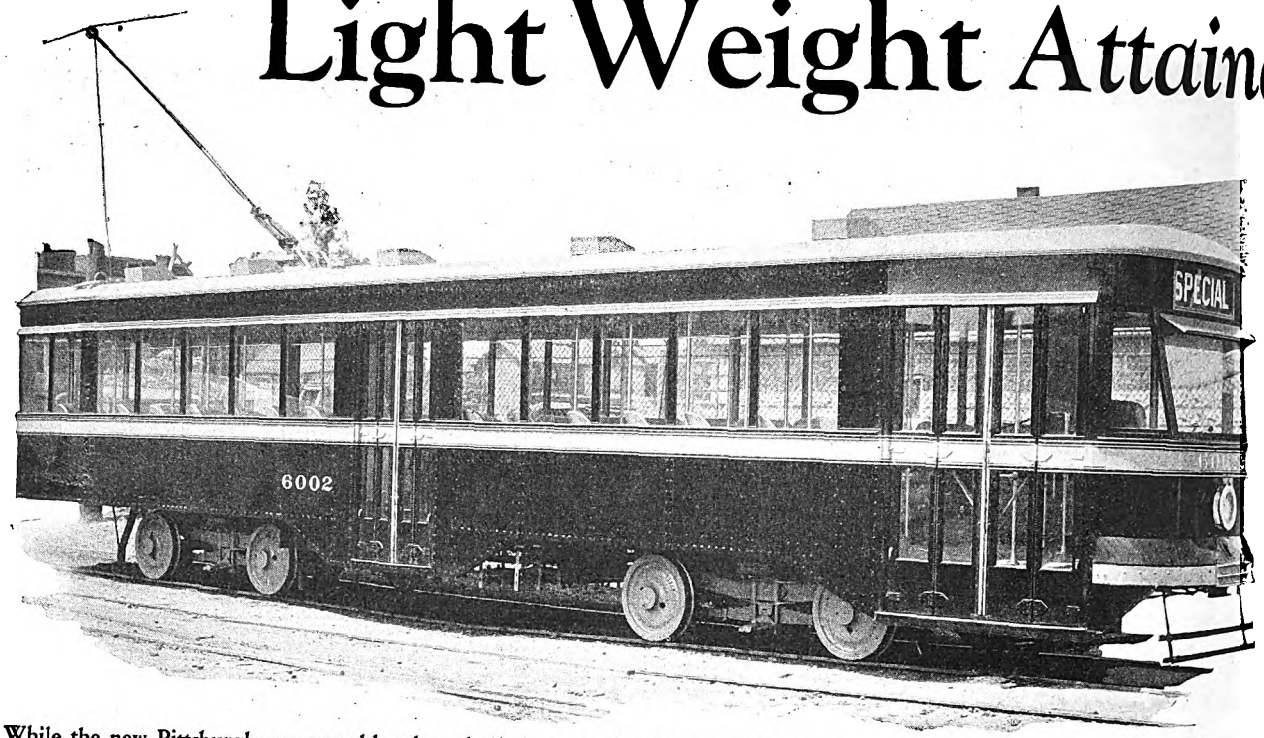
Light Weight Attained



While the new Pittsburgh car resembles those built last year it weighs 27,000 lb. as compared with 36,500 lb. for the earlier model and the exit is at the center instead of the rear

EXTREMELY light in weight, equipped with electro-pneumatic control with pedal-operated accelerator and dynamic brakes, powered with four 50-hp. motors and designed to appeal to the riders, the latest experimental car of the Pittsburgh Railways, recently delivered by the Osgood-Bradley Car Company, represents another forward step in the development of modern cars to meet present-day needs. The car is in general similar to the two Pittsburgh experimental cars supplied by the same builder last year and described in detail in the June 2, 1928 issue of the ELECTRIC RAILWAY JOURNAL. The principal differences are the use of aluminum in the framing, the locating of double cross seats on one side of the rear half of the car instead of a single row of bucket seats at an angle, the substitution of a center exit door for a rear door, and modifications of the control and braking equipment. The step and floor heights, and the inside and over-all height dimensions also have been modified.

The car was built with the lightest possible car body framing construction consistent with the necessary strength and regard for manufacturing considerations. All metallic parts of the body construction and the various items of equipment have been made of aluminum wherever possible. Special aluminum alloy was used throughout the structure where special strength requirements are important, while commercial aluminum was used for the various items of interior finish such as wainscoting, cabinets, headlining, etc., where lightness only is the desirable consideration. The Aluminum Company of America manufactured the various aluminum alloy items and standard rolled sections such as I-beams, channels, tees, etc. The company also produced numerous special sections. The floor of the car is made up of aluminum Chanarch covered with Flexolith, the safety treads at the steps being of "Alumalun."

The weight of the entire body structure including the aluminum Chanarch floor plates and the complete roof with roof canvas, but exclusive of Flexolith flooring, doors, windows, window regulators, furrings, inside finish, and all items of equipment and trimmings, is 3,900 lb. The balance of 10,100 lb. entering into the weight of the complete car body is made up principally of items of miscellaneous equipment and specialties. The trucks weigh 13,000 lb., so that the car completely equipped weighs only 27,000 lb. The trucks at present under the car are the standard Timken No. 52 trucks of steel construction. Special trucks of the same type embodying aluminum wherever possible in their construction are now being developed by the Timken-Detroit Axle Company. With these the weight of the car will be still further reduced.

The exterior and interior of the car throughout are finished with Duco pyroxlin lacquer, a unique color scheme having been developed. The exterior of the car including side

Pittsburgh Car

Extensive use of aluminum reduces body weight of Osgood-Bradley car to 14,000 lb. Four 50-hp. motors provide rapid acceleration and high speed. Accelerator and dynamic brakes are pedal-operated

Bucket seats are used throughout. Behind the center door there is a double row on the left side

sheathing, posts, and letterboards, is in black, the space between the belt rails being Karnak green with double aluminum stripes on the upper and lower belts. A Karnak green stripe and two aluminum stripes also are located on the bottom of the letterboard. The entire roof of the car also is of green.

The interior of the car from floor to advertising card molding is in a two-tone green, the darker color being used from the floor up to and including the window sill capping. The headlining is in ivory. The floor is of green Flexolith, no paint being required.

The seats are of the special bucket type similar to those used in the two experimental cars last year and were developed by Hale & Kilburn, using aluminum in their construction wherever possible. The stanchions at each of the diagonal bucket seats and elsewhere in the car are of alloy aluminum tubing.

The window construction is similar to that used on the two previous Pittsburgh cars except that the post spacing has been reduced from 3 ft. 10½ in. to 2 ft. 6 in., and ⅛-in. glass with aluminum frames has been used instead of $\frac{3}{16}$-in. plate glass.

The following items of special equipment are installed in the car:

Consolidated Car Heating Company heating equipment, the heater cases and backs being of aluminum.

National Pneumatic door operating equipment with light-weight differential engines arranged to be interlocked with the electric control and air brake equipment.

Ohio Brass dash illuminating headlights.

Economy meters.

Ohio Brass light-weight trolley bases.

Keystone trolley catchers.

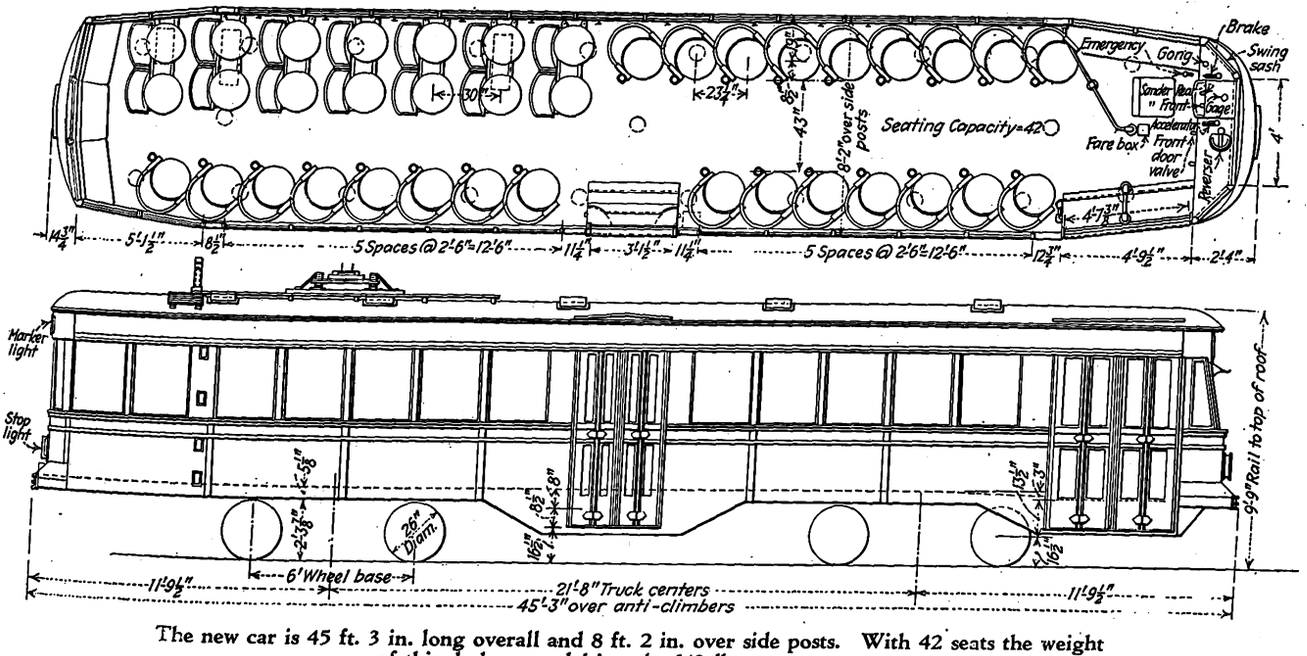
Osgood-Bradley ventilators.

Electric Service Supplies Company pull switches for signal system.

Electric Service Supplies Company dome lamp fixtures arranged with short-circuiting sockets for lamps, 20 in series from the main power circuit, and with dome emergency light fixtures operated through suitable relays and Philco storage battery.

Ternstedt heavy bus type window regulators.

Faraday buzzer equipment.



The new car is 45 ft. 3 in. long overall and 8 ft. 2 in. over side posts. With 42 seats the weight of this de luxe model is only 643 lb. per passenger

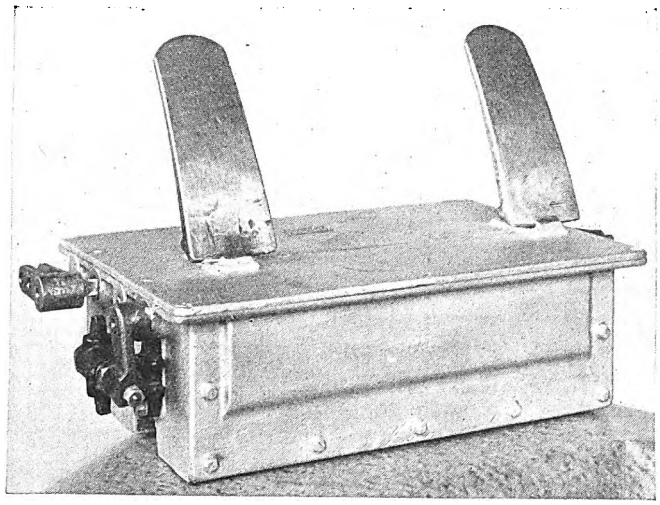
Cleveland fare box.
Nichols-Lintern sand traps.
Nichols-Lintern stop light equipment.
Pittsburgh Railways standard Hunter illuminated sign.
J. L. Howard & Company ball bearing hinges.
Osgood-Bradley life guard.

Four Westinghouse type 1426 motors, rated at 50 hp., are installed on the car. They are geared 4.4:1 to 26-in. wheels. The free running speed of the car on level tangent track is approximately 45 m.p.h.

The control is Westinghouse electro-pneumatic, actuated with line current, with variable automatic acceleration and dynamic braking. Air brakes also are included in the equipment. The main control is through fourteen unit switches. Twelve of these are type UM and are mounted in the platform cabinet. The other two, type



This pedal control for power and brake is mounted in a recess on the cabinet

806, are mounted beneath the car. One is the line switch and the other is the main switch in the braking circuit. The use of 300-volt motors reduces the number of switches necessary, since the fields and armatures are interconnected during dynamic braking with fewer connections than would be possible with 600-volt motors. The type M resistor is mounted beneath the car. It is divided into three parts, one for the main circuit, one permanently in the braking circuit, and the third in the braking field circuit. All of the control apparatus in the cabinet was mounted on a panel and the connections were made before it was inserted in place.

The master controls, both for acceleration and braking, are foot-actuated through two pedals. They have been designed to resemble the controls of an automobile. Variable rates of acceleration and braking may be obtained, and are approximately proportional to the distance the proper pedal is depressed, the maximum being obtained with full depression. The range is between the minimum practical values and the adhesion limit. If the braking pedal is depressed as far as possible, not only is the maximum dynamic braking rate obtained, but the air brakes are applied by means of a mechanical connection with the pedal. This permits the use of the air brake should the trolley pole come off the wire and the dynamic brakes become inoperative temporarily because the emergency switch had not been set. A latch which holds the braking pedal in the fully depressed position permits the operator to leave the car with the air brakes set. If for any reason the operator should remove his feet from both pedals suddenly the power supply would be cut off and the dynamic and air brakes applied to bring the car to a stop. In ordinary service either pedal may be depressed alone and its motion arrested at any desired point. There is a holding position so that either acceleration or braking may be arrested at any point desired. In order to permit track switches to be thrown the brake pedal may be depressed past the dynamic to the air braking position while the car is drawing power.

The proper action of the control energy on the various switches is obtained by an air-operated sequence drum which gives twelve accelerating notches and eight dynamic braking notches. It also automatically applies the air brakes when the dynamic braking has reduced the car speed to approximately 3 m.p.h. To prevent any lag in dynamic braking while the motors are building up their fields, the braking connections place two of the fields across the line in series with a resistance. Since the fields and armatures are interconnected this excites the entire circuit and permits the braking action to start without any lag.

The reverser is of the drum type and is hand operated, being placed with its handle convenient to the operator. It has an emergency position in which dynamic braking will be obtained regardless of the direction of motion of the car or absence of power. This gives a quick and reliable means of stopping the car under practically any conditions. The ordinary control switch is omitted, since moving the reverser handle from either of the operating positions opens the control circuit.

The air brake equipment was specially designed by the Westinghouse Traction Brake Company to operate in connection with the pedal electric control.

The car body is mounted on Timken-Detroit Axle Company No. 52 worm-drive trucks with disk brakes operating directly on the armature shafts. The disk brake for each motor is provided with two sets of shoes operated by special air brake cylinders mounted directly on the trucks. One set of shoes is operated by suitable mechanism through a hand lever adjacent to the motorman.

The Most Complete

Analysis of New Car Economics

Ever Published

BACK in 1922 the management of a comparatively small interurban property comprising 70 miles of track divided into four lines, made a complete replacement of equipment with twelve light-weight cars. The following year, all of the cars on a small city system comprising 17 miles of track in a city of approximately 60,000 population were replaced with 27 light-weight one-man cars. Automobile competition has made serious inroads on the traffic of the interurban. The city system has held its own. Under these conditions the new cars on both properties have been operated long enough so that the *complete* record of the results is available. Was the investment in new cars justified? Look for this article by the management of these properties, in the August number of ELECTRIC RAILWAY JOURNAL. It presents the most interesting, complete and authoritative analysis of new car economics ever published.

Third and concluding article of the survey of new car experience

New Cars

PAY FOR THEMSELVES

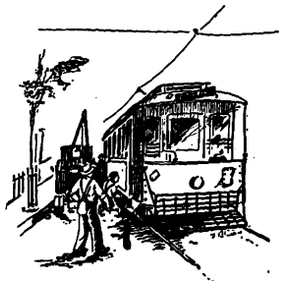
on Many Properties

By

MORRIS BUCK
Engineering Editor
Electric Railway Journal

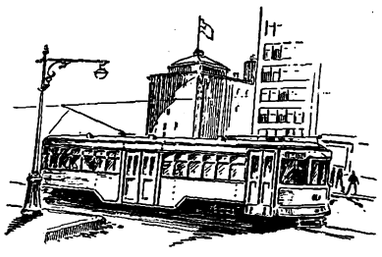
Definite savings of $1,268 in equipment maintenance and power can be made with new cars. Additional savings are certain in maintenance of way and in transportation. Speeding up the service not only reduces costs but makes the ride more attractive and so increases revenue.

PRACTICALLY every new car that has been purchased in the past few years is capable of making faster schedules than the older ones on the same property. The motors are more powerful in proportion to the weight and, taking less power from the line, the loss of voltage in the distribution system is less. Brakes are better designed. The new cars can be brought up to speed more quickly and can be stopped more quickly. Moreover, attention to design of doors, steps, and aisles has made it possible to reduce the time for passenger interchange. Unfortunately, the roads using the new cars have not obtained the full advantage in schedules. Those which have given actual figures in the new car survey by ELECTRIC RAILWAY JOURNAL have shown increases in speed up to 6 per cent, which can be credited directly to the new equipment. Depending on conditions such as length of line, headway, number of stops and length of run in the congested section, modern cars, when segregated on definite routes, should make possible increases in schedule speed of 10 to 20 per cent above those common on the average city road. This in itself will make a material reduction in the cost of service, both in the total and on a car-mile basis. The majority of the expenses vary but little as the speed is increased, so that the additional car mileage that can be obtained will require less investment in equipment and in the facilities needed to care for it.



As to the maintenance expenses, few properties keep separate records for the various classes of cars. Some companies that have made an accurate separation show remarkable savings in the maintenance of new cars as against the other rolling stock. The five-year average of equipment costs in Birmingham, Ala., for new cars is 1.15 cents per car-mile less than the system average, even though the average age of all cars is fairly low. In Detroit, the Department of Street Railways shows that maintenance of new 52-seat Peter Witt cars is 1.04 cents less than for equivalent seating capacity in older double-truck cars that they replace. Over a period of five years the Brooklyn City Railroad finds the cost of maintaining new cars is 2.5 cents less than for the old ones. Chattanooga shows a reduction of 1 cent per car-mile as compared with the general system average. Grand Rapids has found that over a three-year period, an average reduction in maintenance cost for new cars of 2.49 cents.

From the figures analyzed in this study, it is quite conservative to state that on many properties that still are operating heavy equipment of ancient vintage—patching, repairing and rebuilding as best they can, a saving of 2 cents per car-mile in equipment maintenance alone may be expected to result from the purchase of new cars. Consequently, if the new equipment is used for the base schedules, operating approximately 40,000 miles per year, the saving in maintenance alone amounts to $800 per car per year.



Replacement of a car weighing 40,000 lb. with one weighing 24,000 lb. will reduce the total load, including 40 passengers, from 46,000 lb. to 31,000 lb., or one-third. Tests made at various times have shown that the propulsion energy used is practically in proportion to weight, other things being equal. Without making allowance for higher efficiency of the new equipment,

Digitized by Google

this energy saving is reflected directly in power costs. In 1928, the average cost in the power account was 4.38 cents per car-mile for all the companies reporting to the American Electric Railway Association. Deducting 20 per cent for car heating and lighting and for shop and miscellaneous uses, the industry average cost for propulsion was 3.5 cents per car-mile. A saving of one-third of this, or in proportion to the weight alone, is 1.17 cents. For an annual mileage of 40,000 the saving is $468 per car.

Without making allowance for other savings which are bound to come in connection with the replacement of old cars with new, the definite savings of $800 for equipment maintenance and $468 for power can be credited to new equipment. The total of $1,268 represents 8.5 per cent on an investment of $15,000 in a new car. While this is in itself sufficient to justify the replacement of an old car, no account has been taken of the ability of the new equipment to make a greater daily mileage, which will be obtainable both on account of the higher speed possible and the greater reliability and smaller shop time needed. Neither does it make any allowance for the lower transportation cost due to the higher schedule speed possible. The reduction in the number of cars which are needed to give a specified service causes a decrease in the capital invested, reducing the interest and depreciation charges, although these items do not lower the operating expense.

When the opportunities for speeding up the system, saving in track maintenance, and stimulation of riding are considered, no management can afford to overlook the possibilities of new equipment.

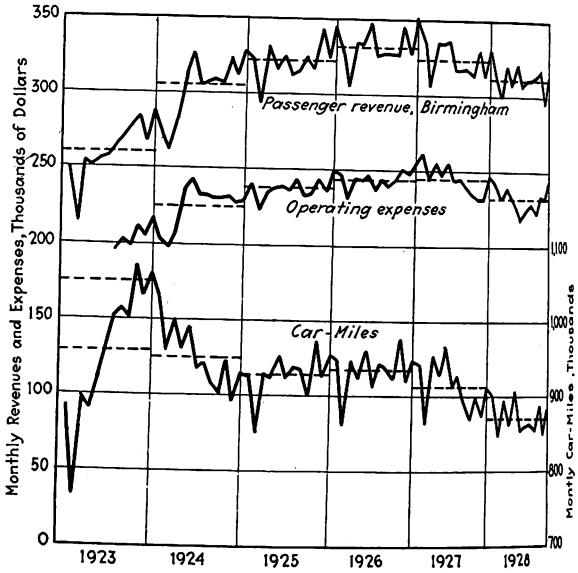
Although the properties included in the survey were selected solely on the basis of the record for purchases of new cars during the past few years, without regard to location or management, it is significant that every winner of the Charles A. Coffin award since it was first offered in 1923 is included in the list. On all of these properties the financial results have been good. All but one of them, which was the winner in one of the early years of the contest, have reduced the operating ratio. The one company has been able to maintain an operating ratio between 60.5 and 64 per cent throughout the six years, or more than 12 points below the average for the country.

More Results from Individual Properties Show Definite Benefits

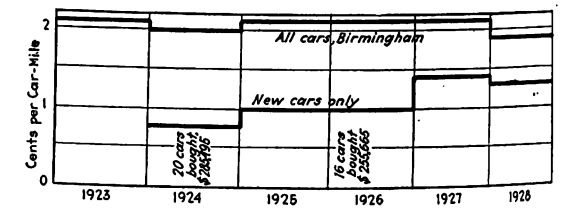
The summaries of information published in this and the preceding articles on the subject of new cars give briefly the results that have been obtained by the properties included in this survey. They all report definite benefits from the new equipment, greater or less according to the proportion of new cars and the effectiveness with which they have been placed. Numerous other properties have obtained advantages from the use of new equipment equal in magnitude, although on many of them it has not been possible to segregate the figures to show the relative revenues and expenses of the various classes of equipment.

Twin City Rapid Transit Company, Minneapolis-St. Paul, Minn.—This company has built 35 cars of an entirely new design, and has modernized more than half of the 1,000 cars already on the system. There has been a good psychological effect in aiding public relationship, although it has not been possible to see any effect on the gross revenue. It is the belief of this company that good riding qualities and pleasing appearance are of value, but that it is even more important to have sufficient motive power and an adequate braking system to insure a material increase in schedule speeds. This will bring substantial reduction in labor costs and the total number of cars operated, and will minimize as well the ever-present criticism by patrons of a "dragging ride."

Birmingham Electric Company, Birmingham, Ala.—This company purchased twenty cars in 1924 and sixteen more in 1926. Although a rerouting of the system in 1927 made possible a considerable reduction in system car-miles, the new cars were maintained at lower costs



Passenger revenues have held up well in Birmingham in the face of a severe industrial depression, while operating expenses have been reduced



Maintenance costs in Birmingham have been consistently less with the new cars as compared with the average of all equipment

than other equipment. The following maintenance expenditures for bodies, trucks and electrical equipment from 1923 to 1928, inclusive, show the advantages of the new cars:

MAINTENANCE COSTS OF CAR BODIES, TRUCKS AND ELECTRICAL EQUIPMENT, BIRMINGHAM ELECTRIC COMPANY

	Cents Per Car-Mile					
	1923	1924	1925	1926	1927	1928
New cars	...	0.8	1.0	1.0	1.4	1.3
All cars	2.1	2.0	2.1	2.1	2.1	1.9

The maintenance cost per car-mile for the system in 1928 was reduced in part because of the influence of the materially lower cost for repairing the new cars.

Improved financial results were obtained in Birmingham despite a severe industrial depression which caused a falling off in traffic. Increased operation of one-man cars has tended to counteract an increase in wages.

Greenfield & Montague Transportation Area, Greenfield, Mass.—Under public ownership this street railway serves the communities of Greenfield, Montague City

Digitized by Google

nd Turners Falls, all in the northern part of the state. Of eight cars on the property two were bought in 1927 at a cost of $27,834. These new cars have given 65 per cent of the service on the main line since May 1, 927. They replaced older and much heavier cars without any change in schedule speed, rates of fare or routing. In November, 1927, the flood which overwhelmed arge areas in the Connecticut Valley made it necessary o co-ordinate the car service with a bus for fifteen days, which reduced the passenger revenue and increased expenses. In 1928 the discontinuance of a local freight rard caused the loss of considerable business. However, he passenger receipts in 1926 were 10.01 per cent more han in 1925, in 1927 were 8.56 per cent more, and in 1928 were 1.82 per cent more. The management cannot say that the new cars have brought any new revenue, but they may have checked a decline in revenues. The patrons are very much pleased with them.

The new cars show a decided decrease in maintenance cost from the old cars. The costs of car maintenance, not including depreciation, were 4.61 cents per car-mile in 1925, 4.84 cents in 1926, 3.94 cents in 1927 and 3.27 per cent in 1928. A 6-ton difference in weights of the new cars as compared with the old cars under test showed a 15 per cent saving in energy at the car. At the substation the alternating current input was 4.45 kw.-hr. per car-mile in 1926, the last full year with the old cars and 3.97 kw.-hr. per car-mile in 1928, the first full year with the new cars.

Modernization Brings Gains in Tennessee

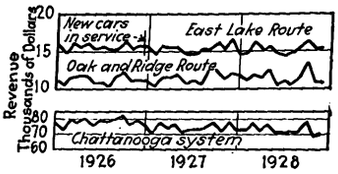
Four Tennessee properties have shown remarkable results from modernization in the past few years. These are the systems at Chattanooga, Knoxville, Memphis and Nashville. Each has purchased new cars in the past few years, although all have been consistent purchasers of equipment over a long period. In 1926 new cars were delivered in Chattanooga, Memphis, and Nashville, while the new cars were received in Knoxville in the following year. The latter property, however, had purchased 44 cars in 1923-1925. In order to make a comparison of the operating results on these four systems, the revenues and expenses have been combined for the years 1926-1928 as against 1923-1925, both inclusive. While there was a slight recession in gross revenue, amounting in the aggregate to $582,350, or 2.7 per cent, on the four properties for a period of three years, there was a reduction of $1,064,845, or 7.3 per cent, in operating expenses in the same period. This was accomplished despite an increase in car-miles operated of almost 7 per cent and an increase in platform wages of 2 cents per hour on all the properties. In fact, the net revenue was 0.3 cent per car-mile more in the latter period, even with the extra car mileage run. The gross saving of $1,064,845 in three years is more than the amount spent for the cars, which was approximately $967,700 for the four properties. While not all of the saving can be credited to the new cars, the managements are agreed that they have been a material factor in improving conditions, and that without them the saving would not have been possible.

SUMMARY OF RESULTS ON FOUR TENNESSEE PROPERTIES

City	Cars Bought	Year	Total Cost
Chattanooga	10	1926	$146,350
Knoxville	12	1927	175,000
Memphis	32	1926	500,000
Nashville	10	1926	146,350
A total of	64 cars		$967,700

Operating results:	1926–7–8	1923–4–5	Difference
Railway operating revenue	$20,793,837	$21,376,187	$582,350 less
Railway operating expenses	13,490,384	14,555,229	1,064,845 less
Net revenue from railway operation	$7,303,453	$6,820,958	$482,495 more
Car-miles operated	56,391,990	52,752,989	3,639,001 more
Cents per car-mile:			
Railway operating revenue	37.6	40.5	2.9 less
Railway operating expenses	24.4	27.6	3.2 less
Net revenue from railway operation	13.2	12.9	0.3 more

Tennessee Electric Power Company, Chattanooga, Tenn.—In October, 1926, this company purchased ten modern cars at a cost of $146,350. At the beginning of 1927 they were placed in service on two lines, the East Lake and the Oak and Ridge, without changes in headways, schedule speeds, rates of fare or method of operation. While revenues in Chattanooga have fallen off in the past few years the lines with new cars showed up much better than the remainder of the system, as may be seen from the following comparison:



Two lines in Chattanooga with new cars show better earnings than the rest of the system

REVENUES ON CHATTANOOGA RAILWAY LINES, TENNESSEE ELECTRIC POWER COMPANY

Year	System	East Lake Route	Per Cent	Oak and Ridge Route	Per Cent	Remainder of System	Per Cent
All old cars							
1926	$934,136	$188,381	20.2	$135,060	14.4	$610,695	65.4
		—New Cars—		—New Cars—		—Old Cars—	
1927	890,561	185,981	20.9	$136,521	15.3	568,059	63.8
1928	866,578	183,609	21.2	138,166	15.9	544,803	62.6

The car-miles operated on these two lines, as well as on the remainder of the system, have changed less than 1 per cent during the three-year period. The difference in revenue is, therefore, attributable almost entirely to the new cars.

Operating expenses have taken a sharp drop from $587,757 in 1926 to $571,165 in 1927, and again to $558,244 in 1928. A considerable portion of this is due to the saving in maintenance expense with the new cars, which for the two years have averaged 1.22 cents per car-mile, while the costs for all cars were 3.12 cents per car-mile in 1926, 3.19 cents in 1927 and 3.25 cents in 1928. The ten cars, naturally, are not a great enough proportion of the 74 cars in daily service to make a material difference, since the cost of maintaining the old cars is increasing each year.

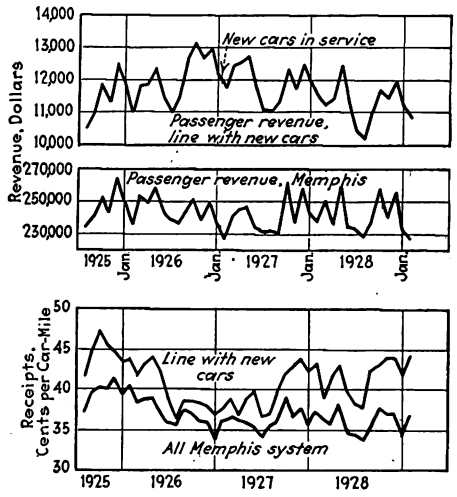
According to the company the new cars have stimulated riding and have improved public relations.

Nashville Railway & Light Company, Nashville, Tenn.—In October, 1927, new cars of an improved type were put in service on one of the heaviest two-man lines. While there was no increase in revenue, the improved feature of the new cars as to comfort and convenience enabled the company to change to one-man operation, making a considerable saving. At the time the substitution was made the company staged a "Pageant of Street Railway Progress." More people viewed this parade than any previous event of the kind in Nashville.

The company believes that the new cars have improved public relations materially.

Memphis Street Railway, Memphis, Tenn.—This company purchased 32 new cars in 1926 at a cost of approximately $500,000, adding them to 199 already in service and retiring eleven, leaving 220 active cars on the system. The new cars were placed on the Peabody

Digitized by Google



One Memphis line that has been equipped with new cars is doing better than the average, both in total and on a car-mile basis

line in August, 1926, and the revenue showed an immediate increase, which continued during 1927. In 1928, when the revenue for the entire system was off, the line with new cars showed comparatively less loss. The car mileage has been varied from time to time to meet the demands, but there has been no radical readjustment.

Records of maintenance costs are not kept separately for the various types of cars. They were 1.66 cents in 1925, 1.55 cents in 1926, 1.61 cents in 1927 and 1.80 cents in 1928. The low cost in 1926 was due to rebuilding 40 of the older cars into one-man cars.

Public relations unquestionably improved with the installation of the new equipment. There have been no franchise or fare changes during the period since the new cars have been in service, so no test has been made of their value in this respect.

Large Savings in Massachusetts

Springfield Street Railway, Springfield, Mass.—Fifty new cars were purchased at a cost of $786,227 and placed in service in 1927 on four lines, with only minor changes in headways and speeds. Routing and fares have remained unaltered. The revenues on these lines held up better if anything than those for the remainder of the system during the general depression which has existed in the city during the past two years. From 1926 to 1928 there was a reduction of $595,205 in the cost of operation. While accounts are not kept separately, the cost of maintaining equipment dropped from 4.41 cents to 3.66 cents per car-mile. Part of this reduction of 0.75 cent is due to the use of new cars for one-fifth of the total service.

The company feels that much of the improvement of public relations in the community is due to the expenditure for new equipment.

RESULTS WITH NEW CARS, SPRINGFIELD STREET RAILWAY

Year	Annual Passenger Revenue: System Total	Lines with New Cars: Amount	Lines with New Cars: Per Cent	Lines without New Cars: Amount	Lines without New Cars: Per Cent

*Before new cars were installed.

Worcester Consolidated Street Railway, Worcester, Mass.—As in Springfield, 50 cars were bought in 1927 at a cost of $787,679 and placed on four routes. Schedules were unchanged. The revenue has remained practically constant, having a reduction in 1928 of 5.6 per cent from 1926, whereas the lines without new equipment have dropped off 17.1 per cent, or more than three times as much. While costs are not segregated, there has been a reduction of $816,913 in the total from 1926 to 1928. Equipment costs have gone down from 5.75 cents per car-mile to 3.75 cents in the two years with the modern equipment, making about 22 per cent of the total. As in Springfield, the new cars, representing a very vital part of the rehabilitation program which the company is putting through, have improved public relations.

RESULTS WITH NEW CARS, WORCESTER CONSOLIDATED STREET RAILWAY

Year	Annual Passenger Revenue: System Total	Lines with New Cars: Amount	Lines with New Cars: Per Cent	Lines without New Cars: Amount	Lines without New Cars: Per Cent
1926	$2,922,099*	$781,651*	26.74	$2,140,448	73.26

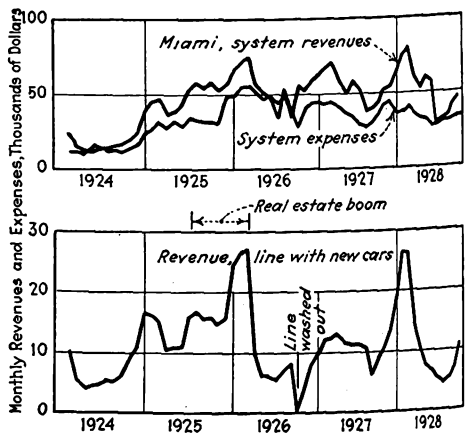
*Before new cars were installed.

Miami Beach Railway, Miami Beach, Fla.—This property has been affected in the last few years by the land boom in the city. The great increase in business in the winter of 1925-1926 prompted the purchase of twelve new cars, which were placed on one route. In addition twenty new cars were taken over from the Coral Gables Corporation.



In Miami, Fla., one route with new cars is doing as well now as it did during the real-estate boom in 1925-1926

The new cars began service in January, 1926. The revenues went up immediately from $16,900 in December to $24,600 in January, with further increases in February and March. With the collapse of the boom the riding fell off sharply. There was a further setback in October, 1926, when the hurricane washed the line off the causeway into Biscayne Bay. Hence the receipts for October and November were far below normal. In

Digitized by Google

order to handle the traffic the line was double-tracked in July, 1927, and the headway was changed from ten and twenty minutes to five and ten minutes, the schedule speed being increased from 9.8 to 16.6 m.p.h.

The cost of car maintenance in 1924 and 1925 was 2 cents per car-mile. In 1926, when it was necessary to use all available equipment on account of the boom, and when repairs were abnormal as a result of the hurricane, the cost went up to 4.1 cents. In 1927, however, it fell to 2.6 cents and in 1928 remained at 2.8 cents. The new cars, of course, are of greater capacity than many of the single-truck cars in former use on the property.

Public relations have improved on the whole as the new cars are large and roomy, with ample motor equipment. The new cars have been so popular that the patrons of some of the other lines on which there is less riding have requested the new type cars.

Wheeling Traction Company, Wheeling, W. Va.—This road purchased a total of 23 new cars in 1924, at a cost of $322,432. These have been in service ever since, carrying about one-third of the total traffic. There has been a marked improvement in public relations, notably evidenced by the passage of many better new franchises. The progressive attitude of the management in the rehabilitation of the property has been largely responsible for this result.

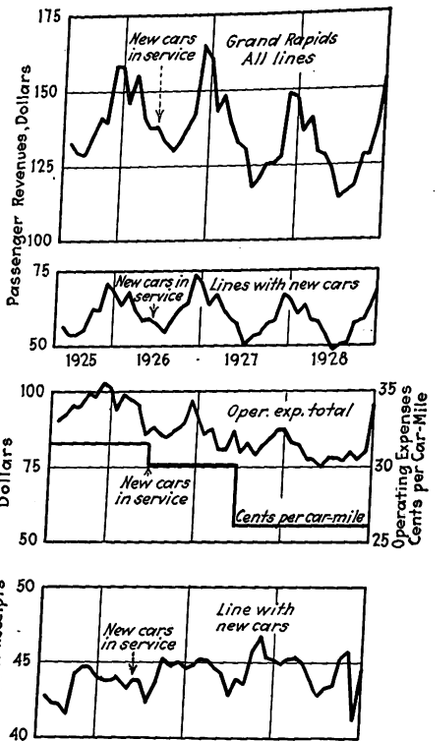
Wheeling Public Service Company, Wheeling, W. Va.—Fifteen new cars were placed in service on this system in January, 1927. For approximately six months the gross revenue showed an increase of 2.5 per cent. Afterward, owing to industrial conditions, the revenue fell off and is not yet up to normal. The new cars were designed for one-man service, making a saving of about 30 per cent in conducting transportation. The maintenance of equipment cost compared with that of cars which had been in service for fifteen to twenty years is estimated by the management at about 25 per cent less. Taken as a whole, the costs for the year show a decrease of about 27 per cent. Not all of this can be attributed to the new cars, as considerable construction work in the way and structures department is now resulting in a saving.

The public relations have improved with the new equipment. It is possible to give better service with fewer delays, and this naturally creates a better feeling on the part of the riding public.

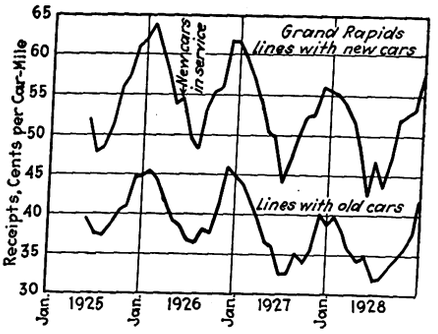
Brooklyn City Railroad, Brooklyn, N. Y.—New cars have permitted this company to speed up its schedules on all lines where they have been installed, reducing the duration of the stop from an average of 8.2 seconds to an average of 6 seconds, and have done their part in reducing accidents of all kinds. On lines where other conditions such as the opening of subways have not complicated the situation they have materially reduced the cost of maintenance. Over a period of approximately five years this reduction has been 2.5 cents per car-mile.

Revision of some surface lines on account of the opening of new subway routes and the addition of express service to others has resulted in a reduction in gross revenue. The net, however, has been about the same since the installation of the new cars, despite the increases of wages of trainmen and shopmen. The economies are attributed to the new cars. In the opinion of the management they have had a great deal to do with creating more favorable relations, both with the public and with the employees. On the whole there is no question but that their purchase has been a wise investment.

Grand Rapids Railroad, Grand Rapids, Mich.—Following the experimental installation of three cars in 1925 in an effort to determine what features were of greatest benefit, this company bought 27 new cars in 1926 at a cost of $359,544. These cars were placed in service on two lines. There were no material changes in headways, speed, fare or routing, although two-man operation was replaced by one-man operation. The immediate effect of the new cars was an increase of revenue as compared with the year before. For the first twelve months the lines with the new cars showed an increase of $15,448, while the lines using the old cars showed a decrease of $15,956. The new cars thus were able to keep the system revenue practically up to the level of the year before, although they only produced 36.8 per cent of the car-miles. Although in the last two years revenue has fallen off, principally on



Two Grand Rapids lines with new cars are bringing in a higher proportion of the gross revenue than they did in the old days, while the operating expenses, both total and in cents per car-mile, are much less. Receipts per car-mile are shown below in comparison with the rest of the system



RESULTS WITH NEW CARS, GRAND RAPIDS RAILROAD

	Before New Cars	After Installation of New Cars		
	June-May 1925-1926	June-May 1926-1927	June-May 1927-1928	June-January 1928-1929*

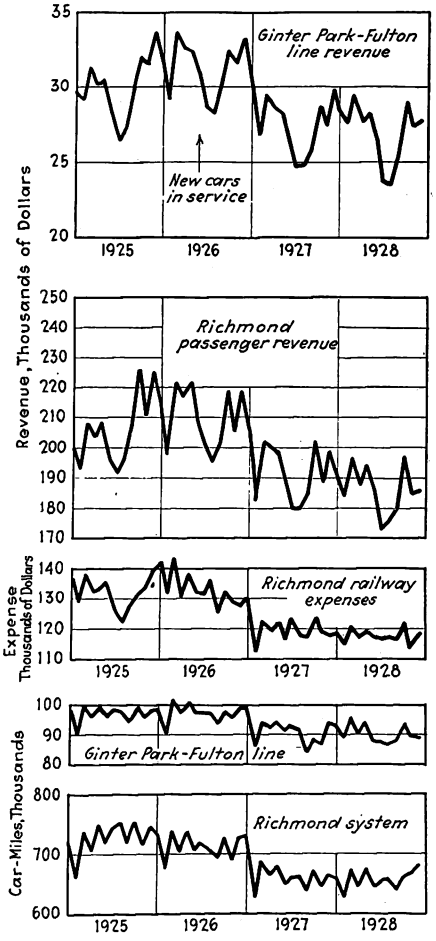
Digitized by Google

account of unfavorable industrial conditions in the city, the management contends the decrease would have been even greater had it not been for the modern equipment.

Maintenance costs of the new cars have been very low, as may be seen from the following table:

ANNUAL COSTS OF CAR MAINTENANCE IN GRAND RAPIDS

	Cents Per Car-Mile	
	New Cars	All Cars
1925	....	4.79
1926	0.75	4.24
1927	0.99	3.16
1928	0.95	2.80



The Ginter Park-Fulton lines in Richmond, Va., with its new cars, has done much better than the average of the system in revenue. The expenses of the system have been reduced sharply in the past two years

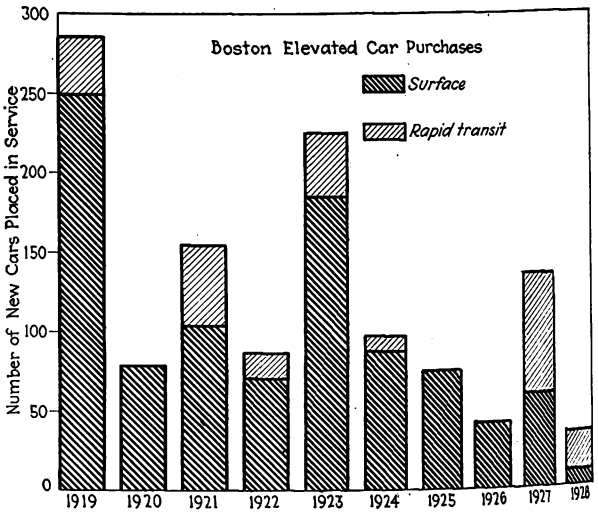
Virginia Electric & Power Company, Richmond, Va. — In June, 1926, fifteen new cars were purchased at an approximate cost of $216,000 and placed in service on the Ginter Park - Fulton line. It is rather difficult to determine the effect of the cars on revenues, since there was a rather complete rerouting and co-ordination of rail and bus service in January, 1927. The line also was paralleled for approximately 0.9 mile by a bus line which was started in January, 1927. This took away considerable revenue.

The earnings on this line have held up proportionately higher than for the system as a whole. While the headways, routing and fares have remained substantially the same there has been a slight saving in car-miles during 1928 on the line. There also has been an increase in speed, from 9.21 m.p.h. to 9.31 m.p.h. While exact data are not available for maintenance cost on the new equipment the company estimates a saving of 1 cent per car-mile with the light-weight double-truck cars as compared with heavy equipment. The total car maintenance for the system has been reduced year by year as follows: In 1925 it was 4.47 cents, in 1926, 4.12 cents, in 1927, 4.0 cents and in 1928, 3.87 cents.

The new cars have been of considerable value in fostering good public relations in that section of the city served by them.

Arkansas Power & Light Company, Little Rock.— Thirty new one-man cars were purchased in 1926 as part of a modernization program. Immediately afterward the company changed over all of its cars for one-man service. It was found possible not only to hold the schedule speed, but to increase it slightly with the advent of the one-man service, while the accidents were reduced materially.

Boston Elevated Railway, Boston, Mass.—There is no comparison between the modern equipment on this system today and that in 1918. During the past ten years this company has spent $19,000,000 for new cars and buses. In this time there have been placed in service 906 new surface cars of modern type, 165 steel elevated and tunnel cars, 95 Cambridge Subway-Dorchester Tunnel cars, 48 East Boston Tunnel cars and about 300 buses. The company has retired 1,476 out-of-date cars, and 72 of the new cars have been sold or destroyed by fire. With fewer cars in service, the number of seats furnished has been increased due to the larger capacity of the modern cars and to more frequent headways, in part made possible by the use of one-man cars. The new cars have wider doors and lower steps, thus serving convenience and reducing accidents.



Consistent purchases of cars, both for surface and for rapid transit lines, have marked the program of the Boston Elevated Railway during the past ten years

Of course the substitution of modern cars for old has resulted in substantial economies. Their use is, however, only one of many changes made during the ten-year period, and it is not possible to allocate economies in dollars to the modern equipment.

Purchases of new cars by years are shown in the accompanying diagram. A consistent program has called for additions every year. With the adoption of public control an adequate depreciation fund has been set aside, amounting to between $2,000,000 and $3,000,000 per year. This makes it possible to provide for future renewals. An accompanying table shows how the new cars have been put to good use. The box cars, articulated and earlier types of semi-convertible cars which previously made up the surface rolling stock have virtually been retired except for emergency duty.

SERVICE WITH VARIOUS EQUIPMENT, 1918 AND 1928, BOSTON ELEVATED RAILWAY

	Per Cent of Total	
	1918	1928

Pacific Electric Expands

Pick-Up and Delivery Service

Co-ordinated rail and truck freight service, established by means of contract arrangement with independent truckmen, meets demands in satisfactory manner

Independent truck owners are glad to accept contracts with Pacific Electric Motor Transport Company

By

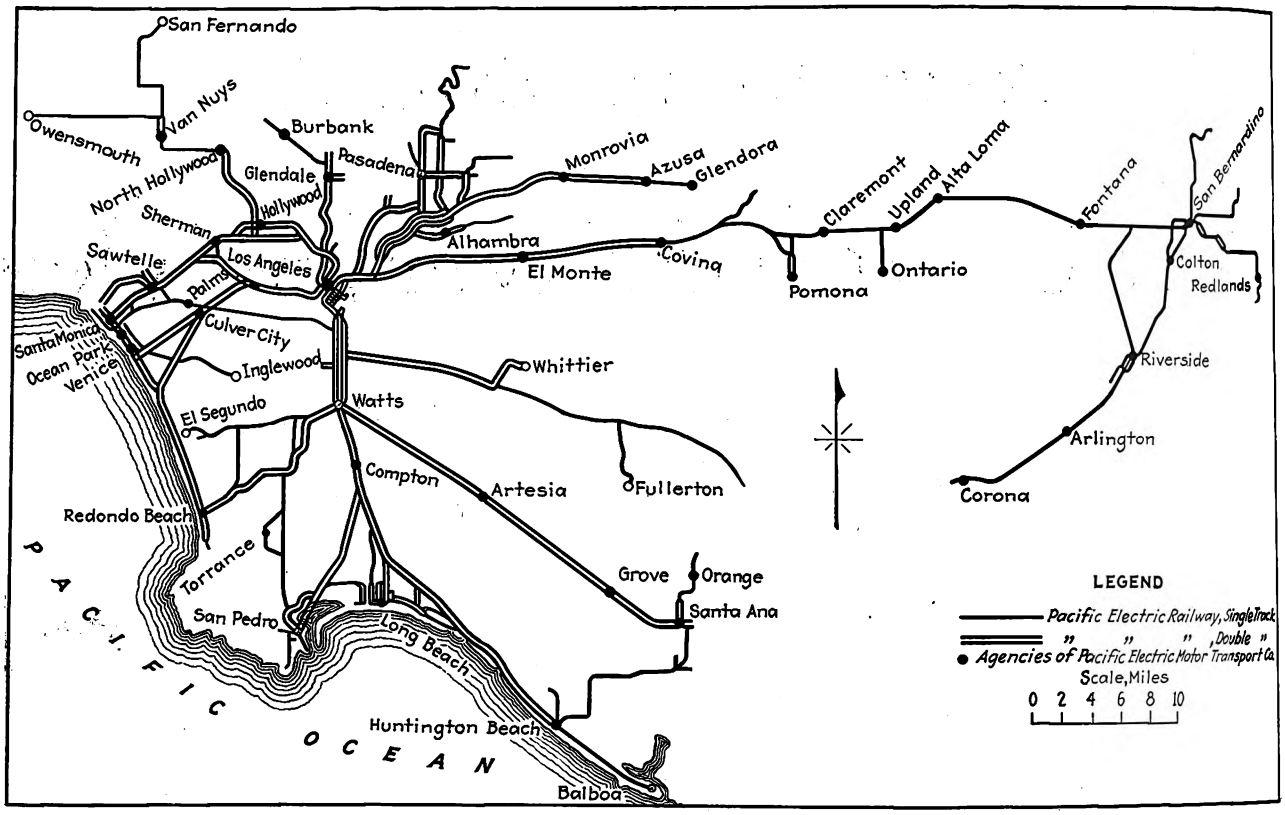
PAUL T. PORTER

Editor Bureau of News, Pacific Electric Railway
Los Angeles, Cal.

TO GIVE better service to the shipper and at the same time meet the inroads of motor truck competition, the Pacific Electric Railway, through a separately organized and operated subsidiary, the Pacific Electric Motor Transport Company, last March inaugurated a store door, freight pick-up and delivery service. The Transport Company publishes rates from store door at point of origin to store door at point of destination. It issues a single through billing from and to both points and undertakes the performance of the entire service. At originating points the Transport Company's trucks pick up shipments at the merchant's store door and haul them to the station where they are loaded on cars of the Pacific Electric Railway and hauled by rail to the station of destination. At such destination station the shipments are transferred again from the rail cars to the motor trucks and delivery is made to the store door of the consignee.

In addition to store-door to store-door delivery, the tariff of the Transport Company in some instances includes rates from or to the station; that is, from the station at originating point to store door at point of destination; or from store door at point of origin to

Digitized by Google



Map of territory served by Pacific Electric Motor Transport Company

station at point of destination. The object of these alternative rates is to enable the Transport Company to render service similar to that supplied by private truck carriers. In no instance does the Transport Company publish station-to-station rates. The contract of the latter company with the Pacific Electric Railway provides for the new company to make joint use of the railway's freight stations and station employees, the Transport Company participating in payment of salaries to such employees and paying rent for the use of facilities employed.

A combination waybill and expense bill is used, the complete document being made out by the agent at the forwarding point. An outstanding advantage of this practice is that the expense bill is ready to go with the truck driver who makes delivery at door of consignee. The plan of operation also provides a c.o.d. service for the shipper, the truck driver making the collection. In the case of regular customers, whose financial status is unquestioned, the Transport Company's agent makes collection for services rendered.

In recognition of the fact that the C.O.D. shipper is pleased with the quick return of collections for merchandise so shipped, the Transport Company management conceived and perfected a plan whereby such collections are paid over to the shipper within from 24 to 36 hours after pick-up of the shipment. This feature of the service has been commended most highly by many of the shippers.

Use of the rail car for the line haul between origin and destination points is simply an operating convenience, and so far as the shipper and receiver are concerned, the railroad does not enter into the performance of the service contract. The rail service is carried out by the railroad for the Transport Company under a private contract. Under the plan of operation now in effect the Pacific Electric Motor Transport Company has not found it expedient to purchase its own motor trucks, contracts to date having been made with local truck operators within the towns or districts being served. Sensing the possibilities for increased business, truck operators have been quick to enter into contracts. The large tonnage which promises to develop has also been an incentive to truck owners to seek a contract arrangement with the new company. Rates of the new company are not gaged or based upon existing rail rates between the same points. Necessarily, they are designed to meet on common ground motor truck carriers operating in the same territory, and while the Transport Company's rates are in some instances the same as station-to-station rail rates, in most cases they are higher.

The large number of freight trains operated by the Pacific Electric Railway makes possible a one-day delivery. Shippers are urged to notify of pick-up not later than 3 p.m. and when this is done guarantee of delivery is made for early the following morning. Failure to notify of pick-up by 3 p.m. does not necessarily imply that a truck will not call the same afternoon and accomplish delivery the next morning, and arrangements have been made whereby shipments, picked up as late as 5:30 p.m., have been delivered early the following morning. Many shippers find it necessary to keep their floor space clear and insist that shipments be taken as soon as they are ready. To meet this condition contracts with truck operators stipulate that they shall make pick-up within two hours after being notified to call.

Operators of the truck fleets have shown both a willingness and even desire to obtain contracts in the various cities where the pick-up and delivery service has been put into operation. For the most part they look upon a tie-up with the new Transport Company as a medium for increasing their tonnage and providing business that will permit the maximum use of their equipment. In not a single instance to date has a truck owner abrogated his contract. What effect the new concern will have upon long-distance hauling has not yet

Digitized by Google

been determined, but the truck fleet owners evidently feel no alarm, due to the fact that much of their business is of a character that cannot be duplicated or performed by the Transport Company.

The ultimate success of the undertaking cannot be gaged until the operation shall have been continued for a number of months. However, since the service was inaugurated on March 11, each month has witnessed a gratifying increase in the tonnage handled, and the Transport Company's management has expressed itself as being enthusiastic over the reception accorded the service of the new organization.

While tonnage increases have not been made public, evidence that the service has met a receptive welcome among shippers is reflected in the fact that on June 1 twenty additional southern California cities were added to the original list of 24—there now being 44 cities within a 70-mile radius from Los Angeles to which the service is available. The business already being handled is said to compare favorably with many of the larger transportation agencies which have been in business for many years. It is also stated that in the short time since the service was begun 245 industries have been served, of which 210 were not previously users of the rail service of the Pacific Electric Railway. It is estimated that a business of 500,000 tons per year will be developed.

The service was inaugurated without any special advertising nor were additional solicitors put out to introduce it. Freight solicitors of the railway are lending their assistance during the routine of their calls upon industrial firms, and agents in many of the cities aided to some extent in acquainting the shippers of the districts with the new type of service.

Canadian Association Celebrates Silver Anniversary

Program of Montreal convention reflects progress in the dominion's transportation and growth of electric railway service

MONTREAL, the scene of the formation of the Canadian Electric Railway Association 25 years ago, witnessed the 25th anniversary convention held June 4-7. The meetings were held in the newly-completed stadium, while most of the social events took place at the Windsor Hotel. In the absence of the president, D. W. Harvey, the meetings were presided over by Vice-President C. H. Dahl.

The annual address of Mr. Harvey, read by the secretary, pointed out the growth of the electric railway business in Canada in the 25 years during which the association has been in existence. That this growth is continuing is shown, according to the speaker, by the increase in gross revenues of the member companies of $3,000,000 in 1928 as compared with 1927. Further, there were no abandonments of city service last year. Faith in the future growth and development of the electric railway, he said, has been shown during the year in cases where suburban single-track lines have been changed to double-track. There has been a steady increase in route-miles operated by the Canadian companies by the extension of permanent track and motor bus routes. Nevertheless, the speaker feels that the companies must be at least one step ahead of any conditions which might adversely affect the upward trend in the matter of revenue passengers carried. The plants—the only ones of their kind in each community—are surely adapted to earn revenues other than those from carrying passengers. An increase in the profitable use of the transportation plant will make it possible to produce better transportation.

Four committees presented reports. These covered motor buses and trucks, rail corrugation, publicity and merchandising of transportation, and safety and accident prevention. The committee on rail corrugation recommended that an intermediate manganese alloy, preferably sorbitized, offers the most hopeful solution from the standpoint of the rail. In the discussion it was pointed out that this recommendation, made independently, confirms that of the similar committee of the International Association.

New sources of revenue and further uses of equipment were investigated by the motor bus and truck committee. It was stated that the most outstanding ways of getting more business are interline operation, night operation of coaches, and package express. It was pointed out that the latter business can be handled on early and late trips when the passenger load is light, so that the service is interfered with but little.

Two formal papers were read during the meetings. The first was on the subject of developments in track design, construction and maintenance, by A. T. Spencer, general superintendent construction and maintenance, Montreal Tramways, and O. C. Rehfuss, chief engineer Canadian Steel Foundries. Experience with various types of track structure, both in Montreal and elsewhere, was given. In the discussion which followed considerable difference of opinion developed as to the merits of various kinds of ties. Experience in thermit welding of joints under traffic was given by E. M. T. Ryder of the Third Avenue Railway, New York City. A method has been developed in which a maximum of three minutes is needed for pouring the weld. Others said that pre-cast rail filler has been valuable in reducing noise, but that in some instances it has had a tendency to break down and leave an opening alongside the rail.

Three Distinct Classes of Transport

R. N. Graham, manager of railways Penn-Ohio System, Youngstown, Ohio, read a paper on the relation of urban transportation to suburban and interurban traffic. In a territory with a central city surrounded with suburban communities and smaller cities with independent business and trade activities three classes of transportation must be given. While the cities themselves are vitally dependent on mass transportation, and in them the effect of the private automobile is least, it is a more serious factor in suburban transportation and is most serious of all in its effect on interurban traffic, according to the speaker. The urban resident saves the least in time and money with his automobile. The suburban resident saves more in car fare to offset the high price of running

Digitized by Google

his automobile, and the interurban passenger can so time his infrequent shopping and entertainment trips as to use his automobile to the best advantage. As a direct result the greatest mileage of abandoned street railway lines is in the interurban classification.

Suburban lines should not be cut off at the end of the city system, said Mr. Graham, but the cars should be run through to the center. The city cars should be speeded up so that the suburban cars will not be delayed unduly, and the headways should be so chosen that the suburban cars, making infrequent stops, can gain the space between city cars. Loading platforms, shelters and illumination all help to popularize the service. If one-man cars are used, signals, switches and fare collection should all be designed to require a minimum of time on the part of the operator. Buses have been found useful in suburban transportation, and the speaker held that their use is not an alternative but is supplementary. Buses can be run express through city streets and so can make superior speeds. Since buses cannot be operated economically on long lines at a flat rate of fare, the suburban bus must charge a higher fare, not as an equivalent service to the street car but as a supplementary service. Interurban service is not supported by regular, every-day riders, being merely a convenience to the casual rider. Nothing can be gained by commutation fares or other reduced rates. Fares must depend on mileage, and so the bus, from the standpoint of riding capacity, is as fitted to produce a profit as the street car.

A feature of the Canadian Association's meetings is the discussion of "Timely Topics." Much interest developed on the subject of follow-up training and grading of car men. D. E. Blair, Montreal, brought out that the early training of the man is likely to crop out in after years, so that a close follow-up is needed. Since some men are more prone to accidents than others, they should he watched and have their occupations changed if necessary.

Records of the Montreal Tramways show that a relatively small proportion of the men have a large share of the accidents. H. O. Allison, Pittsburgh, Pa., corroborated this statement. He has found many men of ten to twenty years' service who have needed reinstruction.

On the subject of systematic maintenance of rolling stock, A. M. Lindsay, Montreal, pointed out that adequate records, standardized methods and practices, regular inspection and periodic overhaul are all needed to prevent failures. W. R. McRae, Toronto, feels that it should be unnecessary to point out the need for systematic maintenance when there is no argument whatever to be made against it.

Increase of Schedule Speed Held a Vital Need

G. E. Waller, Hamilton, and W. F. Irvin, Toronto, discussed ways and means for increasing schedule speed. It was pointed out that many factors are within the control of the company, such as the track, cars and power. Other conditions that are beyond the direct control of the company are traffic, parking, etc. The principal means of improving schedule speed are increases in rate of acceleration and braking, reduction of time of passenger interchange, elimination of stops, installation of electric switches, substitution of loops for wyes, etc. In Toronto the standard spacing of stopping places is now six per mile in the residential areas and seven per mile in the business districts. The public is becoming appreciative of the improvement in schedules afforded by the changes. Installation of automatic synchronized signals caused a reduction of 10 per cent in speed from the manual system. Replacement of this with the co-ordinated system caused an increase of 9 per cent in speed, but did not bring it back to what it was with the manual system. Long signal cycles have been found very bad, causing added congestion and reducing the speed.

Trolley Maintenance Saves Delays

Preventing delays to traffic by the use of modern methods in the overhead department were discussed by G. H. Cartwright, Quebec, and J. F. Neild, Toronto. According to Mr. Neild, the control of the system comes down to the keeping of accurate records. The location of wire is important. Use of a plumb-bob has not been sufficient, since there are sections of track where the rails are not parallel horizontally. A better method is to inspect the side wear on the wire and adjust the position to equalize this. It was considered better to remove trolley wire with a reduction of 35 per cent in area in congested districts rather than to risk breaks, as the cost due to loss of service may easily outweigh the value of the wire.

W. E. Massie, St. Catharines, and W. R. Robertson, Toronto, spoke of the comparison between cost of steel and cast-iron car wheels. In Canada the cost, including all factors, does not differ greatly. Experiments on a one-wear heat-treated rolled-steel car wheel on the Niagara, St. Catharines & Toronto Railway, have proved satisfactory. It is expected to get 100,000 miles with one wear at a cost comparable with that of the other types of wheel.

As is customary, three formal luncheons were held on the three days of the convention. The first was devoted to short talks by those of the founders who were able to be present. They included J. E. Hutcheson, Acton Burrows, E. A. Evans, R. M. Hannaford and D. E. Blair. The second day the audience was addressed by Leslie Vickers, economist of the American Electric Railway Association, who discussed trends in local transportation. On the third day the address was by J. F. Saint-Cyr, chairman of the Montreal Tramways Commission.

Officers were elected at the closing meeting to serve for the ensuing year, as follows:

Honorary president, J. F. Saint-Cyr, chairman Montreal Tramways Commission.

Honorary vice-president, Acton Burrows, president Acton Burrows, Ltd., Toronto.

Honorary advisory council, Hon. T. Ahearn, Ottawa; Edward Anderson, Winnipeg; Lt.-Col. J. E. Hutcheson, Montreal; C. A. Magrath, Ontario; W. G. Murrin, Vancouver; J. C. Smith, Montreal.

President, C. H. Dahl, assistant general manager Winnipeg Electric Company.

Vice-president, G. E. Waller, vice-president Dominion Power & Transmission Company, Ltd., Hamilton.

Treasurer, H. C. Patton, comptroller Toronto Transportation Commission, Toronto.

Auditor, J. E. Richards, manager and treasurer London & Port Stanley Railway, London, Ont.

Executive committee: The president, the vice-president, the treasurer, the immediate past-president (D. W. Harvey, Toronto), and D. E. Blair, Montreal; T. W. Brackinreid, Port Arthur; F. D. Burpee, Ottawa; W. S. Hart, Three Rivers; D. W. Houston, Regina; W. B. Powell, Montreal; W. R. Robertson, Toronto; L. Tait, London; K. B. Thornton, Montreal, and H. E. Weyman, Levis.

In connection with the convention an exhibit of electric railway materials and supplies was held. The leading manufacturers of this class of equipment in Canada were represented, as were several of the principal American bus builders. The Montreal Tramways also showed typical examples of its latest rolling stock.

Vision of Local Business Men Puts Oklahoma Railway on PAYING BASIS

Passenger traffic has **increased** 25 per cent in three **years on** the co-ordinated **street car** and bus system **operated** by the Oklahoma **Railway** in this **rapidly** growing **southwestern** city

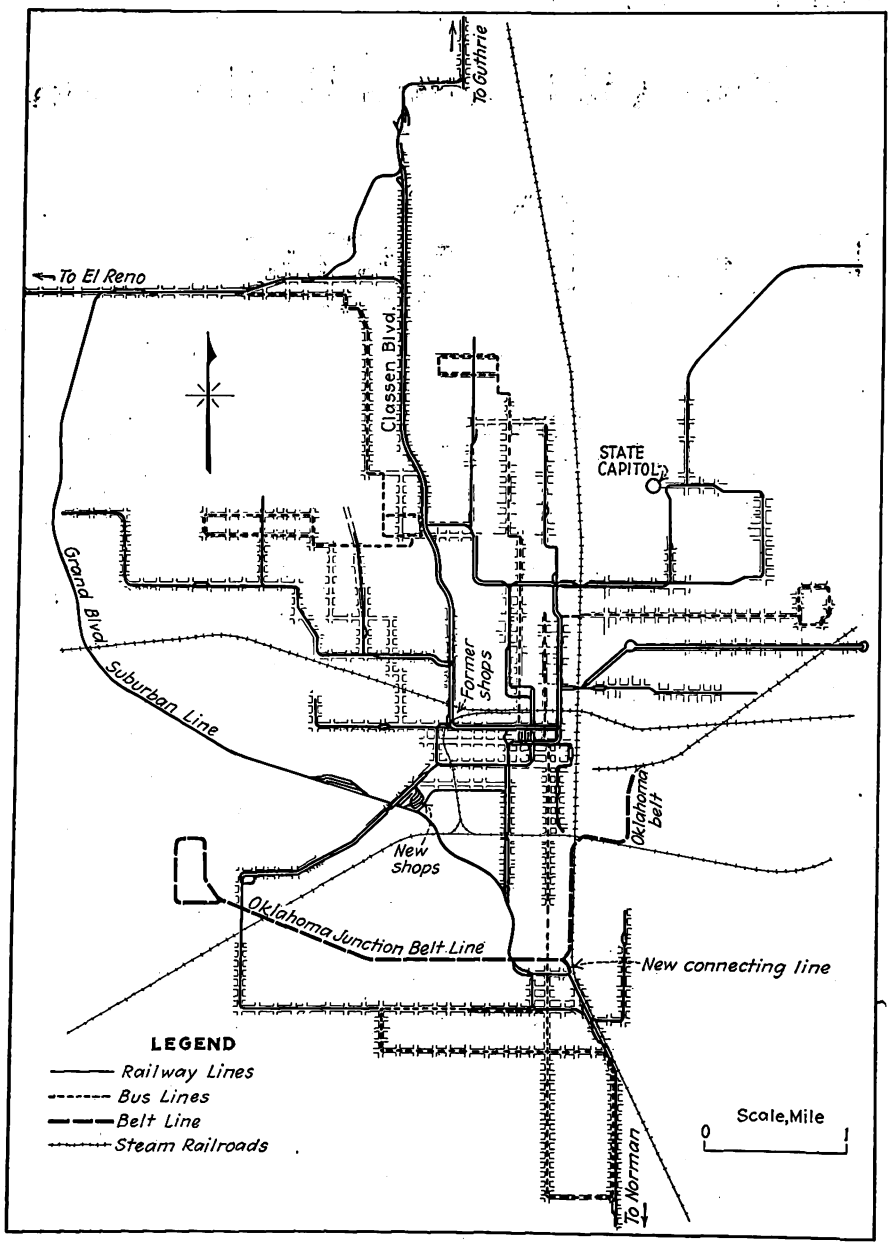
Improvements costing $2,000,000 have been made during the past three years. New equipment has been purchased and new carhouse and shops built. Number of passengers carried has increased 25 per cent. Facilities for freight handling have been greatly improved

EMERGING from its financial difficulties, the Oklahoma Railway is now able to meet all fixed charges and earn a small net revenue. During the past three years there has been a steady increase in patronage and it appears that the company has successfully passed through the period of depression which has been generally felt by electric railways throughout the country. The company was first organized in 1903 as the Metropolitan Railway, with only 6 miles of track. Today it has more than 150 miles of track and is the largest electric railway in Oklahoma. Since 1926 the number of passengers carried on its lines has increased 25 per cent. Although the company has steadily increased the number of buses in service, the proportionate increase in the number of street car passengers has been more rapid than in the number of bus passengers. In 1926 bus passengers constituted 25.4 per cent of the total traffic, while last year the bus passengers were only 24.4 per cent of the total.

These results have been achieved under the management of Oklahoma City business men. In 1927 the Oklahoma Railway was purchased by Hubert R. Hudson and his associates, William Mee, banker; Dr. G. A. Nichols, real estate man; T. C. Thatcher, miller; A. E. Monroney, merchant and A. O. Campbell, contractor and builder. Prior to that the company had been in the hands of receivers for about three years. The new owners have expended nearly $2,000,000 in the purchase of new cars and buses, making extensions to city lines, enlarging and remodeling the terminal station and building a new carhouse and shops.

The latest step in the company's program of equipment improvement was the purchase early in the present year of six new buses and ten new street cars for city service. The cars are being built by the St. Louis Car Company at a cost of $110,000. They are double-truck, four-motor, one-man cars with a seating capacity of 36 and weight of 24,000 lb.

Digitized by Google



Oklahoma City is served by some 75 miles of street railway track, besides the new Grand Boulevard electric freight line, the recently electrified belt lines and numerous motor bus routes

During 1928 the company remodeled its downtown terminal station at an expenditure of approximately $25,000. The roof of the station was extended, a number of ticket and concession stands constructed, additional entrances and exits provided and other minor improvements made to permit more rapid handling of car and bus traffic. This station has been a feature of the company's service for many years. A majority of the 125 street cars and 40 buses operated by the company are routed through the terminal, which is located in the business center of the city. During the early days of the receivership an effort was made to partially dispense with the terminal by through routing certain cars. This was done in the hope of speeding up crosstown service and eliminating as far as possible transfer of passengers. The plan was later abandoned and the terminal station is again being used as before.

Approximately $250,000 has been spent on new carhouses and shops located in the southwestern part of the city. These stand on property which once was the most widely patronized amusement park in Oklahoma City. The buildings consist of a main structure, including paint shop, carpenter shop and garage. The old location of its shops near the center of the city, will be made available for industrial sites.

The new owners recently abandoned the operation of the railway power station at Belle Isle on the Guthrie-Oklahoma City interurban line just north of Oklahoma City. This plant has been owned and operated by the company for many years, together with high-voltage lines extending to the towns of Yukon, Cashion and Edmond. The Belle Isle property also included 90 acres of lakes and small streams which for nearly three decades served as one of Oklahoma's chief playgrounds. This land, including the site of the amusement park, the lakes and streams, the generating plant and the high-tension lines, was sold recently to the Oklahoma Gas & Electric Company.

Freight Brings Added Revenue

Under the receivership various steps had been taken to cut operating expenses and increase revenue. The new owners realized, however, that a large amount of additional business must be created in order really to put the property on a paying basis. The most promising means of securing the necessary additional revenue was thought to be by expansion of freight business. The company owns and operates interurban lines centering in Oklahoma City, extending to Norman, El Reno and Guthrie and intermediate points over which passengers, express and freight have been carried for years. These three lines, constituting a total of about 85 miles of track and radiating to the southward, westward and northward, respectively, are connected with the city transportation system, which includes about 75 miles of track.

Shortly after the Hudson interests took over the property a plan was devised for increasing freight revenues by constructing a freight line around the northwestern, western and southwestern suburbs to tie together the three interurban lines and enable the company to carry freight more rapidly and with less interference to and from city traffic than was possible with existing facilities. At that time all freight originating on or consigned to the three interurban lines was being carried over the Classen Boulevard city line, which also served for carrying city and interurban passenger traffic. Classen Boulevard is one of the main outlets from the business district to the northern environs of the city, and for most of its length is lined with fine residences. One of the reasons for building the new line was the opposition of a number of Classen Boulevard property owners to the operation of freight trains through this district.

PASSENGERS CARRIED BY YEARS

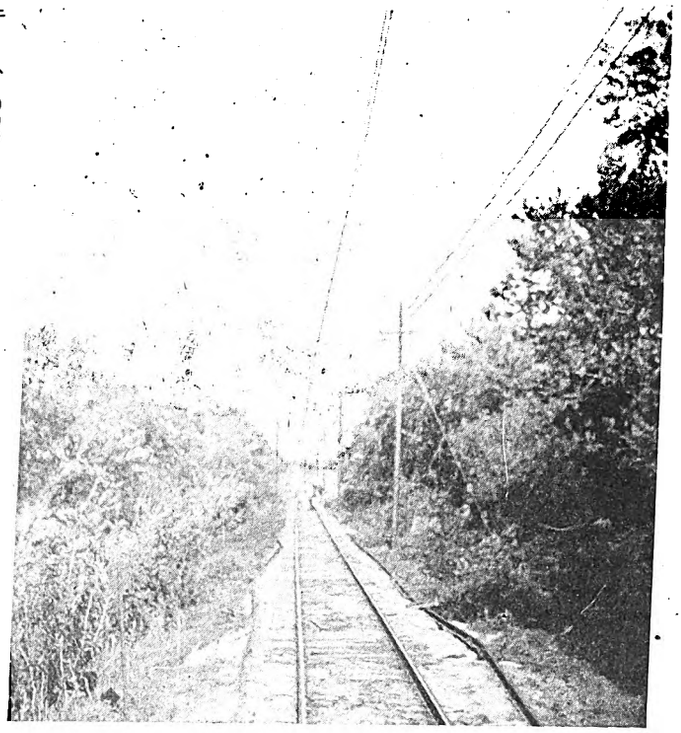
Year	Number of Passengers — Street Car	Bus	Total
1926	13,000,000	3,300,000	16,300,000
1927	14,682,000	3,900,000	18,582,000
1928	16,424,000	4,000,000	20,424,000

Many difficulties were encountered in negotiating an agreement satisfactory to the City Council, Classen Boulevard residents and to the company. Several months expired before a final agreement was reached in March, 1928, providing for construction of the new Grand Boulevard line. Officials of the railway, however, showed their good faith by beginning construction before this agreement was finally signed, and in rushing the work to early completion with a large force of men as soon as all difficulties were out of the way. This line was completed and put into operation in December of last year, at a cost of approximately $1,250,000, including relocation and construction of new shops, terminal yards, switching facilities, and purchase of new equipment.

For several reasons the Grand Boulevard line was located for the most part outside of Oklahoma City. The company desired to locate the line where it would not interfere with future growth of the city, and also where land values were relatively low and industrial sites and switching facilities could be acquired at reasonable prices by individuals, firms and corporations. While the company is not sponsoring any industrial real estate developments along this line, it is encouraging the sale of manufacturing and other industrial sites.

Belt Lines Leased and Electrified

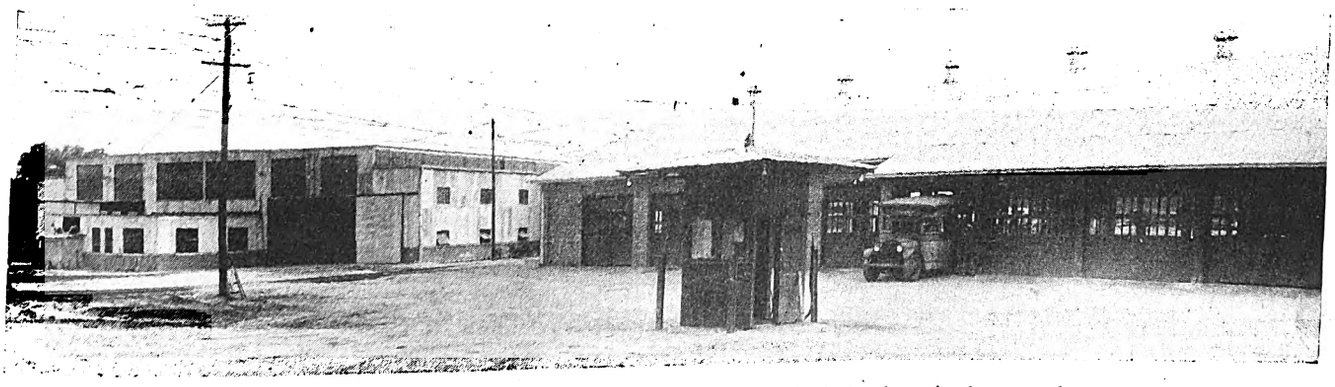
About a year ago the new owners secured a ten-year lease on the Oklahoma Belt Line Railway, approximately 5 miles in length, at that time steam operated and connected to the principal trunk line railroads entering Oklahoma City. This belt line connects with the Oklahoma Junction Railway, which has about 5 miles of switching and side tracks in the packing-house district. The Oklahoma Railway acquired a 99-year lease on this property also. The principal reason for acquiring these roads was to secure freight terminal facilities to handle business from the packing-house district and also other business originating on or consigned to steam railroads connecting with the belt lines. Oklahoma City has an extensive packing-house industry and stock yard facilities, and a great deal of business is handled to and from the packing-house district. The volume of traffic resulting from acquiring the belt lines and constructing the new freight line is steadily increasing, and the management believes that these various acquisitions will prove to be a profitable investment.



Right-of-way of the new Grand Boulevard freight line which partially encircles the city through its outskirts

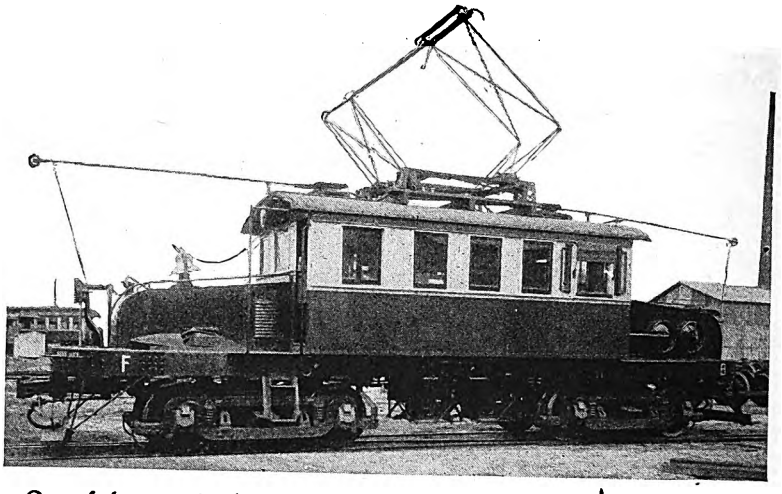
In addition to the packing-house business, the Oklahoma Railway handles much freight and express traffic of many kinds that originates at points along the interurban lines. The company also serves several sand pits which have a large output, located northwest of the city near its El Reno and Grand Boulevard lines.

In addition to the connections between the two belt lines, the Grand Boulevard line and steam railroads already mentioned, the other city and interurban lines connect with the new line at many points. At some of these points freight is diverted over city lines to its place of destination or delivered to outlying lines from points of origin in the city. The company is still permitted to carry freight over some of the city lines in the southern section of the city, a district which is largely industrial and where there are comparatively few residences of the better class. The belt lines and the Grand Boulevard line are so connected with the city system that they may be used for passenger traffic if that should be desired.



New car and bus shops of the Oklahoma Railway recently built in the suburbs to replace the old shops in the center of the city

Digitized by Google

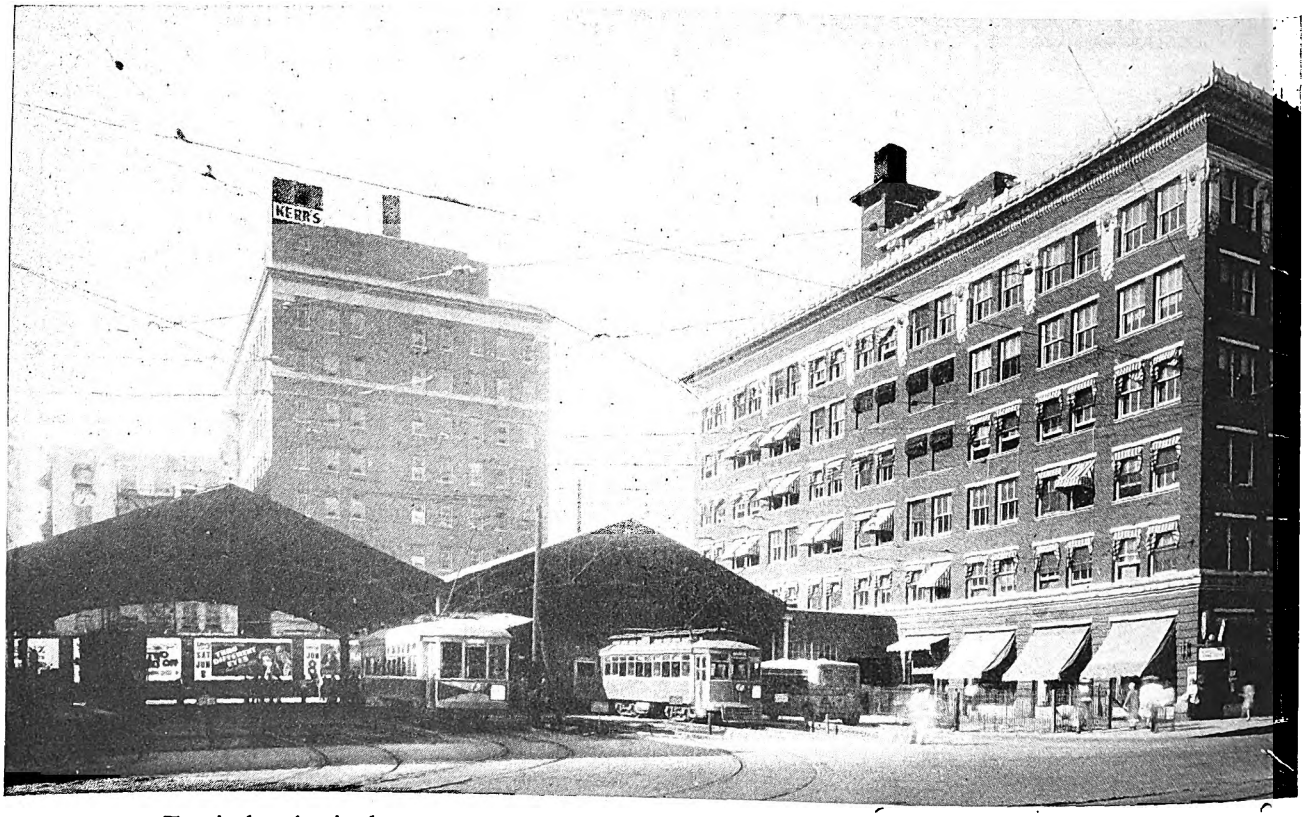


One of the new 600-hp. electric freight locomotives equipped for either pantograph or trolley operation

When the company assumed operation of the two belt lines on May 1, 1929, it immediately put into service two 600-hp. electric locomotives. Three more of these locomotives have been built in the shops of the company. Each engine has four 150-hp. motors and weighs about 75 tons. The motors were manufactured by the Westinghouse Electric & Manufacturing Company and the trucks by the Standard Motor Truck Company. All other construction was done in the railway shops. The company also has several older 400-hp. electric locomotives, making a total of eight. Pantographs are used on the freight and belt lines and ordinary trolley equipment on other lines.

The general situation in the territory, in which the company operates, is extremely favorable. Oklahoma is enjoying a rapid commercial development along all lines. This is particularly true of Oklahoma City and surrounding territory. Building permits have exceeded $1,000,000 per month for more than 2 years. Industrial development is moving forward, as is truck farming, poultry raising, dairying and other industries which create new freight and passenger business for transportation lines. A new oil and gas field has been opened almost in the southeastern suburbs of the city.

The Oklahoma Railway has adopted an aggressive policy in securing new freight business. It has also secured a permit from the Oklahoma Corporation Commission to operate interurban passenger motor buses along the highway paralleling its interurban line between Oklahoma City and Norman and has applied for bus permits to carry passengers parallel to its other interurban lines. Judging by the results so far accomplished, prospects are bright for a continued increase in both passenger and freight business.



Terminal station in the central business district of Oklahoma City serves both car and bus passengers. The building at the right houses the offices of the Oklahoma Railway

The Readers' Forum

Requirements of Materials for Car Flooring

Johns-Manville Corporation
New York, N. Y., May 7, 1929.

To the Editor:

An article appeared on page 687 in the Oct. 13, 1928, issue of Electric Railway Journal telling of the use of car flooring material, one of the constituents of which was a bituminous material.

In the March 23, 1929, issue of Electric Railway Journal in The Readers' Forum section, there appear some comments by R. C. Brett, research engineer of the Trundle Engineering Company, Cleveland, Ohio, under the title "Asphaltum Not Advantageous for Car Floors." The author of these comments makes a sweeping condemnation of car floors using asphaltum, on the basis of tests presumably conducted as part of his research engineering work. The unfortunate part of the author's comments is that by making his conclusions so specific and positive, he indicates very clearly that his tests have not been sufficiently comprehensive to include some of the more refined compositions of flooring, and show lack of familiarity with the subject of car flooring in general.

Simply by way of rebuttal, it might be well to state that it is not only possible but entirely feasible to furnish composition flooring composed of filler ingredients such as coke breeze, held together with a bituminous binder which will not exceed a unit weight of 0.9 lb. per square foot per $\frac{1}{8}$ in. thickness. "The type of flooring now commonly used by railroads," as expressed by the author, rarely has a lighter weight than the figure mentioned, and if it does, this lighter weight can be secured only through the introduction of sawdust, wood fiber or other deleterious ingredients, which not only weaken the structure of the floor itself but increase its porosity to such an extent that water will readily pass through the floor.

With regard to the thickness of composition floorings now in general use, one would hardly be so optimistic as to expect a $\frac{3}{8}$-in. thick composition flooring to give satisfactory service over a period of years, unless this composition flooring had sufficient mechanical strength to withstand in itself the stresses placed upon it, or else was sufficiently flexible to accommodate itself to these stresses without fracture.

To condemn a flooring material because it will soften under the heat produced by the combustion of the car is hardly justified by a consideration of contingent factors. It should be significant that composition flooring will not burn unless its temperature has been raised above 550 or 600 deg. F. To produce this temperature other combustible materials would have to be present. In modern steel car construction this is barely possible. In old wooden construction the car would be consumed by fire beyond the point of further usefulness before the flooring would be seriously affected. Thus the composition flooring does not constitute a fire hazard, but, rather, it is a fire retardent, as you may learn from the Chicago Board of Underwriters.

The test results and scientific deductions or conclusions of research engineers are extremely valuable contributions to engineering literature and trade publications. Obviously, such information is of value only if it reflects an unbiased or uninfluenced consideration of facts.

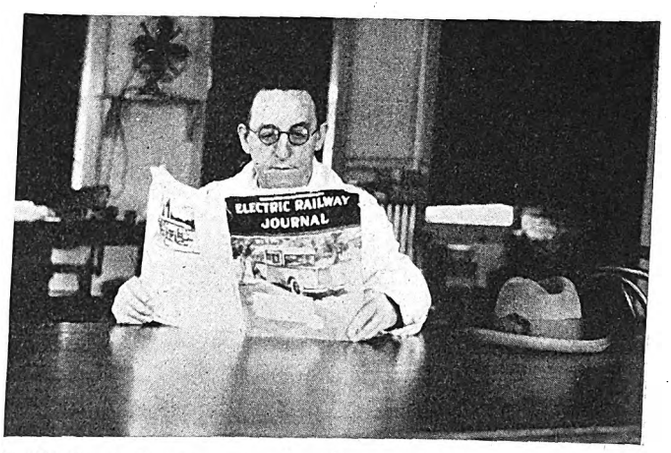
P. D. Mallay,
Chief Engineer General Railroad Department.

Maintenance Contest Teaches Better Methods

Virginia Electric & Power Company
Norfolk, Va., May 15, 1929.

To the Editor:

Every subscriber to Electric Railway Journal is introduced to solutions of the other fellow's problems that not only teach him better and more efficient methods, but actually make for better maintenance all over the industry, in that each and every subscriber has before him a periodical review of such improvements throughout the electric railway field. The present maintenance contest, designed specifically for that purpose, is proving one of the most interesting and far-reaching ventures of its kind known of by the writer since his connection with the industry. In Oct. 27, 1927, issue the Journal said editorially of a similar contest:



T. W. Sanderlin, carpenter shop foreman in Norfolk, Va., studying the practicability of a special clamp for preventing theft of rear-vision mirrors

> The many articles submitted show an earnest desire on the part of the men who submitted them to lower maintenance costs, to provide more efficient and better methods, to eliminate fatiguing operations and manual labor, to overcome troubles experienced in the various operations and to provide improved equipment to do the work.

That is just what the present maintenance contest is doing. For instance, the Virginia Electric & Power Company at Norfolk for some months past was troubled with the theft of rear-vision mirrors from the cars. In the Oct. 20, 1928, issue a contest item described a special clamp designed to stop such losses which had been tried out successfully on another property. Its adoption in Norfolk stopped the thefts.

This particular instance is but one that shows how a free interchange of ideas surely will bring to light methods that can be adopted with good results on any property.

C. B. Hall,
Chief Clerk, Mechanical Department.

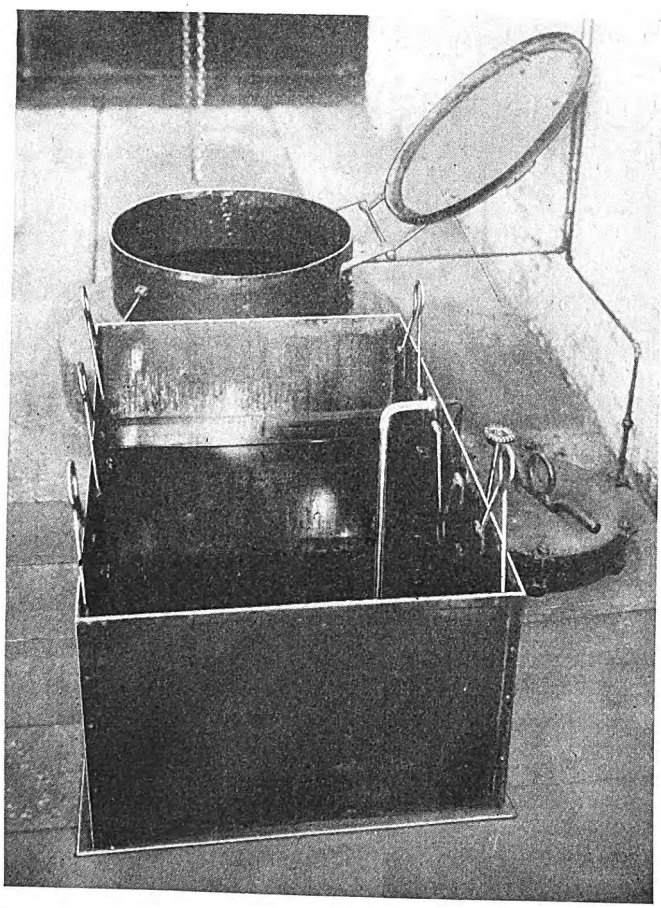
Improved Armature-Dipping Methods Developed

By F. V. Skelley
Superintendent of Equipment Des Moines City Railway
Des Moines, Iowa

DIFFICULTY in obtaining proper penetration of varnish when armatures were dipped led the Des Moines City Railway about two years ago to undertake a series of experiments from which the methods now used have been developed.

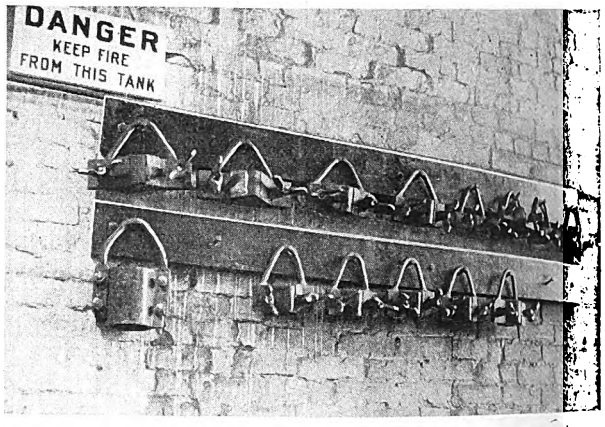
At first armatures were dipped in a tank of varnish for twenty minutes and after draining were baked for 48 hours. It was found that the varnish did not penetrate to the bottom of the slots although the coils were known to be loose. This condition was verified by tearing out the coils of several armatures after they had been dipped and baked. Other experiments were then made to improve conditions. A steel tank was built large enough to hold an armature. With the vat filled to the proper level with baking varnish of a standard make and the armature under test sealed in the tank, a vacuum of 25-in. gage measure was applied, followed by a pressure of 110 lb. per sq.in. After ten minutes of this treatment the armature was removed and the coils torn out. The results obtained were little better than with the twenty-minute dipping at atmospheric pressure.



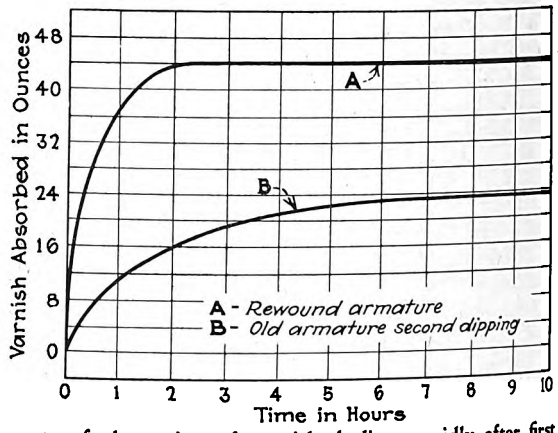
Rectangular varnish vat in shop of Des Moines City Railway will accommodate six G.E.247-I armatures at one time. Circular tank in rear is used for larger armatures. Between rectangular vat and the wall is a 17-in. diameter pressure tank, 45 in. deep, for storage of surplus varnish

Soaking the armature in varnish was then tried, starting with 24 hours' duration and decreasing the time to 18, 16, 12, and finally 6 hours, tearing the coils out each time to determine the amount of varnish in and around the bottom coil in the slot. As the penetration of the varnish was satisfactory for armatures soaked six hours or more, it was decided to test the rate of penetration up to six hours so that the time might be reduced to as short a period as possible for performing a satisfactory job.

A rewound G.E. 247-I armature was preheated as usual and submerged up to the commutator in a tank of varnish placed in a room where a constant temperature of 104 deg. F. could be maintained. The result as shown by curve *A* on the accompanying chart indicates that 2 lb. 12½ oz. of varnish was absorbed in two hours and that practically no further absorption took place up to ten hours. Next an old G.E. 247-I armature, that had received a previous dipping of twenty minutes, was soaked for ten hours. The rate of penetration was found to be much slower and the varnish continued to be absorbed for six hours. The temperature in this test was held constant at 112 deg. F. Only 1 lb. 3 oz. of varnish was absorbed by the armature during its second dipping period. The thickness of varnish adhering to a clean metal plate was one mill. The second soaking of the armature added two and one-half mills, or gave a total of three and one-half mills thickness of varnish on all metal surfaces.



Armature shaft clamps of various sizes are neatly stored on a rack located directly above varnish vats



The rate of absorption of varnish declines rapidly after first 60 minutes as shown by armature test curves

As a result of these experiments, the armature-dipping equipment now in use consists of a rectangular metal tank 48x32 in., and 40 in. deep, in which six G.E. 247-I

Digitized by Google

armatures can be soaked at one time; a circular tank of 6 ft. depth and 30 in. diameter, in which all large armatures are soaked; and a pressure tank of 45 in. depth and 17 in. diameter, for the storage of surplus varnish. Air under pressure is admitted to this latter tank and varnish forced through a connecting pipe and valve into the rectangular vat. When the valve is opened and air pressure removed, the varnish flows back by gravity. It is thus possible to maintain 30 in. of varnish in the large vat irrespective of the number of armatures being dipped at one time. Hinged brackets along each side of the vat slip over the end of the armature shafts to hold them in a vertical position. The method of operation with this equipment is to take an armature that has been in service 80,000 miles, tighten the bands if necessary, and soak in varnish for six hours or more; then bake until the insulation resistance is satisfactory.

Some Essentials for Trolley Wheels

By Dr. James Silbestein
Metallurgical Engineer, Chicago, Ill.

INVESTIGATION of service obtained from trolley wheels shows that the mileages obtained vary from 1,400 to 17,000 and that the cost per 1,000 car-miles varies from 2 cents to 33 cents. This wide variation indicates that more knowledge is needed regarding desirable characteristics for making trolley wheel castings and that their purchase should be subject to rigid inspection.

There are a number of factors which influence the life obtained from trolley wheels. Among these are electric conductivity, arcing properties, hardness, wear resistance and soundness of castings. Trolley wheels are made of copper-basic alloys. Their electric conductivity ranges between 10 and 70 per cent, the International Annealed Copper Standard being 100 per cent. While a high electrical conductivity naturally is desirable, this property is not as essential for long life as some other factors, and an electric conductivity of 10 to 20 per cent may be considered satisfactory.

The destructive action of arcing should be as small as possible. Alloys high in zinc result in more arcing and so are not suitable. A small percentage of zinc, up to 5 per cent, is beneficial since it has a deoxidizing and cleansing effect upon the metal. It has been found that the service performance of alloys containing 5 per cent of zinc is just as satisfactory as the phosphor bronze alloys. Lead which is added to bronzes to improve their wearing qualities is undesirable in trolley wheel alloys. Extensive tests have shown that the destructive action of arcing is greater for alloys containing lead than for lead-free and that the life of the wheels is less in the former case.

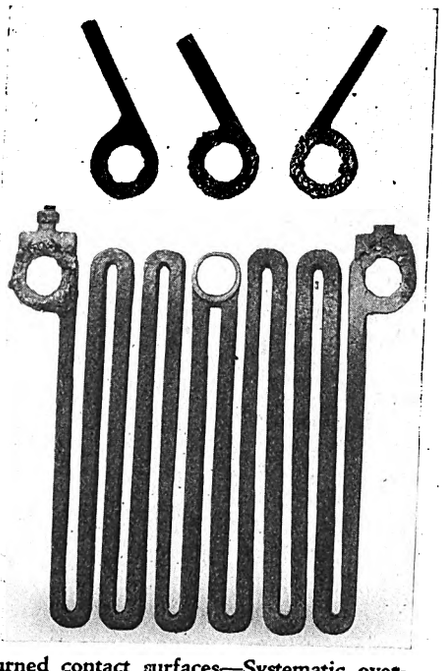
Hardness is not an essential quality of a trolley wheel alloy and a greater hardness is no indication of better wearing resistance or longer life. In general, the Brinell hardness of trolley wheel alloys ranges from 40 to 55. Service tests have been conducted with alloys having a Brinell hardness as high as 75 and the results of these tests indicate that the harder alloys were no better than the softer ones. The fact that hardness is not a measure of wear-resisting qualities has lead to extensive investigations on methods of testing abrasion resistance of metals. Finality in methods of testing for this purpose has not yet been attained and different types of abrasion testing still yield results which are not comparable. In view of the great importance which the rate of wear has for parts such as trolley wheels, trolley wires, rails, treads of wheels, axles and bearings, a satisfactory abrasion test would be highly desirable, but so far it is necessary to resort to the slower method of testing in service.

Overhauling Cast Grid Resistors

By R. S. Beers
Railway Engineering Department General Electric Company Schenectady, N. Y.

WHEN car equipments are overhauled the motor resistors should receive the same attention that is given the remainder of the equipment. They should be put in shape so that they will operate without further attention until the next overhauling period. Whether it is necessary to dismantle and rebuild the resistors may often be told by a visual inspection of them.

This inspection should be followed by an insulation test, a bank of lamps and trolley voltage between the grids and the resistor frame being used for this purpose. After this the resistance of the resistors should be measured. A simple means of checking the accuracy of the resistance measurements is to measure the total resistance and also the individual steps. If the individual steps do not add up to the total, some error has been made.



Burned contact surfaces—Systematic overhaul of grid resistors discloses conditions of this kind when they exist

If the resistance is a good deal higher (30 per cent or more) than called for by the manufacturer's connection diagram, it is desirable that the resistors be torn down and the grids restacked. The grid bosses, if they are rusty or if they have tiny pieces of mica sticking to them, should be thoroughly cleaned. The easiest, quickest and most successful means of cleaning them is with a sand blast. If the sand used is not too coarse, this method cleans off rust and any foreign matter, leaving the contact surfaces of the grid boss just as clean and parallel with one another as they are on new grids. Filing or grinding cleans the contact surfaces of the grid boss, although it usually reduces the conductivity because the surfaces are no longer parallel.

Grids with badly burned contact surfaces should be discarded. Where trouble from this cause is excessive it can be reduced by using a thin copper (about 0.01 in. thick) washer between the contact surfaces.

Design of
Maintenance Contest Trophy
Completed

IN KEEPING with the purposes and spirit of ELECTRIC RAILWAY JOURNAL'S maintenance contest, the design has been completed of the trophy to be awarded to the company rendering the most outstanding contribution, through participation in the contest, to the improvement of maintenance practice of local transportation companies. The final design is the beautiful example of the silversmith's art illustrated on this page.

The trophy takes the form of a wall plaque of bronze, mounted on polished wood. In relief across the upper part of the shield is an emblematic representation of the various phases of transportation maintenance work. The heroic size of the figures is symbolic of the importance of the human element in maintenance performance. This design, together with the lettering and the decorative border, are worked in sterling silver on the bronze shield.

After the final meeting of the judges, following the close of this year's contest on July 15, the name of the winning company will be inserted on the trophy in the space provided. The actual presentation will be made at the coming convention of the American Electric Railway Association at Atlantic City this fall, and the trophy will be on display in ELECTRIC RAILWAY JOURNAL'S booth in the new Atlantic City Auditorium.

In addition to the company trophy, there will also be awarded at the convention the individual cash prize of $200 to the electric railway man submitting the best single item in the contest. Departmental certificates of merit will go to each of the four departments — equipment, way and structures, electrical, and bus—which receive the highest rating from the judges under the same terms as those used for selection of the company winner. At their coming meeting the judges will also select the winners of individual departmental prizes of $25 each for the final period of the contest which closes on July 15. Winners of these cash awards will be announced in the August number of ELECTRIC RAILWAY JOURNAL.

ENTRIES ELIGIBLE TO JULY 15

ITEMS submitted in this contest up to midnight July 15 are eligible for all of the prizes listed above. These entries are now coming in at a rapid rate as the closing date approaches. There is no limit on the number of items that can be submitted by any individual, department or company, and the total number of items entered by a department or company is one of the factors to be considered by the judges in awarding the departmental certificates of merit and the beautiful company trophy. The JOURNAL will pay $5 for every item published which does not win a prize.

Full details of the contest were published in the Oct. 20, 1928, issue of ELECTRIC RAILWAY JOURNAL. There are also available for the asking printed folders giving the conditions of the contest and suggestions for preparing entries. There is still time available for individuals, departments and companies to make a bid for these prizes. But the time is getting short, and this is the last announcement in the JOURNAL before the close of the contest on July 15.

Mailed items must bear a postmark up to midnight of that date. Be sure to mark entries "Maintenance Contest."

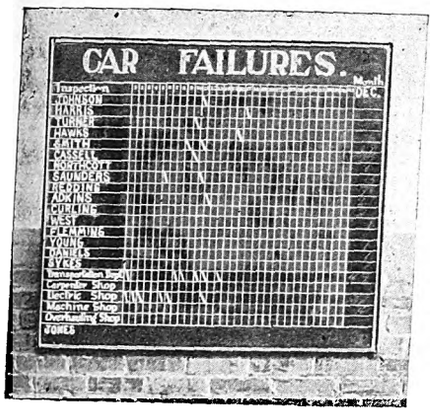
Devices and Practices Found Useful in Expediting

MAINTENANCE WORK

Many maintenance ideas have been received which have proved of great value to men in the railway industry. What can you contribute?



Blackboard used to classify car failures and to charge them against the employee responsible

Pull-Ins Charged to Men Responsible*

By C. B. Hall

Chief Clerk Mechanical Department Virginia Electric & Power Company, Norfolk, Va.

AN ENERGETIC campaign against car pull-ins is being carried on by the Virginia Electric & Power Company, Norfolk, Va. One means which has proved successful in reducing car failures on the road is the use of a blackboard upon which pull-ins are charged against the particular inspection employee responsible. The blackboard is 43x49 in. in size and is placed at a conspicuous point on the wall of the inspection shop.

This has caused a feeling of personal responsibility for the failures when they occur, and as a result pull-ins have been reduced 46 per cent during a period of three months. This reduction reflects the extent to which better maintenance is carried out, and the more careful work done toward eliminating sources of trouble that would cause failure on the road.

Use of a special inspection form together with the inauguration of a system of classifying pull-ins has reduced car failures considerably. The inspection form provides for signatures of the entire inspection force. In another column the work done is listed. Use of this has played a large part in bringing about the good performance figures.

The average miles per pull-in during the last six months of 1928 were as follows:

Month	Average Miles Per Pull-In.
July	10,019
August	11,134
September	15,088
October	16,510
November	16,889
December	18,432

With one exception, the December figure is the best showing made on the property during the past ten years, certainly a convincing argument for close supervision.

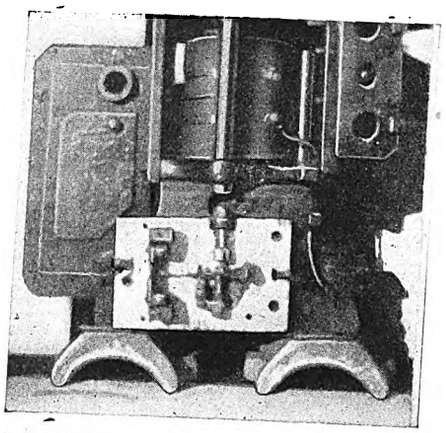
Delayed Break Interlock for Circuit Breakers*

By Harvey L. Bullock

Superintendent of Electrical Equipment Cleveland Union Terminal, Cleveland, Ohio

A DELAYED break interlock has been found of particular advantage on multiple-unit control equipment of the New York Central Railroad for preventing the burning out of operating coils by opening the circuit automatically. Its use also guards against broken operating switches and improper handling by the operator. It prevents burning of operating switches in the cab by distributing the arc over each individual unit of car equipment in long trains.



Type of delayed break interlock for remote control automatic circuit breakers and overload coils

The interlock is mounted on the side frame of the circuit breaker and is operated by connecting to a special main solenoid hinge pin with an insulated operating rod. This latter is connected to a contact lever under which is located a cushion spring.

Submitted in Electric Railway Journal Prize Contest.

Digitized by Google

The action of the interlock is delayed by the use of a toggle latch on the contact lever and is timed to unlatch at the moment of locking the circuit breaker in the closed position. The cushion spring, being compressed, then throws the lever to the unlatching or trip position if the operator desires to use the hand control in emergency. Two contacts are provided—an upper and a lower one. These are used for set and trip circuits. Magnetic blow-out coils to extinguish the arc have also been provided.

This device is now standard on New York Central cars with DB-102 circuit breakers and is also embodied in the late type of PC-10 controllers. It has practically eliminated circuit breaker troubles of this nature and consequent delays to trains.

Group Form for Testing Equipment*

By William J. Hankey
Substation Division, Power Department Cleveland Railway, Cleveland, Ohio

ROUTINE work of testing and calibrating equipment in automatic and manual substations of the Cleveland Railway has recently been arranged in group form. Use of the form not only enables the chief inspector to tell at a glance what particular piece of apparatus or mechanism is to be tested, but it also enables the test crews to prepare for the next test period or next apparatus to be tested. In the arrangement of the form, consideration was given to minimizing the transportation of test equipment from one plant to another. If several operations are necessary on some one piece of equipment, provision is made on the form to do this while the equipment is out of service.

A schedule of testing and calibrating equipment in ten automatic and five manual plants is carried out by two men working but three days each week on this type of work. The remainder of their time is devoted to biweekly and detailed inspection, testing experimental hookups, graphic clocks and meter maintenance.

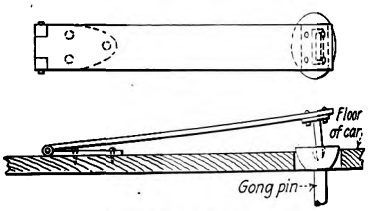
The group form sheet lists the various apparatus in their respective groups, the necessary testing equipment required for the work, the next date the apparatus is to be tested, the station involved, and the date the work is completed. In this way a complete yearly record of all testing and calibrating activities is recorded on one sheet.

Submitted in Electric Railway Journal Prize Contest.

Pedal Gong Ringer*

By Felix E. Reifschneider
Engineer Ithaca Traction Corporation, Ithaca, N. Y.

THE forward location of the gong pin on one type of car of the Ithaca Traction Corporation was such that the motorman could only use his toe. If the pin were turned halfway it was locked to prevent ringing on the rear platform. Various circumstances caused the pin to be locked when it should have been available for operation by the motorman. To eliminate this serious trouble, a pedal was devised as shown in the accompanying drawing. A 6-in. hinge was screwed to the floor with the staple bolted to the underside at one end, which fitted a depression in the top of the pin, preventing accidental turning.



Pedal used to ring warning gong on cars of Ithaca Traction Corporation

The increased leverage has two ad-

Type of group form used for testing substation equipment of the Cleveland Railway

Digitized by Google

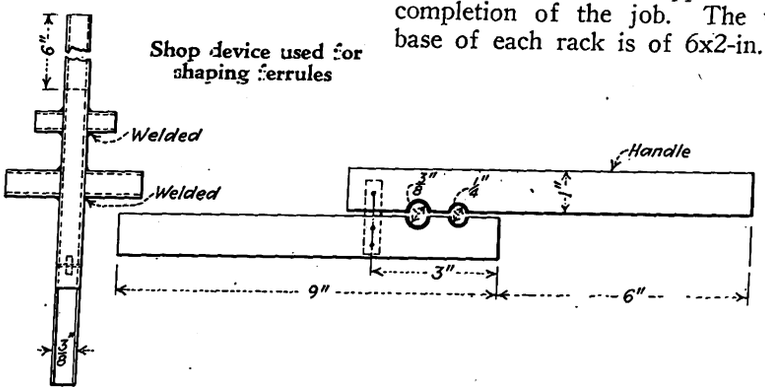
vantages, it produces a more intensive ring and the motorman also is able to locate the pedal sooner without looking for it, thus greatly reducing the chance for accident. The cost of placing this pedal on each car is $1, which includes labor and material.

Form for Shaping Ferrules*

By H. J. Beadle

Engineer of Equipment Dallas Railway & Terminal Company, Dallas, Tex.

IT IS THE practice of the Dallas Railway & Terminal Company to use ferrules over the ends of leads where they go into terminals. The ferrule is cut from tin and is pushed under the rubber covering of the wire for a distance of about ½ in. Instead of using a pair of pliers to shape the ferrule on the lead, so that an accurate fit will result when the lead is placed in the round terminal hole, a form for shaping the ferrules is employed. This consists of two blocks 1 in. square and 9 in. long, the upper one being hinged to the lower so that the ferrules can be inserted and removed quickly. An extended section a little longer than the ferrules is welded to the two blocks so that pressure for shaping can be applied the full length of the ferrule. This forming tool makes the ferrules round and results in a close fit and satisfactorily soldered job.



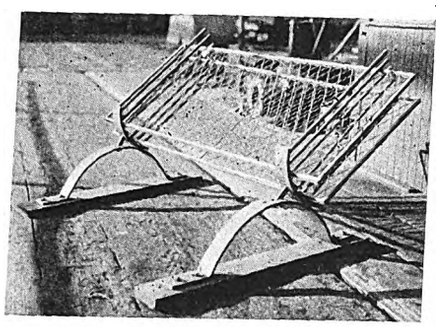
Shop device used for shaping ferrules

Reversible Screen Holders

By D. L. Patison

Foreman Paint Shop
Omaha & Council Bluffs Street Railway
Omaha, Neb.

RACKS have been designed to facilitate the painting of street car window guards by the Omaha & Council Bluffs Street Railway. These racks hold the screens in such a position that after one side has been painted the whole frame can be turned over approximately 90 deg. to bring the other side uppermost for completion of the job. The wood base of each rack is of 6x2-in. timber, 30 in. in length. Six ⅝-in. rods, 24 in. long, project from a curved metal base, made of ½-in. stock, 3 in. wide. Details of the loose-pin coupling between upper and lower "rocker" iron sections are shown in the accompanying pictures.



Reversible holder which permits painting of both sides of window screens with a minimum of handling of wet surfaces. Five screens at a time can be accommodated

New Test Rack for Air Equipment

By J. A. Duffy

Superintendent of Equipment
Monongahela West Penn Public Service Company, Fairmount, W. Va.

AIR equipment of the cars of the Monongahela West Penn Public Service Company is subjected to rigorous tests after overhauling before it is allowed to pass for installation. A test rack has been designed to duplicate all the brake operations of every piece of apparatus of the automatic air equipment. This rack is used also for detail tests of safety car equipment and triple valves. The arrangement of the apparatus for these tests is shown in the accompanying diagram.

Among the various valves which can be tested on this rack are: brake valves, brake valves with selector valve, emergency valves, combined foot and cutout valves, pilot valves, and main reservoir cutoff valves. Other tests which may be made are the friction tests, the opening tests, the capacity tests, the test for ball check valve leakage, closing tests and porosity tests. In testing triple valves for railway service, an application and a release test will indicate roughly whether or not the triple valve should be removed for closer inspection or repaired on account of packing ring leakage, resistance, opening through ports, etc. The tests are made with 70 lb. in the supply line and with the test apparatus shown on the Westing-

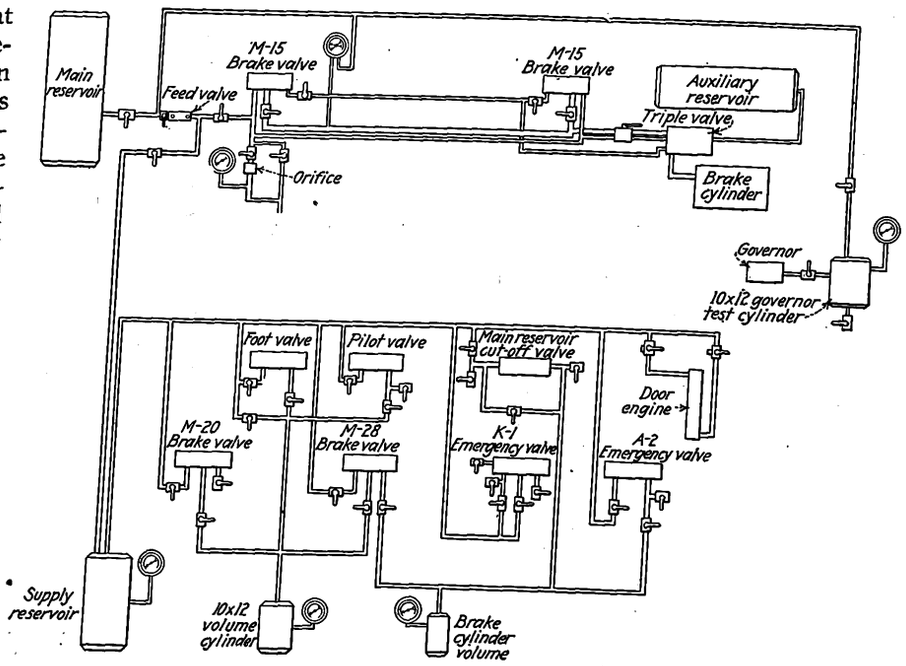

Diagram showing arrangements of valves, gages and reservoirs and the piping of a test rack for air equipment of the Public Service Company at Fairmount, W. Va.

Digitized by Google

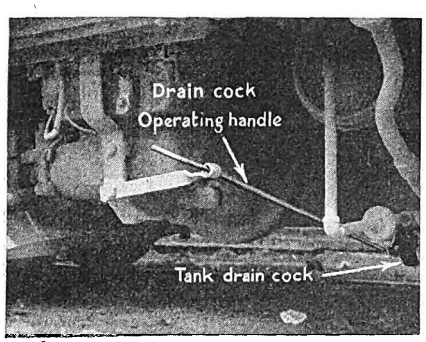
house Air Brake Company's drawing F-31968.

In the event that a valve is removed from a car for test without first being overhauled, it should be taken down and inspected to make certain that the working parts are in good condition.

Particular attention should be given to the clearance of the lower valve stem and its bushings. Door engines and air compressors may also be tested satisfactorily with this test rack.

Reservoir Drain Valve Operating Rod

DRAINING of air reservoirs on the cars of the Richmond Railways, Inc., Staten Island, N. Y., is on a definite time basis so as to prevent brake trouble. Still greater care is exercised during the winter months



Since this operating rod has been in use all tanks are kept drained

to guard against freezing. The reservoirs are installed in the center of the cars and it has been found very inconvenient to reach the drain valves unless the car is over a pit. When pit storage was impossible there was a tendency for the men to neglect the draining. As a result freezing troubles were encountered.

A special operating mechanism was installed, as shown in the accompanying illustration to make the valve accessible and to assure drainage. It will be noticed that a $\frac{3}{8}$ in. round rod with an eye in one end is attached to the drain valve handle and extends outward toward the side of the car. This rod is supported by a $\frac{1}{4}$x1-in. eye bracket 12 in. long fastened to the compressor supporting bracket. With this arrangement the reservoirs can be drained without the car being over a pit.

The possibility of accident has been reduced with this arrangement, as a man does not have to crawl beneath the car.

Testing Friction Tape

By G. H. McKelway
Distribution Engineer Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y.

WHEN it is desired to compare samples of rubber friction tape, or to obtain an approximate idea of their value, the usual method is to rub together pieces of the tape and then to pull them apart. It is a popular belief that the value of the tape can be determined by noting its stickiness or "tackiness." This is a mistaken theory, however, as the stickiness of a tape is not proof of its quality but, on the other hand, may be an indication of its worthlessness. The best tapes are those that have been compounded with a large percentage of new, high-quality rubber, and such tapes are seldom so "tacky" as those made up with less crude rubber and more rubber substitutes.

Another mistaken assumption is that tape of a light color is not as good as black tape. The color of rubber is gray, while the color of most of the cheaper substitutes is dark brown or black. Sometimes coloring matter is added purposely to the rubber compound to make it darker but, unless that has been done, the lighter colored tape is likely to be the better.

Still a third mistake in regard to tape is the belief that, when two pieces are pulled apart, the fibers of the compound should be long. The fiber of good quality rubber compound, on the contrary, is quite short.

To decide upon a good make of friction tape, there are three things that must be decided: (1) The strength of the fabric; (2) the holding power, not the mere stickiness, of the compound; (3) the insulating properties of the tape. There are standard laboratory tests which will determine accurately all of these qualities and, if possible, such tests should be made before purchasing large quantities. However, when only a small amount of tape is wanted, it is desirable to have some easy test which can be made by anyone and which will give approximate results.

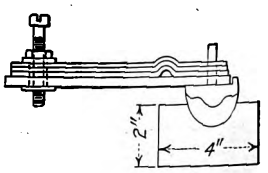
For deciding on the strength of the fabric, a comparatively narrow strip of tape, say $\frac{3}{4}$ in. wide, should be taken in the hands and the two ends pulled apart until the tape breaks. By noting how much pull must be exerted to break it, an approximate idea of its strength can be gained. This is a very rough test, but any tape that breaks easily should be rejected.

For the second test, another strip of the tape should be bent back on itself and then forward again, so as to make a "Z" about 1 in. in length and made up of three thicknesses of tape. These three layers should be squeezed together firmly and the pressure maintained for three minutes. Then take hold of the ends of the tape and attempt to pull out the "Z" lap. It will be found that with a good quality of tape the fabric will break before the lap will open. The purpose of the "Z" lap is to insure that the compound on both sides of the tape is tested. Occasionally, a tape will be found with a better grade of compound or with it applied better on one side than on the other. A single lap will test only one side of the tape, whereas with the "Z" lap both sides come into contact with each other.

The voltage of railway circuits is so low that any well impregnated fabric will withstand it. Therefore, unless a higher voltage is available and can be used easily and safely, there is not much reason for making a voltage test; especially, since the tape might be good at the point tested and much poorer at a point an inch or two away. To make sure that the tape is impregnated well and uniformly, it should be held up to the light and any "pin holes" in it counted. There should be none, or, at the most, only one or two in a strip a foot long.

Form for Riveting Controller Finger Tips

RIVETING new tips to controller finger springs used to be a troublesome job in the shop of the New York & Queens County Railway, Woodside, N. Y. The new tips often caused heavy arcing after they were installed in the controller. Careful analysis of the cause of this arcing disclosed the fact that it was due to improper contact. This was brought about by the existence of abrasions on the tip contact surfaces,



This fixture for riveting tips on controlling fingers has speeded up the riveting process and eliminated arcing failures

Digitized by Google

which were made by the vise jaws during the riveting process, a condition which needed to be eliminated.

The riveting form shown in the accompanying sketch was developed for riveting the tips to the fingers and to prevent damage to the tip surface. It is made of steel and is 2 in. square and 4 in. long. The top surface is provided with a groove of such width, depth and contour as to conform exactly to the surface of the tip to be riveted. The tip is placed in the groove and the finger spring and shunt are placed over the rivet. The force exerted on the riveting process is distributed evenly over the tip surface and thereby prevents the formation of any abrasion.

Labor and Time Saving Pole Racks*

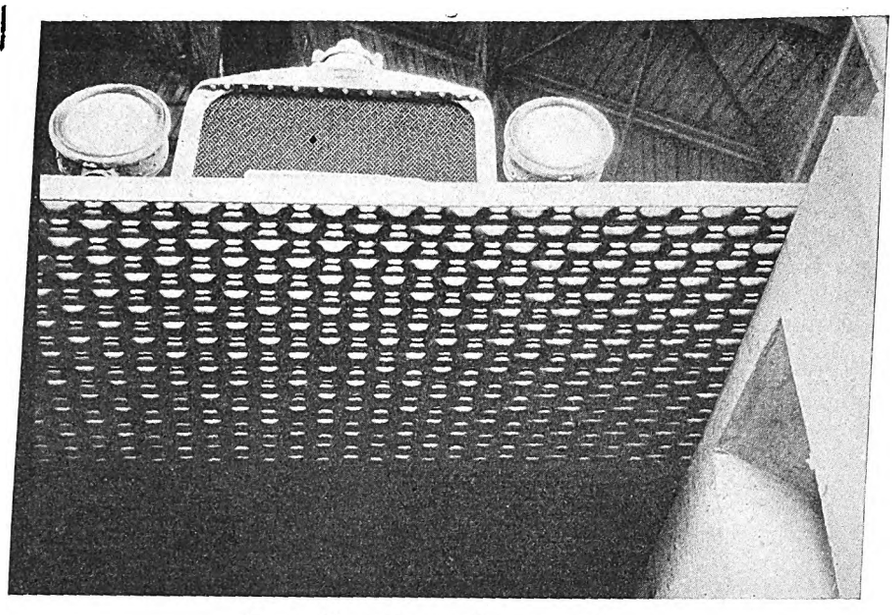
By C. B. Hall

Chief Clerk Virginia Electric & Power Company, Norfolk, Va.

A NEW type of pole rack recently adopted by the Line Department of the Virginia Electric & Power Company at Norfolk, Va., has resulted in a saving of approximately 50 per cent in time and labor. Poles, needed by linemen, can now be rolled off the racks onto pole wagons or line cars, instead of being hauled from a pile in the yard. Five of these special racks have been erected along the company's yard siding.

Poles 15 ft. long, or less, are placed in the ground at a depth of 6 ft. resting on a base of concrete. These supports are braced with 12 x 12 in. obsolete bridge timbers and old T-rail, and hold an assorted stock of poles ranging from 30 to 50 ft., each rack accommodating about 100 poles. The project, built entirely of discarded materials and by company employees at odd times, was completed at a cost of $200.

**Submitted in* Electric Railway Journal *Prize Contest.*



Removable gratings used to cover pits

Overhaul Pits Covered by Grating

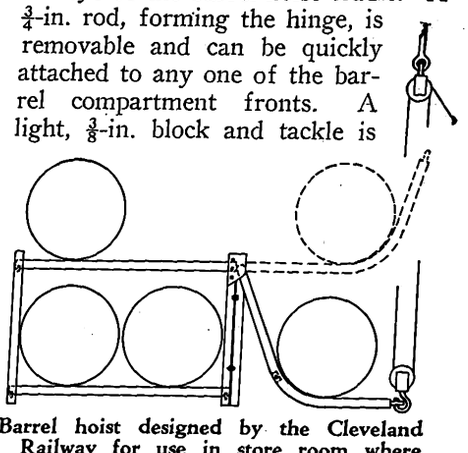
ALL pits in the shop of the Surface Transportation Company, New York City, bus subsidiary of the Third Avenue Railway, are covered by means of removable iron grating. This grating is made in sections 24 in. wide and 63½ in. long. Each section is composed of nineteen strips of $\frac{3}{16}$x1$\frac{1}{16}$-in. flat iron spaced 1½ in. centers and braced by strips of $\frac{1}{8}$x1$\frac{1}{16}$-in. flat iron zigzagged through the space and riveted to each $\frac{3}{16}$-in. strip. These sections can be removed readily to provide access to any part of the bus desired. This arrangement has been found very satisfactory and has prevented the men from accidentally falling into the pits.

Portable Barrel Hoist*

By F. W. Braund

Superintendent of Power Conversion Cleveland Railway, Cleveland, Ohio

A ONE-MAN barrel hoist has been installed by the Cleveland Railway for use in an oil room where transformer oil is stored on a double-deck rack, and where head room is insufficient to accommodate a portable crane. Eye bolts of ample size are anchored in the ceiling, mounted forward of the oil rack and directly over the eye of the barrel-hoist cradle. A ¾-in. rod, forming the hinge, is removable and can be quickly attached to any one of the barrel compartment fronts. A light, ⅜-in. block and tackle is used as the hoisting medium, swinging the barrel cradle slightly above center, thus allowing the barrel to roll without the help or guidance of workmen. With this equipment, full barrels of material can be hoisted and placed several tiers high on a rack.



Barrel hoist designed by the Cleveland Railway for use in store room where space is lacking for the operation of cranes

Improved appearance of the pole storage yard of the Virginia Electric & Power Company was obtained by the erection of racks

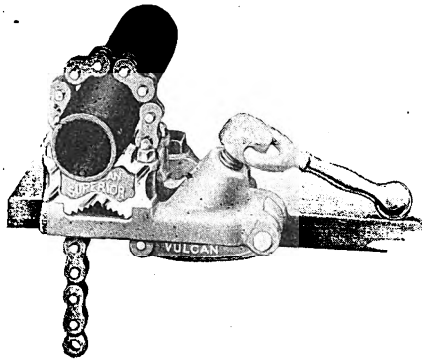
New Products

Convenient Chain Pipe Vise

THE new Vulcan Superior vise, recently placed on the market by J. H. Williamson Company, Buffalo, N. Y., has two outstanding advantages over previous models. The handle for adjustment is on top of the vise where it is easy to operate, while the jaws are reversible; i.e., when the teeth are worn the bolts



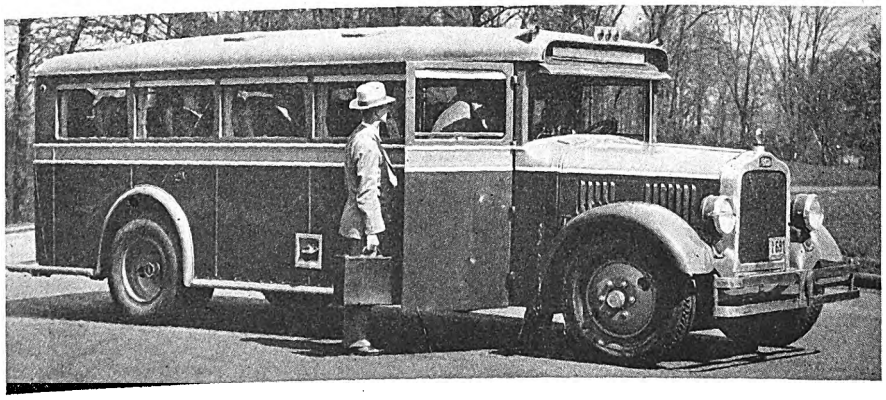
Chain pipe vise with reversible jaws has many advantages over previous models

have to be unscrewed and the jaws turned over. This feature prolongs the life of the vise considerably. In addition, the vise accommodates pipes which are $\frac{1}{2}$ in. larger than previous models could take care of. The vise is made from tough wrought steel, drop forged base, jaw, handle and chain arm. It is finished in chrome plate and furnished in two sizes for $\frac{1}{8}$ and $4\frac{1}{2}$-in. pipe.

White Designs 18-21-Passenger Bus

EXCEPTIONAL flexibility and safety under all operating conditions are claimed for a new bus recently put out by the White Company. The bus has four-wheel hydraulic brakes with Westinghouse vacuum servo to insure positive contact. The seating capacity in this six-cylinder bus, known as model 65, varies from 18 to 21 passengers. From the standpoint of the operator it meets the popular demand for a medium-sized vehicle. Much attention has been given to accessibility of parts, making inspection and maintenance unusually convenient and economical.

Numerous orders have already been received for the new model, including an order for five from the Union Pacific Railroad for carrying tourists to the National Park of southern Utah.



Medium size bus for intercity service recently put on the market by the White Company

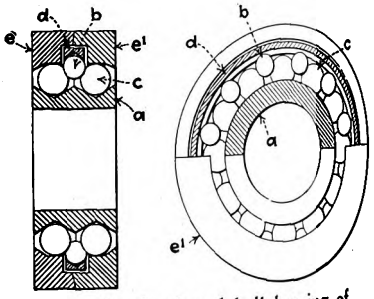
Buzzer for Electric Railway Cars and Buses

IN A NEW buzzer recently put on the market by the Consolidated Car Heating Company, the sound is transmitted to the moulded base which acts as a sound box, thus permitting the use of a totally enclosed cover which protects the mechanism from dust and moisture. Aside from its neat appearance, the construction is simple and rugged, and consists of a steel frame with a grounded coil, an armature and contact strip, Swedish blued spring steel, and tungsten contacts which are provided with a solid locking adjustment. The terminals are arranged for leads to enter from the back or from below, which reduces to a minimum the possibility of damage. The cover screws, terminals, and adjusting screw are all accessible from the front. The finish is in dull black. The buzzer is mounted vertically and is only $4\frac{3}{4}$ in. long, $2\frac{5}{8}$ in. wide and $1\frac{7}{8}$ in. high, with rounded ends. Usually one or two are installed in series with the standard fuse and resistance box for trolley voltage, or direct from any battery voltage, in which latter case the resistance box might be omitted.

Compact car buzzer recently brought out by the Consolidated Car Heating Company, Inc.

Bearing Has Three Rows of Balls

IN GERMANY a new type of ball bearing with three rows of balls has been put on the market recently. The main feature in this new bearing is that a third row of small balls is used instead of a ring between the two rows of bearing balls, serving solely to keep the larger balls in the two main rows from touching each other. The small balls, which are called distancing balls, are held in place by a grooved ring which revolves freely inside the body of the bearing. The construction of the bearing is shown in the accompanying illustration: "a" is the inner race having two grooves, one each for each row of bearing balls "c" and "c'."



Recently developed ball bearing of German design

The distancing balls are indicated by "b" while "d" is the ring holding them, and the outside race consists of two halves, "e" and "e'." The illustration shows that sliding friction is replaced by rolling friction.

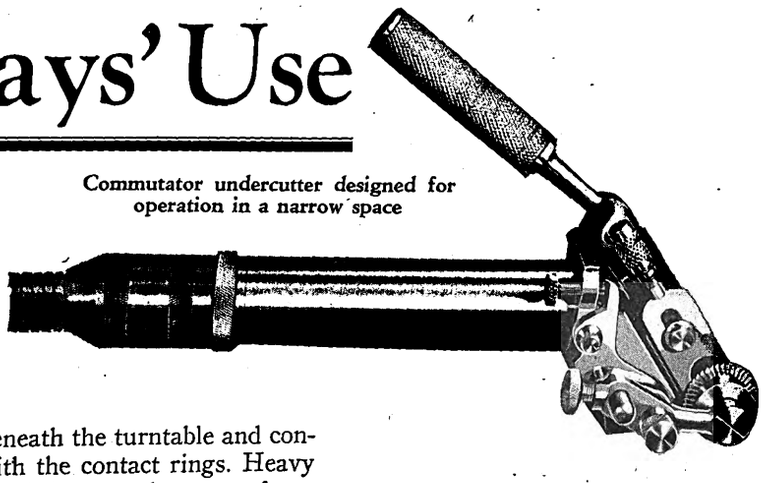
Products for the Railways' Use

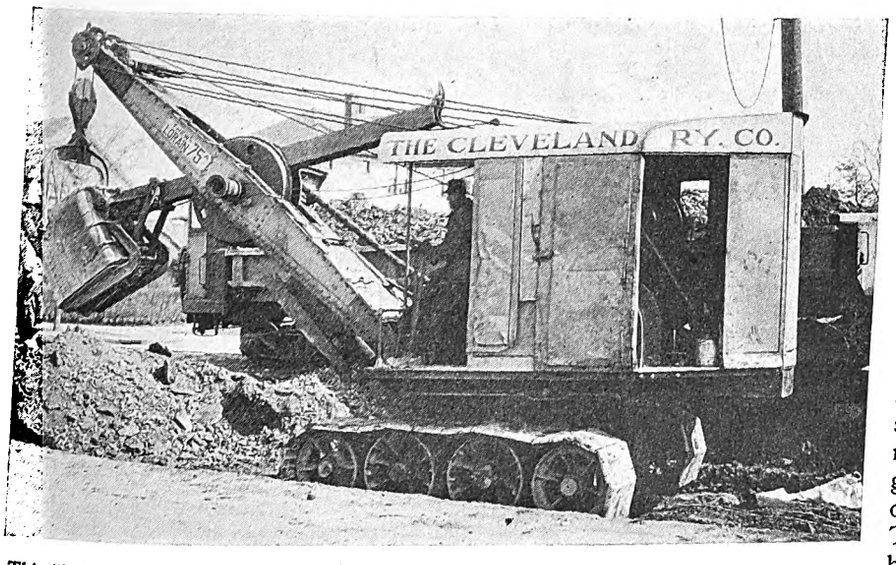


Commutator undercutter designed for operation in a narrow space

Bob-tailed Shovel Has Reduced Clearance

TWO electric shovels recently purchased by the Cleveland Railway are unusual because they have been "bobtailed" to reduce the clearance required. The standard tail-swing of 10 ft. 10 in. of the Lorain 75 has been reduced to 8 ft. 9½ in. Further reduction in clearance has been obtained by cutting off the left rear corner of the cab and rotating the platform on a diagonal, thus enabling the unit to swing further without fouling the adjacent track. In making these modifications, nothing has been radically changed on the crawler or superstructure, each of these retaining the Thew "center drive."

The new electric shovel is equipped with a 12-ft. or 14-ft. boom and a 10-ft. or 12-ft. stick, giving reduced swing and height clearances desirable for street railway work. The electric motor used is a 50-h.p. a.c. or d.c. unit furnished in a range of types suitable for any ordinary current. Control of the motor is by means of an automatic push button just to the right of the operator. Power for the motor is taken through the truck and delivered to substantial brass contact rings bolted to the steel crawler frame and thoroughly insulated from it. Power is then transmitted up to the turntable by means of brushes suspended beneath the turntable and contacting with the contact rings. Heavy leads in conduit carry the power from the brushes to the electric motor.



This "bobtailed" shovel gives additional clearance between shovel and passing street car when excavation is continued during regular operating hours

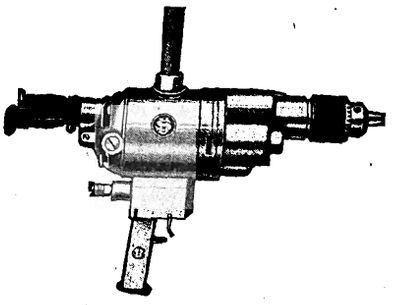
Compact Commutator Mica Drill for Heavy-Duty

A NEW undercutter manufactured by the Ideal Commutator Dresser Company, can operate in a space only 3½ in. wide, and, therefore, offers an advantage over the previous model, because its use does not necessitate dismantling brushes, brush boxes, brush rigging, etc., and because no time is lost in reassembling them before putting the motor back in service. This saves from one to three hours on every job, and this time can be spent in undercutting, instead of getting ready to undercut and to reassemble.

It is claimed that this new cutter will not heat, jump, or chatter. A set screw is available to lock the depth gage, while a micrometer adjusting screw will raise and lower this gage. The roller guide can also be raised or lowered by a micrometer screw to conform to size of cutter used. The distance from the saw to the roller guide is less than the width of the average small copper bar, and thus permits the guide to be used on the next slot, requiring but one slot to be cut by hand. Another feature of this undercutter is the depth gage adjacent to the saw so that the actual depth can be easily measured. It will not mar the copper but will give a bearing support.

Drill for Heavy Duty

FOR heavy duty a low speed, ¾-in. drill has been developed by the United States Electrical Tool Company, Cincinnati, Ohio. An alternating-current or direct-current universal motor of 60 cycles or less operates the drill at 400 r.p.m., load speed. It has S.K.F. ball bearings, special thrust bearings in chuck spindle, and extra heavy chrome nickel steel gears which run in a grease-tight case. The armature is double silk insulated and enameled. The body frame and commutator head are made in one piece of aluminum.



Heavy-duty drill has a two-pole trigger switch and a three-jaw screw back chuck which can hold straight shank drill bits

NEWS *of the Industry*

Governor Vetoes Missouri Enabling Act

Governor Caulfield of Missouri on June 25 vetoed the terminable permit bill passed by the recent Assembly and applicable only in St. Louis, Mo. The measure was recommended by the St. Louis Transportation Survey Commission, Mayor Miller, other city officials and leading civic and business organizations. It was supported by the St. Louis Public Service Company and the People's Motorbus Company. The opposition was led by the St. Louis *Post Dispatch*.

Governor Caulfield held that the measure was an evasion of the St. Louis charter, which restricts public utility franchises to a period of 50 years, and that it did not confer any additional powers on St. Louis, but authorized the Missouri Public Service Commission to grant permits or franchises for an indefinite length of time. The Governor said:

"I would sign this bill were I not convinced that it is an unnecessary and unwise evasion of the charter-making power of St. Louis. All other cities, and even St. Louis County, are excluded from its provisions. It confers upon the State Public Service Commission powers that it can only exercise as to St. Louis.

"It would seem that the bill was not passed upon its merits but upon assurance to the Legislature that St. Louis, and St. Louis only, wanted it. It is called an enabling act, but I do not find that it confers upon the city of St. Louis any power which it does not now have, except the power to enable the Public Service Commission to grant such utilities a 'terminable permit' or 'indeterminate franchise' for a longer period than fifty years. The city may include in a franchise granted by itself all of the features contemplated by the proposed law for contract ordinance precedent to the issue of the terminable permit."

The Governor also stated that the people of St. Louis alone should decide whether the city charter should be amended to grant the issuance of terminable permits or indeterminate franchises for a period in excess of 50 years. He pointed out that it is important the friendly relations between the people and public utilities be maintained.

Committee Awaits Seattle Mayor's Efforts

Plans of the Traffic Research Committee at Seattle, Wash., engaged in maturing a program for rapid transit, will be held in abeyance pending the result of Mayor Frank Edwards' effort to re-finance the municipal railway system. The committee is in sympathy with the Mayor's plan, and it does not wish to embarrass him by the injection of other plans while negotiations are pending looking toward the improvement of the present system. The committee found the physical and financial conditions of the system to be serious, and agreed that rehabilitation of the railway is the first necessary step. It is not enthusiastic over railway extensions unless the matter of what is to be done about them is first studied in connection with rapid transit needs.

Chicago to Hasten Draft of Settlement Franchise

According to the present plans, the Council's committee will lay out the fundamentals upon which the new ordinance looking toward unification in Chicago should be drawn. This plan will then be submitted to the attorneys for the companies, the citizens' committee and Attorney Fisher, who will be asked to work with lawyers representing the City Council in the actual writing of the draft under the authorization contained in the enabling legislation passed by the Legislature and signed by the Governor. When a skeleton draft has been completed the lawyers will be asked to submit it to the Council's committee. Then it is planned to hold extended public hearings on this draft, at which those who desire to present views on the ordinance will have an opportunity to do so.

Unification Recommended

San Francisco city engineer would bring private and municipal lines together under a five-cent fare with deficit met by taxpayers

CITY ENGINEER M. M. O'Shaughnessy of San Francisco, Cal., on June 5 submitted to the Board of Supervisors, through the Board of Public Works, his "Report on the Street Railway Requirements of San Francisco, with Special Consideration to the Unification of Existing Facilities," together with his valuation of the Market Street Railway properties. His report on the California Street Railway system was filed in December, 1928. The report on the transportation requirements is in a single volume of 400 pages, while the valuation of the Market Street Railway system occupies 7 volumes, approximating 3,500 pages, and the volume on the California Street system covers some 300 pages.

The preparation of the report required nine months' work on the part of a staff of experts and assistants under the direction of the city engineer. In a foreword to the report, Mr. O'Shaughnessy says:

"It is almost axiomatic that, from the standpoint of the riding public, the best service can be provided by a unified street railway system with universal transfers; also that, on a given wage scale, such a unified system, under a single management, can provide a given standard of service most economically.

"San Francisco, under mandate of the people, as expressed in our charter, is committed to the proposition of municipal ownership of its public utilities.

"The municipality, in the operation of its own railway, after due consideration and by proper legal procedure, has adopted a standard of wages for its railway employees. In this report, in the endeavor to evolve an operating plan, looking toward the continued maintenance of the 5-cent fare, no consideration has been given to the obvious possibility of a reduction of the wage scale, which has been considered as a fixed quantity.

"As a result of the studies made, it is obvious that even the unified system cannot be operated on the municipal wage scale on a 5-cent fare, nor can the private company maintain its tracks and equipment in a satisfactory operating condition and render a proper standard of service on a 5-cent fare.

"The recommendation to cover any deficit, in the operation of a combined municipal system, by a subsidy from taxes, is considered to be sound in principle, and not without precedent, as witness New York. A plan of this kind is believed to be far more desirable than an increase in the rate of fare."

The following recommendations are made in this report:

RECOMMENDATIONS TO PURCHASE

1. That a Public Utilities Commission be established for the purpose of administering the utilities of San Francisco, as is now being done in New York and Detroit.
2. That the city acquire by purchase the properties of the California Street Cable Railroad and the Market Street Railway at the most advantageous figure possible to be arrived at through the negotiations authorized by Ordinance No. 8125.
3. That the negotiations with the California Street Cable Railroad be on the basis of purchasing it on its earning value, namely, $604,463, as set up in my report on that company, and that negotiations with the Market Street Railway be held with a view to securing their property for $17,500,000.
4. That the properties of the Market Street Railway and the California Street Cable Railroad, if and when secured, be combined and operated with the Municipal Railway.
5. That the fare be retained at 5 cents with a universal transfer privilege.
6. That deficits resulting from the unified operation and retention of the 5-cent fare be met by additions to the tax rate.

Mr. O'Shaughnessy says that to carry out these recommendations, it will be necessary to reach an agreed price with the two companies and to submit to the electors a proposal to issue bonds to cover the cost of purchase of the two private systems, and provide sufficient money to cover all deferred maintenance and the additional facilities which have been recommended. Further bonds should be authorized to be sold from time to time, as the necessity arises, to meet the increased capital cost incident to rehabilitating the tracks of the

Digitized by Google

company. The amount of these bonds should be sufficient to allow an expenditure of approximately $500,000 annually for several years.

Operating Recommendations

The following additional recommendations are made, contingent on the acquisition and unification of the three roads, with the idea of securing the most economical, efficient, and satisfactory operation of the combined system.

1. That the rerouting plan set up in this report, with such modifications as developments may show to be necessary, be placed in effect.
2. That, in order to speed up the transportation in the downtown district during the rush hours, all parking of vehicles be prohibited between 7 a.m. and 10 a.m., and between 3 p.m. and 6 p.m., on the streets north of Howard Street, south of Bush Street, and east of Larkin Street, with extensions on Mission Street to 12th Street, Market Street to Valencia Street, McAllister Street, O'Farrell Street, Geary Street and Sutter Street to Van Ness Avenue.
3. That all licenses to operate jitney buses be withdrawn and their operation be prohibited.
4. That the practice of exchange of transfers between buses and street cars be discontinued.
5. That the railroad system be relieved of all costs of paving except those incidental to making track repairs and any additional cost of street paving occasioned by the presence of track.
6. That the skip-stop method of operation be placed in effect where street spacing permits.
7. That the United States Post Office Department be required to pay the transportation of its employees on duty now carried free.

In making his recommendations, the city engineer has given careful consideration to the possibility of acquiring the private roads piecemeal as their franchises expire, but has determined that such a procedure would be contrary to the best public interest, as it would inevitably lead to poor service and further deterioration of the properties remaining in the hands of the companies. Without the consent of the companies to a universal transfer system, many patrons would be forced to pay double fare.

In discussing the situation at hand, due to the expiring franchises of the Market Street Railway and the California Street Railroad, the city engineer points out that the time has now arrived when, through the expiration of these franchises, it becomes necessary for the city to make a definite decision and plan of action. The city should either carry out the charter mandate by taking over and operating the systems of the private companies or adopt a plan whereby the private organizations can continue to render the character of service necessary, keeping in mind the ultimate acquisition by the city. The city engineer's studies show that the Market Street Railway has already been compelled to defer track reconstruction to such an extent that $550,000 should be expended at this time to catch up this deferred maintenance. In addition a definite program of reconstruction should be carried out over a period of years.

The study of the Market Street Railway finances and its track condition makes it evident that on the basis of a 5-cent fare the private company cannot indefinitely maintain its tracks and equipment in condition to render satisfactory service, and that a continuation of the operation on the 5-cent fare under private ownership means that both the quality of the service and the condition of the property will deteriorate year by year.

A high standard of street railway service is essential to the continued growth and prosperity of San Francisco, and the city engineer points out that this high standard of service can best be rendered under a unified system, with universal transfers, and if the 5-cent fare is to be maintained, with the high standard of wages paid by the municipality, this can only be done through a contribution from taxes. This follows, of course, only if the present trend in street railway traffic continues, as it has for several years, distinctly downward.

The city engineer justifies this recommendation for contribution from taxes as being sound, in that it puts a portion of the burden of maintaining this high standard of service on the taxpayers whose properties and business are directly benefited by such service, instead of leaving the entire burden on the riding public.

Valuation of the Market Street Railway Properties

The city engineer finds the value of the Market Street properties as of June 30, 1928, on the reproduction cost basis, as $46,625,506, which, after making allowance for the depreciated condition of the properties, reduces it to $29,369,331. Certain of the company's properties would be eliminated if the city were to take them over. The value of the properties to be taken over on the reproduction cost less depreciation basis would be $27,997,344.

The market value of the outstanding securities of the Market Street Railway, based on the high price for the first three months of 1929, was $16,273,496, and the low price for the same period, $13,206,769.

The city engineer suggests that in his opinion a figure of $17,500,000 would be a fair price for the city to pay for the properties which it would desire to take over. In his report on the California Street Cable Railroad's properties, the city engineer found the reproduction cost of the entire properties to be $2,252,458, and after allowance for depreciation this figure was reduced to $1,097,404. After eliminating property which the city would not require, the reproduction cost less depreciation was reduced to $903,704. In this report the city engineer recommended a purchase price not to exceed $604,463 for the properties which the city desired to secure.

The city engineer has made a comprehensive survey and study of the traffic of the Market Street Railway lines. On the basis of the data secured, he has worked out a plan combining the Municipal Railway system, the Market Street Railway system, and the California Street Cable Railroad system into a single unified system involving a complete re-arrangement of routes and designed to give an excellent and improved service to all sections of the city. Such a plan will materially improve traffic conditions on Market Street and effect economies of operation, while improving the service. The number of lines operating on Market Street east of Sutter Street under this plan would be reduced from 20 to 13, and between 4th Street and Geary Street from 13 to 9, with corresponding reductions in other sections. The city engineer also points out additional necessary changes in routings which will further improve Market Street conditions if the transbay bridge is built.

Details of 53 proposed new routes are presented which show that it will be possible to operate service equivalent to or better than that now operated, with a reduction of between 3,500,000 and 4,000,000 car-miles per annum—approximately 10 per cent of the total car mileage now operated by the three systems. On the basis of the operating cost of the Municipal Railway system, $750,000 to $1,000,000 a year would be saved on this particular item on the unified system.

Tables show estimates of the financial results of municipal operation of the combined systems on the basis of continuing the 5-cent fare, and making allowance for the estimated loss of revenue occasioned by universal transfers. On the basis of these estimates, under the present municipal wage schedule, the unified system, with the proposed rerouting of cars, after providing adequately for depreciation of the properties, would indicate an operating deficit of $869,667 annually, as compared with an operating deficit of $1,623,648, if the present service were to be continued under the municipal wage scale. These deficits do not take into account interests and ultimate fixed charges. When the interest and fixed charges are added to the operating deficit, on the basis of the purchase price suggested by the city engineer, the gross deficit would be $2,741,867 annually. This figure would be reduced to $2,346,867 as the result of certain increases in revenue and decreased operating costs which would result if certain other of the city engineer's recommendations were put in effect. On the basis of an assessed valuation of $850,000,000, this latter figure would amount to 27.6 cents on the tax rate.

Changes in Southwestern Association's Plans

At a recent meeting, the governing body of the Southwestern Public Service Association, Dallas, Tex., made several changes in the constitution, so as to permit and encourage even greater cooperation in the future, than in the past, with the other associations with which the Southwestern is affiliated. Most important of these were provisions to waive separate Southwestern conventions and encourage attendance by the membership at suitable regional conventions of their craft; especially the Southwestern division, Natural Gas department, American Gas Association, Southwest Geographic division, and National Electric Light Association. Provision will be made, however, to have group or sectional meetings at such times and places as will be profitable for any of the groups or sections which constitute the association.

As for the past 35 years the Southwestern will represent the interests of the gas, the electric, the railway, and the telephone companies, in Texas and Louisiana. An advisory council, to consist of one representative from each of the member companies, is to convene from time to time to consider the general affairs and policies of the association, and elect an executive committee.

The officers and executive committee selected for 1929-1930 are:

President, Knox Lee, Southwestern Gas & Electric Company, Marshall, Tex.

First vice-president, chairman gas section, Frank L. Chase, Vice-president, Lone Star Gas Company, Dallas, Tex.

Second vice-president, chairman electric section, J. W. Carpenter, president, Texas Power & Light Company, Dallas.

Third vice-president, chairman railway section, W. B. Tuttle, president, San Antonio Public Service Company, San Antonio, Texas.

Other members of the Executive Committee are: George H. Carter, vice-president, Texas Utilities Company, Marlin, Texas; J. G. Holtzclaw, vice-president, Gulf States Utility Company, Beaumont, Texas; W. L. Prehn, general manager, Southwestern Bell Telephone Company, Dallas, Texas; treasurer, R. G. Soper, vice-president, Dallas Gas Company, Dallas, Texas; secretary, E. N. Willis, Dallas, Texas.

New Youngstown Grant

Service-at-cost continued under an arrangement designed to secure a liberal flow of capital for investment

JUNE 21 marked the date of operation by the Youngstown Municipal Railway, Youngstown, Ohio, under its new 25-year franchise passed by Council on May 22 and signed by the Mayor on May 25. Among the outstanding features of the grant are the following:

1. Continuance of service-at-cost arrangement in effect during past ten years.
2. A new provision regarding repairs in paved streets, under which the company is required to repair only such paving as may be damaged or disturbed on account of operation of cars or damaged or disturbed on account of necessary repairs to tracks, rails, or joints in the rails.
3. A provision regarding new paving or reconstruction of paving by which the company shall be assessed only that amount which represents the increased cost of paving foundation under its tracks in excess of what the cost would be to the city in paving in case there were no car tracks.
4. A provision that all expense of change in tracks, pole lines and paving necessitated by public improvements shall be borne by the city and paid by city.
5. The company is authorized to operate over all bridges and grade separation viaducts now owned or controlled by the city of Youngstown. In case of the construction or reconstruction of bridges over which the tracks of the company exist or may hereafter be laid, the company is to pay only for the tracks and appurtenances thereto and only such part of the cost of the bridge or viaduct as shall actually be occasioned by the construction of the track or tracks.
6. A provision that on and after Jan. 1, 1930, all expense in connection with the office of the Street Railroad Commissioner including salary of the commissioner and any employees of his office, shall be borne and paid by the city.
7. A provision that should the city suffer, aid, permit or foster competition in transportation except by such companies as are now operating under franchises heretofore granted by the city to such companies, individuals or partnerships as are now operating or may operate under present existing city ordinance, the city shall then lose control of the service and rate of fare provided for in this franchise and such loss of control shall continue so long as competition is permitted by the city.
8. Provision is made that the company shall be allowed to earn (after taxes and depreciation) 6 per cent on its present capital value, 7 per cent on all additions to capital, and one-half of any excess above such permitted return after $100,000 is accumulated in the surplus fund of the company.

The new franchise was prepared by a committee of fifteen of the most prominent citizens of Youngstown, appointed for the purpose by the City Council in May, 1928. The chairman of this committee was the president of the largest financial institution of the city and other members of the committee represented in an executive capacity other financial institutions, other large industrial concerns and other business interests of the city. The committee commenced to function actively in September, 1928. Public hearings were held.

Against Hasty Action on Pittsburgh Subway

George S. Davison, chairman of the City Transit Commission, at Pittsburgh, Pa., has asked delay on any action in the nature of a commitment on any subway plan at this time. It is pointed out that on June 25 the special election will take place on the metropolitan city question and that in the new charter plan consideration has been given to the district assessment plan of financing such improvements.

Mr. Davison regards it as desirable that the city get the proper start in the financing of subway construction, "by utilizing the special assessment method to help pay for its initial subway construction and thereby make less difficult the application of this plan to later subway projects."

Specifications Out for Lackawanna Electrification

Equipment specifications for the multiple-unit cars for use on the Lackawanna Railroad electrification out of Hoboken, N. J., are now in the hands of the manufacturers, and it is anticipated that bids will be received in the near future. Bids already are in for the catenary structure and the contracts may be awarded within the next month.

As noted previously, power contracts have been signed with the Public Service Electric & Gas Company, the Jersey Central Power & Light Company and the New Jersey Power & Light Company for supplying power for the entire electrification. The contact line will carry 3,000 volts direct current.

$10,000,000 Annual Parking Loss in St. Louis

Elimination of all parking in the downtown sections of St. Louis, Mo., is being considered by the Traffic Committee of the St. Louis Safety Council. Oliver T. Remmers, chairman of the committee, personally favors the elimination of parking, saying that the Council's contention is right that the streets were designed for the movement of traffic rather than for the storage of unused automobiles. It has been estimated that the parking of automobiles in downtown streets costs the city $10,000,000 annually through loss of business that otherwise could be obtained from tourists and other visitors.

Governor Comments on New Chicago Bills

Governor Emmerson of Illinois has signed the Chicago traction bills passed by both branches of the General Assembly. In going over the bills before they were signed by the Governor, attorneys discovered that House Bill 513, amending the cities and villages act, was faulty and so a Senate bill was substituted. The attorneys declared that the change in no way affected the group of bills approved.

The Governor issued a statement in part as follows:

On Dec. 6, last, Judge Wilkerson, before whom receivership proceedings are pending involving one of the surface lines companies, appointed a committee of prominent citizens to work out a definite plan of settlement upon which the city and the companies could agree. The bills now before me, with the exception of House Bills 515 and 737, are the result of the efforts of this committee.

The six agreed bills were submitted to the City Council for approval and were endorsed by practically a unanimous vote. They were agreed to by the companies and were brought to Springfield by the citizens' committee and the local transportation committee of the City Council.

The fullest opportunity was given in both branches for thorough consideration of all of these bills. They were passed in the House by upwards of 110 votes and in the Senate by 41 votes.

The measures are properly safeguarded by provisions that any ordinances drafted under them must be submitted to a vote of the people before becoming effective. The bills do not in themselves settle the traction question, and no settlement can be effected until the City Council has agreed upon the terms of settlement and the people, at a referendum, have approved the action of the Council.

For many years the ideal of those who have studied local transportation in Chicago has been unification of surface and rapid transit facilities, with subways in the congested areas, all operated on the basis of a unit fare with transfer privileges.

The citizens' committee and members of the City Council believe these bills give the city all the authority it needs to work out an adequate unification plan.

Under their terms the city has the power not only to determine the details of the plan of settlement, but also to regulate operation, rates and service, and the right of purchase by the city, should that be desired, is protected. In the arguments of those who request the vetoing of the bills no good reason has been offered for setting aside the judgment of the City Council and the two Houses of the General Assembly.

The terminable permit measure, one of those approved, applies to the entire state. Bills will be enacted July 1.

More Seven-Cent Schedules Rejected in New York

The New York Transit Commission on June 18 rejected as illegal the 7-cent fare schedules filed by the Eighth & Ninth Avenue Railways on July 16, 1928. The ground for the decision was the same as that given in rejecting the higher fare plea of the Drydock, East Broadway & Battery Company three weeks ago, namely, that the company had proceeded under the wrong section of the Public Service Commission law. The regulatory body made the point that the 5-cent fare under which the company operates in the city of New York was "contractual in nature" and could not, therefore, be altered by the commission. The opinion added that it was doubtful whether the company, even if granted a 7-cent rate, could meet the competition of the rapid transit lines and other surface lines along its routes.

Late News Briefs

Tulsa, Okla. — After crippling transportation facilities for two days, employees of the Oklahoma Union Railway returned to their positions on June 18. The differences between the company and employees were submitted to the State Board of Arbitration and Conciliation. The strike was the second transportation tie-up in the history of Tulsa. It resulted from a request for a 3-cent hourly wage increase by members of the local union, and for a seven-day vacation each year on full time. Wages now range from 45 to 55 cents an hour. The company has not earned operating expenses at any time since the present owners took over the property in 1923.

St. Louis, Mo.—The St. Louis Electric Terminal Railway has asked the Board of Public Service to secure the vacation of a 127-ft. section of Brooklyn Street in connection with the construction of its proposed elevated and subway line which will connect the McKinley Bridge with a new passenger-and-freight terminal at Twelfth Boulevard and Washington and Lucas Avenues. Property owners have signed a waiver of damages.

Seattle, Wash. — G. B. Avery, in charge of the municipal street railway, has ruled that trainmen must stand an inspection every three months, under the critical eyes of station masters. Full length mirrors and shoe-shining stands are to be installed in each carhouse, and conductors and motormen are to be supplied with snappy new badges and new gilt cap bands to replace the cap insignias now worn.

Louisville, Ky.—Harland Bartholomew has explained to Mayor Harrison and members of the City Planning and Zoning Commission a preliminary major street plan which he has prepared as the first phase of a comprehensive plan for Louisville. Mr. Bartholomew said that Louisville has 597 miles of streets and the plan adds 9 miles to this total and makes 140 miles of the city streets major thoroughfares which will accommodate from four to eight lines of traffic. The commission arranged for a committee of its members to make revisions and suggestions before it is adopted as a layout of the principal traffic streets for the city until 1980. On this committee is Frank H. Miller, vice-president of the Louisville Railway.

St. Louis, Mo.—*Transit News*, published by the St. Louis Public Service Company, has come out for the elimination of parking in streets occupied by street cars, especially in the congested districts. The railway's research department estimates that each automobile parked in the downtown streets occupies space valued at $5,000, and that the rental and tax value of this space is $375 a year. This does not take into consideration the tremendous economic loss caused by the delay to patrons of the railway by the unwarranted congestion caused by parked automobiles.

Canton, Ohio.—The Canton Street Car & Bus Company has been incorporated by A. C. Blinn, president of the Northern Ohio Power & Light Company, J. B. Young, his secretary, and Windall L. Willkie, chief counsel for the company, to furnish Canton with transportation by street car, all bus, or a combination of the two in accordance with plans matured previously, to which reference has been made before in the ELECTRIC RAILWAY JOURNAL.

Cuyahoga Falls, Ohio.—An agreement has been reached between the City Council and the Northern Ohio Power & Light Company whereby the street cars will be taken off Front Street and routed over Second Street, both north and south bound, for a period of 30 days beginning June 10. During the same period a crosstown bus service will be established from Cleveland Boulevard on Northampton Road over Northampton, Portage, Newberry, Tallmadge, High, and back over Portage to Northampton and Cleveland. The experiment is to be tried without committing either the city or company to any definite program as to the permanent discontinuance of car service on Front Street.

Joplin, Mo. — The Missouri Public Service Commission at Jefferson City on June 21 authorized the Southwest Missouri Railroad to charge in Joplin a cash adult street car fare of 8 cents with two tokens for 15 cents and 3 cents for children. This is an extension of the adult fares authorized by the commission in April, 1928, for a period of thirteen months.

Ballston Spa, N. Y.—The Public Service Commission on June 6 directed the Kaydeross Railroad to repair its railroad. The line is electrically operated, is 12 miles in length, extending from Ballston Spa to Nill Grove where it serves the two mills of the Kaydeross Paper Company and the Cotrell Paper Company. There are two passenger trains a day.

Indianapolis, Ind. — Public bequests of approximately $160,000,000 to be available in 2129 are made in the will of the late Will A. Latta, attorney for the Indianapolis Street Railway, filed for probate here on June 13. It provides for $50,000 to be kept intact for 200 years at compound interest.

Frankfort, Ky.—The possibility of the State of Kentucky developing a State Utilities Commission appears slim. At the last session of the Legislature a special committee was named to investigate and report on the needs of state regulation of the various public utilities. The chairman says that as representatives invited to discuss the matter had failed to put in an appearance, it would seem that there was not much demand for a utility commission or any reason to recommend establishment of a commission.

Flushing, N. Y.—Edward A. Roberts, manager of the New York & Queens County Railway, convinced that the "Orange Trolley" is the quick, convenient way to New York, recently distributed a little folder containing a homily on the utility of the route, a map of the district served and last, but not least, a complimentary ticket in the form of a stub "good for one continuous passage on June 21, 22 and 23, 1929, on inbound cars to New York only."

New York, N. Y.—An independent Socialist attack on the transit policy of the present administration in New York City has been launched by Louis Waldman, former Socialist candidate for Governor, who has addressed a letter to Mayor Walker in which he asks sixteen questions intended to clear up a situation that is "full of talk about transit and new subways and no results."

Dallas, Tex.—Residents of East Dallas have asked the City Commission to require the Dallas Railway & Terminal Company to extend the Junius Heights line to Greenville Road and Llano Street in accordance with Everman Plan No. 5. Opposition was registered to the plan to continue the present shuttle bus service in lieu of the extension of the line.

New York, N. Y.—The New York Transit Commission has ordered the Brooklyn-Manhattan Transit Corporation to expend $2,500,000 for new cars. Railway officials intimate they will comply with the order. The commission is considering the matter of seeking the appointment of a receiver to take charge of all revenues of the Interborough Rapid Transit Company in excess of the $6,335,000 annual profit guaranteed by the city on the company's lease of the city-owned subways.

Chicago, Ill.—The Woods electrification bill providing that all steam railroad terminals in Chicago shall be electrified before 1933, the cost to be met by sale or lease of air rights, was killed in the Illinois Senate, as that body prepared to adjourn for the summer.

Schenectady, N. Y. — *Riders' Guide* has been started by the Schenectady Railway in the form of a four-page leaflet 6½ in. deep by 3¼ in. wide. The first issue is dated June 15. It is intended to print messages as to company policy, schedules, service, safety and any other topics that may be of an informative nature. Students of the Junior High and High Schools of Schenectady and Scotia were asked to suggest names for the new publication and the name decided upon by the committee was suggested by Miss Agnes Svolos, who received an award of $10 from the company.

COMING MEETINGS

July 1-2—National Motor Bus Division, American Automobile Association, annual meeting, Hotel Lafayette, Buffalo, N. Y.

July 10-11—Regional Conference of New England Electric Railway Executives, Copley Plaza Hotel, Boston, Mass.

July 11—New York Railroad Club, annual outing, Travers Island, N. Y.

July 17 — Central Electric Traffic Association, Miami Hotel, Dayton, Ohio.

July 24-26—Electric Railway Association of Equipment Men, Southern Properties, Lafayette Hotel, Lexington, Ky.

July 26-27—Central Electric Railway Accountants' Association, Angola, Ind.

Aug. 15-16—Wisconsin Utilities Association, Transportation Section, Hotel Northland, Green Bay, Wis.

Aug. 27—National Association of Railroad and Utilities Commissioners, Glacier National Park, Mont.

***Sept. 28 - Oct. 4* — American Electric Railway Association, 48th annual convention and exhibit, Atlantic City Auditorium.**

Nov. 20-21—Association of Electric Railway Equipment Men, Middle Atlantic States, Richmond, Va.

Nov. 21-22—Public Utilities Association of Virginia, annual meeting, Chamberlain-Vanderbilt Hotel, Old Point Comfort, Va.

Recent Bus Developments

Uniform Specifications Discussed

Bus specifications as drawn up by the National Automobile Chamber of Commerce, *Bus Transportation*, the Connecticut Public Utilities Commission, the Society of Automotive Engineers, and the Motor Vehicle Conference Committee were discussed at the joint meeting held on June 20 and 21 in Washington, D. C. The purpose was to try to standardize the principal dimensions and equipment of buses. Although the desirability of this was recognized, several members of the code committee felt that standardization might impede the development of the bus.

The opinion was advanced that what might be considered a desirable feature today may easily prove to be old fashioned five years hence. At such time, a state commission inspecting a bus of improved design would not accept it because it would not conform to the regulations laid down five years previously. It was thought that enough leeway should be maintained in the specifications to allow the manufacturer to incorporate his new ideas in the bus, thus giving the operator the benefit of experience gained during past years and not retarding development by regulations.

One of the changes made in the proposed rules is that a maximum length of 40 ft. be allowed, but leaving a loop hole for state commissions to reduce this maximum length if considered desirable. This overall length is to be measured from bumper to bumper. Although a prolonged discussion took place concerning the desirability of including the sleeper buses in the code, it was thought that, due to insufficient experience, it would be inadvisable to do so.

Railways Protest Queens Bus Service

Supreme Court Justice Strong in Brooklyn reserved decision on June 26 on the application by the New York & Queens County Railway and the Steinway Railway for an injunction to restrain the Long Island Transportation Company from maintaining a bus service between Astoria and Elmhurst. At one point, Justice Strong in interposing his own opinion said he thought transportation service "could be improved." Justice Dike suspended operation of the buses recently pending the outcome of the litigation. The petitioning companies, maintain trolley lines in Queens. They contend that the defendant company is engaged in unfair competition. A. T. Davison, counsel for the railways, argued that the bus company also was operating without franchise or certificate of convenience and necessity.

Another Westchester Route Sanctioned

On June 25 the County Transportation Company, Inc., was granted a certificate of public convenience and necessity by the Public Service Commission to operate a bus line in the village of Mamaroneck, Westchester County, New York. The petition for the route was a result of the abandonment of the service of the New York & Stamford Railway in various cities and towns of Westchester County. Commissioner Van Namee pointed out that the granting of the certificate completes the chain necessary to allow continuous operation over routes in Westchester County formerly operated by the trolley line. It is a further move in the series referred to in ELECTRIC RAILWAY JOURNAL NEWS for June 22, page 82.

Co-operation in "Save-a-Life" Campaign

The People's Motorbus Company and the St. Louis Public Service Company cooperated in the "Save-a-Life" campaign in Missouri during June. One of the things they did was to have all of their buses and other automotive equipment inspected by the authorized service stations. The bus companies have found that a very large percentage of all accidents between their buses and other motor cars is due to the defective brakes or steering mechanism of the other cars.

Two Cases Before Illinois Commission

Two cases, both involving bus problems, are before the Illinois Commerce Commission. In one the Chicago Railways and the Chicago Motor Coach Company are involved, and in the other the Chicago & Joliet Electric Railway, the Illinois Traction System and the Tri-State Bus Company.

Some time ago the commission authorized the Chicago Railways to operate buses over certain streets, later rescinded the order, and then authorized the Chicago Motor Coach Company to operate buses. The railway filed suit in the Supreme Court, which holds that the commission arbitrarily exercised its authority when it granted the bus company a permit. It sent the case back to the commission with instructions that the railway be given a hearing.

A hearing in the other case was set for June 27. Some time ago, after 16 companies had been involved, the commission ordered the Chicago & Joliet to operate between Chicago and Joliet, the Alton Transportation Company, a bus line owned by the Chicago & Alton, from Joliet to Carlinville; and the Illinois Traction System between Carlinville and East St. Louis. When the Alton failed to operate, the commission issued an order to the Tri-State Bus Company to operate from Chicago to East St. Louis, whereupon the two electric railways again petitioned the commission.

More Buses for Eastern Massachusetts

Buses will be substituted for cars by the Eastern Massachusetts Street Railway on the Wakefield, Stoneham-Winchester route on July 7. The change has been timed to coincide with the rebuilding of streets constituting the through route from Wakefield to Stoneham, so that the rails may be removed before the roadwork is started by the state. The Wakefield-Stoneham line was opened 37 years ago next August as the beginning of a net work that for many years made Wakefield the electric railway center of northern Greater Boston.

Trucks Curbed That Bootleg Excursions

Competition of trucks insured to carry merchandise but which on Sundays and holidays run afoul the bus lines by carrying picnic and outing parties has been effectively stopped in Massachusetts under the compulsory automobile insurance law. Owners of trucks guilty of such violations face loss of registration and operators are arrested for driving trucks that are not properly insured. The extent of the use of trucks for service of this kind is surprising.

Millbury, Mass.—Town officials and officers of the Worcester Consolidated Street Railway are endeavoring to reach an agreement on the fare to be charged by the buses which are to supplant the trolleys early in July.

Dayton, Ohio.—The Dayton & Troy Electric Railway has asked the State Supreme Court to require the Utilities Commission to revoke the certificate of the Inter-City Coach Company on the ground of alleged improper practices.

Troy, N. Y.—Consent of the Public Service Commission to abandon certain portions of its lines in Troy was asked on June 20 by the United Traction Company. Officials of the company have voted to substitute buses, a certificate for the operation of which is also asked of the commission. A hearing on the petition will be held later.

Fitchburg, Mass.—The Fitchburg & Leominster Street Railway has asked the State Department of Public Utilities to restrict the Suburban Bus Lines Company, Inc., from operating in Fitchburg and Lunenburg. It is said that of late the bus line has been picking up and letting off passengers within the limits of Fitchburg and that it is running special trips to Whalom Park, operated by the railway, in direct competition with the railway. The bus company claims it has been serving Lunenburg more adequately than the railway did before it abandoned its route. The management said it would put a stop to the handling of local business in Fitchburg by its operators in contravention of the rights of the railway there.

Dover, N. J.—A portion of the Morris County bus line, route 72, operating between Newark, Morristown, Dover, and Netcong, has been extended by Public Service Co-ordinated Transport from Netcong to Budd Lake and Hackettstown. Over the route between Newark and Dover the Morris County Traction Company formerly operated, but the service of that company was replaced by buses of the Public Service some time ago.

St. Louis, Mo.—Eight windows were broken and a parked automobile damaged when the fan-belt of a bus of the St. Louis Public Service Company broke and threw parts of the broken blades on both sides of the street on June 16. Recently a similar mishap occurred to a bus of the People's Motorbus Company. Richard W. Meade, president of the People's company, said that the two cases in St. Louis were the first of the kind to his knowledge, although buses in his charge have traveled many million miles.

Financial and Corporate

Key System to Reorganize

Two distinct corporations may result from plans under consideration. Committee working out details

ANNOUNCEMENT has been made by A. J. Lundberg, president, Key System Transit Company, Oakland, Cal., that the company will default interest payments due on July 1, on its first mortgage, general and refunding mortgage bonds, and on notes of the Key System Securities Company. Mr. Lundberg admitted this is the initial step in a program of reorganization in which the company's capital structure will be changed and a new plan of operation followed, but stated he could not discuss details at this time.

The company has been able to pay interest by rigid operating economies, sale of non-operating properties and use of funds from its depreciation account and could have continued to meet its obligations in this manner for some time to come. However, the directors felt that serious deterioration of the property eventually would result from this process and, as the day of reckoning inevitably would arrive, decided upon action at the present time.

At a conference held on June 22 with members of the California Railroad Commission it is understood that Key System officials submitted a plan to separate into two distinct corporations, the System's East Bay street car division and its transbay ferry and interurban division. It is also understood that the commission asked for additional data on the company's plans, but pointed out that it could render no decision without a public hearing.

The transbay division has shown a 4½ per cent return on the investment, but the deficit of the street car division annually has been so high that it more than offset the profits from the ferry and interurban service. President Lundberg has stated that stockholders will not be asked to invest further capital in any branch of the company which is not able to show a return on the money invested, so it is thought probable that they will be asked to advance additional capital for the building up of the former division but will not be asked to sink any further capital in the latter.

With new money thus derived from stockholders and from the probable sale of valuable real estate which the company owns, together with advantages arising from changes in capital structure, it is pointed out that if the proposed segregation of the properties is permitted, the company taking over the transbay ferry division would be in a sound financial position. On the other hand, the condition of the street car division is so unsatisfactory that its ultimate fate is extremely doubtful. It is pointed out that on many occasions the railroad commission has urged that the Key System and Southern Pacific work out an agreement which would abolish present duplication of lines. This now may be accomplished. There are also rumors to the effect that the Southern Pacific or Western Pacific may buy the Ferry-Interurban system, and others that the Key System may abandon the street car lines.

Details for perfecting the plans for changes are in the hands of a committee of which C. O. G. Miller, president of the Pacific Lighting Corporation and chairman of the board of the Key System, is chairman.

Public Financing by Stone & Webster

Stone & Webster, Inc., will shortly add $57,500,000 of capital funds through public financing. The business will continue under the same management with added advantages of a substantial public ownership.

The present Massachusetts corporation will be dissolved and a Delaware corporation formed with the same name. The authorized capitalization of the new corporation will consist of 1,500,000 no-par shares of capital stock, of which 400,000 shares will shortly be offered at $100 a share. The present large stockholders are at the same time increasing their interest to the extent of $17,500,000, or 175,000 new shares. There will be outstanding altogether approximately 1,300,000 shares of stock. The management expects to list its shares in New York.

The board of directors will be enlarged to include W. Cameron Forbes, former governor general of the Philippines; Joseph P. Grace, chairman of W. R. Grace & Company; Herbert L. Pratt, chairman of Standard Oil Company of New York; Eliot Wadsworth, former assistant secretary of the Treasury; Albert H. Wiggin, chairman of Chase National Bank.

Wrongly Directed Municipal Ownership Efforts

Constant agitation for public ownership is a matter which receives substantial comment in the recent interim report of the committee on public service company securities of the Investment Bankers' Association approved by the board of governors at White Sulphur Springs. In the words of the report:

"There is never-ceasing propaganda for public ownership and operation and for the extension of the legal rights and jurisdiction of the municipal corporations. Many thoughtful people are lured by the idea of public ownership as a wise method of curbing disliked practices of private ownership."

The committee feels, however, that such efforts are wrongly directed, and despite examples of sporadic success, are based on misinformation and misconception of the inherent nature of the businesses attacked and of the nature of our government.

Chicago, Ill.—A committee consisting of George Woodruff, vice-chairman of the National Bank of the Republic, Joshua D'Esposito, chief engineer for the Union Station Company, and Col. A. A. Sprague, vice-chairman of the Citizens' Traction settlement committee, will be named by the city to pass on the valuation of the elevated lines under the proposed plan for unification.

City Controller Scores P.R.T.

Questions many items of expense in preliminary report on affairs of railway. Full audit promised later

CITY CONTROLLER HADLEY of Philadelphia on June 20 transmitted to City Council the preliminary report of the audit of the accounts of the Philadelphia Rapid Transit Company. The Controller demanded of Council a special investigating committee to look into the whole subject of P. R. T. expenses over the five-year period to June 30, 1928, covered by the audit. The Controller also transmitted a special report of Dr. Milo R. Maltbie, who is aiding him in the audit. The Controller promises a more definite and exhaustive report by Dr. Maltbie, but stated the audit could not be completed for at least three more months.

Fourteen leading points thus far developed by the audit demand special investigation, City Controller Hadley informed City Council, asking for a special councilmanic committee of inquiry to go into them. They have been summarized in part as follows:

1. Control of the majority of stock of the P. R. T. Company and how acquired by Mitten Management.

2. Payment of management fees of $6,551,347 to Mitten Management in addition to $19,108,538 paid to general officers of the P. R. T. Company for salaries and expenses of mmanagement as well as directors' fees amounting to $96,540.

3. Commitment of the P. R. T. Company to a 30-year lease for offices in the Mitten Building at a rental of $400,000 a year for the first ten years and $500,000 a year for the next twenty years, in addition to the payment of taxes, assessments, repairs, etc., for the entire building by the P. R. T. Company. The P. R. T. sublets to Mitten Management a portion of the building for an amount less than the cost of the P. R. T.

4. Payment of $25,000 for cancellation of lease covering a portion of the corner of the first floor of Mitten Building.

5. The purchase of the Yellow Cab Company at more than $500 a share for no par value stock.

6. The operation by the P. R. T .Company of the Quaker City Cab Company, notwithstanding the fact that the Public Service Commission has failed to approve the acquisition of the cab company.

7. The borrowing by Mitten Management of P. R. T. funds to the extent of $15,556,050, for which less than 3 per cent was paid to P. R. T. Company.

8. Payment to J. W. Braun of $621,794 and the purposes for which this money was used.

9. The question of gratuities, donations, subscriptions, etc., amounting during the auditing period to $53,125; expenses of the Co-operative Committeemen trip to Buffalo, $18,009; show at Buffalo—"Little Nellie Kelly," $13,411.

10. Loss resulting from sale of newspapers on street cars—$25,992.

11. Expenditures for legal services, including two or more individual payments of $50,000 each, which will appear in a subsequent report.

12. Damage claims settled with attorneys.

13. Services rendered by experts and fees paid for valuations made, and many other items of expenditure listed by Haskins & Sells.

14. The alleged practice of employing city officials and former city officials by the P. R. T. Company.

Des Moines System Sold

Walter J. Cummings and associates of Chicago purchase road in Iowa city under foreclosure

A SYNDICATE headed by Walter J. Cummings, Chicago, was the only bidder for the property of the Des Moines City Railway at the public auction held on June 22, at Des Moines, Ia.

E. J. Kelly, special master, who conducted the sale, has recommended to the federal district court that Mr. Cummings' bid of $1,855,000 be approved, and it is expected that Judge Martin J. Wade will give his approval just as soon as a sufficient time has elapsed to allow creditors to file possible objections.

Associated with Mr. Cummings in the purchase were Charles H. Wilcox, president of the General Steel Company, Chicago, and Charles G. Adsit, former vice-president of the Georgia Power Company, Atlanta, Ga.

The Des Moines City Railway had been in receivership since Nov. 12, 1926, when Federal District Judge Martin J. Wade granted the application of the Harris Trust & Savings Bank, Chicago, which filed a petition on Nov. 11, setting forth that the company was in default on the principal payment on $700,000 of debenture bonds. Clyde E. Herring, Des Moines business man, and F. C. Chambers, former manager of the railway, were named receivers.

After the receivers filed a report announcing that they had on hand $118,000 to pay indebtedness of $1,759,152, Judge Wade ordered the property sold.

Prior to the sale, Mr. Cummings announced that he had purchased the debenture bonds and notes held by the Harris interests, constituting the principal indebtedness of the company, outside of first mortgage bonds totaling $5,762,000.

The 103 miles of tracks, overhead, carhouses, automatic substations and rolling stock of the railway are valued at approximately $10,000,000.

Mr. Cummings made public plans for the immediate shipment of ten late model street cars to Des Moines, and announced service betterments which include more cross-town buses, and more bus feeders for the railway system.

The car strike which threatened over the famous two-man car contract signed between the union and the company back in 1915 appeared rather remote when Mr. Cummings pointed out that he is using nothing but two-man cars on his lines around Chicago, and that the ten new cars promised to Des Moines all require two-man operation.

Mr. Cummings purchased the car system without the inclusion of the two-man car agreement which was to run till 1940, but gave no indication that he will attempt to institute one-man car service in Des Moines. He also indicated he did not intend to alter the 10-cent single fare or the weekly pass which sells for $1.25 and is good for an unlimited number of rides for seven days.

Mr. Cummings is president of the Chicago & West Towns Railway, and president of the Cummings Car & Coach Company.

4,444 Exhibits in Trade Commission's Inquiry

Field accounting work has begun on two large operating subsidiaries of two important holding companies in connection with the investigation which the Federal Trade Commission is making of public utilities in pursuance of a Senate resolution.

Summaries are almost completed on the growth of capital assets and capital liabilities, on issuance and purchase of securities and on service fees for six holding and service companies.

Field work has been started on relations between utility companies and service organizations in the offices of four management groups, while the preparation of all information available on intercorporate relationships in general, is nearing completion.

The foregoing material will be used in preparation for public hearings on the financial phase of the utilities investigation.

The total number of exhibits introduced is now 4,444.

On June 27 it was announced the inquiry had been adjourned till September.

Conspectus of Indexes for June, 1929

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Detroit, Mich. — The United States government will seek to collect $300,000 from the Detroit United Railway, the predecessor of the present Eastern Michigan Railways, in respect of profit and income taxes for 1918 and 1920.

Tacoma, Wash.—According to Commissioner Ira S. Davison, gross receipts of the municipal belt line were $10,453 in April and net profit $2,063. This pulled the line out of the "red" for the year to date, and left a balance of $341 to its credit.

Indianapolis, Ind.—Merger plans contemplate that all the interurban properties owned and leased by the Terre Haute, Indianapolis & Eastern Traction Company shall be put into a corporation to be known as the Indiana Rapid Transit Company, neither the securities nor earnings of which will be guaranteed by the Indiana Electric Corporation, which would own all common stock. It is entirely probable that the Central Indiana Power Company properties and the light and power business of the railway will be consolidated in the main corporation, while the railways will be left on their own revenue-earning ability.

Oakland, Cal. — The Key System Transit Company has applied to the Railroad Commission for permission to abandon its street car line now operating between East Fourteenth Street and the plant of the Pacific Tank & Pipe Company in East Oakland.

St. Louis, Mo.—During April the number of revenue passengers hauled by the People's Motorbus Company increased 8.45 per cent compared with April, 1928, while revenue street and bus passengers of the St. Louis Public Service Company dropped 5.24 per cent.

Springfield, Mass.—Recent reports of the Springfield Street Railway show an appreciable decline in the number of passengers carried. The report for April, 1929, shows 2,924,343 revenue passengers, as against 2,951,664 in April, 1928. Transfer passengers were 379,575, as against 379,172 in April of last year. The company recently reiterated its adherence to the policy of replacing trolleys by buses in suburban service where economic condition warrant the charge.

Denver, Colo.—Group insurance aggregating $1,250,000 recently was taken out for its employees by the Denver Tramway. No employee less than nine months with the company is eligible to the $1,000 to $1,200 coverage. The average monthly premium is 60 cents per individual, the company defraying the remaining cost. The contracts were signed by 95 per cent of the men who are eligible.

Personal Items

C. E. Morgan With West Penn

Executive of Brooklyn City Railroad joins vast railway system radiating from Connellsville as vice-president

DYNASTIES, whether political or industrial, to be successful, must be directed by men of action. It is, of course, always interesting to inquire into the economic consequences of countries and corporations, but to the great majority of us Mussolini means more at the moment than does Italy and John D. Rockefeller means more than does Standard Oil. In contrasts of this kind in electric railroading Clinton E. Morgan means more at the moment than does the Brooklyn City Railroad. So this industry will pause at the news that Mr. Morgan, inseparately a part of the Brooklyn City Railroad since 1919,

C. E. Morgan

is to become vice-president of the West Penn Railways, Pittsburgh, Pa.

Mr. Morgan's work as doctor of the sick system of lines of the Brooklyn City Railroad has ended. He has done well with the job for which he was originally retained. He goes to Pittsburgh on the eve of the merger of the lines of the Brooklyn City with those of the surface lines of the Brooklyn-Manhattan Transit Corporation. Certainly, if he made no promises when he assumed the job in Brooklyn Mr. Morgan need make no excuses now.

Previous to October, 1919, the Brooklyn City Railroad was operated as part of the property of the Brooklyn Rapid Transit Company, the predecessor of the Brooklyn-Manhattan Transit Corporation. Mr. Morgan was placed in charge as assistant general manager, then served as general manager and latterly as vice-president and general manager. He came from the West with a long record of accomplishments and crowned his work with a record for rehabilitation and vigorous management in Brooklyn that has greatly enhanced his reputation.

Mr. Morgan began railroading as a clerk in the office of a steam railroad. For the next five years he acted as assistant to the president and other officers of the Indianapolis & Greenfield Electric Railway. In 1905 he had charge of the work of the rebuilding and operating the Indianapolis line, and was also superintendent of the Danville line of the Terre Haute, Indianapolis & Eastern Traction Company. Four years later he accepted the position of general manager of the Indianapolis, Crawfordsville & Western Traction Company. He resigned in 1912 to become connected with the Michigan Railway.

To say that Mr. Morgan has been active in the affairs of the American Electric Railway Association hardly characterizes his work properly. He has been more than active. He is a charter member of the Central Electric Railway Association and in the past has served as a member of the standardization committee on equipment in both the Central Electric Railway and the American Association. Also he was a member, and later chairman of both the schedule and time tables and the rules committees of the Transportation and Traffic Association. He also served on the block signal committee. Mr. Morgan now is the chairman of the committee on publications of the American Association and is the third vice-president of that body.

Ray P. Stevens Heads New Power Merger

Details of the merger offer by which J. P. Morgan & Company and F. L. Carlisle & Company hope to weld together a $565,000,000 power combine in upper New York State have been made public. Niagara-Hudson Power Corporation is the name of the new concern, and it has offered, by exchange of its shares, to acquire the Buffalo, Niagara & Eastern Power Corporation, the Northeastern Power Corporation and the Mohawk-Hudson Power Corporation, together with their many subsidiaries.

Floyd L. Carlisle is chairman of the board of directors; George H. Howard, president of the United Corporation, is chairman of the executive committee; Ray P. Stevens, former president of the Allied Power & Light Company, will be president.

The vice-presidents are Alfred H. Schoellkopf, vice-president and general manager of Buffalo, Niagara & Eastern, and E. L. West, also of the same concern.

H. L. Reichart Vice-President, New York State Railways

At the meeting of the directors of the New York State Railways following the recent change of control from E. L. Phillips and associates to that of the Associated Gas & Electric interests, Howard L. Reichart, secretary and treasurer of the New York State Railways, was elected a director and vice-president of the company.

Mr. Reichart has been connected with the New York State Railways since its incorporation, and was formerly associated with the late Horace D. Andrews when the latter was president of the New York State Railways and the Rochester Railway & Light Company with offices in New York City. Mr. Reichart went to Rochester when the general offices were moved there in 1918. He was appointed assistant secretary of the New York State Railways in 1913, and in April, 1925, he was elected secretary and treasurer of the company.

C. H. Dahl Heads Canadians

Assistant general manager at Winnipeg was elected president at recent Montreal meeting

C. H. DAHL, assistant general manager of the Winnipeg Electric Company, Winnipeg, Man., in charge of operation, was elected president of the Canadian Electric Railway Association at the recent meetng in Montreal. His work at Winnipeg covers the responsibility for the operation of the transportation service, the electric and the gas utilities.

The new president of the Canadians was educated in the public and the high schools of Marinette, Wis., the Normal School at Oshkosh, Wis., and the University of Wisconsin. From the last named institution he holds a B.A. degree.

Mr. Dahl taught school for seven years previous to his collegiate training. He joined the Wisconsin Railroad Commission in 1917 as case investigator, and held that position until November, 1919, when he became connected with the

C. H. Dahl

Winnipeg Electric Company as statistician. A statistician is in a position to take in the full measure of the operations of a company if he will, and this is just what Mr. Dahl did.

During his four years of almost silent work in that capacity he made himself one of the best informed men in the company's service, so that when in May, 1923, he was appointed assistant to the vice-president, Mr. Dahl, if he didn't know all about the company, knew a great deal. Incidentally, he had learned much about other Canadian utilities since statistics are the measure by which one company is compared with another in the matter of performance. In November, 1923, Mr. Dahl was appointed assistant to the operating manager, and from that post was advanced to assistant general manager in charge of operations. This was in December, 1924.

B. C. Cobb Heads Penn-Ohio Edison

B. C. Cobb has been elected president of the Penn-Ohio Edison Company to succeed R. P. Stevens, who resigned to become president of Niagara-Hudson Power Corporation. Other officers elected were T. A. Kenney, vice-president; H. G. Kessler, controller, and E. E. Nelson, secretary.

F. A. Merrick Westinghouse President

E. M. Herr, president since 1911, elected vice-chairman. Plans vacation after long intensive service. New president was formerly vice-president and general manager

F. A. MERRICK was elected president of the Westinghouse Electric & Manufacturing Company by the directors on June 26. In announcing the election A. W. Robertson, chairman, stated that directors, while accepting the resignation of E. M. Herr, president since 1911, in order that he might go on an extended vacation, had elected Mr. Herr vice-chairman.

Mr. Merrick advances to president from the position of vice-president and general manager. He is a native of New Jersey and received his technical education at Lehigh University. Shortly after his graduation, he was employed by the Steel Motors Company, a subsidiary of the Lorain Steel Company, where he was responsible for many important electrical inventions and where he held the position of manager and chief engineer.

On the acquisition of the Steel Motors Company by the Westinghouse Company, Mr. Merrick entered the Westinghouse organization. He was immediately selected to prepare plans for a plant in Canada, and, in 1903, upon the formation of the Canadian Westinghouse Company, Ltd., was sent to the Dominion as superintendent of the company. In turn he became manager of works and later vice-president and general manager of Canadian Westinghouse Company, Ltd.

In the World War emergency, Mr. Merrick was assigned to organize the operations of the New England Westinghouse Company, to manufacture rifles for the Russian government. When the United States entered the war, further demands were made upon the plant for American war material.

From $20,000,000 Sales to $200,000,000 Under Mr. Herr

The achievements of Mr. Merrick before, during, and following the World War won for him in January, 1925, the position of vice-president and general manager of the Westinghouse Electric & Manufacturing Company, with headquarters in East Pittsburgh, Pa. In June, 1925, he was also elected a director of the company. Mr. Merrick will make his headquarters in Pittsburgh.

During Mr. Herr's management, the Westinghouse Company grew from a business with $20,000,000 sales annually to one with an annual business of approximately $200,000,000. The period of his connection with the company dates from 1905 when he resigned from the Westinghouse Air Brake Company to become first vice-president of the electric company. When the Westinghouse Electric was forced into a receivership in 1907, Mr. Herr was appointed one of the receivers and also general manager. The reorganization was successfully completed within a little more than a year and Mr. Herr resumed his former position with the company. In 1911 he was elected president.

After he was graduated from the Sheffield Scientific School at Yale University in 1884 with the degree of Ph.B. Mr. Herr entered the office of the mechanical engineer of the Chicago, Burlington & Quincy Railroad at Aurora, Ill., as a mechanical draftsman and through successive promotions became engineer of tests, superintendent of telegraphs, and finally division superintendent of that road. In 1891 he became division master mechanic of the Chicago, Milwaukee & St. Paul Railroad. Two years later he accepted the position of general superintendent of the Grant Locomotive Works in Chicago and in 1894 became general manager of the Gibbs Electric Company of Milwaukee.

F. A. Merrick

In 1898 he was asked by George Westinghouse to accept the position of general manager of the Westinghouse Air Brake Company, located at Wilmerding, Pa. Mr. Herr remained with this company until 1905 when, as before mentioned, he was elected first vice-president of the Westinghouse Electric Company.

Despite the exacting demands made upon his time as an official of the Westinghouse Company, Mr. Herr retained his deep interest in educational matters. It was he, perhaps, who helped most to develop the educational system for the employees of the Westinghouse Company. In 1920 he was elected a member of Yale Corporation and later was appointed to the Prudential Committee, which is charged with all financial matters connected with that University. He was also made a member of the Corporation's committee on educational policy, on which committee he has assisted in formulating the educational policy of the university and particularly that of the Sheffield Scientific School. If Mr. Herr has a hobby, it is etchings. Greatly interested in the graphic arts, he has one of the finest collections of Cameron prints in the United States. Mr. Herr was born at Lancaster, Pa., on May 3, 1860.

E. M. Herr

William Orem, Promoted by Salt Lake & Utah

C. H. Simpson, district freight agent of the Salt Lake & Utah Railroad, Salt Lake City, Utah, has resigned to become affiliated with the Pacific Nash Motors Company, San Francisco. William Orem, general agent, will take over the duties of Mr. Simpson, who has been with the railroad for six years. H. J. Stagg, Provo, Utah, traveling freight and passenger agent, has been appointed commercial agent with headquarters at Salt Lake City, and J. J. Sutherland, agent at Provo, has been promoted to succeed Mr. Stagg.

Commissioner McCardle Reappointed in Indiana

Reappointment of John W. McCardle and the appointment of Jere West, Crawfordsville, Ind., as members of the Indiana Public Service Comission have been announced by Governor Harry G. Leslie. Mr. West will succeed Harvey Harmon, Princeton, as a democratic member of the commission. At a reorganization meeting Mr. McCardle was elected chairman to succeed Frank T. Singleton of Martinsville. Mr. McCardle's appointment marks the beginning of his thirteenth year as a member of the commission. He was chairman from 1921 to 1926. Mr. West retired from the Circuit Court at Crawfordsville on Jan. 1.

H. Hobart Porter Heads Music Publishing House

At the postponed annual meeting of the Oliver Ditson Company, music publishers, held in Boston, the directors elected H. Hobart Porter, well known in the utility field, president, to succeed Charles H. Ditson, recently deceased. Mr. Porter announced that he would continue the basic policies inaugurated by Oliver Ditson, when he founded the business in 1835.

W. S. Robertson has resigned from the post of president and general manager of the Minnesota Power & Light Company, Duluth, Minn., to become associated with the American & Foreign Power Company, a subsidiary of the Electric Bond & Share Company. He was president and general manager of the Duluth company for six years. It is expected that Mr. Robertson will go to China to take charge of the firm's interest in the Far East.

J. Fred Hull was sworn in June 4 as a member of the Missouri Public Service Commission. He has been appointed for a six-year term to end on April 15, 1935. He succeeds J. P. Painter. Until a few days ago Mr. Hull was postmaster for Maryville. Before that he was editor of a newspaper there.

"For the Love of Mike!"

Pittsburgh honors J. M. Loftis, who has done so much there in the interest of safety

AMERICANS tell the Chinese that their custom of putting food on an ancestor's grave is absurd because dead men cannot eat. The Chinese, in turn, ask the Americans why they put flowers on the graves of their departed since dead men cannot smell.

There can be no doubt that it is a fine thing to give bouquets to living friends. And that is exactly what the Pittsburgh trainmen did when they set aside the week of May 26-June 1, 1929, as "Safety Week" as a testimonial of their respect and admiration for J. M. Loftis, superintendent of transportation of the Pittsburgh Railways.

Quite appropriately, the slogan adopted for the campaign was, "For the Love of 'Mike,' be careful." During the campaign, which was sponsored by the company's bureau of accident prevention, all of the trainmen, as well as many employees from other departments of the company, wore lapel buttons bearing the photograph of Mr. Loftis, better known as "Mike."

J. M. Loftis

Mr. Loftis went to Pittsburgh forty years ago from Randolph County, West Virginia, at the age of 21. Since he had had about a year's experience as motorman and conductor at Wheeling, his first thought upon arriving in Pittsburgh was to connect with one of the local railways. Consequently, he applied for and secured a job with the Citizens' Traction Company, October 9, 1889, as laborer. A year later he was made night watchman and night receiver at the East Liberty Depot. After more than two years at this place, Mike asked for an outside job as gripman on the road so that he might work "on the outside." Several years later, when the Citizens' Traction Company was taken over by the Consolidated Traction Company, Mr. Loftis was made a motorman and for a period of one year operated out of the Homewood carhouse, as it was called at that time. Promotions followed in rapid succession for Mike after that.

In May, 1898, he was appointed inspector; in September, 1899, he was made division superintendent in charge of the Butler Street division; in May, 1904, he was again transferred to Homewood, this time as division superintendent; and in 1910 he was appointed superintendent of the entire system between the Allegheny and Monongahela Rivers except the Second Avenue lines.

In January, 1913, Mr. Loftis was promoted to the office of assistant to M. J. Maxwell, superintendent of transportation of the Pittsburgh Railways, and in July of the same year, following the death of Mr. Maxwell, he was appointed superintendent. From that time until the present, 16 years, Mr. Loftis has successfully carried out the duties of this office, and through the conscientious and faithful performance of his work, holds the high esteem of all who know him.

He has been a tireless and active worker for safety in the company ever since concentrated efforts in this direction were started by C. G. Rice, head of the company's claim department, twenty years ago.

C. J. Crampton Became Secretary of Dallas Commerce Chamber

C. J. Crampton, in charge of the public relations department of the Dallas Railway & Terminal Company, Dallas, Tex., has been elected executive secretary of the Dallas Chamber of Commerce. He assumed his new duties July 1. Mr. Crampton has been with the Dallas company for ten years. During this time he has done much to promote safety on the company's lines as well as to foster a closer personal relationship between the employees and the employers. In addition to being in charge of public relations he has been superintendent of the safety department of the railway, a department which he originated. He also founded *Partners,* the company weekly publication, an important organ which affords an outlet for opinions, suggestions and personal comment for the railway's employees. Mrs. Corita C. Owen, who has been secretary to Mr. Crampton, will continue as editor of *Partners.*

W. H. McCarty Heads Middle Atlantic Equipment Men

W. H. McCarty, elected president of the Middle Atlantic States Association of Railway Equipment Men recently, has been connected with the Capital Traction Company, Washington, D. C., and its predecessors since 1895. Since 1912 he has been master mechanic of the company and at present has charge of the maintenance of car, bus, and automotive equipment, in which work he has made a notable record.

Mr. McCarty went to the company at Washington unusually well-equipped in practical training since he had served a rigid apprenticeship with the American Bridge & Iron Company in the machine division. There he underwent the sturdy course of training in his profession which starts with a rat-tail file being placed in the hands of the apprentice and is concluded only after the novice has run the gamut of all the various kinds of work there is to do around the shop.

Not content, however, with this training, Mr. McCarty sought further experience and gained it as an employee of the locomotive shops of the Norfolk & Western Railroad at Roanoke, Va. Here again, this time for a period of two years, he had a hand in all the various classes of work that passed through the locomotive shops. It was from this service that he passed to the Washington & Georgetown Railroad and its successors, with which his career has carried him to eminence in the field of maintenance work and won respect for his opinion upon things mechanical not only in his own company but among his fellow craftsmen. This is well instanced, perhaps, by his notable association work as a member of the special committee No. 6 of the rolling stock division of the American Engineering Association, his many other association activities and in his very recent election to head the Middle Atlantic Association at the Wilmington meeting. Mr. McCarty is a native of Virginia.

W. H. McCarty

Dr. Philip Kremer, long connected with the street railway system in Berlin, Germany, latterly as assistant to the general manager, will on July 1 become manager of the street railway and bus system of Frankfort-on-Main. Dr. Kremer is known to many American electric railway men. He made an extended trip in this country last summer, so arranged that he attended the convention of the American Electric Railway Association in Cleveland.

Howard P. Savage, general manager of the Metropolitan Motor Coach Company (Marigold Lines) Chicago, Ill., has been appointed a colonel on the personal staff of Governor Louis L. Emmerson of Illinois. Mr. Savage is past national commander of the American Legion, and previous to becoming general manager of the Metropolitan system he was assistant general manager of the Chicago, North Shore & Milwaukee Railroad.

George I. Wright, engineer of electric traction of the Reading Railroad, with headquarters in the Reading Terminal, Philadelphia, Pa., has just returned from a six-weeks' trip to Europe. While abroad he visited nine countries, making a study of railroad electrifications in connection with the pending developments of the Reading.

William G. Marshall, since 1926 director of personnel for the Philadelphia Company and affiliated corporations, has been appointed assistant to Vice-president T. P. Gaylord of the Westinghouse Electric & Manufacturing Company. Mr. Marshall will be in charge of employees' relations, but no change is contemplated in the existing positions of director of personnel or manager of employees' service.

Transportation Engineering Department for G. E.

H. L. Andrews Named Engineer, W. B. Potter, Consulting Engineer, and A. H. Armstrong and W. J. Davis, Jr., Associate and Consulting Engineers

REORGANIZATION of the railway engineering department of the General Electric Company and its future designation as the transportation engineering department has been announced by E. W. Allen, vice-president of engineering. H. L. Andrews is named engineer of the department; W. B. Potter is appointed consulting engineer with A. H. Armstrong and W. J. Davis, Jr., as associates and consulting engineers. Included in and as divisions of the transportation engineering department will be the railway equipment, the air brake equipment, and the industrial locomotive engineering departments at the Erie, Pa., Works, and the automotive engineering department at the Lynn, Mass., River Works.

Mr. Andrews, engineer of the new department, was graduated from the University of Missouri in 1910 with the degree of B.S. in electrical engineering. In August of that year, he entered the testing department of the Schenectady Works of the General Electric Company and was made assistant head of the floor test the following year. In May, 1912, he was transferred to the railway motor department, and, in 1916, joined the railway engineering department. A year later he was placed in charge of car equipment. Late in 1925, he was appointed assistant engineer in administrative charge of the department.

W. B. Potter is a native of Connecticut. Upon leaving school he began service as a machinist apprentice with Sawtele & Judd, Hartford, Conn. Foreseeing the future of the electrical industry, he secured employment with the Thomson-Houston Company at Lynn, Mass., in June, 1887. He became interested in electric railways through reports of Frank J. Sprague's work and decided to follow electric railroading.

In connection with a study of electric railway equipment, in 1892, Mr. Potter conceived the series-parallel controller, since used almost universally in control for electric railway motors. Mr. Potter continued in the department with the absorption of the Thomson-Houston Company by General Electric and, in 1895, was made chief engineer.

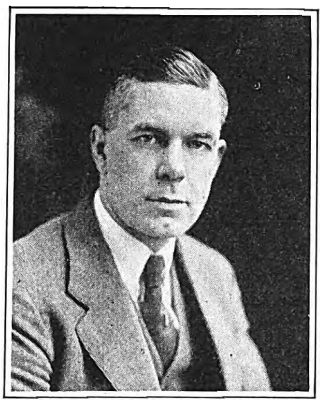
Among the projects which have engaged the attention of Mr. Potter were the Manhattan Elevated Railway, Baltimore & Ohio electrification, Paris-Orleans electrification, New York Central terminal electrification, West Jersey & Seashore Railroad and later, the Detroit Tunnel, Great Northern and Southern Pacific lines. Later, work such as that on the Butte, Anaconda & Pacific, Chicago, Milwaukee & St. Paul, and the Victorian Railways was carried out under his general supervision.

More than 130 patents have been issued to Mr. Potter for various inventions, including the series-parallel controller, the surface contact system, the three-wire system of railway operation, electro-pneumatically contact control system, and the otheograph. Other patents relate to electric switching, motors, generators, third rail, electric braking, air brakes, and various schemes of motor control.

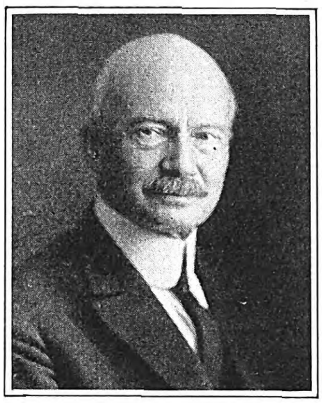
Albert Horace Armstrong was graduated from Worcester Polytechnic Institute in the engineering course in 1891 and entered the employ of the Thomson-Houston Company at Lynn in the same year. In 1897, he entered the railway engineering department and has since devoted most of his time to the study of railway problems. One of his most important earlier studies was that of train acceleration.

In addition to an extensive study of interurban and heavy traction work, Mr. Armstrong has taken part in the engineering study connected with various steam road electrifications. For many years he has held the position of assistant engineer of the railway engineering department, and chairman of the electrification committee of the company. He is the author of a section of the standard handbook on the subject of railways and also of numerous papers which have been delivered before various technical societies.

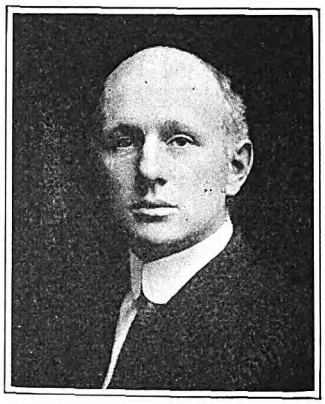
W. J. Davis, Jr., is a graduate of the Rose Polytechnic Institute. He began his work with the General Electric Company in the testing department upon graduation in 1892. After completing several of the regular tests, he was placed in charge of the calculating room of the testing department which was just then being organized. His next work was with W. B. Potter, who had then recently been made engineer of the railway department. In connection with his work on heavy electric traction, he introduced forced ventilation for railway motors and made an exhaustive pioneer study of the subject of train resistance. In February, 1921, he was transferred to railway engineering department in Schenectady.



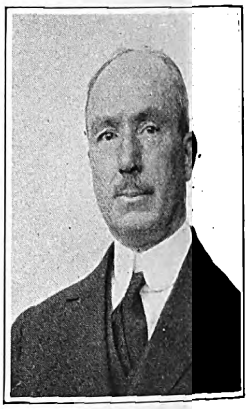
H. L. Andrews



W. B. Potter



A. H. Armstrong



W. J. Davis, Jr.

New Counsel for New York Board

Denis R. O'Brien has been named by the Board of Transportation of New York City as counsel to succeed William G. Fullen, who resigned in August and was later appointed to head the Transit Commission. Mr. O'Brien has been assistant corporation counsel, in charge of the contract bureau, since 1926. He has aided the Board of Transportation in the past few months in the preparation of city contracts for subway cars, power supply and signal equipment. As head of the contract bureau of the Corporation Counsel's office he has passed upon city construction contracts and handled contract litigation.

Edward F. Kelley, secretary of the Louisville Kiwanis Club and secretary to James P. Barnes, president of the Louisville Railway, Louisville, Ky., has been named chairman of the Secretaries' Conference of International Kiwanis Clubs. It is the first time in the history of the organization that the Kentucky-Tennessee Kiwanis district has received such an appointment. The post requires Mr. Kelley to preside over approximately 1,278 secretaries of Kiwanis Clubs.

Frank S. Peters, connected with the Kansas City Public Service Company, Kansas City, Mo., in various capacities since November, 1919, has become general superintendent of the Kansas City, Merriam & Shawnee Railroad. His first position with the Public Service Company was in the treasury department as a clerk. An experienced transportation man, Mr. Peters was soon transferred to that branch of the service. From the transportation department, Mr. Peters was transferred to the maintenance department and thence to the mechanical department, where he was advanced from a clerkship to the position of assistant to R. S. Neal, assistant superintendent of maintenance.

Sir Thomas White, elected to the board of directors of the Barcelona Traction, Light & Power Company, Ltd., at the annual meeting of shareholders, replaces E. R. Peacock, former president, who has retired from the board due to pressure of other business, brought about by the death of Lord Revelstoke, senior partner.

C. F. Mitchell, vice-president and controller of the Pittsburgh Railways, Pittsburgh, Pa., has been elected a director to fill a vacancy caused by the resignation of A. W. Robertson.

Walter H. Burke in Power Field in Northwest

Walter H. Burke has been elected president and general manager of the Minnesota Power & Light Company, Duluth, Minn. Mr. Burke went to Duluth three months ago from Houston, Tex., as assistant general manager of the local company. Since 1927 until he came to Duluth, Mr. Burke was Southwest district manager of Stone & Webster, with headquarters at Houston. He had been with the company for sixteen years when he resigned to go to Duluth.

For the first time during all his experience in the utility business Mr. Burke will not be confronted by the solution of transportation problems. This, of course, is merely a coincidence. From such problems he has never shrunk as his record of accomplishment with Stone & Webster, successful Coffin award contestant both in the light and power and the railway fields, indicates.

In addition to his post as president of the Minnesota Power & Light Company it is expected that Mr. Burke will be elected executive vice-president of the Superior Water, Light & Power Company in Wisconsin. Both of these companies are included in the system of the American Power & Light Company, under Electric Bond & Share Company supervision.

Mr. Burke was graduated from the University of Maine in 1906 as an electrical engineer, and after several student courses with large power concerns he joined the Stone & Webster firm, going first to Dallas and thence to Milwaukee. In 1914 he was assigned as assistant to the vice-president of the Stone & Webster at the executive offices in Boston, remaining there until 1923. He then served successively as director of the utility operations in Keokuk, Iowa, Houghton, Mich., and Fort Worth, Tex., after which he was appointed as Southwest manager at Houston, in charge of the properties in several states and Mexico. He was born in Portland, Me., in 1884.

J. H. McGraw Doctor of Commercial Science

The degree of Doctor of Commercial Science was bestowed upon James H. McGraw, chairman of the board of the McGraw-Hill Publishing Company, publisher of the ELECTRIC RAILWAY JOURNAL, by the New York University on June 12. Dr. George Alexander, president of the council of the university, in presenting Mr. McGraw, said:

"James Herbert McGraw, teacher, publisher of many technical periodicals, broad-minded and far-seeing man of business, is presented for the honorary degree of Doctor of Commercial Science."

William H. Nichols, acting chancellor of the university, in conferring the degree upon Mr. McGraw, said:

"Educator transformed into publisher, you have never ceased to be an educator. Your notable career accentuates that tendency in commercial life through which, however private its form, its operations have a public character and become an important element in public education.

"Wherefore, I welcome you to the degree of Doctor of Commercial Science, with all the rights and privileges thereunto appertaining, in evidence whereof you will receive this diploma, and be invested with the insignia appropriate to this degree."

Capt. Mark A. Smith, an engineering specialist in aerial and motor coach transportation, has joined the staff of Ford, Bacon & Davis, Inc. Captain Smith has been identified with the motor coach industry almost from its beginning. He was one of the first to approach the problems of design, production and distribution from the engineering standpoint. He has served as advisory transportation counsel to various state governments and has held many offices and has headed many committees in the Society of Automotive Engineers.

Miss Ella D. Troughton has been appointed assistant treasurer of the New York State Railways. Miss Troughton is only twenty-six years old. She went with the New York State Railways in 1921 from West High School in Rochester where she was an honor student in the business course. In the post of secretary to the secretary and treasurer, her natural ability soon evidenced itself and she was placed in charge of the office force in the secretary's office. Besides being appointed assistant treasurer of the New York State Railways, Miss Troughton has also been appointed assistant treasurer of the United Traction Company and the Schenectady Railway.

R. K. Brown, formerly superintendent and chief engineer, Salt Lake & Utah Railroad, is now superintendent of construction for the Utah Building Commission, recently created by the state legislature.

OBITUARY

Will H. Latta

Will H. Latta, attorney for the Indianapolis Street Railway, Indianapolis, Ind., was killed on June 12, when the auto in which he was driving alone was struck by a southbound Monon train near Carmel at a side road crossing.

Mr. Latta was to have been married on June 17 to Miss Margaret Sander. Fort Wayne, at the Little Church Around the Corner in New York, and had booked passage for a honeymoon trip to Europe on June 19. The Rev. H. C. Stoup, uncle of Miss Sander, and pastor of the church, was to have performed the ceremony.

Mr. Latta had made his home at the Claypool Hotel, Indianapolis, for several years. He was born on a farm near Ligonier. After being graduated from DePauw University, he married Miss Carrie Hunt, Coatesville, a student in the university. Mrs. Latta died in February, 1927. Following his graduation, Mr. Latta taught several years in the university, later entering the law office of Augustus Mason in Indianapolis. About 29 years ago he became associated with the legal staff of the railway. He had served as a member of the board of trustees of DePauw University.

Frederick R. Slater

Frederick R. Slater, vice-president in charge of public relations of the Queens Borough Gas & Electric Company, Far Rockaway, N. Y., died on May 4. At one time Mr. Slater served the Manhattan (Elevated) Railway, New York, as assistant engineer. This was during conversion of the lines from steam to electric operation. Later he became a member of the engineering staff constructing the New York subway and was made principal assistant engineer of the Interborough Rapid Transit Company. For about six years he was with the firm of Latey & Slater, consulting engineers in the design and installation of electric railway equipment. He was born in Washington, D. C., in 1872.

Charles Finigan

Charles Finigan, superintendent of the Westchester Electric Railroad, Mount Vernon and New Rochelle, N. Y., and the Westchester Street Transportation Company, Inc., died recently.

He began his railroad career in 1902 under his father, William Finigan, who was superintendent of the New York City Interurban Railroad, Mount Vernon. Shortly after his father's death, this company was operated by the Union Railway and later by the Westchester Electric Railroad. Mr. Finigan's first work was in the car shops; he also served as foreman in the overhead line department and as operator and starter in the transportation department. He was appointed superintendent of the Westchester Electric Railroad on Dec. 1, 1919, and of the Westchester Street Transportation Company, Inc., on Aug. 29, 1926, when that company became a part of the Third Avenue System.

James P. Boyden

James P. Boyden, since 1905 superintendent of wires for the Boston Elevated Railway, is dead. He entered the employ of the West End Street Railway as a rodman. A short time later he resigned and entered the office of Alixes H. French, civil engineer at Brookline then engaged in engineering work for the town as well as private practice. Subsequently he reentered the employ of the West End Street Railway, later leased to the Boston Elevated. While in the employ of the Elevated, Mr. Boyden has been in direct touch with every foot of underground conduit constructed on the system, and as superintendent of wires was in direct charge of the transmission and distribution system of the company. He was born in Walpole, Mass., 61 years ago. He was educated in the public schools there and at the local high school.

Henry M. Lane

Henry Marcus Lane, at one time head of the Lane & Bodley Company, Cincinnati, lost his life on May 15, in the Cleveland Clinic Hospital disaster. Among the achievements for which Mr. Lane was noted were the design and construction at Cincinnati, in 1885, of the Walnut Hills cable railroad, the first in Ohio, and the Vine Street cable railroad in that city in 1887. He also was noted as a designer of large Corliss engines, used in cable railway installations and in early electric generating stations. He also was consulting engineer for cable railroads in several other cities. Mr. Lane was 75 years old. He was graduated from the Massachusetts Institute of Technology in 1873.

John E. Eustis, a member of the Public Service Commission for the First District of New York, from 1907 to 1914, died on June 22. At the close of the Civil War he resumed his education, being graduated from Wesleyan University in 1874 with the degree of Bachelor of Science. In 1877 he received his law degree from the Dwight Law School, entering the legal profession as a member of the firm of Olin, Rives & Montgomery.

Industry Market and Trade News

Three Properties Order Standardized Cars

Recognition of the efforts of the car builders to produce standardized units is indicated by orders recently placed by three representative companies with the Osgood-Bradley Car Company, Worcester, Mass., for a total of 27 cars. Five cars will be delivered in August to the Altoona & Logan Valley Electric Railway, Altoona, Pa., while the Scranton Railway, Scranton, Pa., has ordered ten cars, and the Union Street Railway, New Bedford, Mass., has ordered twelve. The new cars, all of which are practically identical in design, differing only in certain minor features of trim and decorative effect, are of a type developed by the car builder's engineers with the view to combining pleasing appearance, balanced proportions, and easy riding qualities with rugged construction, light weight and features that would make for low operating and maintenance costs. A car of this type, built as a sample and distinguished by its designers with the trade name of "electromobile," was shown at the Cleveland convention last year, and was described in detail in ELECTRIC RAILWAY JOURNAL, issue of June 23, 1928.

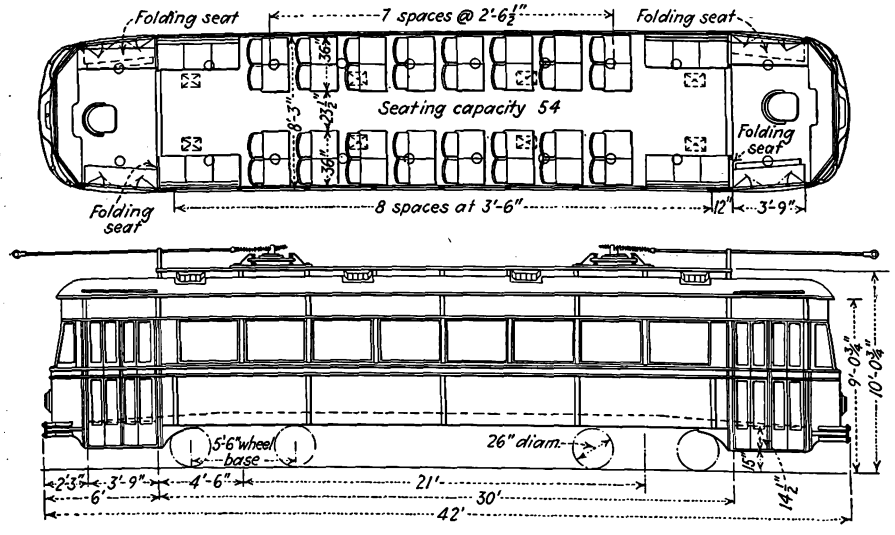
The cars are built for double-end operation but with controls arranged for one-man operation if so desired. In general appearance they follow conventional lines with straight sides, rounded ends, and low-arch roof, but with the motorman's window of the sloping, automotive type. Standard structural shapes have been used in the framing, and, while an effort has been made to keep the weight at a minimum consistent with adequate strength and ruggedness, together with a liberal margin for safety, no attempt has been made to achieve extreme light weight. It is estimated, however, that each car will not exceed 34,000 lb. in weight, completely equipped. Perhaps the most unusual departure from the conventional is the elimination of the customary foundation brake rigging and the use of automotive type of brake diaphragms at each wheel, an arrangement which is expected to produce better equalization, simplified brake rigging, and a reduction in weight. Otherwise the trucks, which are Osgood-Bradley type 45-46, present no unusual features.

All operating apparatus, including controller handle, brake valve handle, reset switch handle, sign box handle, windshield wiper and light switches are within easy reach of the seated operator. Equipment cabinets and switch and control devices are built into the vestibules and concealed, although readily accessible through doors and panels. An arrangement of signal lamps indicates to the operator whether doors are open or shut, and door control is interlocked with motor control, so that the car cannot be started until all doors are closed.

Special attention is given in the new cars to passenger comfort. The floor in the car body is finished with a composition, aisle width is 22 in., and wide vision windows of plate glass are provided, as well as adequate heating and ventilating devices. Sixteen reversible cross seats, eight on each side of the aisle, are of the full upholstered type of composition leather, with deep spring cushions and individual form-fitting backs. Stationary foot rests are provided and grab handles are built into the seat framing next to the aisles. A longitudinal seat is built into each corner, and the capacity can be further increased, so as to provide seats for a total of 54 passengers, by the use of folding seats for three passengers each, which are provided on each side of each vestibule.

Detail specifications of the five cars of this type supplied to the Altoona & Logan Valley Electric Railway are shown in the accompanying table.

Name of Railway	Altoona & Logan Valley Electric Railway
City and state	Altoona, Pa.
Number of units	5
Type of unit	One-man, motor, passenger, city, double-end, double-truck
Number of seats	54
Builder of carbody	Osgood-Bradley Car Company
City and state	Worcester, Mass.
Date of order	March, 1929
Date of delivery	August, 1929
Weight	34,000 lb.
Bolster centers	21 ft.
Length over all	42 ft. 6 in.
Length over body posts	30 ft.
Truck wheelbase	5 ft. 6 in.
Width over all	8 ft.
Height, rail to trolley base	11 ft. 6½ in.
Window post spacing	42 in.
Body	All steel
Roof	Arch
Doors	End
Air brakes	Westinghouse Traction Brake Company
Armature bearings	Plain
Axles	Heat-treated
Car signal system	Faraday
Compressors	D.H.-16
Conduit	Metal
Control	Safety Car Type K75
Destination signs	Hunter 226 RB
Door mechanism	National Pneumatic
Doors	Folding
Finish	Enamel
Floor covering	Duralastic
Gears and pinions	Tool steel
Glass (non-shatterable)	Front
Hand brakes	Peacock staffless
Hand straps	Elcon railing
Heaters	Consolidated Car Heating Company
Headlights	Crouse-Hinds, Golden Glow
Headlining	Agasote
Interior trim	Statuary finish
Journal bearings	Hyatt
Journal boxes	Hyatt
Lamp fixtures	Electric Service Supply
Motors	Westinghouse 510A, outside hung
Painting scheme	Orange, Pratt & Lambert
Roof material	Canvas covered
Safety car devices	St. Louis Safety Devices
Sash fixtures	O. M. Edwards Company
Seats	Heywood-Wakefield
Seat spacing	30½ in.
Seating material	"Cletan" leather
Slack adjusters	Osgood-Bradley
Steps	Stationary
Step treads	Kass
Trolley catchers	Earl
Trolley base	OB, form 4
Trolley wheels	Electric Materials Company
Trucks	Osgood-Bradley 45-46
Ventilators	Garland C-1 Junior
Wheels, steel	26 in. diameter
Wheelguards or fenders	H. B.
Special devices	C. S. spring bumpers



Floor plan and elevation of new car for Altoona & Logan Valley Electric Railway

Track Improvements in Progress

With the reconstruction of approximately 3,000 ft. of double track on Summer Ave. the Springfield Street Railway, Springfield, Mass., has just completed its biggest track job of the year. All-steel ties and 6 in. 100 lb. T-rail were used on this job, the total cost of which was about $43,000.

To meet the demands of a $500,000 roadway program now under way, the Memphis Street Railway, Memphis, Tenn., has purchased one differential motor car and trailer and one differential electric locomotive crane car. This equipment is to be manufactured by the Differential Steel Car Company.

More than 3,700 ft. of double track is being laid on Lincoln Way, Massillon, Ohio, by the Northern Ohio Power & Light Corporation. Specifications call for use of 100 lb. rail in concrete. The cost will exceed $100,000.

The Scranton Railway Company, Scranton, Pa., will expend more than $100,000 in a building and improvement program this year in the city and its suburbs. The work, which is mainly of a maintenance nature, calls for track and pavement reconstruction, new special work and the replacing of considerable 80 lb. rail with 100 lb. rail.

Illinois Terminal Railroad System will install some 20 miles of new 90 lb. rail at various points along its route.

Canadian Railways Buying Many New Cars

ORDERS for more than 260 new cars have recently been placed by electric railways in Canada, or are likely to be placed in the near future. One hundred and six street cars of the most modern type are being constructed by the Canadian Car & Foundry Company for the Montreal Tramways. The Toronto Transportation Commission has recommended to the board of control the purchase of 55 motor cars and 55 trailers. The Ottawa Car Manufacturing Company, Ltd., is building 21 cars for the Quebec Railway, Light & Power Company, seven for the Regina Municipal Railway, and five for the Saskatoon Municipal Railway, while the British Columbia Electric Railway of Vancouver, B. C., has announced that fifteen cars will be purchased as soon as certain franchise difficulties are adjusted.

Deliveries under the Montreal order are already under way and it is expected that practically all of the cars will be completed by the end of July. A few of the cars under the contract will be the one-man type, in order to provide additional equipment for lines on which cars of this type are now authorized, but the greater part of the order will be of the two-man type such as are now used on the most heavily traveled routes in that city. An unusual feature is the manner in which the new cars are to be heat insulated. Between roofs and ceilings and in wall panels hair felt is employed, while between the two wooden floors thick strips of cork are inserted. In addition to improving the heating facilities, this will lessen vibration and reduce noise. Thermostatic control of heating will be provided, to maintain an even temperature and obviate the possibility of seats becoming overheated.

Details regarding the new Toronto cars are not available at this time as the order has not been placed, but it is estimated that the total cost, including motors, will be about $1,750,000. Of the cars ordered by the Quebec Railway, Light & Power Company, six are of the interurban type of semi-steel construction, weighing complete about 85,000 lb., and fifteen are for city service, being of the single-end, two-man type, seating 35 passengers. The Regina and Saskatoon cars are also for city service, the former being of the one-man, single-end type, while the latter are of the one-man, double-end type. Like the Montreal cars they are to be heat insulated, with construction throughout incorporating many of the latest features making for passenger comfort and easy riding qualities. Details regarding the Regina, Quebec and Saskatoon cars, all of which are being built by the Ottawa Car Manufacturing Company, of Ottawa, Ont., are set forth in the accompanying tables.

SPECIFICATIONS FOR CARS RECENTLY ORDERED BY CANADIAN PROPERTIES

Name of Railway	Regina Municipal Railway	Saskatoon Municipal Railway	Quebec Ry., Lt. & Power Co.	Quebec Ry., Lt. & Power Co.

Electric Railways Add to Bus Fleets

Electric railway properties in various sections of the country continued to add to their bus fleets during the month, the majority of buses purchased being of the large capacity type and for city service. The Boston Elevated Railway has ordered nine 40-passenger buses from the Twin Coach Corporation, of which several have been delivered within the past week. When deliveries are completed the company will have 35 Twin Coaches in service, in addition to a number of other large capacity buses of the Versare and ACF types. All of the recent order are of the straight mechanical type.

Twenty-nine buses each with a seating capacity of 40 passengers have been purchased within the last thirty days by the Northern Ohio Power & Light Company, Akron, Ohio, from the Twin Coach Corporation. Twenty-five of the new buses, including six of the express type, will go into service on the Akron city lines, two express type buses will be placed in service between Dover and New Philadelphia to take the place of the local car service formerly operated between these cities, but which was recently discontinued, and two express buses will be kept in reserve. The cost of the new coaches exceeds $300,000, and when the order is completed the company will have 82 of these 40-passenger buses in operation, in addition to over 200 buses of other types and lesser capacity.

Twin Coach Corporation has delivered three buses of the parlor car type to the Southern Pacific Motor Transport Company for service out of Portland, Ore., four urban type buses to the Los Angeles Motor Coach Company, two urban type buses to the Tennessee Electric Power Company, at Chattanooga, and four of the urban type to the Detroit Motor Bus Company. The Detroit Company now has 24 buses of this type in its fleet.

The Wisconsin Power & Light Company, Janesville, Wis., has purchased seven 23-passenger Yellow Coaches for service on the Janesville city lines. The buses cost about $6,000 apiece.

The Pacific Northwest Traction Company, Seattle, Wash., has purchased two White buses of the 30-passenger type and four ACF buses of slightly larger capacity, all for intercity service. The body design of the new buses incorporates the raised observation compartment in an improved form, a feature originated on this property.

During the later part of May the first of the new super-service buses being built by the Public Service Co-ordinated Transport was turned out of the Newark shops. The new type of bus accommodates 32 passengers in seats of green leather with arm rests and extra high backs and headrest. Other equipment includes balloon tires, specially designed springs with an extra long wheelbase, and a heating and ventilating system of the blower type controlled from the instrument panel. Ninety-four bodies of this type will be constructed in the Newark shops for mounting on chassis supplied by the General Motors Truck Corporation. The buses will be used for long hauls in interstate and suburban service.

Citizens Transit Company, a subsidiary of Citizens' Traction Company, Oil City, Pa., has taken delivery of one ACF urban type coach.

The Southern Michigan Transportation Company, controlled by the Michigan Electric Railway, Jackson, Mich., has purchased five metropolitan type coaches and three parlor coaches from the ACF Motors Company.

Logan Valley Bus Company, subsidiary of the Altoona & Logan Valley Electric Railway, has received one ACF 23-passenger urban coach.

The Fonda, Johnstown and Gloversville Railroad, of Gloversville, N. Y., has accepted delivery of four Mack model AB four cylinder 25-passenger city type buses.

The Connecticut Company, New Haven, Conn., has accepted delivery of two Mack model AB 29-passenger city type buses.

The Denver Tramway Company, Denver, Col., has received two White model 54 six cylinder buses and one model 53 bus.

The Alabama Power Company has purchased a White Model 50B bus for service in Birmingham, Ala.

Eight 21-passenger Fitzjohn pay-enter grand coach bodies mounted on Reo GB 179 in. wheelbase chassis have been delivered to the Montreal Tramways, Montreal, Can.

Wheelguards to Replace Fenders on Seattle Cars

George B. Avery, superintendent of public utilities, Seattle, Wash., has obtained approval of the Board of Public Works for a plan to replace the present street car fenders with wheelguards. Six feet of space will be saved on every two cars in the crowded downtown business district at the peak of the day's rush hour, according to Mr. Avery.

Laconia Car Company, Laconia, N. H., through its directors, has decided to close the company's car building department and liquidate the assets incident to that part of its business. The closing of this department brings to an end a New England industry that has been in business for nearly 100 years.

American-LaFrance & Foamite Corporation, Utica, N. Y., has installed the fire fighting apparatus in the new municipal auditorium at Atlantic City.

Peter Smith Heater & Manufacturing Company, Detroit, Mich., has changed its name to Peter Smith Stamping Company, with the heating branch of the business operated under the name of Peter Smith Heater Company, a separate corporation.

General Electric Company, Schenectady, N. Y., has published bulletin GEA-991 descriptive of insulating material for railway and industrial-haulage apparatus.

Wagner Electric Corporation, St. Louis, Mo., has issued bulletin No. 162 on Wagner transformer oil, containing complete specifications as prepared for their own organization, but recently released for transformer buyers and users. The bulletin discusses the purposes of transformer oil, its properties, methods of testing, and precautions to take when handling and storing.

Perey Manufacturing Company, Inc., 101 Park Avenue, New York, has issued a folder describing the value of Perey turnstiles in preventing pilfering and "gate crashing" and in toning up the morale of an operating organization through removing the temptation to defraud.

International Steel Tie Company, Cleveland, Ohio, has published in pamphlet form the results of the recent Nielsen survey covering the use of steel twin ties on the property of the Kansas City Public Service Company.

Westinghouse Electric & Manufacturing Company has released circular No. 1834 entitled "Synchronous Visual Supervisory Control," describing the present types of Westinghouse supervisory control units, giving their application, advantages, and system of operation. The circular is illustrated with typical control equipment.

ELECTRIC RAILWAY MATERIAL PRICES—JUNE 29, 1929

Metals—New York

Copper, electrolytic, delivered, cents per lb.	18.
Lead, cents per lb.	7.00
Nickel, cents per lb., ingot	35.
Zinc, cents per lb.	6.725
Tin, Straits, cents per lb.	44.583
Aluminum, 98 to 99 per cent, cents per lb.	24.30
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	45.00
General service	31.50

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	$4.10
Somerset mine run, f.o.b. mines, net tons	1.80
Pittsburgh mine run, Pittsburgh, net tons	1.70
Franklin, Ill., screenings, Chicago	1.70
Central, Ill., screenings, Chicago	1.35
Kansas crushed mine run, Kansas City	2.25

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, 5/16 in. and larger, cents per lb.	2.80
Tie plates (flat type), cents per lb.	2.15
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.95
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	$2.70
Sheet iron (24 gage), cents per lb.	2.90
Sheet iron, galvanized (24 gage), cents per lb.	3.65
Galvanized barbed wire, cents per lb.	3.35
Galvanized wire, ordinary, cents per lb.	3.15

Waste—New York

Waste, wool, cents per lb.	13.
Waste, cotton (100 lb. bale), cents per lb.:	
White	12.5
Colored	9.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	11.1
White lead in oil (100 lb. keg), cents per lb.	13.2
Turpentine (bbl. lots), per gal.	$0.56
Putty, 100 lb. tins, cents per lb.	5.725

Wire—New York

Copper wire, cents per lb.	19.875
Rubber-covered wire, No. 14, per 1,000 ft.	6.85
Weatherproof wire base, cents per lb.	20.875

Paving Materials

Paving stone, granite, 5 in., f.o.b. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	$2.78
Paving brick 3½x8½x4, N. Y., per 1,000 in. carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd., delivered	3.25
Cement, Chicago consumers' net prices, without bags, f.o.b.	2.05
Gravel, ¾-in., cu.yd., delivered	3.25
Sand, cu.yd., delivered	2.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	13.75
Light copper, cents per lb.	12.00
Heavy yellow brass, cents per lb.	8.25
Zinc, old scrap, cents per lb.	3.25
Lead, cents per lb. (heavy)	5.00
Steel car axles, Chicago, net ton	$16.75
Cast iron car wheels, Chicago, gross ton	14.75
Rails (short), Chicago, gross ton	18.75
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.75

Consolidation of
Street Railway Journal and Electric Railway Review

CHARLES GORDON, *Editor*

Volume 73 New York, August, 1929 *Number 17*

Reviving the Will to Win

WHEN the will to win permeates an organization from top to bottom, victory is already half won. This truth has been recognized by military leaders from the time of Alexander the Great on down to the days of Pershing and Foch. Examples are not lacking to show that this axiom applies with equal force in the affairs of every day life.

A few years ago the spectacular achievements of electrical engineering were attracting much attention and many opportunities for improvement in the design of steam locomotives were being overlooked. Because of the wonderful progress of electricity, the morale of the mechanical engineers was relatively low. They were disheartened but they were not beaten. With grim determination they pushed the design of superheaters, automatic stokers, boosters and other devices that greatly increased the efficiency of the steam locomotive. Today steam and electricity are competing on a new basis. Continued progress will be made in electrification, but the day has apparently not arrived when the steam locomotive will be generally superseded by electricity on our trunk line railroads. Had not the steam locomotive designer challenged the advent of electricity with improvements previously undreamed of, the iron horse of the poets would today be definitely on the way out. It is greatly to the credit of these designers that the challenge of competition found them just starting to fight.

A close parallel to this can be found in the local transportation industry. Widespread public attention has been attracted by the spectacular development of the bus, while the street car has come to be regarded as a back number. Although bus service has actually replaced car service on only a very small part of the track mileage of the country, the contrast in appearance between old run-down cars and new up-to-date buses has created the impression that the day of the electric railway is passing. The attitude of the public has been contagious and many electric railway men themselves became discouraged—to say nothing of the builders of cars. Apparently sight was lost of the fact that attractive modern vehicles, comfortable, speedy and quiet can be built to run upon rails as well as upon rubber tires.

Of course, this is easier said than done. Difficulties are real and numerous in the way of improving the performance of street cars to the extent to which they must be improved if they are to survive. But these difficulties are not insurmountable. Evidence of a reviving confidence in the future of the electric railway is quite apparent. So also is the evidence that the field for the motor bus is far broader than that anticipated for it during its early days, and that replacement of unprofitable rail mileage is a secondary rather than a primary field for the automotive vehicle. When the problems facing the industry are attacked in a spirit of confidence, apparent difficulties may be expected to give way before courage and determination. Here again, the will to win is half the battle.

Legislation Needed to Check Cut-Rate Taxicabs

THOUGH taxicabs offer a type of transportation service closely approximating that of a private automobile, the extensive promotion of flat and cut-rate taxicab operations in the past two years has lowered the standard of this industry, much to the regret of the legitimate cab companies, which are striving to maintain this vehicle in its proper place. Wherever cut-rate taxis have started up, price wars have followed, resulting in some instances in an increased volume of taxi riding but with losses to all established transportation agencies giving local service. The experiences have proved that semi-private vehicles cannot be operated permanently at rates of fare comparable to those charged by mass transportation vehicles, and that the whole set-up is economically unsound. But in spite of the many failures under cut rates and the agitation against this kind of operation these operators have continued to expand until at the present time they exist in approximately sixteen large cities and 122 smaller cities throughout the country.

Legitimate taxicab companies have been the principal sufferers from this evil, but the electric railways also have been affected, in some cases rather seriously. In line with their objective of carrying a large number of riders at a small fare the cut-rate cabs have really turned "jitney," paralleling the street car lines and picking up their passengers. The cab rates in some cities actually are lower, when four people ride, than are those of the street car. Naturally the cut-rate cabs collect much revenue that properly belongs to the railways.

It is the opinion of H. A. Innes-Brown, editor of *Taxi Weekly,* who spoke on this subject at the recent C.E.R.A. meeting and whose paper is abstracted elsewhere in this issue, that the only solution to the problem is to secure protective legislation. Moreover, to be really protective this legislation should be sought by the street car companies as well as the legitimate taxicab companies. Local council ordinances ruled out the jitneys in most cities but only after the jitneys had seriously harmed the railways. Similar legislation, as suggested by Mr. Brown, is just as necessary at the present time to check this second jitney peril.

It is always unfortunate when transportation agencies leave their own proper field in search of business that really does not belong to them. The net result usually is a lowering of their standard of service and a reduction in revenue for the other agencies with no increase in their own net income. Cities in which cut-rate cab companies are now operating will suffer from impaired service

Digitized by Google

from both the legitimate taxicab companies and the electric railways in the long run if they do not take steps to end this disastrous attempt to sell transportation for less than it costs.

Complete Analysis Proves Value of Equipment Replacement

PERHAPS the most complete record ever compiled of the results obtainable through the replacement of obsolete, heavy rolling stock by light equipment of more modern design, is published elsewhere in this issue in an article by F. W. Bacon, vice-president International Utilities Company. The results are of particular interest and significance because they represent a complete historical record giving a comparison of income and expense for old and new equipment on a combined interurban and city system, on which a complete replacement of all existing rolling stock was made.

Nor are these the only considerations that commend these tabulations to the earnest attention of the entire industry. Second only in importance to the completeness of the record, is the fact that this whole analysis deals with exactly the type of property that has been the subject of the most serious question in discussions regarding the future of electric railway operations. The city lines of the Kentucky Traction & Terminal Company are located in a community which even in the "booster" figures of the Chamber of Commerce is credited with a population of only 60,000. The interurban lines are of the type which radiate from this comparatively small city, into surrounding rural territory.

Moreover, the economies usually available in a change from two-man to one-man operation do not enter into the results on this small city property, for the change to one-man operation had been made a number of years before new equipment was purchased, and all figures, both for the five-year period with old equipment and for the five years with the new cars, are based upon one-man operation. Finally, it is worthy of special note that the old cars which were replaced were not the heavy double-truck units so commonly in use, but were single-truck cars weighing only 26,350 lb. In the light of these significant facts, therefore, Mr. Bacon's article seems to justify careful study by every operating executive who is giving attention to the possibility of equipment improvements.

Earning Power as a Basis of Security

SIGHT should not be lost of the nice financial point made in the decision rendered recently by Supreme Court Justice Rodenbach, in which he authorized the New York State Railways to abandon the Rochester and Sodus Bay line and parts of lines in Syracuse, Utica and Sherrill. The question involved was the substitution of property under the terms of a mortgage given to secure an issue of bonds. For the bondholders, the Security Trust Company of Rochester questioned the right of the railway to discontinue the lines. It wanted to be sure that the letter of the mortgage under which it acted in behalf of the bondholders would be met under the changes proposed.

The mortgage agreement did not directly mention abandonment of any part of the system, but Justice Rodenbach pointed out that there could be no question that discontinuance of useless and unprofitable lines was to be expected. In his opinion, the use of the property would be clogged to an unnecessary extent by forcing maintenance of the lines it was intended to abandon. In this particular case he felt the bondholders were safeguarded since the public authorities had recognized the changed conditions and had readjusted fares to meet the change.

Even more important than that was the opinion of the court to the effect that holders of bonds secured by mortgage on physical property were required to co-operate in the readjustment to the new conditions. This was not intended as a rebuke to the trustee. It was the kind of an expression of opinion the trustees desired, restricted as they had been under the terms of the indenture securing the bonds. Of course, there will be salvage from the sale of the abandoned railway lines. From this source officials of the New York State Railways hope to realize $70,000, and they have signified their willingness to turn this amount over to the trustees, together with stock in seven allied bus lines which the railway will control.

As pointed out briefly in ELECTRIC RAILWAY JOURNAL NEWS for June 22, this case serves to emphasize again the fact that it is not so much the actual property back of their bonds to which the bondholders may look, but rather to the earning capacity of that property. It was an interesting issue upon which the court passed—interesting from both the practical and the academic points of view.

Developing Men as Well as Machinery

MEN and machinery! These two things terseiy sum up the whole of the transportation industry and of its problems as well. What thought and effort have been devoted to the machinery! What fortunes have been spent on research and improvement, more research and more improvement! Today street cars run almost unbelievable distances without a failure, dwarfing the records of the much-advertised endurance fliers and commercial automobiles. Substations run automatically, almost without the touch of a human hand. Track has been improved time after time and become better and better, as the result of the expenditure of millions of dollars in research.

But human research has lagged. Employees have offered themselves, or the personnel department has gone outside the gates and hired them, never expecting to find the perfect man to match the perfect machine. In a measure this is right, for of course the perfect man does not exist. But after the man is hired, even if he is the best we can get, he is also as good as he can be made?

In isolated spots careful selection of employees along the well-established principles of psychology has brought a better grade of men, better suited to take up transportation work. Nearly all companies have realized the necessity of a brief period of training to adjust the raw material to the new and unfamiliar tasks. But almost always the training has stopped at this point and has failed to carry on educational and developmental work to broaden the employee, intensify his interest in his job, and fit him into the scheme of the industry so rationally that he knows he is part and parcel of it. Many have followed the maxim: "To educate a nigger is to spoil a good mule driver," and that to initiate a motorman or conductor into the problems of the company he works for is to unsettle him, make him dissatisfied and make him feel too good for his job.

Not all men react alike to education and training.

Digitized by Google

But with proper selection at the time of hiring, no fear need be entertained as to the effect of future instruction and education. The employees need to know the business because they are the salesmen of the service. So far as 99 per cent of the customers are concerned, these men are the only representatives that they ever know or even see. Like it or not, they discuss the affairs of the company together. Why not have them well informed, accurately informed, painstakingly informed, so that they may present our business to our customers as we would do it ourselves were we to meet them?

After all, the success of this industry is particularly dependent on the performance of its men. One side supplies the capital or the management, or perhaps both; the other makes the direct contact with the public. One side supplies the machinery and the vision; the other gives the man power without which they would be useless. Men and machinery. Machinery and men. And the one must be developed as well as the other.

Drivers of Hard Bargains May Suffer Most

IT SEEMS incredible that ideas should persist in the matter of franchise grants that have been unsound for more than a quarter of a century. But such ideas do persist among the representatives of the public chosen to office. This is particularly true in cities of moderate size, in several of which grants are now under negotiation. It is not so much the radical who would drive a hard bargain, but rather the small business man, the very man who ought to know better.

Instead of looking at the situation as a business proposition, deciding the amount and character of service best designed to meet the requirements of the community and then making terms that will enable the company to give that service, the process too often is reversed. There is little in the proceedings of the modern business concept that both parties should gain from a contract. The principle that there is a mutuality of interest between the negotiators in a franchise hearing, rather than the idea of barter and trade, needs constant reiteration. There is no such thing as a low franchise bid. The trials and tribulations of the past with railway receiverships prove that no organization can continue indefinitely to render service at a loss. Service tends unmistakably to seek the level of the liberality or lack of liberality of the franchise itself.

Change Needed in Concept of Utility Regulation

RECENT developments in the power industry have focused public attention to an unusual extent upon the subject of utility regulation. Much of the discussion which has been heard sounds like an echo from the dark ages, when the object of regulation was restrictive and punitive, rather than constructive. Many of the self-appointed guardians of the public welfare seem to feel that because private interests are making attractive profit the public is being gouged. Henry Ford, in a recent interview in the *Electrical World,* disputes that assumption. He insists upon the modern conception of business fair dealing, that the reward for initiative and enterprise is a secondary consideration, provided that both parties profit from the transaction.

With the local transportation industry, the problem is different but not less important. Power is a vital and necessary service, but so also is transportation. Although the public has much at stake, its attention is more difficult to attract because the problem is one of relieving the industry in difficulty in contrast with that of controlling one which is expanding rapidly. Nevertheless it is apparent that the public is the greatest sufferer through the inability of community transportation facilities—under the conditions imposed—to keep pace with growing community requirements.

Proceedings before regulatory commissions with respect to local transportation are limited largely to the age-old ground of valuation, and the right to earn a fair return. But in many instances the primary question is not one of right to earn but of ability to earn. Local transportation encounters today a new factor which demands a radical change in the whole concept of regulation. That is competition. And it is obvious that any business is hopelessly handicapped in meeting competition unless it is permitted that necessary flexibility with respect to rates which is essential in meeting the inroads of unregulated competitors. In any such vital facility as community transportation, the public interest lies in regularity, reliability, safety and character of service. The public interest also demands that the facilities available be permitted to keep pace with growing community requirements. Without a sound financial basis, no enterprise can accomplish these objectives. It seems high time, therefore, that while the public is considering the deficiencies of present regulatory policy, the need for a changed concept to permit greater flexibility in the management of local transportation be given the attention which its importance warrants.

More Speed for the Locals

FEATURED in advertising, manned by selected employees, and favored by the dispatcher, the interurban limiteds are the pride of the road. So that they can get through in the fastest possible time, work trains, freight trains, and passenger locals must give way and take to the sidings. The cars used on the limited runs often have been specially designed for this purpose. They are provided with easy riding trucks, powerful motors, wide windows, upholstered seats and other refinements directed toward passenger comfort and convenience. All of which is as it should be and in line with present-day tendencies. This kind of service has done much to uphold the prestige of the interurbans and to offset the inroads of automobile and bus competition.

But would it not be well also to give attention to the matter of speeding up the local trains and bringing these cars up to the standard that is provided for the limiteds? Those who ride the locals constitute a numerous element of the patronage at all seasons of the year. As a class they are people of influence in their respective communities whose good will it is desirable to cultivate. Most assuredly they would react favorably to improved service either in the way of greater comfort or greater speed. While it may not be possible to provide parlor cars, it will nearly always be possible to speed up a local schedule. By speeding a little here and cutting a siding there; by taking advantage of every possible opportunity to gain a moment's time—in the main by clear-cut instructions to the motormen to "hit the ball," and by tightening up the schedule accordingly, the trains can be sent over the road in faster time, and the passengers impressed by the fact that they are receiving the faster service for which there is so general a demand.

Complete Car

New cars on 70-mile interurban in rural territory return investment in three years and in five years on 17-mile city property in community of 60,000. Detailed summary of operating results over ten-year period presents unusually complete analysis of new car economics

By

F. W. BACON

Vice-President International Utilities Company

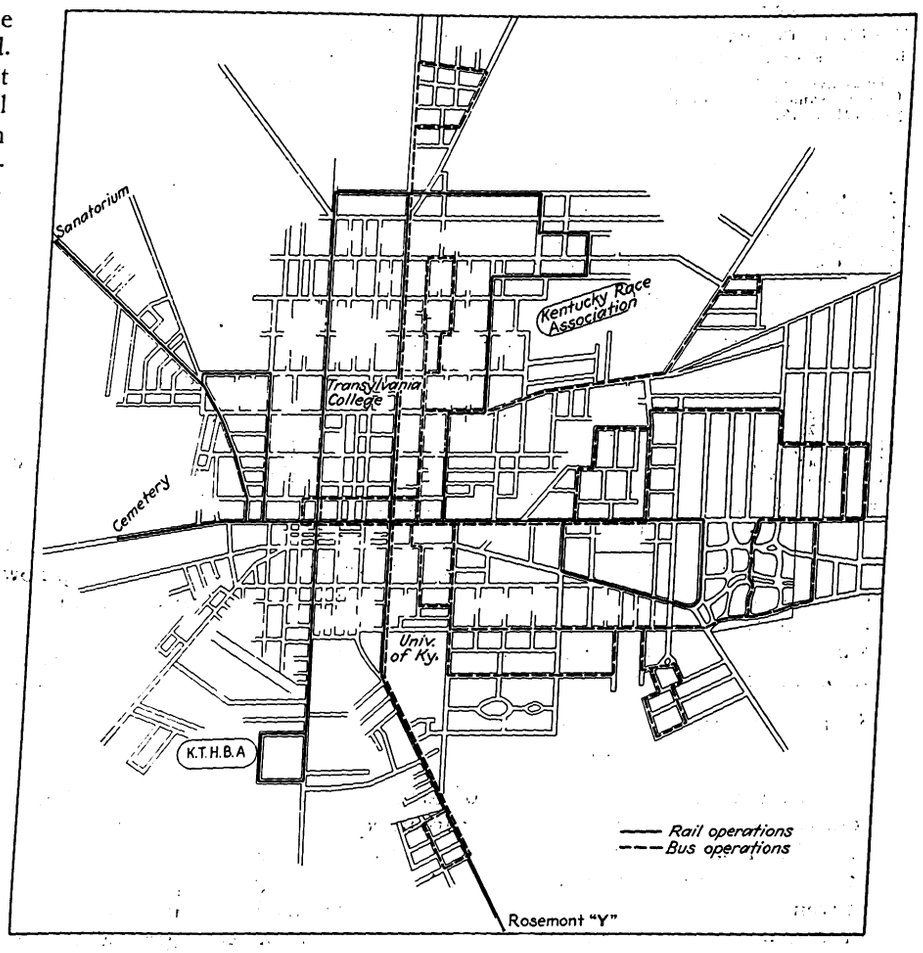
DURING a continuous period of eighteen years, the Kentucky Traction & Terminal Company, which I represent, has owned and controlled the public utility properties comprising power and light, local transportation and ice, serving exclusively the city of Lexington, Ky., and surrounding territory. Consequently, we have had a very major interest in the development of the city and its immediately tributary territory. The transportation property comprises some 70 miles of interurban system (divided into four lines radiating out from Lexington) and 17 miles of city trackage. Prior to 1922 there was in operation on the interurban a standard type of car weighing approximately 35 to 40 tons, of the design in common use at that time, and operated with two men. In the city the cars were a common type of single-truck equipment. They weighed 13½ tons and had been operated with one man for a number of years before they were replaced.

On a property of this size, facing the rapid growth in automobile competition, it was obvious that the possibilities for the development of transportation business were limited. The maximum length of ride on the city lines is not more than 1 mile, and under these conditions the effect of direct automobile competition and, in addition, their tendency to pick up passengers waiting for street cars, is particularly severe. Nevertheless, this company was faced with its responsibility for maintaining efficient, modern, comfortable and attractive transportation service in the community whose good will it has continued to enjoy for many years and with whose destiny its other utility properties, as well as its transportation system, are intimately associated. Here, then, was a problem of keeping faith with the community and at the same time keeping operating costs and fixed charges on the transportation

Digitized by Google

lines within the limits of the volume of business that could be expected.

We were convinced that frequent and convenient headway is essential in any transportation service which may be expected to win a fair response from the public. We recognized, likewise, that with the old equipment available, it was impossible to provide the character of transportation service which we felt the public had a right to expect; or to hold operating costs at a point which would permit the property to continue to maintain reliable transportation service in the community. Consequently, we decided to replace all of the existing equipment on the entire property—both interurban and city lines. The replacement was made on the interurban in 1922. The cars selected were of a light-weight double-truck type to be operated by one man. Twelve of these were purchased, and all of the old equipment was either sold or scrapped. In the following year the cars on the city lines were all replaced with 27



Although the maximum length of ride in Lexington is only 1 mile, new lightweight cars have produced a substantial increase in patronage and revenue and have returned their cost in five years despite jitney and bus competition. Buses of the Kentucky Coach Company now carry more than 1,800,000 passengers per year. The buses parallel two important rail lines

Replacement in Lexington

Returns Investment in Five Years

light-weight, single-truck one-man cars of a special design, in which careful attention was given to features of passenger comfort and attractiveness. The total investment was $306,999.

Since this property now furnishes a rather complete example of an entire replacement of equipment on both an interurban system and a small city operation, for which results are available over a sufficient period of time to afford a fair basis for drawing conclusions, it should be of interest to the industry to set up a comparison of operating results over a period of years before and after the acquisition of the new equipment, so far as it is possible to set up such a comparison and to attach significance to the figures. Obviously, the question of greatest interest is whether or not the investment in new equipment was justified. We are quite convinced that it was. In fact, if we had attempted to continue operation of the interurban lines with the old equipment, this part of the property would have long since been abandoned. Had that been made necessary, the million passengers now handled annually by these lines would have been forced to use other forms of transportation at a probable increased cost of transportation service. We feel that had this become necessary it would have been against the general interests of Lexington and its surrounding territory, in which, as the operators of power and ice utilities, we have a considerable stake. On the

city lines the results have been such that we feel that the service has been put upon a basis on which it can be perpetuated for the community, despite the limited earning power of a street railway system in a city of approximately 60,000 population.

CAR INVESTMENT LIQUIDATED ON BOTH INTERURBAN AND CITY LINES

On the most conservative basis of comparison with the old cars, the investment in the interurban equipment was liquidated within three years. This has been accomplished despite an average annual reduction in gross revenue of approximately 5 per cent. On the city lines the new car investment was liquidated within approximately a five-year period. I want to make it quite clear that the transportation property of this company as a whole is not a money-making enterprise even in its present form. It is with considerable difficulty that we are able to make the property self-sustaining, due to its limited scope of operations. When you look at our earning statement today, including intercompany charges and depreciation, etc., a casual observation would lead to the conclusion that it is a decided liability. This, however, is not the case; efficient and economical transportation service is a necessity to this community, vital to its development and welfare, and although the railway does not contribute directly to the earning power of the combined operations after paying its interest and its proportion of the general overhead we regard the transportation system as a real asset to the combined properties. While the investment in new cars has not contributed any collectible return, it has, through putting the property on a self-sustaining basis and through its general effect upon the public's attitude, contributed in a very real way to the interests of the company.

Taking up now the specific analysis of the effect of the new equipment on the interurban lines, the immediate effect of comfortable light-weight cars and improved service increased the gross revenue during the first year following the replacement. A competing bus service, however (since acquired by this company), and steady, increased use of private motor vehicles, has had the effect of causing a decrease in gross averaging about 5 per cent a year. Therefore, it is of particular interest to note that on the interurban lines the liquidation of the investment in new cars over a period of three years has been accomplished entirely through operating economies, and the investment has proved to have been justified despite a gradual loss in gross business.

To give a fair idea of the extent of the competition

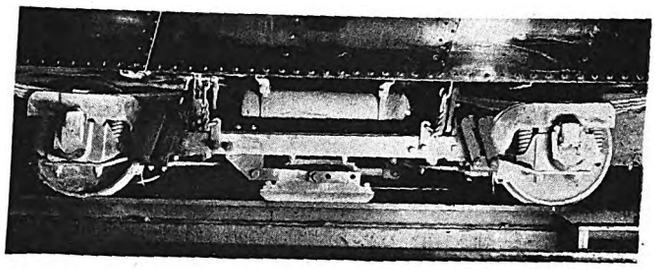
Twelve new interurban cars were installed during the period from Feb. 8, 1922, to March 5, 1922.
Change from two to one man operation of cars was made between Feb. 11 and 24, 1922.
Weight of old interurban cars 75,600 lb.
Weight of new interurban cars 25,100 lb.
Fares: Effective June 10, 1918, cash rate increased from 2½ cents to 3 cents per mile. and mileage rate increased from 2 cents to 3 cents per mile.
Effective Aug. 21, 1920, cash and mileage rates increased from 3 cents to 3⅓ cents per mile.
Effective Dec. 1, 1921, cash rates were reduced from 3⅓ cents to 3½ cents per mile, and tickets rates reduced from 3⅓ cents to 3 cents per mile.
There is an additional saving of $30,000.00 yearly in the operation of the new interurban cars due to the reduction in the power house kilowatt demand being released for commercial purposes.

Digitized by Google

encountered, there is presented herewith in Table I the results of periodic checks of highway traffic made since 1912. Each check was made for a period of five consecutive days from 6 a.m. to 6 p.m., and shows the number of motor vehicles and the passenger movement per day on roads between points served by our interurban lines. The checks were made at the same points each year, during the same hours and by the same men. It will be noted that in 1927 and 1928 there was an average of approximately 12,500 passengers carried daily by automobiles between points served by the four interurban lines. The average number of passengers per car varied between 2.2 and 2.3. Although there was a slight increase in the number of automobiles between 1927 and 1928, there was a slight decrease in the number of passengers riding in them. There has likewise been a slight decrease in bus passengers, and there are indications that for the time being, at least, the conditions have become static.

Table II presents a detailed summary of operating statements on the interurban before and after the substitution of new equipment. There is also presented in this table, for comparison, a summary of what the statement would have been during the period for the new equipment, had the old equipment been continued in operation. It is assumed for purposes of comparison that the same service had been given with old equipment as was given with the new, and that the gross revenue would have been the same as it has been for the new equipment. Obviously, an analysis of the financial results with new equipment on this basis, in an effort to determine the justification for the investment in new cars, is indeed very conservative. There is every reason to believe that



The unique air-magnetic track brake developed on this property has made possible increased speed with safety and has effected large reductions in accident cost. The illustration shows the equipment mounted on the single truck of the city cars

the gross revenue would not have been the same had the old cars been continued in service. In fact, we are quite convinced that it would have been much lower, and that with the higher attendant operating costs, these interurban lines would have long since been abandoned. Table II shows a comparison of the three-year period immediately preceding the installation of new cars, with the three years immediately following. These figures do not show the economy resulting from the light-weight equipment in the form of reduced power station demand, which released generating capacity for the sale of commercial power amounting to $30,000 per annum.

Gross Increased On City Lines

In Table III there is presented a comparison of operating statements for the city lines over a five-year period with old and new equipment. Prior to the installation of new cars it had been found impossible to increase the

Twenty-seven new city cars installed during the period June 24, 1923, to Sept. 2, 1923.
Weight of old city cars, 26,350 lb.
Weight of new city cars, 16,000 lb.
Fares: Effective Nov. 18, 1917, cash fare increased from 5 cents to 6 cents; Metal tokens from 4⅛ cents to 5⅝ cents.
Effective June 14, 1920, cash fare increased from 6 cents to 7 cents; Metal tokens from 5⅝ cents to 6¼ cents.
Effective Dec. 21, 1927, cash fare increased from 7 cents to 8 cents; Metal tokens from 6¼ cents to 7⅛ cents.

Lexington Board of Commerce Population Statistics

1923—50,000	1926—56,801
1924—48,641	1927—57,312
1925—55,000	1928—59,808

There was no reduction in station demand account of installation of the new city light weight cars, due to air and magnetic brakes, increased speed and other electrically operated safety devices.
All operations, both with old and new equipment were one man.

Digitized by Google

revenue; in fact, the property was steadily losing ground in the face of growing automobile competition. It should be noted particularly that there has been an increase of 30.1 per cent in passenger car-miles operated for the five-year period with new equipment, compared to the preceding five years with the old cars. This brought an increase of 17.8 per cent in gross revenue, and an increase of 10.6 per cent in the number of revenue passengers carried. All of this is based upon a ten-year comparison—five years with old equipment and five years with the new cars. Operating expenses decreased only 1.3 per cent. The costs per car-mile, however, were

reduced from an average of 20.9 cents for the old equipment, to 15.8 cents average over the five-year period with new cars, or a net reduction of 24.4 per cent. All operations in this comparison, both before and after the installation of new cars, were one-man. The net result of the investment in new cars has been (after deducting interest at the rate of 7½ per cent on the new cars) to increase the gross income 50.9 per cent over the five-year period, while at the same time permitting service to be increased 30.1 per cent. The net annual return on the investment in new cars was 22.6 per cent. It seems quite obvious, therefore, that the investment in new equipment was amply justified.

But even the summary given in Table III does not tell the whole story of the showing made by the new equipment. During the five-year period of operation with new cars, severe jitney competition developed in Lexington. This was accompanied and followed by 5-cent, at random, bus competition, paralleling the rail lines in the city and running to points beyond. In 1925 this was cleaned up through the installation by our company of a modern bus system, which now operates approximately 766,000 miles per year and carries more than 1,800,000 passengers. Much of this operation is in the direct territory of the railway, while some of the routes reach into areas beyond the rail lines. The important fact, in considering the question of the results accomplished with new cars on the railway, is that although the bus system has built up new business of its own, a considerable portion of its traffic is directly competitive with the railway lines. A summary of the bus operations is presented in Table IV.

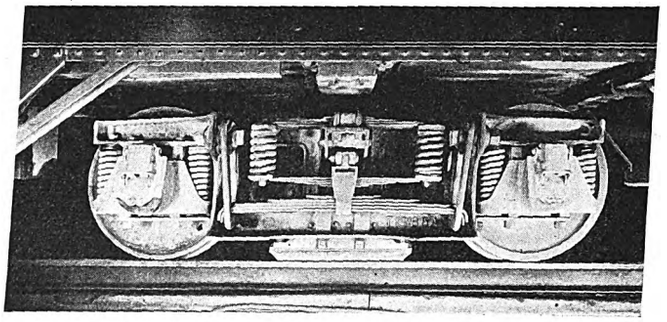
Track Life Extended and Maintenance Reduced

Still another phase of the experience on this property seems worthy of particular note. In all studies of the possible economies to be expected through the purchase of modern light-weight equipment, the factor of track life and track maintenance are major items upon which it is extremely difficult to make even approximate estimates. Our experience, therefore, extending as it does over a period of more than five years with a complete replacement of cars, helps to throw additional light on the possibilities for track economies through the operation of light-weight equipment. In our particular situation, covering all the depreciable values in the track and roadway department, we estimate that the substitution of lighter cars has extended the life of this structure 50 per cent. We value this property—rail fastening, special work, bridged ties and paving (all the actual depreciable property in the track and roadway department)—at $1,083,000. Based on these values we estimate that the reduction in depreciation amounts to $18,058 per year, which would be properly creditable to the return on the investment in new cars.

Table V gives a summary of the total track and roadway maintenance on this property for the past eight years, and also certain statistical facts with respect to the track department. The figures include all divisions, both interurban and city lines. They are set up to show the year 1921, the last year in which operation was entirely with old equipment. In 1922 the interurban cars were changed, and in 1923 new cars were operated on the city lines as well. For the remaining five years, 1924 to 1928 inclusive, all operations were with new equipment. The statement indicates a reduction of approximately $20,000 per year in the total expenses of this department. Of this amount, our organization estimates that the direct economy which may properly be credited to the light-weight equipment is slightly more than $15,000 per year, or approximately 5 per cent on our total car investment of $306,999.

Track Saving Alone Justifies Investment

Adding together the amount creditable because of increased life of track through decreased wear and tear with light-weight equipment, and the direct reduction in maintenance cost, the total saving is approximately $33,000 per year, or 10.7 per cent on the cost of the new cars. On the basis of a permanent property, therefore, the investment in new cars is justified by the figures for track economies alone. The facts of outstanding interest in Table V are not only the reduction in total cost, but in the track cost per car-mile operated, which is about half the former figure. The ton-mile information given is approximate only, but on the basis shown represents about a 40 per cent decrease despite considerably increased car mileage. The costs for maintenance per mile of track during the latter periods shown in Table V —with increased age of the structure—in comparison with earlier years, seem of particular interest and significance.



New trucks built by the Cincinnati Car Company, are designed so that the air-magnetic track brake is carried between the wheels

One feature of the equipment on both interurban and city cars on this property is of enough special interest to seem worthy of particular mention. This is the success achieved in the reduction of accidents and accident costs after more than two complete years of experience with a special auxiliary magnetic track brake which was applied to all of our new cars during the year 1926. The development of the equipment followed continuous and persistent though vain efforts to reduce the number of accidents and the accident liability on the property. We finally came to the conclusion that there was need for some more positive means of stopping cars in an emergency than that afforded by the conventional air brake. After considerable study, and in collaboration with the engineers of the Cincinnati Car Company and the General Electric Company, there was perfected a special type of air-magnetic track brake which gives the motorman of a car marginal braking capacity, in the event of emergency, 30 per cent to 35 per cent above that of his air brakes alone, regardless of rail conditions.

Full details of this equipment were given in an article in the July 17, 1926, number of Electric Railway Journal. Our pupose in this development was primarily that of reducing accidents—fulfilling to the limit of our ability a moral obligation to the public and to our passengers. In addition to this humanitarian objective was the desire to reduce the cost and losses which invariably result from accidents regardless of where the actual

TABLE VII—COST OF INSTALLATION, MAINTENANCE, OPERATION AND DEPRECIATION AIR-MAGNETIC BRAKES

Installed 53 equipments May 17, 1926, completed Dec. 26, 1926

Investment cost installed	$26,602.43
7 per cent on capital investment (two years 1927-1928)	3,724.34
4 per cent depreciation on magnetic brakes (two years 1927-1928)	2,128.20
Increase maintenance cost of air and magnetic brake equipment for years 1927-1928 over straight air-brake equipment year 1926	376.42
Total	$6,228.96
Total savings on collision accidents (years 1927-1928 over years 1924-1925)	15,408.91
Total maintenance depreciation and interest	6,228.96
Total savings after interest and depreciation charges	$9,179.95
Actual return on magnetic brake investment without crediting saving for 431 accidents that may have been prevented, per cent	48.5

responsibility lies. After two years of experience with all cars equipped with this device, there is presented in Table VI a five-year record of accident statistics and costs for the property.

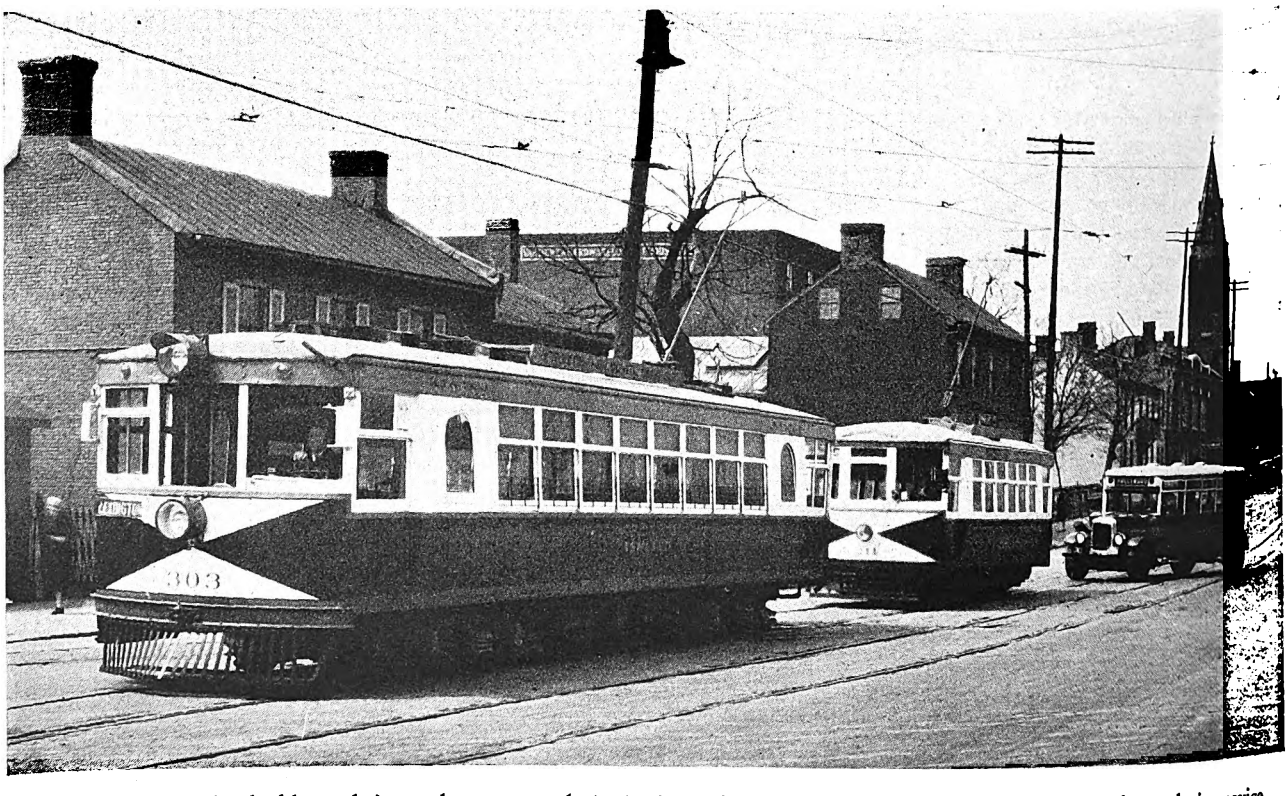
Table VI shows large reductions in the number of front-end accidents following the installation of the track brakes in 1926. It shows, in addition, reduction of accident costs on both the interurban and city lines. These results were achieved despite increases of 15.8 per cent in car mileage operated on the interurban and 29.4 per cent on the city property. At the same time there was an increase of 28.6 per cent in the number of motor vehicle licenses issued in this immediate territory. The record shows an actual reduction of 109 accidents from collision with pedestrians or vehicles. In addition, motormen's reports indicate 322 collision accidents prevented through the use of the magnetic track brakes in emergency.

A summary of the actual financial results of the installation of this special brake equipment is given in Table VII. Briefly, the total cost represented an investment of $26,602. After deducting all charges we figure that this installation has actually earned a return of 48½ per cent in the direct reduction of accident cost, without attempting to assign any monetary value to the prevention of 431 collisions or potential collisions. No allowance is made in these figures for the saving in catastrophe insurance. Entirely on the basis of the performance of this brake equipment, the insurance companies have made a reduction in the rate for catastrophe insurance applicable to this property from $2 to $1.40 per $1,000 of revenue.

Because this equipment was designed and installed on our cars after they had been in service for several years, it was necessary to carry the brake on an outrigger on the double-truck cars. On a new car installation today, the brake can be included in the original design of the trucks, making a more satisfactory installation and reducing the cost considerably. Nevertheless, with only minor changes and improvements, the design as originally worked out for the Lexington property has proved entirely successful mechanically and has not materially increased maintenance costs. Total air-brake maintenance in 1926 was $2,538. With the auxiliary track brakes installed and in operation during 1927, the cost of all brake maintenance was $2,680. In 1928, total brake maintenance costs were $2,773, the increase of $235 being almost entirely accounted for by a damage cost of $153 resulting from a motor vehicle running into the side of a car.

An important maintenance feature resulting from the use of the track brakes is the almost total elimination of flat wheels and the increase of mileage obtained from wheels on both interurban and city equipment.

As used on this property, the track brake is used wholly as an auxiliary brake. Judging from a check which we made in 1927, it is estimated that the average number of applications per year will run between 14,000 and 15,000. In our practice there is no restriction on the use of the magnetic brake.



Twelve light-weight double-truck interurban cars and 27 single truck city cars replaced all of the equipment formerly in service. This represented an investment of $306,999. In addition, a modern bus service was developed to replace former jitneys

Short Signal Cycles

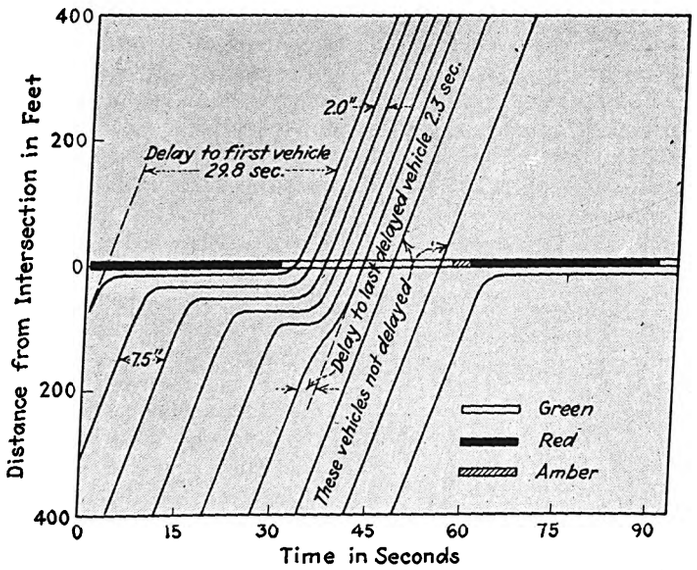
SPEED UP TRAFFIC

By

HAWLEY S. SIMPSON

Traffic Engineer, Essex County, N. J.

EXPERIENCE with automatic signals has demonstrated many inherent inefficiencies, and much attention is now being directed to the economics of traffic movement at the intersection, which constitutes the critical point of any street system. Through this area passes twice the traffic per lane which approaches on the intersecting streets, and it thus becomes absolutely essential that the most efficient movement of traffic at such points be obtained if traffic stagnation is to be forestalled. One of the greatest, yet most common, extravagances in modern road construction is to invest large sums in super-wide highways, while allowing traffic to be throttled in a "bottleneck" at every important intersection. In general it has been found that the shortest interval which will permit pedestrian traffic to cross with ease is the most efficient interval.



Vehicular movement at street intersection equipped with automatic signals, showing effect of signals in reducing intervals between vehicles—assumed conditions 480 vehicles per hour moving at 20 m.p.h.; signal cycle, red 30 seconds, amber 3 seconds and green 27 seconds

To obtain the maximum efficiency of traffic movement every heavy traffic intersection should be studied with the view to determining whether traffic signals should or should not be used, or whether the grades should be separated. If traffic signals are considered, it can in general be stated that but two factors should be analyzed and two questions answered, namely:

1. Will the installation reduce the accident toll?

2. Will the installation reduce the volume of vehicular delays below that experienced without traffic signal control?

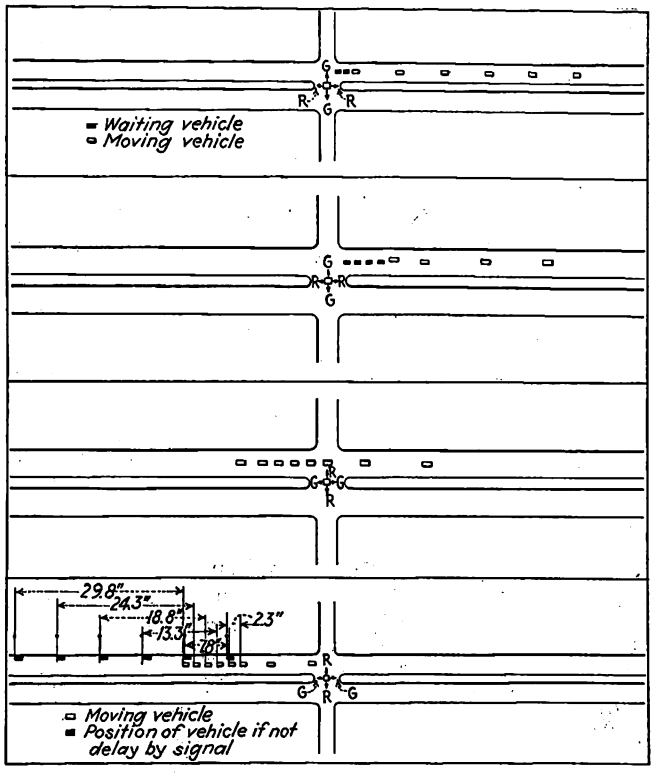
The first question would receive a negative answer from many engineers in instances where traffic volume is not heavy. Accident records of intersections where the hazard increased materially following traffic signal installation, often show the hazard returning to pre-signal level after the signal's removal. An analysis by the writer of accidents at 52 intersections in twelve municipalities in New Jersey showed an accident reduction of about 35 per cent following automatic signal installation when traffic through the intersection exceeded an average of 1,000 vehicles per hour from 8 a.m. to 6 p.m. But when traffic was below an average of 800 vehicles per hour the analysis indicated that automatic signals were not effective in reducing the number of accidents.

Mathematical analyses made recently of automatic traffic signals installed and operated at intersections of light traffic volume have shown unwarranted vehicular delays. Therefore, before a signal installation is decided upon, a careful study of the probable effect of a traffic signal on both the accident situation and the traffic flow should be made. When this is done, and it is determined that signals are economically warranted, the further question arises as to what would be the most efficient cycle.

Vehicular movement can be expedited to a marked degree by the proper selection of time cycles of automatic traffic signals. It has been found that the most efficient time interval is the shortest interval that will allow pedestrian traffic to cross the street with ease.

In progressive signal systems, the length of the cycle is quite rigidly indicated by the distance between the signalized intersection and the vehicle speeds to be maintained. At isolated intersections and in synchronous systems the length of cycle may range between wide limits. Cycles now used vary from a minimum of about 40 seconds to a maximum of 180 seconds.

Digitized by Google



Spacing of vehicles before and after passing through signaled intersection, showing delays caused by operation of signals

In order to determine the relative efficiency of various length cycles, the writer has developed formulas from which the accompanying graphs are drawn, and which may be used to determine the theoretical average minimum delay at an isolated signalized intersection under any condition of traffic volume or cycle. Briefly stated, the formulas sum up the delays to each individual vehicle, thus arriving at the total intersection delay. More specifically, the delay to the first vehicle arriving on the stop signal equals the red period, plus a portion of the preceding amber period, plus an acceleration loss, minus a variable to account for the average condition of arrival at the intersection. The delay to succeeding vehicles will always equal the delay of the preceding vehicle minus the difference in time spacing between arriving and leaving vehicles, or 7.5 seconds and 2.0 seconds, respectively, as shown on the chart on page 765. The delay to all vehicles will equal the sum of the delays to the first and last delayed vehicle multiplied by one-half the number of delayed vehicles.

These facts may be readily understood by an examination of this chart, which shows the detailed delays to each vehicle in one lane on one street with an average movement of 480 vehicles per hour. Under the conditions assumed, eight vehicles will pass in each lane in one signal cycle. Of these eight, five will come to a full stop and one will be required to slow down, the delays ranging from 29.8 seconds to 2.3 seconds and totaling 96.3 seconds. Only two vehicles will not be delayed. A series of charts on this page shows the same conditions with vehicles on only one side of the main thoroughfare. The first shows the position of the eight vehicles 15 seconds after the beginning of the display of the red signal, two of the vehicles already having stopped, one slowing down and five approaching. The second shows their position at the end of the red period and the beginning of the green period, four vehicles stopped, one practically stopped and three approaching. These vehicles immediately begin to move and at the end of 15 seconds of the green period all vehicles are in motion, as shown on the third chart, but in the meantime the fifth car has had to stop and the sixth slow down due to the necessity for the first four to accelerate and space themselves at a safe distance.

The fourth chart shows the position of the eight cars, all moving, at the end of the green period. There is also shown the position which the first six cars would have had if there had been no signal at the intersection. The delay to each is shown in seconds, the sum equalling 96.3 seconds.

Incidentally, this figure also demonstrates one of the reasons why signals increase the efficiency of the street system when traffic is heavy. The six delayed vehicles occupied 1,320 ft. of street space when approaching the intersection at 20 miles per hour and required 45 seconds to pass any point. The grouping effect of the signal resulted in the cars being more closely spaced on leaving the intersection, occupying only about 352 lineal ft. of street space, and requiring only 12 seconds to pass a point; an increase in efficiency which warrants the delays imposed when the volume of cross traffic demands it.

A comparison of the relative volumes of delays per hour produced by various length cycles with varying traffic volumes is presented in the chart on page 767. The statistics are computed for only one lane in one direction under the special condition noted in the title of the chart. The total delays for one hour at an intersection may be computed by scaling the delays to each lane from the diagram, provided the cycle is divided evenly between red and green. The same relative increase in delays when long cycles are used will occur regardless of the proportions into which the cycle is divided.

In order to determine the probable accuracy of the formulas and assumptions, field surveys were analyzed by W. B. Powell, consulting engineer, Buffalo, at three signalized intersections. The computed delays using the above mentioned formulas varied from the observed delays by less than two and one-half per cent. Mr. Powell concluded that traffic volume did not warrant traffic signal operation which fact is amply supported by the statistics, while a detailed study of the cycles used gave the following additional conclusions:

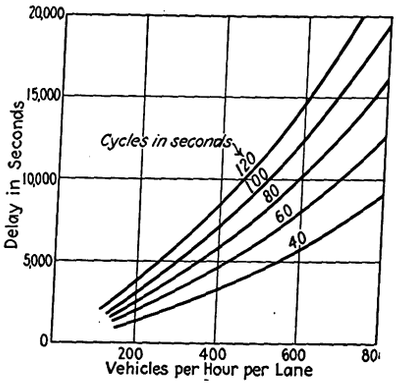
1. The cycles were badly proportioned between red and green.
2. The lengths of cycle were somewhat excessive (70, 75 and 80 seconds).
3. The amber period for such light traffic should have been three seconds, rather than five seconds.

If the same length cycles had been proportioned so that the green periods were proportional to the traffic—but no period less than 20 seconds—the delays would have been reduced to 75 per cent of that observed. If a 60 second cycle had been used allowing 40 seconds green on the main street, 20 seconds on the cross street and a three second amber, the delays would have been further reduced to 61 per cent of the actual delay, but the delay to main street traffic would have been somewhat higher in proportion and such a change might not have been justified. This is a very practical illustration of the economic losses due to the unnecessary use of signals in combination with careless or unstudied regulation of the timing.

The conclusion from this study is the evident efficiency of the use of the shorter cycles. The reasons are

Digitized by Google

apparent by study of the charts. When vehicles are stopped and waiting at the intersection and are ready to proceed at the capacity spacing, it becomes uneconomical to use the cross street for vehicles moving at greater spacings. This conclusion might be carried to the extreme, and cycles of a few seconds selected as most efficient, but such reasoning must be tempered with judgment, and consideration given to the rights of pedestrians. The green period must be sufficiently long to permit a group of pedestrians to cross the highway without vehicular interference. An average speed of pedestrian travel may be taken as 5 ft. per second, fixing 12 seconds as the time required to cross a 60-ft. pavement. There must be allowed some clearance to permit more than one pedestrian to make the crossing and to allow for vehicular interference from turns. This allowance may be assumed as 8 seconds, fixing the minimum practical length of the green period at 20 seconds.



Total delays per hour with various lengths of signal cycle — assumed conditions; red is half the total length of cycle and amber is 3 seconds

Another and by no means unimportant argument favoring the shorter cycles is introduced by consideration of another element of the pedestrian problem. With very long cycles, as in New York City, the pedestrian cannot be expected or even forced to wait at the curb, as was recently tried, until the green light appears, but will attempt to thread his way through heavy moving traffic, with an attendant increase in accident hazard, and a reduction in the efficiency of the intersection brought about by the unregulated conflict between pedestrians and vehicles simultaneously attempting to move at right angles to each other. Shorter cycles have been found to be productive of greater pedestrian observance of traffic signals with the attendant benefits.

In conclusion, it is apparent that the use of automatic signals cannot but produce delays totaling many vehicle hours per day, in some cases absolutely without necessity, but where studies prove the economic advisability of the use of signals, analyses should be made to determine the shortest and the most efficient cycle that will be practicable.

Third Regional Meeting Held at Boston

BASIC problems facing the electric railway industry were discussed at the third regional conference held at Boston, Mass., on July 10 under the auspices of the Advisory Council. About 40 electric railway executives from the New England territory attended the meeting. This was the third regional conference of this type, the first having been held in San Francisco in February and the second in St. Louis in April.

At the outset of the meeting J. N. Shannahan, chairman of the Advisory Council, announced the selection of Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL, to be managing director of the American Electric Railway Association to fill the vacancy created by the resignation of Lucius S. Storrs. The chairman then called upon Mr. Gordon to give his views on the problems confronting the industry. According to Mr. Gordon there is no panacea for the troubles of the electric railways. He pointed out the need for arousing the interest of business men in the problems of local transportation by stressing the relation between transportation and business development and property values. In conclusion Mr. Gordon expressed his abiding faith in the industry and predicted substantial future development.

During the discussion it was emphasized that every effort should be made to arouse business men to realize they have a vital interest in the successful operation of their local transportation systems. The public does not understand the situation because too many railway managements have been inarticulate. Fundamentally the public is even more interested in the soundness of its transportation than the security holders themselves, according to Mr. Shannahan. When the public is properly informed its attitude may be counted upon to be fair. As a result of the work of the management at Omaha, an extremely unfavorable situation has been completely changed during the past two years and the company restored to favor with the public. His experience there convinced him that other similar situations can be successfully worked out if approached in the right way.

Edward Dana, general manager of the Boston Elevated Railway, said that while the total annual traffic on the system shows a slight decline, the weekday traffic has increased. This presents a serious problem, but does not indicate any decreasing need for public transportation service. He emphasized the need for rapid transit extension. C. V. Wood, president of the railways in Springfield and Worcester, pointed out that transportation must be made more salable by being made attractive. Speed is the most important factor. In 1863 the average speed of the Worcester Street Railway was approximately 8 m.p.h. It is not much better today. Special attention should be given to increasing the speed of operation.

To improve its position materially an electric railway must select a definite objective, according to George Clifford, division manager of Stone & Webster. He cited examples among the Stone & Webster properties to show results when this principle is followed. The human element is important. Employees should be educated to know their business and to make favorable contacts with the public. Prof. A. S. Richey also stressed the importance of securing co-operation from platform men.

Considerable discussion centered around the subject of taxicab operation. Elton S. Wilde, president of the Union Street Railway, New Bedford, expressed the opinion that regulation of taxicabs is highly desirable.

Digitized by Google

When this is done it may become expedient for the electric railways to enter this field. Henry Page, general manager of the Worcester Consolidated Street Railway, discussed the taxi situation in Worcester and emphasized the need of regulation, as did several other speakers.

W. B. Spencer, executive assistant United Electric Railways, Providence, suggested that this industry would do well to undertake an extensive advertising campaign to popularize its product. A. J. Boardman, general manager Eastern Massachusetts Street Railway, discussed the need for greater co-ordinated effort among the companies. Fred Gordon, general manager Cumberland County Power & Light Company; O. M. Lord, vice-president York Utilities Company, and A. D. Kendrigan, general manager Manchester Street Railway, all discussed problems confronting their companies.

National Motor Bus Division Reorganized

REORGANIZATION of the National Motor Bus Division was the outstanding result of the third annual meeting held at Buffalo on July 1 and 2. A. M. Hill, chairman, recommended that the work for the ensuing year should be primarily aimed at development of accurate and useful information on the tax situation affecting the industry throughout the country. Upon his suggestion, a special committee was appointed which was given responsibility for co-operating with other agencies working on the same problem. It was recommended also to have all state regulatory bus laws codified in index reference volumes. This was prompted by the fact that many members of the division are operating across state lines or connecting with other interstate operations. This creates a real need for up-to-date information on the status of state regulations.

The opinion was advanced that highway transportation should be regulated on its own merits, without regard to its effect on other forms, because trouble on the highway is increasing and the effect of bus traffic on the railroad is slight and is steadily growing less. It was stated that it was fortunate that the interstate bus bill failed of passage at the last session of Congress, because the power to regulate interstate commerce rests only with Congress and should not be delegated to the state, as was provided in the bill.

In a report submitted by the legislative committee it was said that while interstate legislation had been the outstanding problem, state regulations had also received a great deal of attention. State bus associations, state legislatures and regulatory authorities have received assistance in the preparation of laws and regulations. It is believed that this work will help establish uniformity in state regulatory practice.

Trailer buses are receiving more attention than in the past. They will double passenger capacity with but slight increase in the maintenance requirements, it was said. The possibilities of light-weight metals in reducing heavy weight are illustrated in a new seat developed for airplane service by the Aluminum Company of America. This is 40 in. wide and weighs only 24 lb., complete with upholstery. It was stated that the design might have to be made stronger and, therefore, heavier for bus application, but even then it was thought that the weight could be reduced approximately 50 per cent.

San Francisco Chosen for 1930 Convention

THAT the 49th annual convention of the American Electric Railway Association will be held at San Francisco, Cal., was decided at a meeting of the executive committee on July 12. The desirability of holding a convention on the Pacific Coast has been under discussion for several years, and it was felt that it would be particularly appropriate to hold it there next year. The exact date of the 49th convention was not fixed by the committee, but it was decided that it should be held some time in June. This departure from the usual practice of holding the convention during the early fall was made in order to permit delegates attending the railway convention to attend also the annual convention of the National Electric Light Association, which will be held at San Francisco in June. Whether the A.E.R.A. convention will be held immediately before or immediately after that of the N.E.L.A. was not decided.

In accordance with the custom that has been followed for some years past, the meeting of the executive committee was held on board the steam yacht *Florida*, belonging to Barron Collier. In the absence of the president and the first vice-president of the association, J. H. Hanna, second vice-president, presided. J. N. Shannahan, chairman of the Advisory Council, announced the selection of Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL, as managing director of the association. The appointment was formally made and approved by the committee. Mr. Gordon expressed his appreciation and spoke of the wonderful opportunity of leadership in an industry with an investment of $6,000,000,000.

At the outset of the meeting, J. W. Welsh, general secretary, announced that he had been offered a position with the Cleveland Railway which he desired to accept. The suggestion had first been made a long time ago, he explained, but he had felt that he could not consider it at the time when the association was without a managing director. Since the selection of a new managing director by the Advisory Council, he felt free to accept the offer of the Cleveland Railway and submitted his resignation to take effect Sept. 1. Mr. Welsh's resignation was accepted with regret by the executive committee, and a special committee was appointed to prepare a statement of appreciation for the services he has rendered the association during his tenure of office.

Routine reports were presented by numerous committees. An interesting discussion occurred concerning the appointment of a committee on fare research. It was the consensus of opinion that such a committee could render the industry an important service.

For officers during the coming year the nominating committee made recommendations as follows: President, Paul Shoup, Pacific Electric Railway; first vice-president, J. H. Hanna, Capital Traction Company; second vice-president, C. E. Morgan, West Penn Railways; third vice-president, G. A. Richardson, Chicago Surface Lines; fourth vice-president, J. H. Alexander, Cleveland Railway; treasurer, Barron Collier.

To fill the vacancies in the executive committee effective to the end of the association year, the nominating committee recommended W. H. Wood, president Virginia Electric & Power Company, to fill the unexpired term of J. H. Alexander, and Thomas Conway, Jr., president Cincinnati, Hamilton & Dayton Railway, to fill the term of D. W. Snyder.

A sample two-car unit for the Lackawanna electrification on the test track

Lackawanna Electrification

Plans Completed

General plans for this 160-mile suburban electrification are complete and contracts are being let for the equipment and construction. Multiple-unit trains will give suburban service on the Morristown line from Hoboken to Dover and on the branches to Montclair and Gladstone

PLANS for the electrification of the Lackawanna Railroad between the Hoboken, N. J., terminal and Dover via Morristown, as well as the branches to Gladstone and Montclair, now are virtually complete. The main line from Hoboken has three tracks as far as Millburn and two tracks from there to Dover. The Montclair branch has two tracks all the way from the Roseville Avenue junction, while the Gladstone branch from Summit to Gladstone is a single-track line. The entire project involves 70 miles of route and 160 miles of single track, including main track, yards and sidings. While many details remain to be worked out, bids for the major parts of the work, such as the overhead construction, the cars and the substations, will soon be taken and contracts will be let in the very near future.

The engineering work is being done by Jackson & Moreland, engineers of Boston, Mass., under the direction of G. J. Ray, chief engineer D. L. & W. Railroad.

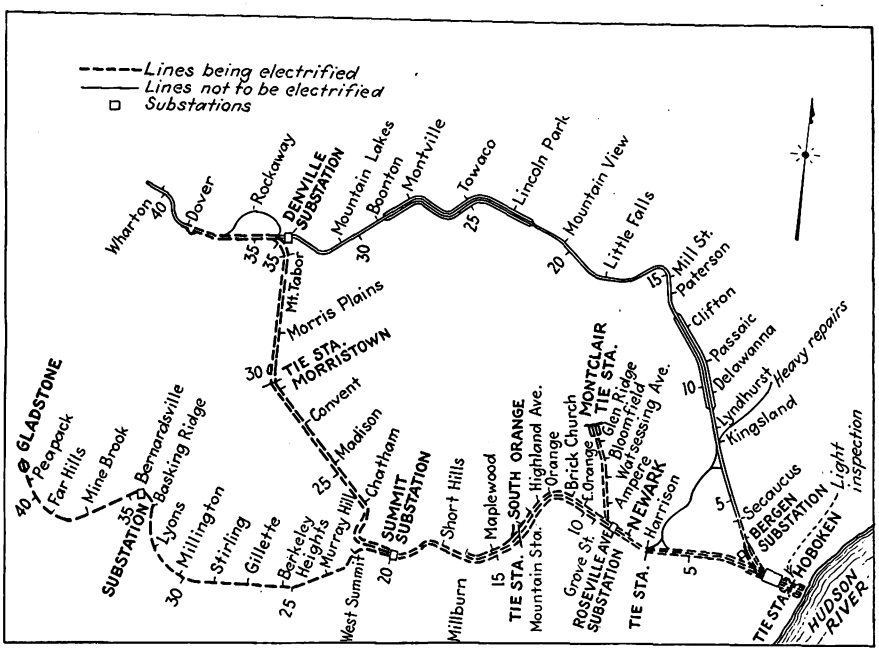
The immediate electrification will be confined to the suburban trains within the zone mentioned above. These will be operated with multiple-unit cars, arranged in permanent groups of two, a motor and a trailer, which can be coupled to form trains of two, four, six, eight, ten, or twelve cars. Certain heavy freight trains will also be handled between Secaucus and Hoboken freight yards by electric power.

All of the 141 motor cars required for the service will be purchased new. They will be 71 ft. long over bumpers. The trailers with which they will be coupled to form the two-car units are at present in steam service in the suburban district. Sixty, including ten combination cars, are of the so-called low-roof type. They are practically identical in general design and appearance with the motor cars to be ordered. The remainder are of the high-roof type, and include 71 coaches, five combination smoker-baggage cars and five club cars. These cars are all of modern, all-steel construction. The motor cars will weigh 148,000 lb. complete with electrical equipment, and the trailers 113,000 lb., making the weight of a complete unit 261,000 lb., excluding passengers. Each motor car seats 84, and the trailer coaches seat 78 or 82, making a total of 162 or 166 for the unit.

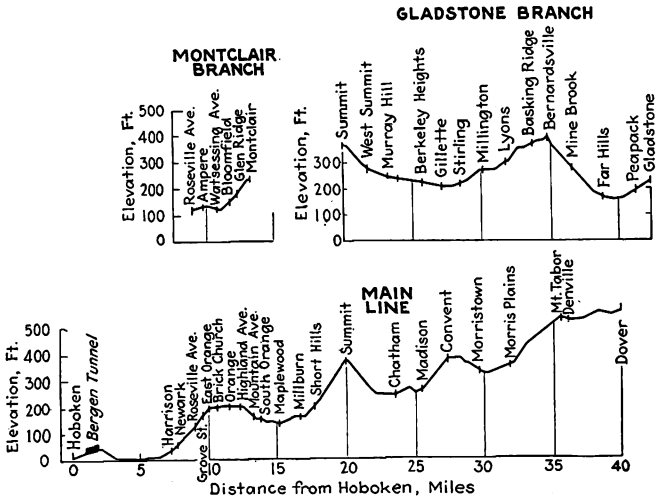
Each unit will be semi-permanently joined with MCB type couplers. All operating electrical equipment will be carried on the motor car, and current for the lights and heaters on the trailers will be carried through jumpers between the ends of the cars. Connections between units will carry the control circuits only, and will be made through jumpers. Each two-car unit will have a motorman's control station at each outside end only. Connection with the contact system will be made through two pantographs which are mounted on the motor car.

Each motor car will be equipped with four motors having a one-hour rating of 230 hp. at 1,500 volts. Pairs of motors will be connected permanently in series, and the pairs will be handled with series-parallel control. A feature of the equipment is that the motors will

Digitized by Google



This map shows the Lackawanna electrification. Figures are miles from Hoboken. Power will be transformed to 3,000 volts d.c. in five rectifier substations



The profile is irregular, there being a rise of more than 500 ft. from the Hoboken terminal to Dover on the main line

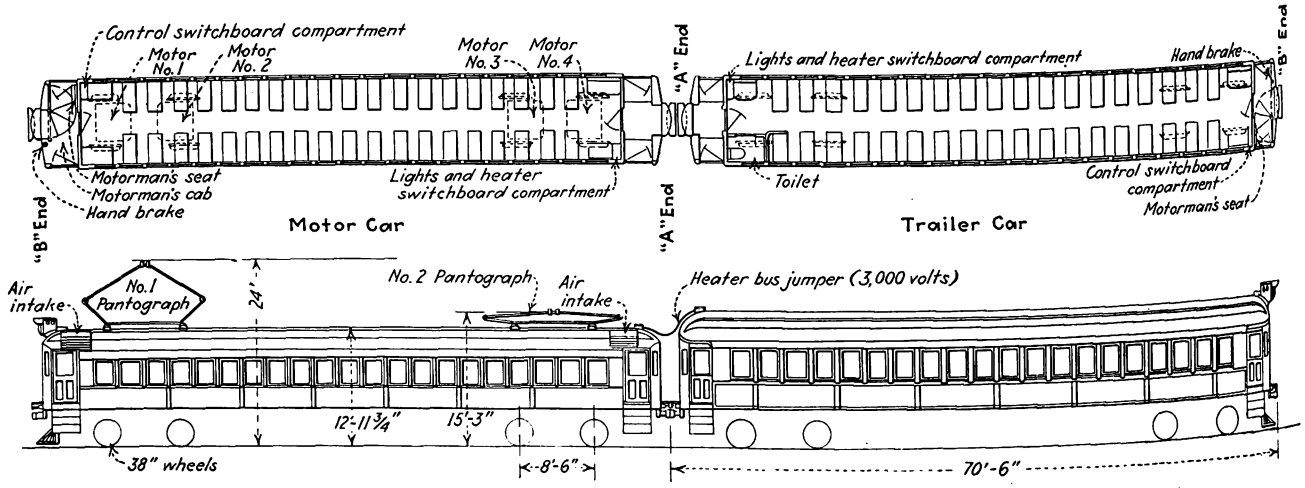
be self-ventilated, the cooling air being taken from the roof of the car at either end, and led to the motors through suitable ducts.

The motor control will be of the multiple-unit, electro-pneumatic type, the magnet valves being actuated with storage battery current. Acceleration will be automatic, although an optional hand control of acceleration is possible. The automatic acceleration has been designed for a rate of 1.5 m.p.h.p.s. with a six-car train. Braking will be at the rate of 1.75 m.p.h.p.s.

Current for the control and for the car lighting will be taken from an auxiliary circuit supplied by a generator forming part of the dynamotor, with a storage battery in parallel, the battery also being charged from this generator. The dynamotor has two 1,500-volt windings with commutators in series. It supplies power from a tap at the mid-point for the 1,500-volt air compressor. The separate generator armature on the same shaft supplies 40 to 50 volts for the control, lighting and battery charging circuits.

The heating for all the cars will be by 3,000-volt current taken from the line. There will be 40 heaters in each car, each with two elements. These heater elements will be divided into two circuits, each circuit being connected across the 3,000 volts. The heat control will be thermostatic, the two circuits being connected and disconnected automatically as needed to maintain the desired temperature by means of auxiliary contactors.

The contact lines will be of the catenary type. For the two and three-track sections the wires will be supported on steel bridges. The vertical members will be steel beams of H section, carrying single cross-members. A few four-track sections will be supported with lattice girder bridges. On the Gladstone branch, which is single track, the overhead will be supported from brackets attached to wood poles. Typical construction is shown in the drawings reproduced. The normal spacing of the catenary structures is 300 ft., but this is varied to some extent to meet conditions, as at stations and on curves. Each of the bridges will be supported by concrete footings. These are being placed at the present time. On the meadows, where the ground is little if any above



Trains will be made up of units, each consisting of a motor car and a trailer semi-permanently coupled. The complete unit weighs 261,000 lb. and seats 162 or 166 passengers

TABLE I—LOCATION AND RATING OF SUBSTATIONS, LACKAWANNA RAILROAD ELECTRIFICATION

Substation	Rectifiers: Number of Units	Rectifiers: Capacity of Each, Kilowatts	Number of Transformers	Source of Supply: Volts	Source of Supply: Cycles	Source of Supply: Company
Bergen	3	3,000	3	13,200	60	Public Service Electric & Gas Company
Newark	4	3,000	4	26,400	60	Public Service Electric & Gas Company
Summit	2	3,000 (2 tanks)	2	66,000	60	Jersey Central Power & Light Company
Denville	2	3,000 (2 tanks)	2	33,000	60	New Jersey Power & Light Company
Bernardsville	2	2,000	2	33,000	60	New Jersey Power & Light Company

tidewater, it has been found necessary to sink piles in order to get a suitable foundation for the concrete footings.

The contact line on the main portion of the system will consist of two contact wires. These and the main and auxiliary messenger cables will be in parallel, with a total equivalent section of copper of 800,000 circ.mil. There will be two No. 0000 trolley wires throughout on the main line.

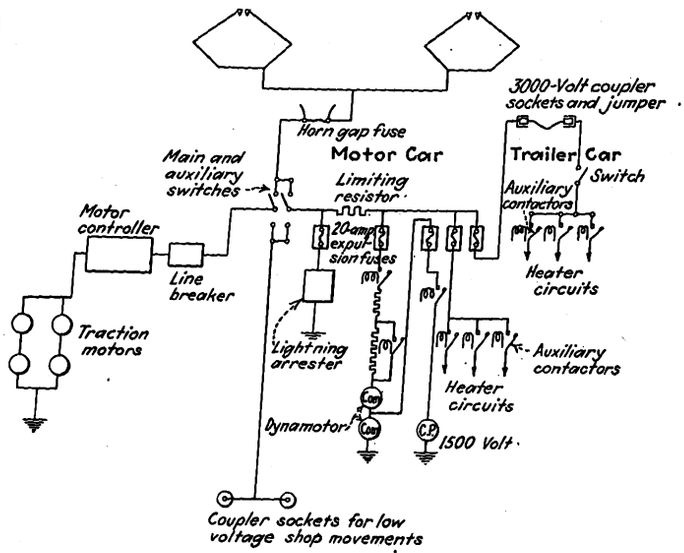
Normally the overhead system will all be tied in together through the substations and tie stations, but automatic switches will be provided that will isolate any section in which trouble occurs.

Power for operation of the system will come from three sources. The Public Service Electric & Gas Company will supply the substations at the west end of the Bergen Tunnel, near the Hoboken terminal, and at Newark, the Jersey Central Power & Light Company the one at Summit, and the New Jersey Power & Light Company the stations at Denville and Bernardsville. Tie stations will connect the overhead conductors for the several tracks together at Hoboken, Harrison, South Orange, Montclair Morristown and Dover.

The power will be converted from 60 cycles alternating current to 3,000 volts direct current in five substations. The locations are shown on the map and the ratings and equipment are given in Table I. Mercury arc rectifiers will be used throughout for conversion. Each rectifier tank will deliver power at 3,000 volts. Three sizes are specified, 3,000-kw. single-tank units being used in the Bergen and Newark substations, 3,000-kw. (two-tank) units in the Summit and Denville substations, and 2,000-kw. units in the Bernardsville station. The Bernardsville station will be equipped for automatic operation.

The main line from Hoboken to Dover has many heavy grades, as may be seen from the condensed profile. There is a rise of more than 500 ft. from Hoboken to the junction with the Boonton branch at Denville. This has necessitated relatively heavy motive power for steam service, particularly on the long run to Dover. With electric power it will be possible to make certain reductions in the running time.

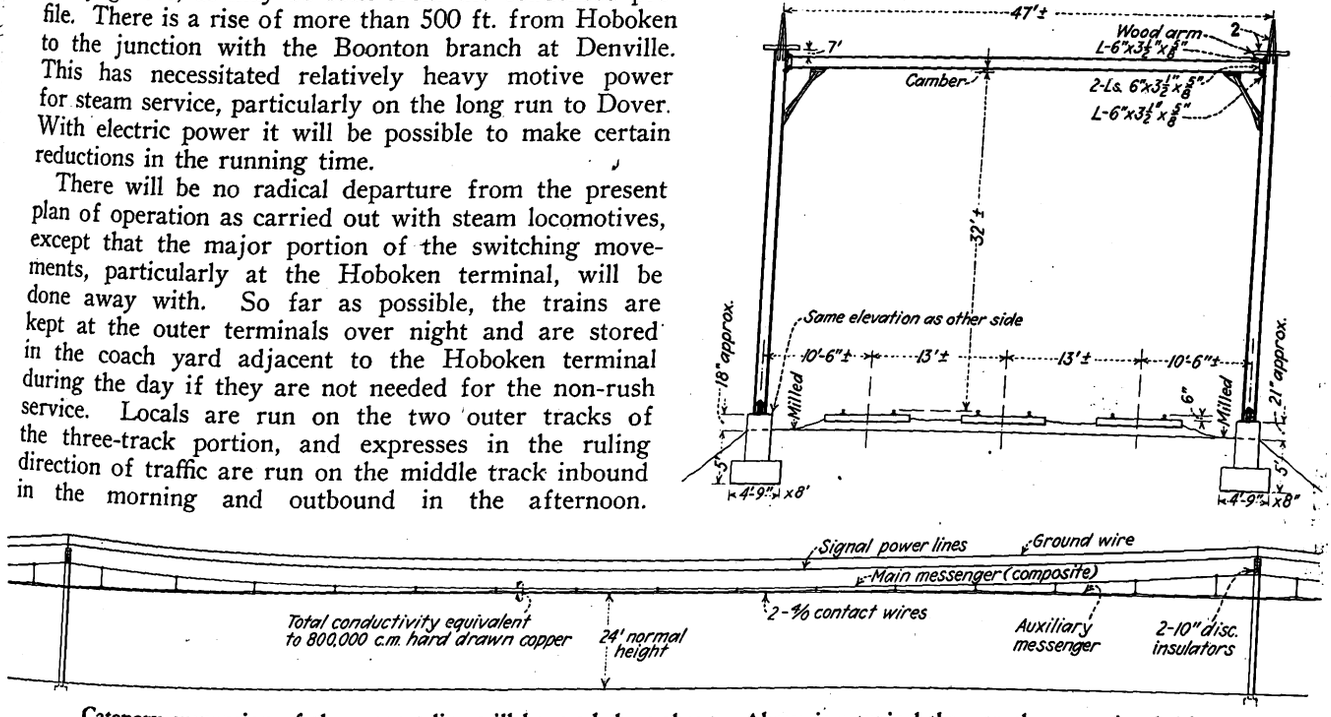
There will be no radical departure from the present plan of operation as carried out with steam locomotives, except that the major portion of the switching movements, particularly at the Hoboken terminal, will be done away with. So far as possible, the trains are kept at the outer terminals over night and are stored in the coach yard adjacent to the Hoboken terminal during the day if they are not needed for the non-rush service. Locals are run on the two outer tracks of the three-track portion, and expresses in the ruling direction of traffic are run on the middle track inbound in the morning and outbound in the afternoon.



Connections of the major electrical equipment are shown in the schematic car wiring diagram

A shed for light inspection will be provided at the Hoboken terminal. Heavy repairs will be made at Kingsland, about 7 miles across the meadows on the Boonton division. This is the main repair shop for the eastern portion of the railroad, so that the added facilities will be kept to a minimum.

Electrification of the Boonton division is not contemplated at present. The greater portion of the business on this line is freight. By far the larger part of the commuting business, as well as most of the through trains, go out over the division which is being electrified. The through trains will be hauled by steam locomotives for the present.



Catenary suspension of the contact line will be used throughout. Above is a typical three-track supporting bridge.

Gross and Net Earnings Are Holding Up

REPORTS of operation of 27 electric railways in the United States and Canada now available show that the revenues are holding steady on the properties included. Out of 23 reports for which comparable monthly figures are given, fifteen companies show greater gross receipts for 1929 than for the corresponding month in 1928. Fifteen of the companies show a reduction in operating expenses for the current year, and eighteen show an increase in gross income after taxes. The disposition of gross income is given for only seventeen of the companies in comparison with last year. Eleven of these show a greater amount available for dividends or surplus.

The best showing is made by the Canadian properties. All the six listed show more revenue this year than last, and every one of them shows greater net. This relatively better showing of the Canadian properties has been commented on previously in this paper. Evidently the causes for it are still in evidence.

The report of the Boston Elevated Railway for the twelve months ended June 30, which is included along with the monthly statement for May, shows a reduction in gross and net revenue, even though operating expenses were lower than for any year since that ending June 30, 1923. The decline in gross, according to a statement from Edward Dana, is continuing and increasing depression in summer riding, and the increase in automobile riding, particularly during the open winter last year. It is pointed out that in spite of the decline in total passenger revenues there has been a substantial increase in weekday traffic for the eight months of the year from October to May, inclusive. Rental charges on rapid transit lines increased by $291,116 this year as compared to last year.

Conference Method Effective for TRAINING EMPLOYEES

Experience of numerous electric railways shows this kind of educational work to be of great value. Methods vary somewhat on different properties, but the basic principle has been applied successfully in transportation, track, overhead line and shop departments

BELIEVING that the efficiency of the human element in electric railway operation is a factor equally as important as the efficiency of the physical equipment, many companies have recently been devoting special attention to educational work among their employees. In these activities the conference method of training has been playing an increasingly important rôle. Among the companies which have successfully used this method are the Milwaukee Electric Railway & Light Company, the Boston Elevated Railway, the Cleveland Railway, The Kansas City Public Service Company, the Northern Ohio Power & Light Company, the Chicago, North Shore & Milwaukee Railroad, the Louisville Railway and the Capital Traction Company. The underlying principle of the conference method of training is that all those present at the meeting enter into the discussion. In this it differs radically from the older and more familiar method of instruction wherein the instructor does practically all of the talking.

Experience shows that a conference can be conducted successfully only with a comparatively small group of persons who have had a similar background. Under these circumstances all take part in the discussion and contribute something from their own personal experience. Such a group can analyze their jobs so as to better appreciate their responsibilities and discover the best way to develop a smooth-working organization.

The conference method has a wide range of adaptability. It has been used most extensively in the transportation department of the electric railways, but good results have been also obtained in other departments. Among the transportation subjects discussed in conferences are accident prevention and safety work, courtesy, fare collection, relations with the public, methods of training motormen, conductors and bus operators, and proper use of equipment. The general subject of the problems and responsibilities of a foreman or supervisor has been discussed on several properties. At Boston, Louisville, Milwaukee and Kansas City the conference method of training has been extended to foremen in the track, power, rolling stock and shop departments.

The size of the group gathered together for conference training varies somewhat on the different properties, but is necessarily rather small. This method of education is adapted primarily to the training of foremen and supervisors, although it has been extended under special circumstances to include trainmen and bus operators. In general, the attendance of the conference group ranges from about 10 to 25 members.

Undoubtedly the success of the conference method of training depends to a large extent upon the selection of the conference leader. He should be a man of proper personal qualifications and should never be one who is in a supervisory relation to the persons who are conference members. It is absolutely necessary that he know the technique of conference teaching, that he have an objective and know how to reach it. At present there are relatively few qualified conference leaders, but the number is increasing steadily with the growing interest in this type of employee training.

The conference method of training has been adopted enthusiastically by the Cleveland Railway as one phase of its educational program. This company has used the group conference idea for training men to avoid accidents, particularly those trainmen whose number of accidents have been above the average. The groups have been limited to twelve and the conference has been conducted by the supervisor of accident prevention, who has had each group discuss an actual accident in which one member was involved. The men have decided who was responsible, what could have been done to prevent the accident and what general standards of operation should be adopted. In the opinion of C. D. Smith, superintendent of the personnel department, the results obtained have been most gratifying.

During the past two years the conference method has been used on the Chicago, North Shore & Milwaukee Railroad in the conduct of two distinctly separate training activities. These are: First, the improvement of standards of personal service on the part of those employees whose duties bring them into contact with the customers, and, second, the development of improved standards of foremanship among those charged with supervising the work of others. The meetings have been in charge of a trained conference leader who gives his whole time to the organization and discussion of the conference group. Every effort is made to get a full and unrestricted expression of opinion from the em-

Digitized by Google

ployees making up the group. Care is exercised that they are given the impression that their knowledge and experience are regarded as having value and that the responsibility for the proper solution of the problem under consideration rests with them. Although it is difficult to measure the results of this training method, the management believes that it has been productive of good results.

At Boston the development of the conference method of training has been an outgrowth of earlier methods which were more in the nature of lectures. In the fall of 1924, group meetings were organized in the four principle operating departments of the company, transportation, track shops and power, as well as a group of women employees. It was early realized, however, that these group meetings did not take full advantage of conference possibilities. More recently the practice has been adopted of holding meetings of the true conference type for men of supervisory rank. According to E. A. Kelly, assistant to the superintendent of transportation, the conference plan has been a marked success. It has caused the men to think for themselves and draw conclusions from their own knowledge of the job. They compare individual experiences and in this way are made to feel that their opinions and suggestions are of value and are given consideration by the officials. The conference gives the employee a renewed interest in his work and makes him feel that he is of importance in the organization. Moreover, much real information and many valuable suggestions have come from the men as the result of these conferences.

The Kansas City Public Service Company at present has four foremen clubs, one each in the equipment, way and structures, electrical distribution and bus garage departments. Each club has its own organization, but nevertheless co-operates with the other clubs. To some extent the activities of these clubs follow the conference method. Their objects are threefold: First, to keep the members in touch with the best modern thought and practice on industrial management and related subjects; second, to provide an opportunity for the exchange of ideas and the discussion of departmental problems; third, to promote social intercourse among the foremen. A man is eligible to membership provided the nature of his work is such that he has foremanship responsibilities regardless of whether he has the direction of only two or three men or a greater number. Also eligible are those closely connected with this work, such as engineers, etc. Each unit meets regularly once every two weeks, from September to May inclusive. The meetings are held on company time. Concerning the results obtained, F. G. Buffe, vice-president in charge of operation, states: "We have found that this is by far the best way to create interest in the work and in the affairs of the company, to improve production and service, to reduce costs and to bring about the friendly co-operation and general good will which are so essential to the successful operation of the property."

The conference method of training was adopted by the Northern Ohio Power & Light Company a little more than a year ago. On this property the attendance is not confined to the supervisory officials, but includes the car and bus operators. According to L. G. Tighe, assistant general manager, the men feel a keener interest in their work when they have an opportunity to discuss their problems and to bring out their own ideas in open and informal meetings. The management feels that the men are ordinarily in closer contact with operations than are the officials and supervisors, and are in a position to develop ideas which will greatly benefit service. It is the belief of the company that the adoption of the conference method by all operating companies will increase the efficiency of the men and reflect favorably on the company, both financially and in the development of good will.

On the property of the Capital Traction Company the conference method as a definite educational procedure was first introduced in July, 1928. Since last fall three series of conferences have been held with: (1) A group made up of division superintendents and assistants, who discussed in particular the hiring and training of car and bus men; (2) A group of shop and roadway foremen, who considered such subjects as foreman's cut orders, building morale, personal relations between foreman and other departments. They take a new interest in their men and handle them better. The appreciation of the value of these conferences is evidenced by the fact that each group has suggested additional present day problems which they wish to handle by this method.

To test the value of the conference training method, the Louisville Railway inaugurated the plan soon after the 1926 A.E.R.A. convention. Conferences are held the second Thursday of each month from 7 to 9 o'clock in the evening. Approximately 40 foremen from the transportation, track, shop, power and line departments attend these meetings. Among the many interesting subjects discussed during the 2½ years that these conferences have been in session are: Carelessness on the job; the importance of reporting all accidents and injuries; an energetic, live foreman will be a good example to his men; how the various departments can be of service to each other; how best to impress on the men the fact that they represent the company before the community; service; safety; how to gain the good will of the public; economy; how can the trainman help the mechanical department? how can all departments help the trainman? how can a man of indifferent nature be made into a good workman? a foreman's responsibility; resuscitation and first aid; fundamentals of personal efficiency; etc.

The company believes that by far the most important benefit derived from these conferences is the genuine spirit of co-operation between departments, which has resulted from the understanding of each other's problems. The necessity for cars to be kept moving on an even headway is no longer considered the problem of the transportation department alone, but, on the contrary, each foreman realizes that it is the problem of every man in the organization. G. B. Powell, superintendent of transportation, believes the foreman's conference has been of great value in the education and development of the key man, the foreman, and the company is looking forward to obtaining new ideas and expecting to develop the conferences into even greater usefulness in the future.

"Advertising to Cure Prejudice"

An extremely interesting story of one railway's unusual publicity campaign—to appear in a future issue.

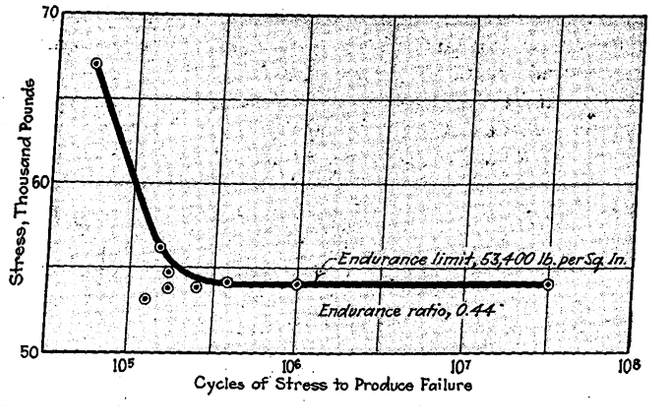
What Happens When Steel Gets Tired

By

D. D. EWING

Professor of Electric Railway Engineering
Purdue University, Lafayette, Ind.



Typical S-N diagram for rail steel. Up to 100,000 cycles the strength of the material decreases rather rapidly

Fatigue of metals is an important factor in failures of track and car construction. This article discusses the causes of the phenomenon and precautions that must be taken in design to minimize the danger. Crystallization is no longer considered the explanation.

IN THESE DAYS when new records of automobile and airplane endurance are being made before the ink used in recording the previous records is scarcely dry, writers in the daily press are fond of remarking about the "tirelessness" of metals and machines. But does metal ever become "fatigued"? If so, what is likely to happen when it is "tired"?

In electric railway operation the materials from which equipment and structures are constructed are often subjected to varying stresses. Car wheels and axles, springs, truck beams, equalizer bars, brake rigging, gears, bolts and studs are all typical elements of equipment which may fail because they become tired. In the track, the rails, spikes, concrete and ties are subject to varying stresses. Trolley wires, span wires, poles and other elements of the overhead system may fail because of fatigue.

What Is Fatigue?

That when animal muscle becomes fatigued it loses strength, is every-day knowledge. Because of the apparent analogy scientists have given the name fatigue to the loss in molecular strength which some metals and other materials suffer under stresses often repeated. That the application of force first in one direction and then in another is more likely to produce failure in a stick or bar than the application of a greater force in one direction only is a principle that was probably known even among the most primitive of men. However, the first recorded work in the way of analyzing the effects of repeated stress seems to be that of a German, Albert, who made some tests on mine hoist chains a hundred years ago.

Wohler, between 1859 and 1870, made a number of investigations which resulted in the formulation of the first really definite notions as to the result of repeated stresses. He found that whereas 800 applications of a stress of 52,800 lb. per square inch would rupture wrought iron, with a stress of 35,000 lb. per square inch 10,140,000 applications were required to produce rupture. From time to time other investigators made contributions to the subject and the theory of the phenomena as held 30 years ago is indicated by the following quotation from a standard text book of that time:

> Rapid oscillations (of stress) cause a change in the molecular structure which impairs the elasticity of the material when such loads are often applied. It is sometimes found that the appearance of a fracture of a bar which has been subject to shocks is of crystalline nature, whereas the same material, if ruptured under a gradually increasing stress would exhibit a tough fibrous structure. Moving loads which produce stresses above the elastic limit cause the wrought iron and steel to become stiff and brittle and hence it is that the working unit stresses should be taken very low.

This theory of fatigue failure came to have wide acceptance. So prevalent is it today that the fracture of a rail, axle, automobile steering knuckle, engine crankshaft or other machine part subject to repeated stresses usually is ascribed to the deadly work of crystallization.

Within the last ten years a great deal of research has been done on fatigue failure, stimulated no doubt by the necessities for new data for use in the design of automobiles, airplanes, steam turbines and other high-speed machinery.

Crystallization Theory Now Rejected

The disclosures of the metallurgical microscope and other developments in the art and science of metallography have led to a complete refutation of the crystallization theory. Under the microscope, wrought iron, steel and other metals are seen to be of granular structure instead of being of smooth and uniform texture. Instead of stresses being uniformly distributed throughout the material, as we are accustomed to think of them, there are actually many irregularities in the stress distribution. The microscope shows that at high-stress concentration points some of the grains of the metal split and slip because there is a non-uniform distribution of stress

Digitized by Google

Under repeated stresses the bond between the parts of the split grains eventually breaks down and minute cracks result. The metal fails by fatigue when these cracks have grown progressively until the remaining sound metal is insufficient to carry the load and a sudden break results. In the fracture the earlier cracked surface is usually somewhat smooth—made so by the crack alternately opening and closing—while the fresh break is rough and crystalline in appearance.

The ability of a material to withstand fatigue may be expressed in either of two ways: (1) The stress at which a material stands up under a definite number of cycles of force application; (2) the endurance limit or fatigue limit, that is, the maximum stress which the material can withstand with an infinite number of repetitions of the stress producing force. Another term much in use is the endurance ratio, which is the ratio of the endurance limit to the ultimate tensile strength of the material.

How Fatigue Data Are Secured

The usual procedure in fatigue testing is to select a number of small specimens of the material to be tested. These specimens are tested one by one in a special form of testing machine which subjects the specimen under test to rapidly repeated stresses, the stress for each specimen being of different magnitude.

For wrought irons and steels, from 500,000 to 5,000,000 cycles of stress may be required to determine the endurance limit, while for cast iron and cast steel over 10,000,000 cycles usually are required. The results of these tests are plotted in so-called S-N (stress—number of cycles) diagram. The accompanying graph is a typical one for steel rails (see Technologic Paper No. 363, United States Bureau of Standards, "Endurance and Other Properties of Rail Steel"). It will be noted that up to 100,000 cycles the strength of the material decreases rather rapidly, while above 500,000 cycles the strength is constant at 53,400 lb.

The reference just indicated sets forth the results of a number of tests on rail steel. The tests were made on specimens cut from the A and B rails of the middle ingots from eleven heats of open-hearth steel. The carbon content of these rails ranged from 0.62 to 0.75 per cent and the manganese content from 0.68 to 0.813 per cent. The data in Table I from these tests are typical of what may be expected from endurance tests on rail steel.

Rails and Car Axles Suffer Fatigue

Steel rails suffer from the repeated stresses set up by the passage of rolling stock over the track. The bearing surface of the rail-head is subject to particularly heavy loading and fatigue doubtless plays a part in such common head failures as surface pitting, transverse cracks, detrusion of the head metal and surface corrugation, as well as in some of the failures of the rail as a whole.

Prof. H. F. Moore, who has had charge of the extensive fatigue investigations being carried on at the University of Illinois during the last ten years, gives the data shown in Table II on car-axle steels (Bulletin No. 165 of the Engineering Experiment Station, University of Illinois).

In these tests the specimens were in a general way similar in shape to a car axle and therefore had somewhat sharp fillets. Sharp fillets produce stress concentrations, and standard fatigue test specimens are designed to avoid such concentrations. Standard specimens cut from the axle of Test No. 3 gave an endurance limit of 35,000 lb. per square inch and an endurance ratio of 0.38. These figures are 46 per cent higher than those in Table II and show the marked effect of specimen shape on the test results.

TABLE I—ENDURANCE DATA ON RAIL STEELS FROM THE MIDDLE INGOTS OF ELEVEN HEATS

Heat Number	Rail	Strength in Pounds per Square Inch: Ultimate Tensile Strength	Endurance Limit	Endurance Ratio
1	A	120,400	47,800	0.40
1	B	119,900	50,400	0.42
3	A	129,750	55,000	0.42
3	B	131,880	54,200	0.40
10	A	132,400	46,200	0.35
10	B	125,650	47,800	0.38
19	A	134,750	59,200	0.44
20	A	115,750	53,600	0.46
21	B	121,500	53,800	0.44

TABLE II—ENDURANCE DATA ON TYPICAL SAMPLES OF CAR AXLE STEELS

Test Number	Chemical Content: Carbon	Chemical Content: Manganese	Strength in Pounds per Square Inch: Proportional Elastic Limit	Strength in Pounds per Square Inch: Ultimate Tensile Strength	Endurance Limit	Endurance Ratio
1	0.45	0.49	57,000	92,000	27,000	0.29
2	0.47	0.66	59,500	100,500	28,000	0.28
3	0.46	0.40	40,800	91,700	24,000	0.26
4	0.62	0.43	53,500	105,100	26,000	0.25

TABLE III—TYPICAL ENDURANCE DATA ON QUENCHED PLAIN CARBON STEELS

Per Cent Carbon in Material	Strength in Pounds per Square Inch: Proportional Elastic Limit	Ultimate Strength	Endurance Limit	Endurance Ratio*	Authority
0.24	47,500	67,500	29,500	0.44	McAdam
0.38	60,000	91,500	33,500	0.37	McAdam
Sorbitic 0.37	80,000	102,600	57,000	0.56	Moore and Kommers
0.49	72,000	126,500	65,000	0.51	Moore and Jasper
1.02	109,000	200,400	105,000	0.51	Moore and Jasper

*Calculated by the author.

From these data may be drawn the conclusion—substantiated by the observations of many other experimenters—that commercial forms are likely to have a lower endurance limit than standard test specimens. Standard endurance limit data, then, represent maximum values. For safety the working stresses should be very much lower than the values of endurance limit as determined on standard specimens.

The first thought of the designer of structures or machine parts is usually to make the design with a certain factor of safety based on the ultimate strength of the material. It appears wiser to use the endurance limit as a basis for the safety factor whenever dynamic loadings must be given consideration.

Endurance Data for Other Steels

Other typical data collected from several sources for plain and quenched carbon steels and for alloy steels are set forth in Tables III, IV and V. Data for cast steels, which are much used in rolling stock parts and as such are usually subjected to dynamic loads, are given in Table VI.

The most common fatigue failure in machines and structures is that from repeated flexure and all the above data were made on specimens subject to reversed flexural stresses.

In some machine parts and structures, the stresses are not completely reversed during a cycle of action but range between a maximum and a minimum. For such incomplete reversal the endurance limit is lighter. Moore and Kommers, in their textbook, "Fatigue of Materials," recommended the following empirical formula:

		Normalized	50,500	89,000	42,000	0.47	

*Calculated by the author.

$$\text{Maximum stress} = S_{max.} = \frac{1.5\,S}{1 - 0.5\,r},$$

where

S = endurance limit for complete reversal;

$S_{max.}$ = maximum stress attained during the cycle;

$S_{min.}$ = minimum stress attained during the cycle (equals $-S_{max.}$ for complete reversal);

$r = \frac{S_{min.}}{S_{max.}}$ (this will be equal to —1 for complete reversal).

When $S_{min.} = 0$, $r = 0$ and $S_{max.} = 1.5\,S$.

When $S_{min.} = -S_{max.}$, $r = -1$ and $S_{max.} = S$.

Thus the maximum stress due to any cause should not exceed 1½ times the endurance limit when the stress varies between zero and a maximum, and should not exceed the endurance limit when the stress reverses during the cycle of action.

Aside from the quantitative data available, the principal facts and conclusions relative to what happens when "steel gets tired" may be summed up as follows:

1. The endurance limit bears a fairly definite relationship to the ultimate strength of the steel. The ratio between these varies from 0.35 to 0.55 for rolled steel and has a mean value of about 0.45. The mean value of the ratio for cast steel is about 0.42.

2. The endurance limit is roughly proportional to the Brinell hardness number—Prof. H. F. Moore suggests that it is equal to 250 times the hardness number for steels below 350 Brinell.

3. Test specimens with nicks, cracks, grooves, sharp fillets, rough surfaces, etc., may show endurance limits 50 per cent lower in value than for standard specimens.

4. The endurance limit is not correlated with the elastic limit or yield point.

5. The endurance limit seems to bear no definite relation to the ductility as measured by per cent, elongation and reduction in area.

6. Chemical composition does not seem to affect fatigue properties greatly except as it affects the ultimate tensile strength.

7. Where localized stresses may exist full-sized shapes have lower endurance properties than the standard test specimens.

8. Stresses above the endurance limit, caused either by a heavy overload applied a few times or a light overload applied many times, reduce the endurance limit.

9. The maximum stress to which a material is subjected should not exceed the endurance limit when the stress is subject to complete reversal, but may be somewhat higher if the stress simply varies from zero to a maximum in one direction.

10. The endurance limit is often considerably below the elastic limit.

11. For ordinary speeds of stress reversal, the endurance limit is independent of the frequency of reversal.

12. Steel which has been subjected to a large number of reversals of a stress below the endurance limit may show a higher endurance limit.

13. Coarse-grained steels and those containing inclusions of foreign matter have lower endurance properties than fine-grained steels.

14. Heat treatment usually improves the endurance properties of steel.

15. The endurance limit is usually higher if periods of rest occur between the loadings.

Trackless Trolley Installed in Japan

RECENTLY two trackless cars were put in service between Shinhanayashiki and Hanayashiki, Japan, by the Hanshin Highspeed Electric Railway, according to the *Far Eastern Review*. This is the first trackless trolley undertaking in Japan. When application was filed in 1925 for permission to operate a trackless car line, there were no regulations to govern its operation. After prolonged consideration by the local authorities, however, it was decided that regulations governing automobile transportation should be applied to the enterprise and the company obtained the franchise to construct the line.

Shinhanayashiki is a newly opened pleasure resort located near the Hanshin Highspeed Electric Railway connecting Osaka and Kobe, and the trackless trolley line was opened to give service to residents and excursionists visiting the resort. The road on which the cars operate has a width ranging from 7 to 10 meters, the average gradient being 1 in 10 and the maximum gradient 1 in 7. Each car will accommodate 28 passengers and is equipped with two 20-hp. 1,500-r.p.m. direct-current motors. It has four brakes; namely, electric brake, contraction system foot brake, expansion system handbrake and center foot brake. Trolley wire suspension is of the compound catenary system. Steel poles, imbedded in concrete on both sides of the road at an interval of 32 meters, were erected as supports.

Following the completion of this line, applications for government sanction for other lines have been filed; one in Osaka, two in Fukushima, eight in Ibaraki, one in Ishikawa, one in Yamanashi and one in Aichi.

Electric Operation Profitable in Switzerland

BY THE end of last year 98.5 per cent of the principal lines of the Swiss Federal Railways had been electrified. Results of operation of the Federal Railways for the year 1928 were very satisfactory, the net profit being 17,000,000 francs. Gross earnings increased from 395,500,000 francs in 1927 to 418,000,000 francs in 1928, while gross expenditure rose only slightly and totaled 254,000,000 francs.

At present two 1,200-kw. rectifiers are installed in the Rockfield station. Space is provided for two additional units

Montreal Tramways Mercury

Results with earlier installation at Verdun prompted the construction of a new station

By

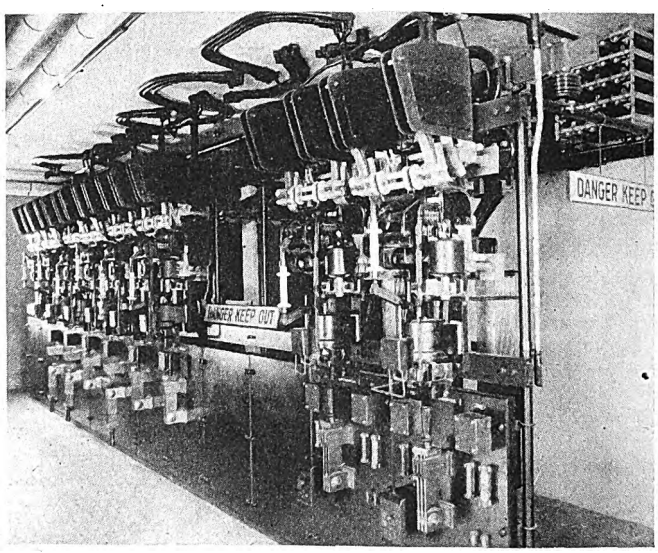
M. L. de ANGELIS

Assistant Electrical Engineer
Montreal Tramways, Montreal, Canada

PROGRESS in the design of rectifying equipment has been so great in the past few years that when, after experience of nearly two years with the Verdun substation, the Montreal Tramways decided to install a second automatic substation using rectifiers it was found possible to make a considerable saving in size and arrangement of the units. The earlier installation was the subject of an article in this paper for April 30, 1927, page 766. Originally two rectifier units, each consisting of two 600-kw. cylinders, were included. Later a third unit was installed, bringing the capacity of the Verdun station up to its designed maximum of 3,600 kw. The dimensions of the building were approximately 37 ft. 6 in. x 79 ft. 6 in. x 34 ft. high, or 28.2 cu.ft. per kilowatt installed capacity.

Before the new Rockfield station, which is located in the suburban town of Ville St. Pierre, approximately two miles west of the Montreal city limits, was designed, the progress in mercury arc rectifiers had been so great that the Brown-Boveri Electric Company, which through Griswold & Company, Ltd., of Montreal, furnished the equipment for both installations, was able to supply rectifiers delivering 1,200 kw. from a single cylinder of a size only slightly larger than that of the 600-kw. cylinders at Verdun. Switching and control apparatus have likewise been refined. It was found possible to construct a building 78 ft. 4 in. x 36 ft. 3 in. x 30 ft. high to house all equipment for four 1,200-kw. units, or a volume of 17.7 cu.ft. per kilowatt of ultimate capacity. At present only two units are installed.

The substation is built of brick with a concrete basement, carefully waterproofed. The main rectifier room is finished in red brick, with concrete floor and roof. The high-tension oil circuit breaker cells and bus structure are along one side of the main room, while the rectifier units are on the opposite side. The circuit breaker cells are built of concrete, and are enclosed at the front by fireproof cell doors. An I-beam supported from the roof immediately over the rectifiers carries a 5-ton chain block for use in dismantling them. The floor of the transformer compartment rests directly on the ground. As the rectifiers are light in weight, no special foundations were needed.



The direct-current feeder switchboard is on the floor directly below the a.c. control board

The basement has a ceiling height of 9 ft. It contains the main room in which are placed the auxiliary devices and the reactors, a furnace room and a toilet. To ventilate the basement there is one large

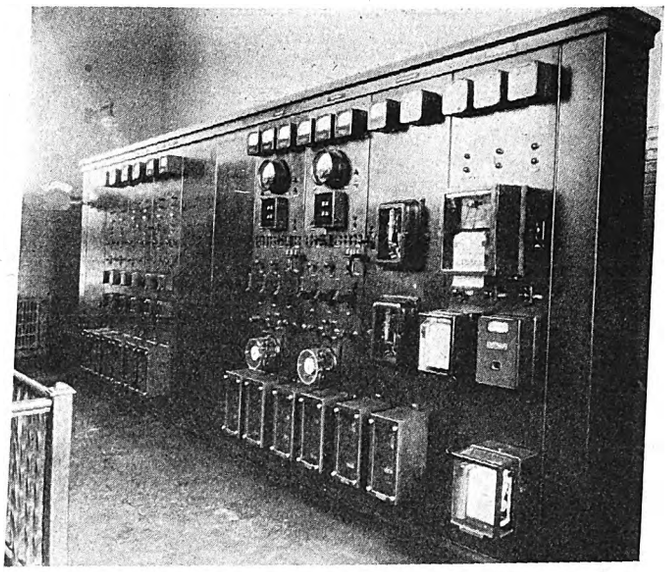
Mer rc Rectifiers



The control switchboard handles all the alternating circuits of the entering lines and the input to the rectifiers. The vacant panels are for two additional rectifiers

opening in the wall, which is equipped with shutters and screens. Flues are provided to exhaust the hot air from the recoolers. The building is fireproof throughout.

Energy at present is supplied by one 12,000-volt three-phase, 60-cycle aerial feeder, but switching equipment is available for an additional one. The oil circuit breakers on these feeders are not of the self-closing type, but must be closed by suitable control switches on the sub-station switchboard.

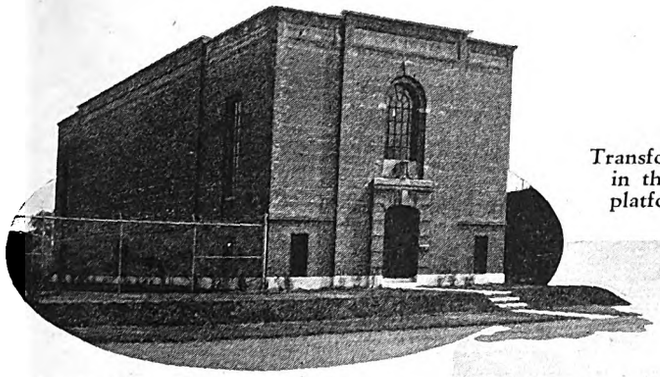
Each rectifier unit consists of one 2,000-amp., 600-volt cylinder fed from a three-phase double-six-phase 12,000/490-volt transformer of the oil-insulated, self-cooled type for outdoor installation, an ignition-excitation set and the necessary vacuum pumps. The rectifier unit weighs 6,100 lb. and the complete transformer 21,200 lb. For feeding the trolley lines there are six 2,000-amp. feeders, with a blank panel for two future feeders.

The rectifiers are cooled by a closed water circulating system, with a radiator-type cooler. Circulation is by centrifugal pumps and blower fans are used to force air through the radiator. The air is taken in from the basement and is discharged through flues from the building. The high-vacuum pumps are cooled with city water, but their consumption is small.

The transformer cells are at the side of the building nearest the rectifiers and are separated from the interior by a fireproof wall. They are roofed over, but the fronts are left open for removal and for ventilation. They are protected with heavy wire screens and may be closed entirely by Kinnear rolling steel doors. Louvers in the walls above the doors, and ventilators in the roof provide for additional ventilation. A feature of the transformer installation is that each transformer is mounted on a truck which runs on a track at the level of the deck of a flat car which may be run on a siding alongside the building.

OPERATING STATISTICS OF ROCKFIELD MERCURY ARC RECTIFIER SUBSTATION, MONTREAL TRAMWAYS, JAN 5 UP TO JUNE 1, 1929

	Unit No. 1	Unit No. 2	Total or Average
Hours of operation	1,548.36	1,598.26	3,146.62
Output in d.c. kilowatt-hours	597,870	594,960	1,192,830
Input in a.c. kilowatt-hours	.....	.....	1,285,480
Average efficiency including all auxiliaries, per cent	.....	.....	92.5
Maximum d.c. load on station, kw	.....	.....	1,210
Water used for cooling high-vacuum pumps, gal.	30,960	31,960	62,920
Time during which units were not available for service, hours	23	0	.....
Time during which units were not available, per cent of total	0.66	0	.....



The Rockfield substation is located in a rapidly-developing section of the city, adjacent to the Lachine canal

Transformers are housed in individual fireproof compartments, with tracks in the floor at the height above the railroad siding of a freight car platform. Kinnear steel doors protect them from the weather

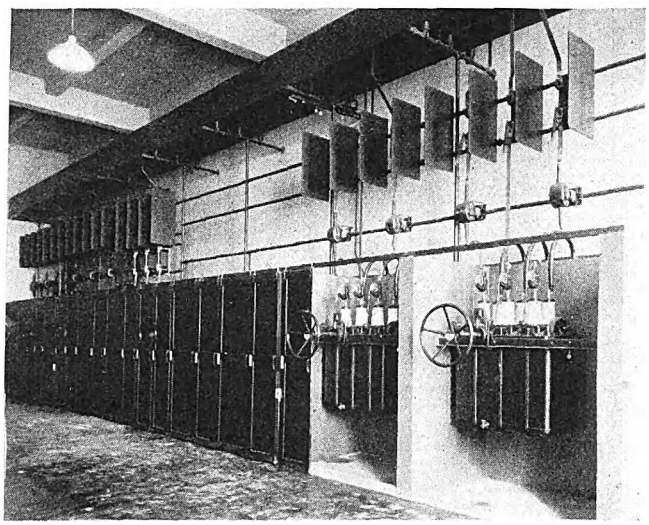
Cross-Section Through Rectifier Room

Cross-Section Through Switchboard Room

Sections through the main rectifier room and basement and through the switchboard room. The a.c. control switchboard is on the main floor and the d.c. feeder board is beneath at the basement level

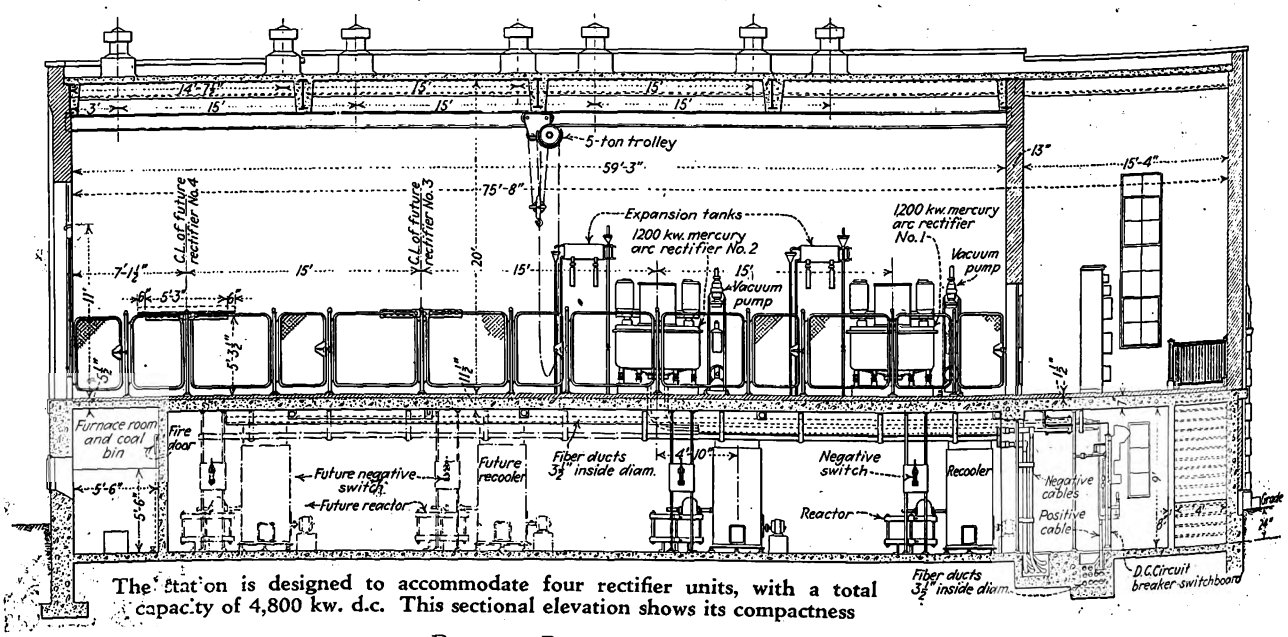


The high-tension oil breakers are housed in concrete compartments in the main room

An innovation in the Rockfield station is that the main control switchboard is in a separate room in the front of the building. It contains the operating switches and automatic control for the entire station, except for the direct-current lines. The feeder board is in a separate room in the basement directly beneath the main control board. The wiring between the two is thus made short and direct.

The equipment is so designed that the station is entirely automatic. It will start either at a predetermined value of 540 volts d.c. on the trolley, by clock or remote control. The sequence consists in closing the high-tension rectifier circuit breaker, starting the vacuum pumps, the ignition and the excitation anodes, and closing the d.c. rectifier breaker on the 600-volt bus. It can be disconnected automatically either at a predetermined low value of about 10 per cent of full load, by clock or by remote control.

The rectifiers are protected against overload, arc-



The station is designed to accommodate four rectifier units, with a total capacity of 4,800 kw. d.c. This sectional elevation shows its compactness

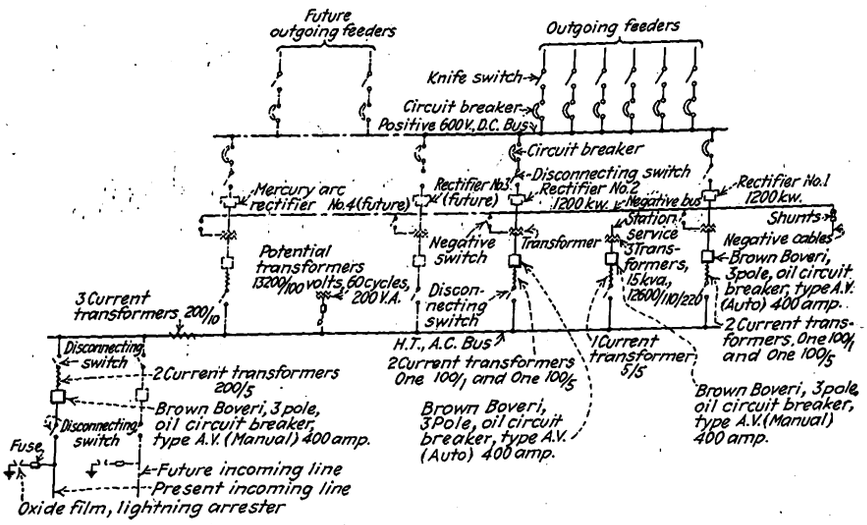
backs, overheating of anodes, failure of vacuum and of cooling water. In the event of an overload or a short circuit the breakers will reclose after each tripping for three times at predetermined time intervals. After this, if abnormal conditions still prevail, the unit or units are locked out. The circuit breaker also will trip and be locked out by excessive heating of the rectifier, by failure of cooling water, by reversed phase or single-phase conditions, or by excessive low vacuum. The plant will not restart until the inspector has reset the lockout switch.

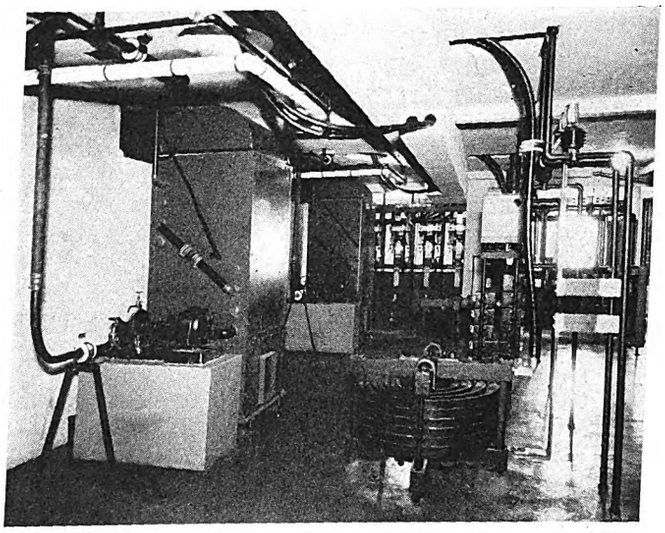
The mercury condensation high-vacuum pumps always are in operation when the rectifiers are in service, but the rotary or roughing pumps operate only according to the degree of vacuum in the rectifier cylinder.



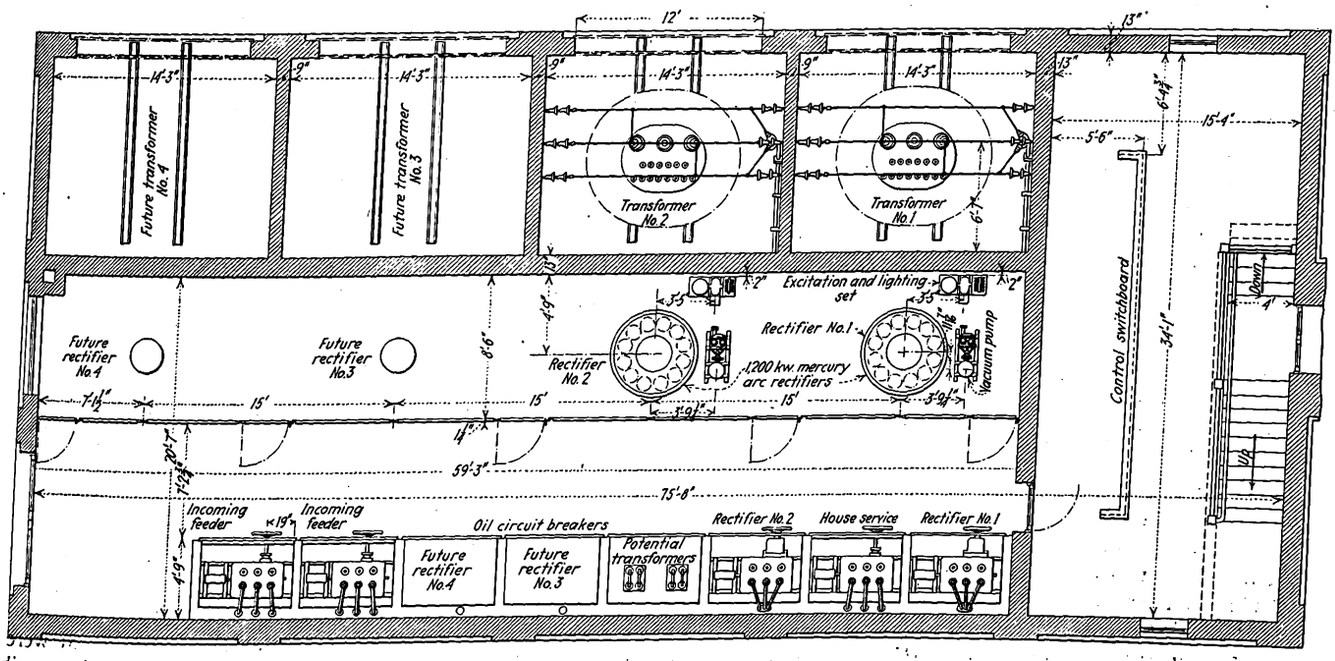
This one-line schematic diagram shows the connections of the two rectifiers installed and the provisions for the two future units. Every effort has been made to keep the equipment simple and reliable

The d.c. feeder breakers are independent of the rectifiers and normally are closed. If tripped by overload or short circuit, they reclose automatically three times at predetermined time intervals. If tripped after the last reclosure they are locked out and must be reset by the inspector.

The station feeds the Lachine and Montreal West divisions of the Montreal Tramways. The building was begun in the spring of 1928 and completed in the fall of the same year. The equipment was then installed and was placed in service on Jan. 5 of this year and has been in service continuously since then, being in operation for 3,146.62 hours out of a total of 3,504 hours of elapsed time. One rectifier has been available for service throughout this period, and the other was out of service 23 hours, or 0.66 per cent of the total time. Because of the present distribution system the station cannot be loaded more heavily, but contemplated changes will in the very near future allot more load to the equipment. Operating statistics are given in the accompanying table.



In the basement are located the recooler, the reactors, the negative bus and the house transformers. The reactors shown in the foreground are to eliminate telephone interference



Plan of the Rockfield substation of the Montreal Tramways. The transformers are in separate compartments, with fire walls between each other and the main operating room. The switchboards are in a separate section at the front of the building by a fire wall

Promotion of

More Profitable Business

Outstanding Topic at C.E.R.A. Convention

MEMBERS and guests of the Central Electric Railway Association assembled at the Golfmore Hotel, Grand Beach, Mich., on June 27 and 28 for a convention, which was one of the most interesting and profitable meetings ever held by the association. The sessions were all well attended, and much interest was shown in all the papers presented. The outstanding feature of the two-day program was a symposium on the promotion of more profitable business, sponsored by D. R. Thomas, president of the Electric Railways Freight Company. Papers on the fundamental problems of the industry and subjects of special interest gave the program excellent balance. The sessions were presided over by President L. M. Brown, vice-president Interstate Public Service Company, Indianapolis, Ind.

The symposium arranged by Mr. Thomas was participated in by seven speakers, who developed the subjects of urban railway business, freight business, truck and trailer interurban operation, express service and advertising. The first paper of the group, on "Promotion of More Profitable Urban Railway Business," was presented by R. N. Graham, manager of railways Penn-Ohio System, Youngstown, Ohio. Mr. Graham pointed out the various factors that have been responsible for the large increase in revenue on his system, emphasizing particularly the results of instituting the weekly pass. He stated that the most logical way to build up more business was to encourage riding in the off-peak hours, when the cars usually carry light loads, by offering the public this service at a more attractive rate. Mr. Graham pointed out the effectiveness of the weekly pass in building up this off-peak riding and how it was proving a time saver to both the patrons boarding the cars and the operators. He also asserted that the pass was serving as a good-will builder for his company.

"The promotion of a more profitable freight business for the electric railway means the promotion of a more profitable service for the customer. Business means service, and unless service is rendered there will be no business—and by service is meant actual performance and not clever conversation." Developing this thought, Frank W. Gerlach, assistant to the president Electric Railways Freight Company, Cleveland, Ohio, pointed out that it is necessary for the electric railways to render the service required by the public in a more satisfactory manner than can be rendered by any other carrier. According to Mr. Gerlach, to meet fully the freight transportation requirements of the public and to promote business in the greatest degree, the electric railways must do one or more of the following things, dependent upon the local conditions affecting the operation of each company:

1. Co-ordinate rail and truck operation, so as to serve off-line points, these truck lines to be used as feeders for the electric railway lines.
2. Provide the shippers and consignees with pick-up and delivery service.
3. Render container service to attract the higher class commodities now carried by truck companies.
4. Encourage the development of carload forwarding companies that will specialize in handling business over the electric railway lines.
5. Take advantage of profitable opportunities to co-ordinate electric railway facilities with those of steam railroad, water navigation and airway companies.
6. Operate freight trains on limited passenger train schedules.
7. Fix the departure of trains at hours most suitable to the shipper, and maintain a force at terminals to meet requirements of the shipper and consignee.
8. Develop the initiative and promotional ingenuity of the sales organization and station agents.
9. Utilize the purchasing power of the company.
10. Improve the appearance of electric railway freight equipment.

Development of an extensive truck and trailer operation in southern Michigan, as well as between Flint, Saginaw and Bay City, by the Southern Michigan Transportation Company, was described by G. W. Quackenbush, traffic manager Michigan Railroad, Grand Rapids, Mich. Mr. Quackenbush could not give a comprehensive report as to the operating efficiency of the system nor figures as to the value of traffic handled, since the new service was instituted only recently, but he did give a clear picture of the character of service offered and the extent of the company's system.

Revenue Possibilities in Express Service

Real express service on electric railways was the subject of a paper by F. W. Brown, general manager Electric Package Agency, Cleveland, Ohio. Mr. Brown explained the character of the service which his company offers and pointed out that real express service is a distinct field, entirely separate from and non-competitive with any other class of service offered by electric railways. He showed that the service could be instituted practically on almost any interurban system and outlined the many advantages of such an express service. An abstract of the paper accompanies this report.

"It is axiomatic," stated W. S. Rodger, traffic manager Eastern Michigan Railways, Detroit, Mich., speaking on the subject of public demands on our transportation system, "that our patrons are demanding speed, safety and comfort from transportation companies in a constantly increasing manner. The demands made upon us for improvements," he continued, "may be the result of our competitors stepping faster than we do and inaugurating methods, which we have silently realized were desirable, but which were withheld from adoption until we were forced to do so, because of inertia or lack of

Digitized by Google

capital. It is also true that competitors have been stirred to action by our efforts. The continued advancement that is being made in our industry is the result of development by all who are engaged in it, and it is up to us to keep at the head of the parade of progress if we expect to succeed and get our share of the constantly increasing volume of traffic which is offered for handling by some means or other. We cannot afford to sit idly by and let the private automobile handle the passengers or the highway truck handle the freight."

The final speaker of the symposium on the promotion of more profitable business was Labert St. Clair, di-

Real Express Service Offers Revenue Possibilities

By F. W. Brown
General Manager Electric Package Agency
Cleveland, Ohio

ELECTRIC railways, keen for new sources of revenue, will find in express service a source entirely undeveloped and with very promising possibilities. With proper encouragement and development it can be made into a profitable activity, not competitive with any other class of service but bringing new shippers into the fold and creating entirely new revenue.

Express service must not be confused with fast freight. It is a different class of service, to serve a different class of shipper. It's the terminal service on shipments and other special features that distinguish it from freight service. The two services do not conflict in any way, and the demand for one is not satisfied when supplied with the other. The public has more in mind when demanding express service than rapid movement between two points. It may have in mind the free pick-up or delivery at point of origin or destination, or that such pick-up would be made long after freight houses are closed, or delivery at destination for an early market, also long before freight shipments would be available. Again, it may desire that the invoice price of the shipment be collected before the consignee can get possession, it might carry an unusual value making insurance desirable or the shipment may be routed over a transfer point, in which case there is often 24 hours quicker service by express than by freight. These are some of the features that the public quite likely has in mind when demanding express service.

The pick-up service at point of origin gets to the small shipper who does not maintain his own truck. It is usually cheaper to call for the express company than to hire a truck to take the goods to the freight house. It also furnishes service without regard to the closing regulations of freight houses.

Delivery service at destination is another feature which the freight department cannot supply at the rate charged for freight transportation. Delivery at 4 a.m. on the market, often with C.O.D. collection to be made, department store purchases of the previous night that must be at the door when the store is opened the next morning, and delivery of individual packages are examples of service that would be impossible by freight.

The classification provided by the express companies permits of the handling of shipments without the same rigid requirements as to containers and packing insisted upon by freight. Trunks and suitcases are handled under a seal, household goods without the necessity of crating and boxing as when sent by freight, and the higher rate secured for the service is based on those conditions.

A great many C.O.D. shipments are handled where the collections are small, and other times when they run into a large amount, but with the rapid movement of shipments by electric freight it is impossible to get an order bill of lading through the bank as soon as the shipment reaches destination. Therefore the handling of C.O.D. shipments by express allows the shipper to get his merchandise to the consignee and collection of the charges at the same time. It also provides an additional source of revenue in the return of money to the shipper.

Ordinary express rates are based on a valuation of $50, and if the shipment carries a greater value an additional charge is made. Therefore, it is possible for a shipper to place the true value on his shipment, pay the necessary fee and have the merchandise insured.

Express rates are usually of two classes, first and second, the first class rate being approximately three times that of first class freight and the second class rate about 25 per cent less than first class. Food products generally fall into the second class.

Express service as described is offered on the electric railways operating into Cleveland and on some of their connecting lines by the Electric Package Agency, which started its service at Cleveland more than 25 years ago, long before freight service was provided on these lines. When regular freight service was instituted the Electric Package Agency continued to serve as an express carrier only. It now provides almost identically the same service on the electric lines over which it operates as the American Railway Express provides on steam railroads.

Complete merchandise express service is provided by the Electric Package Agency over the lines of the Lake Shore Electric Railway; the Cleveland, Southwestern Railway & Light Company; the Northern Ohio Power & Light Company; the Pennsylvania-Ohio System; the Stark Electric Railroad, and to Detroit over the Eastern Michigan lines. It is an entirely separate organization, the directors being the managers of certain of the lines over which it operates, but its management, accounting, supervising and soliciting are entirely separate.

Under the contract with the railways every phase of the service except the actual transportation between point of origin and destination and the station service at such points is performed by the Electric Package Agency. This includes responsibility for shipments between shipper's door and warehouse at point of origin and after received from the railway at destination, supervising, soliciting, advertising, auditing and costs of necessary supplies. The railway receives a shipment from a driver at a point of origin, bills it on an Electric Package waybill and delivers it to a driver at the destination, who collects charges and returns same to the agent. Thus the service performed by the railway is less than for interline or local freight shipments, as no accounting, except that of the local agent, is required, nor is warehouse storage space needed. The average rate received by

Trucks used by the Electric Package Agency for the collection and delivery of express shipments in Cleveland

the railway for this service is 1½ times first-class freight rate on local shipments and above first-class freight rate on interline shipments. Each railway is furnished a settlement report by the 15th of each succeeding month, together with a check for its proportion of earnings.

The advantages of express service may be summed up as follows: The rates charged are the same as those of the old line express company, which are about three times first-class freight rates and, after deducting the cost of the extra terminal service, leaves to carriers a rate per 100 lb. above first-class freight rate, about double the average per 100-lb. rate received for freight shipments. The service adds new business at this high rate which cannot be secured unless you supply all of the features of this class of service, and which the shipper is paying for but finds is essential. It does not conflict with any other class of business you are now handling, either "dispatch freight" or regular freight with free truck service for large shipments. It does not add greatly to operating costs, and in many cases adds nothing at all. It adds a new shipper to your line, who brings the business to your warehouse and takes it away promptly, thus not congesting your terminal, and it pays you liberally and well for your service.

rector of advertising American Electric Railway Association. Mr. St. Clair confined his remarks to the securing of newspaper publicity, advertising that does not cost. He stated that the public is interested in stocks and business at the present time, and that newspapers are anxious to receive public utility news. Have a reporter call if you have something of interest for the newspaper, was the advice of Mr. St. Clair. He urged that all contributions be made brief and suggested as likely material, speeches, live pictures and editorial thoughts.

Likening the flat and cut rate taxicab operations in the country to a virulent disease with the unhealthy ability to spread throughout the country with disastrous results, H. A. Inness Brown, editor of *Taxi Weekly*, urged that the electric railways co-operate with the legitimate metered taxicab companies in battling this evil. Mr. Brown indicated that the present expansion of cut rate taxicab operation is similar to the jitney peril, which so seriously injured the electric railways several years ago, before being forced out of business. Mr. Brown's paper appears in abstract below.

"One of the foremost problems facing the street railway industry is the formulation of its policy with regard

Flat and Cut-Rate Taxicabs a Serious Menace

By H. A. Inness Brown
Editor "Taxi Weekly"

FLAT and cut-rate taxicab operations, in spite of being basically unsound, constantly demonstrate the unhealthy ability of a virulent disease to spread throughout the transportation system of this country. There is nothing really new about this disease. The railways had an attack of it just about fifteen years ago. At that time it was called the "jitney peril."

The street car companies, being unprotected by proper legislation, were seriously injured by these jitneys, some of them being actually forced out of operation. Gradually, however, by drawing public attention to the menace, and by obtaining proper laws against such unfair competition, the jitneys were forced to discontinue. But before such legislation could be obtained hundreds of thousands of dollars had been lost by the street car companies as well as by the jitney operator.

Meanwhile the taxicab business developed. Companies built up good service and a following by furnishing comfortable, standardized cabs with capable, polite drivers. They created the measured mile so that the passenger might pay at a reasonable rate for the actual transportation used. The tendency was to complete personal service with better taxicabs and better drivers.

From 1914 to 1928 the legitimate cab companies prospered. They attracted capital. They made friends. It looked as if nothing could wreck or hurt the business. But in the business itself there were growing up a number of men who knew nothing about costs but who saw an opportunity to "put over something" on the old-time taxicab operator. The taxicab business was suddenly subjected to a similar disease as that which attacked the street railway companies in 1913. Here's how it occurred:

In the spring of 1927 a cab driver in the city of Rochester, N. Y., who had been discharged by his employer, conceived the idea of establishing a cab company which would operate upon rates of fare much lower than those in existence. He received credit from pleasure car dealers, from the tire companies and from the gasoline and oil people. He brought his cabs out at a cut rate of 25 cents and obtained a great volume of business immediately—some of which came from former taxicab patrons of the legitimate taxicab company and some of which came from the street railway company.

All of this business, however, was obtained at a loss and the company was finally abandoned and its promoter had to go elsewhere. Either through his own efforts or through some of his friends, he established, however, other cab operations in Syracuse and Utica. The idea began to spread. Money, taxicab drivers were told, could be made by operating at cut rates. Almost immediately cut-rate operations started in various parts of the country, most of them being financed by pleasure car dealers.

While this Rochester operator did not make money for himself he had caused great losses to the legitimate cab business in the various cities where he had started operations, often forcing the legitimate cab company to reduce its prices so that it in turn competed with the street car companies for riders. For a brief time, it looked as if this new sort of flat-rate operation was profitable. The cars were new and they needed little attention. Soon, however, depreciation began to get in its work—and the cab companies, including those started by the original promoter, began to look for a way back to higher rates and measured miles.

A good example of the outcome of this type of operation is afforded in Columbus, Ohio, where, after a comparatively short period, three companies went bankrupt and Cy Hill, the driver who introduced the flat-rate cabs, left town. His company was overwhelmed in debt, his drivers unpaid, judgments unsatisfied and his cabs worn out. The legitimate cab companies lost money by the invasion and the electric railway suffered a severe reduction in revenue during the period.

But the picture of Columbus might well be the picture of any reasonably large town in America. More than 100 cab companies, which attempted flat rates in the last year, are now in the process of reorganization or liquidation.

It is unfortunate that these failures are not solving the problem of cut rates. Promotions of cut-rate cabs are still going through the country. These promotions are based on the product of one of the largest cheap car manufacturers in America. The method is to offer the cabs for sale to the legitimate cab company. If this company cannot buy them, because they are unsuitable to cab operation, the automobile company's representatives then offer them to the drivers or form a company to operate them at a rate below the standard. The result is a taxicab operation below costs—a taxicab operation that offers a ride at street car prices—a taxicab operation that makes no money but makes everyone in the transportation business lose money.

This problem may seem to be only a taxicab problem. But is it really limited to taxicabs? Has it any effect on the revenue of the street railway company? I believe it has a devastating effect. In Seattle, for instance, the electric railway there reported a loss of $800 a day, due to flat-rate operation. In Columbus a 25 per cent reduction in the number of street car riders occurred during the height of the flat-rate war at a cost of about $20,000 a month to the railway. In Providence the railway said that unless something was done to give them protection from flat-rate taxicab operators that they would be forced to abandon their franchises. In Worcester a similar condition existed, while in at least five other cities of reasonable size, including Richmond, flat-rate operation caused a loss of from $250 to $2,000 a day to regular street car lines.

138 Cities Have Cut-Rate Cabs

Cut rate operations, running at rates per person below the fare on the electric railway lines, have been established in Dayton, Columbus, Akron, Cleveland, Providence, Boston, Baltimore, Rochester, Richmond, Charleston, S. C., San Francisco, Seattle, San Diego, Cincinnati, Louisville, Detroit and 122 smaller cities.

In the West there is one cab company, operating at an extremely low rate, that is planning operations throughout the West and Middle West at rates below the cost of operation. This company's plans, as announced to the public, included the establishment of cut-rate cab companies in small cities as well as larger centers. They state frankly that their form of operation, which gives only transportation to the passenger, without any frills, is likely to cause the legitimate cab company great loss in business. They are after volume—the greatest number of riders at the cheapest possible price. This is vital news. It means that something must be done to prevent a new crop of cut-rate cabs.

The only real solution possible is protective legislation. And such legislation, if it is going to be really protective, must be sought by the electric railways as well as the taxicab companies. The cut rate business hurts the railways as much as it hurts the taxicab man. The taxicab company can meet the competition by cutting rates, but the railways must keep the same rates and fight the competition by the best possible service. If they are going to have the competition of the converted pleasure car or jitney lines, they must find some means of fighting it.

In the wake of flat-rate operations follow bankruptcy petitions, greatly increased traffic hazards, violations of municipal and state laws, demoralization of the transit lines, and an increased volume of rides at a loss. These are facts that force the thinking men in the taxicab business and in the electric railway business to realize that something must be done.

Digitized by Google

to bus operation." With this statement, Thomas Fitzgerald, vice-president Pittsburgh Railways, Pittsburgh, Pa., launched a discussion on the fundamental principles involved in determining the bus policies of an electric railway. "The adoption of a hard and fast policy," Mr. Fitzgerald continued, "is believed to be impracticable, if not impossible. If we grant that the success of policies of public utilities in a large measure are dependent upon meeting and satisfying public opinion, it is self-evident that the bus policy of an electric railway must be adapted and adaptable to changing public opinion. Such a policy should be sufficiently flexible to meet the changing conditions not only in the field of bus operations as they develop, but in the field of electric railway operations as well."

In reviewing the elements which have contributed to the problem of determining the proper bus policy, Mr. Fitzgerald first pointed to the development of automotive vehicles and their effect. He held that it would be unwise to assume that the time has come to determine upon a definite policy toward the bus, in view of the continued expansion of the automotive industry. He warned that if railways continued to offer street car service, which is generally very little different from that offered to a former generation, and if at the same time, bus facilities and service are developed rapidly along modern lines, the effect on the public attitude must be unfavorable to the railway and favorable to the bus.

Mr. Fitzgerald named economy, through which more frequent car service may be provided, speed, reliability of service, greater comfort and elimination of noise as necessary elements in improving the railway service. He stressed the fact that public attitude toward electric railway management, over a long period of time, is based upon the efficiency with which the service is rendered. "This efficiency," he stated, "is directly dependent upon the financial strength of the electric railway, and the management, therefore, must preserve the financial and physical condition of their facilities to obtain success. From this viewpoint, the indicated policy toward the bus operation is that of employing the bus only when the results contribute to the economic well-being of the railway and bus facilities combined." Mr. Fitzgerald listed the fields in which the bus has been demonstrated to be effective and other developments that hold promise.

John R. Blackhall, general manager Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., speaking on the subject of improved interurban operation, named as the three main factors to consider in the operation of an interurban railroad the public, the employees and the investors. "If these three factors," he stated, "are constantly kept in mind by the management, operation will be reasonably successful, unless there is something basically wrong in the rates or financial structure of the organization and the location of the property." It is Mr. Blackhall's opinion that convenience of service is the strongest selling point the interurban railroad can put forward when bidding for the patronage of the public. He defined convenient service as transporting people from where they are to where they wish to go, with safety and comfort, in the shortest possible space of time—but above all, at the time they wish to go. He stressed the importance of making a thorough study of the traveling habits and requirements of the people in the communities served and scheduling trains to meet their requirements in the best possible manner. "The next important thing," he said, "is to see that the trains make the time shown on the time-table."

Expanding on the second factor, employees, Mr. Blackhall stated emphatically that it is impossible for the management of a company to give the public satisfactory service without the active co-operation of the employees. He told of the training given North Shore employees in the handling of customers, and stressed particularly the developing of interest in this work by continuing the training after the preliminary work. Mr. Blackhall told also of the training given North Shore employees in selling rides. He emphasized the point that employees cannot be expected to sell the service without the necessary training to equip them for that work.

"Make your product purchasable without petty irritation and through a price plan that automatically incites voluntary use of your service" was the advice of Walter Jackson, consultant on fares and motor buses, Mt. Vernon, N. Y., for winning and holding customers. Mr. Jackson referred to "habit-creating" fares as essential, along with improved equipment and service, in attracting patrons, and cited the merits of the weekly pass that make it an effective ride promoter.

Three Bus Sizes Meet Most Needs

In answering the question, "What size bus is best suited for city transportation?" Del A. Smith, general manager Department of Street Railways, Detroit, Mich., divided all regular bus lines into three general classifications and gave the type of bus considered best for each class of service as follows:

1. For light, feeder and shuttle service, as well as short extensions into thinly populated territory and outlying districts, the small 21-passenger bus is satisfactory because it makes possible the maximum frequency of service at the minimum cost per mile, providing no extreme peaks are encountered.
2. On secondary or medium lines which have a considerable volume of traffic with a fairly heavy peak load, the 29-passenger bus is desirable and economical because of the greater passenger appeal afforded without seriously lengthening the headway.
3. For main trunk lines and lines where the population is pyramiding or wherever extreme peak loads are encountered, the single-deck street car type bus seating 40 passengers is justified, because it has been proved that the operating cost per mile is but 50 per cent more than for the 21-passenger bus and about 25 per cent more than for the 29-passenger type, giving twice the seating capacity and room for four times as many standees as the 21-passenger unit. In short, the 40-passenger single-deck bus is preferable in service approaching mass transportation.

Mr. Smith also referred to special classes of service, such as de luxe express operation and the use of small capacity buses to replace jitneys. The paper was presented by Homer E. Libby.

The requirements of modern automatic control, as listed by B. O. Austin, control engineer Westinghouse Electric & Manufacturing Company, in his paper, are variable tractive effort, quick response to any change in the controller handle position, smooth and rapid acceleration, effective notching, ability to stop and hold the control at any point, adaptability to foot and hand operation, non-interference with safety devices, simplicity and reliability. Mr. Austin named the fundamental advantages of automatic control as variable automatic accelerating rates, maximum operating efficiency, foot control and low operating cost. Mr. Austin's paper was discussed by W. A. Clough, railway and bus equipment engineer, General Electric Company.

A golf tournament on the afternoon of the first day was the high spot of the entertainment program. At the banquet held the same evening, the entertainment was furnished by the South Shore Chorus, "Mary and Jim," popular radio artists, and a première danseuse from Chicago. Following the banquet a dance was held.

Interior of new Detroit car

Speedy Light-Weight Car Built at Detroit

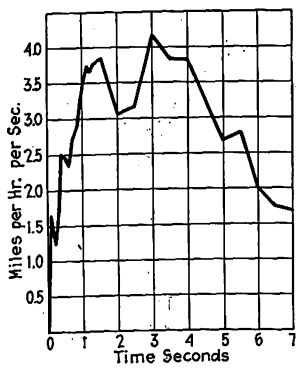
Design of experimental vehicle includes extensive use of aluminum. Four high-speed 50-hp. motors are mounted on Timken trucks

LIGHT WEIGHT, rapid acceleration, and high free-running speed are features of an experimental car recently built by the Department of Street Railways, Detroit. Factors which have contributed to keeping down the weight are: Light-weight motors and trucks, reduced amount of steel framing in car body, absence of heavy brake rigging, use of aluminum as the material for the trolley pole, bumpers, door engines, air compressor and piping.

	New Car, Pounds	Old Car, Pounds
Car body weight	19,400	21,320
Trucks	9,280 (incl. gears)	9,940
Motors	3,820	5,240 (incl. gears)
	32,500	36,500 lbs.

In general, the car follows the Peter Witt design now standard on this system. Four Westinghouse 300-volt 60-hp. motors are mounted on Timken model 52 trucks. General Electric 16-point automatic control is used. The following comparison shows where the reductions in weight have been made.

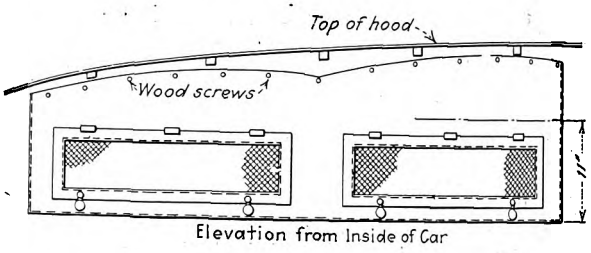
Preliminary tests show this equipment to produce an acceleration rate of 4.18 m.p.h.p.s. in the first three seconds. The acceleration is of such a smooth character as to cause no inconvenience to the passenger, although he cannot fail to notice the speedy action of the car. The numerical value of the rate of acceleration has been determined by the use of a Cambridge recording accelerometer, and a typical acceleration curve is shown in an accompanying illustration.



Rapid acceleration shown by tests of new Detroit car

The braking system is straight air but has the novel feature of using a foot-operated brake valve of the G. E. VB-2 type. This is a balanced air pressure valve and gives an operation akin to that of braking an ordinary automobile. The pedal is spring controlled and may be locked in the application position. The air brake piping is made of dead soft aluminum tubing. The radiating coil for the air brake system is made of a finned type of pipe recently designed by the Peter Smith Heater Company. It possesses the advantage of reduced weight, less internal friction and simplified installation.

The body is of steel construction and uses U-shaped posts and carlines. Wooden post fillers are not used but aluminum post facing of a section shown in an accompanying sketch. The seating arrangement is much the same as previously used except that cross seats have been substituted for longitudinal seats in the forward section. The seats are of an individual type and are deep upholstered with cushioned backs, giving the maximum of seating comfort. The upholstery is Delft blue leather which, with mahogany woodwork, makes a pleasing combination.

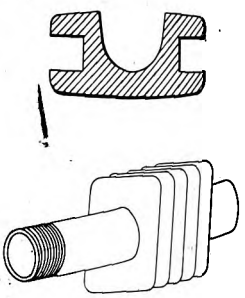


Novel devices included in design

Above: Ventilated cover for door engine allows warm air to circulate around apparatus and prevents freezing in winter.

At right: Cross-section of aluminum window post facing.

Below: Finned pipe radiating coil for braking system.



As a departure from customary practice on this property a single sash was substituted for the usual upper and lower sash, and as the post centers were increased from 29¼ in. to 33½ in. the sash is wider, thus improving the appearance of the car. A wide bottom sash rail was used and into each was fitted an individual ventilator. Forced ventilation is used, following a design developed by the Peter Smith Heater Company. With this system air is admitted to the car through intake ventilators on the roof and exhausted through four grilles distributed in the floor. The exhaust is accomplished by means of a motor-driven exhaust fan suspended under the car floor and connected to the floor grilles by flexible metal tubing.

Reduction of unsprung weight is one of the most important of several noise reduction features that have been included in the design, others are worm gear drive, rubber spring supports, rubber motor supports, rubber mounting of air compressor and trolley base, and sound insulating of the floor with felt. The operation of the car from the noise standpoint has proved highly satisfactory.

A.I.E.E. Discusses

Railway Electrification

At the transportation session during the Swampscott convention the Mexican Railway electrification, contact wire wear and substation design were important topics

PROMINENT on the program of the summer convention of the American Institute of Electrical Engineers, held at Swampscott, Mass., June 24-28, was the subject of transportation. The committee on that subject, headed by W. M. Vandersluis, presented a report showing the progress of electrification of steam railroads during the year. Reference was made to the projects of the Pennsylvania Railroad, the Great Northern Railway, the Cleveland Union Terminal Company, the Reading Company, the Delaware, Lackawanna & Western Railroad, the Boston, Revere Beach & Lynn Railroad and the city of Rochester. These have been mentioned in this paper from time to time. Diesel-electric locomotives, rail cars, supervisory control for substations, mercury arc rectifiers and high-speed circuit breakers are also included among the developments of the year.

Four papers of interest to electric railway engineers were presented. These covered the electrification of the Mexican Railway, contact wire wear on electric railroads, an alternating-current electric railroad substation of the Pennsylvania, and the direct-current substations supplying the Illinois Central. Brief abstracts of these papers follow.

Mexican Railway Electrification Discussed

The paper on this subject, by J. B. Cox of the General Electric Company, gives operating results of the electrification of the Mexican Railway, Ltd., which was the first railway built in Mexico, having been opened to traffic on Jan. 1, 1873. The main line runs between Mexico City and Vera Cruz and is 264 miles long. There are six branch lines which increase the route miles to a total of 482. The most difficult portion of the line consists of 19 miles of 4.7 per cent grade between Encinar and Boca del Monte, where the table-land is reached. In 1921, when the road was returned to its owners following five years of government operation, the property was found to be in unsatisfactory condition, with operating expenses more than doubled, thereby increasing the operating ratio from 0.51 in 1924 to 0.79 in 1920. Higher wages and new working agreements were largely responsible and continued to become more difficult. The mountain division had about reached its maximum capacity with the existing equipment, making it necessary to consider improvements.

A study of the operating costs of this section was made in 1921, from which it was apparent that electrification would relieve the congestion and make it possible to more than double the capacity of the line and at the same time make a yearly saving of $523,000 in operating expense. The electrification was estimated to cost $2,420,000, thus indicating a return of 21 per cent on the gross investment including electric locomotives, in addition to the increased capacity and many other advantages.

Construction work was started in January, 1923, and electric operation between Orizaba and Esperenza was complete in January, 1925. The total cost for the 29-mile section was $2,427,480. Internal disturbances delayed the work several months and reduced the traffic greatly. In March and April, 1928, the traffic became comparable with that of September and October, 1921, for which period the actual traffic records and operating costs with steam had been used as a basis for comparison with the estimated cost of an equal traffic with electric operation.

In the meantime the general results had been so satisfactory that the electrification was extended 35 miles south to Paso del Macho, making a total of 64 miles at a cost of $3,606,937.

The system is operated with 3,000 volts direct current, supplied from a simple catenary system with double No. 0000 trolley wire on the main line and single No. 0000 trolley in yards and passing tracks. There are two 500,000 circ.mil positive feeders and one No. 0000 negative feeder between Orizaba and Boca del Monte. Originally a single substation was installed near Maltrata, being almost in the center of the feeder circuit. This station contains two 3,000-kw., 3,000-volt, three-unit synchronous motor-generator sets for supplying power to the original 29.5-mile electrification. With the extension of the electric zone to Paso del Macho, making the total length of route approximately 64 miles, a second substation was installed at Portrero. This contains two 1,500-kw. units which are similar, except for size, to the original equipment. Both stations are supplied with power purchased from the Puebla Tramway, Light & Power Company at 42,000 volts, 60 cycles.

The initial installation included ten locomotive units suitable for handling both passenger and freight trains. They are of the twin-geared six-motor articulated-truck type, capable of operating at a maximum speed of 40 m.p.h. and provided with equipment for regenerative electric braking. The motors are designed for 1,500 volts per commutator, two being permanently in series.

The Orizaba-Esperenza section has now been in complete operation electrically since January, 1925, and the full records for four years are available. During March and April, 1928, the traffic reached a new maximum

Digitized by Google

which was in excess of that which was attained with steam. Briefly, the ten electric locomotives handled 36 per cent more tons than were handled by more than double the number of steam locomotives in September and October, 1921, with 8 per cent less trains and 40 per cent less train-hours on the road, and at 50 per cent of the corresponding total cost of steam operation for 26 per cent less tonnage. The saving was $67,102 for the two months, or at the rate of $402,612 per year, which alone represents more than 15 per cent on the total gross cost of electrification. This does not represent the total saving, as labor costs had increased sharply in the meantime. When the costs were adjusted to equal traffic and equal wages, it was shown that the equivalent costs for steam service would be $1,068,000 per annum and the electric costs $404,652. The indicated annual saving is thus $663,348, as compared with an estimate of $523,029.

Securing Flexibility in Contact Line

In his paper on contact wire wear on electric railroads, I. T. Landhy, assistant engineer Illinois Central Railroad, described the contact systems of several electrified roads. Flexibility in the contact plane is important, he held, and it can best be secured by staggering the points of support of the contact wire with respect to the messenger, while at the same time damping out the unwanted harmonic wave ahead of the pantograph by means of as high a tension in the contact wire as it will permit. Pantograph design resolves itself into a judicious composition of the following essentials: (1) Sufficient current-collecting surface; (2) lightweight moving parts; (3) sufficient uniform upward pressure; (4) freedom from friction in the bearings. Intrinsically, he said, lubrication plays an important rôle in reducing wear. On long tangents where the contact wire is in the middle of the pantograph the greater part of the time, the lubricant becomes depleted and wear is increased. On curves where the pantograph is wiped across the contact wire the wear is less, the lubricant from the ends of the pantographs being distributed over the whole surface. A comparison of contact wire measurements shows that there is approximately 30 per cent more wear on tangent track than on curves. The experience of the New Haven has been that, generally, the higher the speed the less the wear of the contact wire. The effect of contact wire wear of current collected is not so well known, but the general impression is that the greater the current the greater the wear.

Substations of the Illinois Central and Pennsylvania Described

J. V. B. Duer, electrical engineer Pennsylvania Railroad, described one of the a.c. outdoor substations supplying 11,000 volts single phase for the Philadelphia-Wilmington electrification. In this station all apparatus is in the open except the control board, which is located in a house designed for the purpose.

The railway substations for the 1,500-volt d.c. electrification of the Illinois Central were described by A. M. Garrett, engineer of substations, Commonwealth Edison Company. These substations, owned and operated by the Commonwealth Edison Company and the Public Service Company of Northern Illinois, receive the 60-cycle energy for conversion to direct current from the 12-kv. transmission system of the former and the 33-kv. system of the latter power company. Approximately 80 per cent of the conversion capacity is in synchronous converters and the remainder in mercury rectifiers. The decision to use rectifiers for a part of the load can be assigned to several reasons, principal among them being that this new type had the natural advantage which a unit with no moving parts has over one with rotating parts and wearable and friction surfaces. Other reasons included high efficiency with fluctuating loads, absence of noise and vibration, low maintenance expense, and the elimination of extensive ventilation facilities.

Discussion of the papers presented was called for en bloc by Chairman N. W. Storer, of the Westinghouse company, who presided. Prof. D. C. Jackson of Jackson & Moreland, Boston, commended Mr. Cox's paper because of the cost data included in it.

General Discussion Shows Interest in Electrification Problems

Sidney Withington, electrical engineer of the New Haven road, said the data presented by Mr. Cox would be more convincing if contrasts were made between the most modern steam locomotive power units and electrical equipment. The economies of superheaters, feed water heaters, etc., should be taken into account in modern comparisons. Referring to Mr. Landhy's paper, he said that it is still a question whether to lubricate the railway trolley wire or the pantograph shoe. It may be necessary to utilize some auxiliary moving part on top of the pantograph in order to cut down vibration. Chromium plated material may be useful in future pantograph design. Observation of trolley wear on the Providence-Fall River, Mass., electric branch indicates increased wear on sections of the line leaving stations, heavy accelerating currents being taken from the wire on these stretches.

C. S. Anderson, American Brass Company, pointed out that from 15 to 20 per cent less wear is being secured with cadmium-copper bronzes than with tin-copper bronzes. The former do not become brittle or "hot short" when overloaded.

Major E. L. Moreland, Boston, raised the point that the use of one vs. two contact shoes on pantographs deserves more thorough study in relation to wear. Several speakers maintained that the use of two shoes insures better contact, but the cost of such practice in terms of increased wear was not definitely acknowledged. Most of the speakers preferred two shoes.

W. B. Potter, consulting engineer General Electric Company, said that the electric locomotive presents the greatest problem in railroad electrification from the cost standpoint, in many cases running between 40 and 50 per cent of the total cost of electrifying. He said further that the mercury arc rectifier will be utilized more widely in the future, perhaps being available for 5,000-volt d.c. service in time. The unidirectional characteristics of its output make it promising in electrochemical applications. The future of railroad electrification is very bright, Mr. Potter declared.

In the closing remarks by the authors, it was brought out that the use of high towers by the Pennsylvania Railroad electrification was predicated by the spacing required for 132-kv. transmission. Mr. Garrett pointed out that a good deal remains to be learned about the operation of mercury arc rectifiers, including study of their interior performance, possible improvements and limitations. Results thus far obtained are good, but the subject is not a closed book.

Transmission and axle overhaul is kept separate from motor rebuilding in New Haven bus shop of the Connecticut Company

DAILY CHECK

Shows Condition of Bus Fleet

Comprehensive reports keep Connecticut Company officials well posted concerning condition of equipment. Inspection and maintenance work is done at 15 operating garages. All overhauling is done at the New Haven shop on unit replacement basis. Painting not synchronized with overhaul.

MAINTENANCE of buses operated by the Connecticut Company is based on a mileage system, with the exception of painting, which takes place on an average of once every 12½ months. In order to know exactly when a bus has traveled the required distance for motor overhauling or general unit changes, the comptroller's office keeps accurate records of the distance traveled by each vehicle. When a bus has completed the specified mileage the maintenance department is informed promptly and it is taken out of service.

Experience has convinced the management that it is a good policy to overhaul the various units at predetermined intervals. One of the first requirements in keeping a bus constantly available is that any defect, however small, is brought immediately to the attention of the repair force. To accomplish this, the company has designed a "Motor Coach Defect Card" which is issued to each driver before he starts on his daily run. On this card, the various parts of the bus are listed under fifty-seven headings. Should a defect occur the driver indicates the item by a punch mark on the card, adding any other information which he deems necessary regarding the trouble. At the end of his daily run this card is deposited in a box in the garage. It is collected by a member of the shop force who repairs the item indicated, and, at the same time, notes this fact on a "Motor Coach Inspection Record," which is kept for each bus.

When the bus has traveled 2,000 miles, this record of repairs is used as the basis for inspection. The bus is thoroughly gone over and all defects which have developed since the last 2,000 mile inspection are carefully checked to see that the respective parts are in proper running condition. At every 2,000 mile inspection, this record is compared with the previous one to see if certain defects have recurred. In such instances this is investigated and particular care is taken that the same

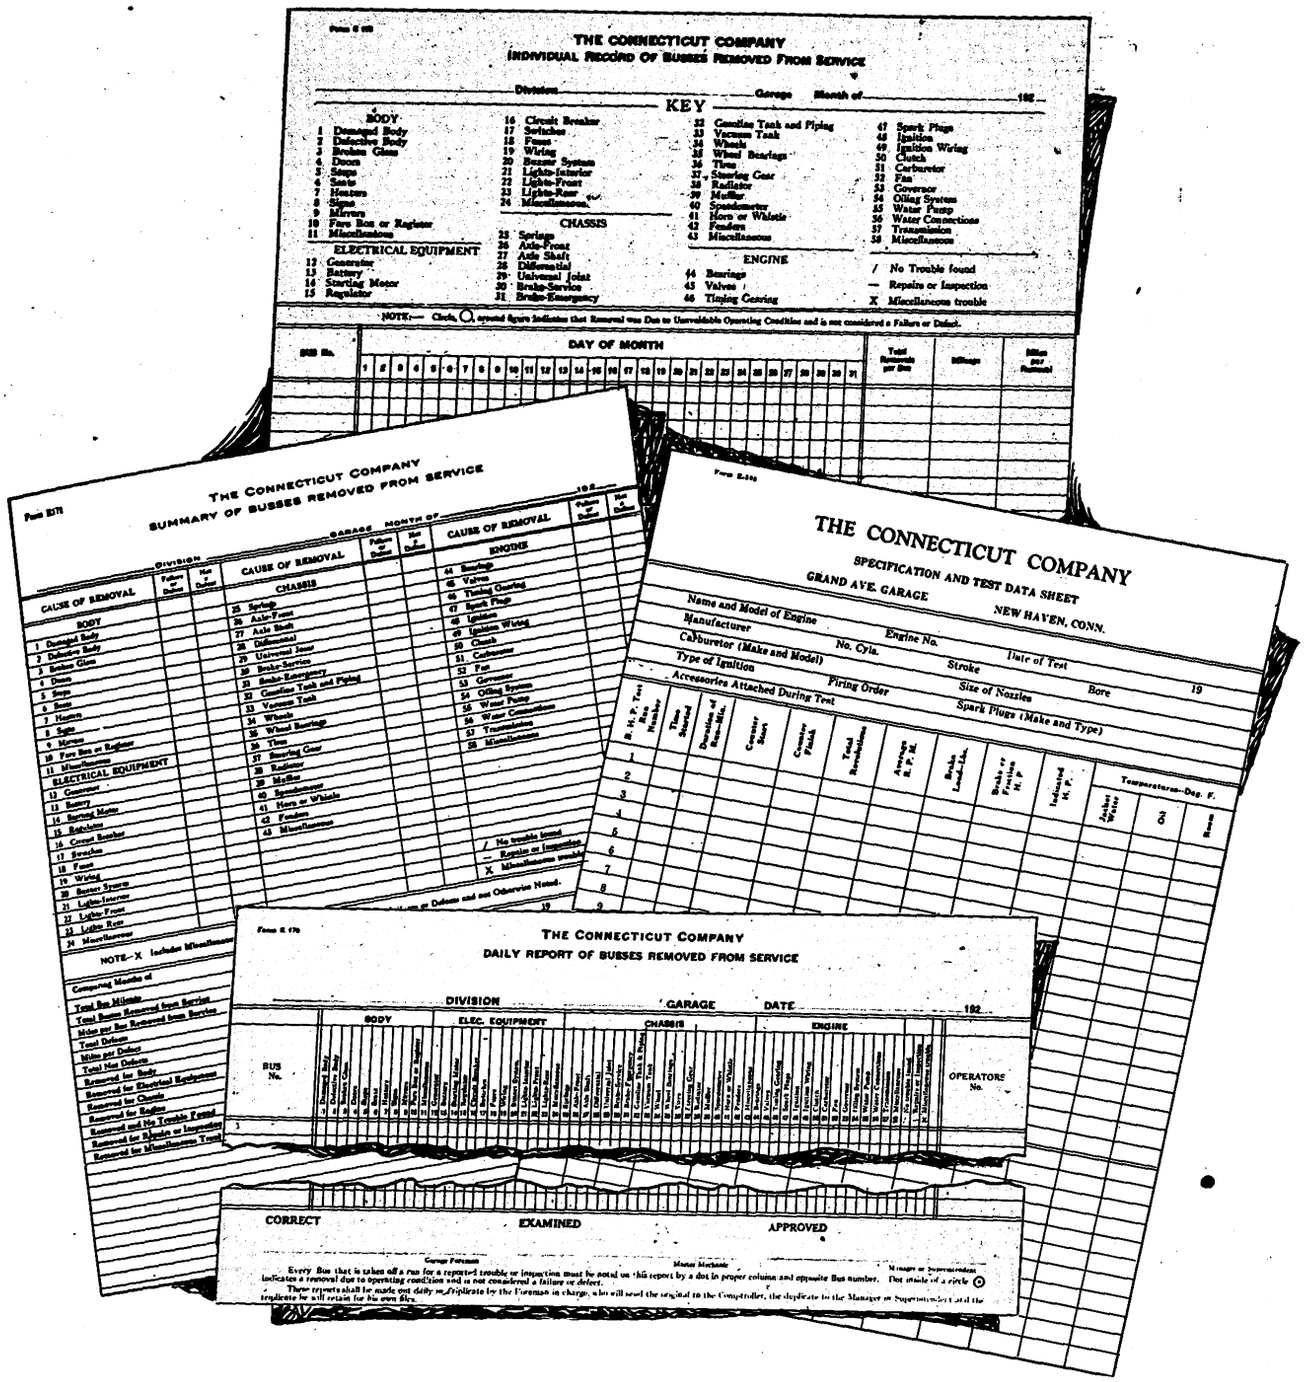
Close check of the condition of the buses is maintained by a detailed record system

Digitized by Google



Forms used for recording information on buses removed from service, and a sample specification sheet

defect does not occur again. These records are kept for three years in order to have available at any time the written proof of the durability or weakness of the various parts of the bus.

Besides keeping the coach continually in first-class running condition by repairing all minor defects, the company recognizes the necessity of reconditioning the motor at intervals independent of the general overhaul or unit change, which takes place after every 75,000 miles of operation. Due to the different construction of the sleeve-valve motor and the poppet-valve type, the removal of carbon from these two types of engines takes place at different intervals. Best results are believed to be obtained when the cylinders are cleaned and the valves reground in the poppet-valve motor after every 10,000 miles and cylinders cleaned in sleeve valve engines every 20,000 miles.

When the carbon has been removed and the valves reground, the master mechanic notifies the maintenance department, which advises the office of the comptroller that the bus has been put in service. He also requests to be notified when that bus has traveled another 10,000 or 20,000 miles, depending on the type of motor. The report sent by the maintenance department to the comptroller's office with the information when a particular bus should be brought in for reconditioning of motor is called "Motor Coach Mileage Report for Valve Conditioning and Carbon Removal," and the notice sent by the maintenance department to the master mechanic is called "Notice of Coaches Due for Valve Reconditioning and Carbon Removal."

When a coach has traveled 75,000 miles, it is considered necessary to take it out of service for a complete unit charge, and the auditing department sends the

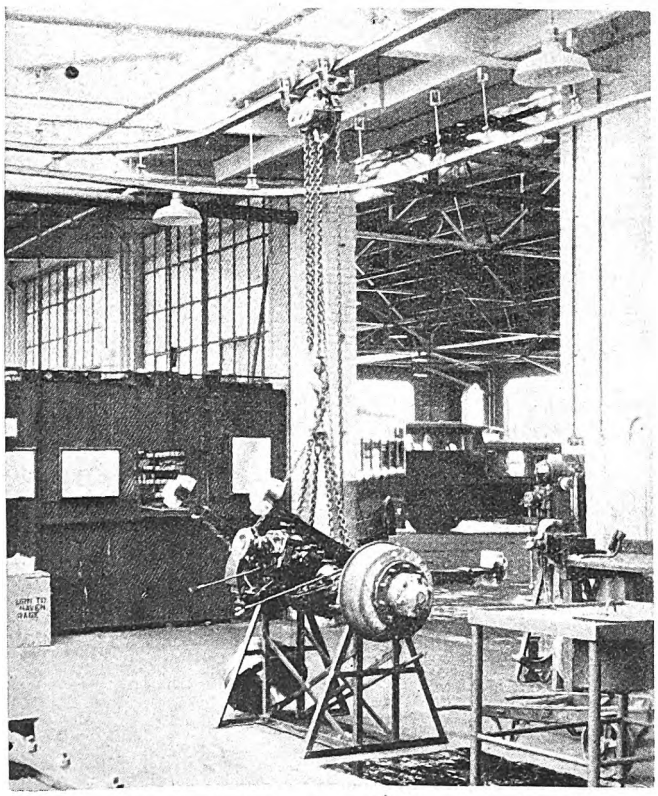
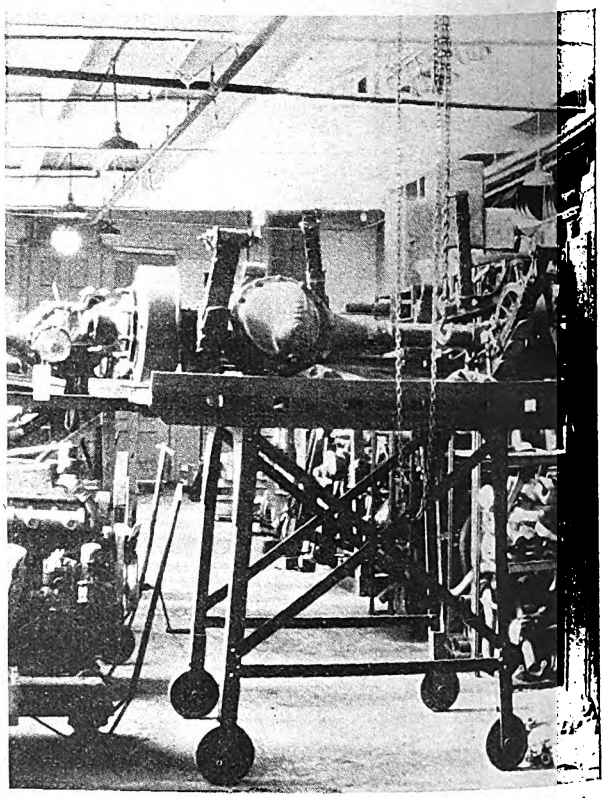
"Motor Coach Overhauling Mileage Report" to the maintenance department, advising that a bus has traveled the specified distance. The maintenance department then notifies the master mechanic in whose division the bus operates and instructs him to take this vehicle out of service and send it to the central repair shop in New Haven.

All necessary repairs are made there, while anything which has been brought to the attention of the division repair force at the 2,000 mile inspections is again carefully gone over to insure that recurrence will not take place. All units such as steering gear, motors, front axle, rear axle, transmission and differential are removed from the bus and replaced by reconditioned units from the storeroom. By following this method, the time out of service is reduced to a minimum. When the bus is finally O.K. for service, it is sent back to its division, and the maintenance department informs the comptroller's office of this, to enable them to keep a record and to advise the chief engineer of power and equipment when the bus should again be taken out for a reconditioning of motor or an annual overhaul. The maintenance department keeps a record of any unit change which takes place and a so-called "Unit Change Slip" is filled out by the foreman in whose shop the change takes place, giving all the information required. In this manner, a careful check is obtained on the performance of all units in operation on the entire fleet.

In order to keep fully posted on the efficiency of the various division repair shops, the company has a number of so-called "floating inspectors" who ride the buses and bring any irregularity to the attention of the master mechanic responsible, while a copy of their daily findings is sent to the main office. Besides filling out this so-called "Mechanical Inspectors' Daily Report," they make



Rear axle completely overhauled and ready to be taken to storeroom



Motor and axle assemblies are stored on specially designed carriages with the motor under the axle

Digitized by Google

a report on each bus they ride, noting the defects observed and the action taken. Independent of the maintenance department, the chief engineer of power and equipment is informed daily by the transportation department which coaches have been held in the garage for more than 24 hours.

A report is received daily of the total number of buses removed from service and an individual record is kept also of buses removed thus indicating weak points in the upkeep of the rolling stock. A list of all buses removed from service is kept for each month, and the chief engineer can thus determine immediately why the buses are kept out of service and detect any laxity or inefficiency in maintenance work.

The units changed after the completion of every 75,000 miles are thoroughly overhauled and parts which require repair are replaced by those which have been reconditioned or are new, so that the bus will be available again in the shortest possible time. Replacement units are kept always available in the central repair shop storeroom. These include engines, transmissions, steering gears, front axles, rear axles and differential assemblies. Should an emergency call come in from one of the divisions for a replacement unit prior to the 75,000 mile overhaul, it can be shipped immediately and the damaged unit sent to the repair shop where it is overhauled and put into the storeroom. Before an engine is again O.K.'d for service and placed in the storeroom, a thorough test is made on the dynamometer.

The layout of the shop is such that the least possible time is required for the conveyance of units from the buses to the various places in the shop where the units are to be repaired. A monorail hoist system beginning at the platforms where the buses are overhauled, conveys the units taken out to the repair bays and through a switch system. The unit can be brought either to the left or the right side of the repair shop for repairs.

Painting of the buses is done entirely independent of the central repair shop. In the territory where the buses operate there are in all five paint shops. In New Haven this takes place in the paint shop of the carhouse. A bus is given one to three coats of paint depending on its condition and dried in a specially designed electrically heated shed, described in the April 28, 1928, issue of the ELECTRIC RAILWAY JOURNAL. By this means it is possible to turn out a completely repainted job in three days, thus reducing considerably the time required for this kind of work, which formerly was about six days.

Cleveland Railway Wins Company Prize in Maintenance

Company prize for year, three of the four departmental certificates of merit, the individual cash prize of $200, and three of the quarterly prizes go to Cleveland. Other awards made to the Cincinnati Street Railway and the San Diego Electric Railway

FAR outdistancing all competitors, the Cleveland Railway was pronounced by the judges to be the winner of the company prize in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest for the year ended July 15, 1929. The prize, a handsome bronze and silver plaque, is presented to the company which has contributed most to the advancement of maintenance practice through participation in this contest. Not only did representatives of the Cleveland Railway win the company trophy, but also a majority of the departmental awards for the year, and the individual cash prize of $200. The interest felt in this contest by all the various departments is shown by the fact that the quarterly prize in the way and structures department was awarded to a Cleveland man at the end of each of the three three-month periods.

In the bus and garage department, two quarterly prizes went to Cleveland, as did two prizes in the electrical and line department. No other company won more than one quarterly prize except the San Diego Electric Railway, which was awarded a prize in the bus and garage department for the first period, and a prize in the rolling stock and shops department for the second period. This company was the winner of the certificate of merit in the rolling stock and shops department. In the other three departments, the certificates of merit went to Cleveland.

After careful consideration of almost 200 articles submitted in the contest, the committee unanimously agreed on the award of the cash prize of $200 to Joseph Croyle, for his article "One Man Tie Nipper," published in the April issue of the JOURNAL. A close competitor for this prize was the article "Efficient Methods Developed for Stringing Trolley Wires" by Angus G. Scott, assistant superintendent of overhead lines of Cleveland, which received honorable mention by the committee. Both of these articles are the result of the experiences of the writers in the maintenance work of the track and overhead line departments, and show clearly the valuable results that can be accomplished by men who do not merely follow routine methods, but try to improve the quality of the work done and to save the company expense.

How Cleveland Won the Company Trophy

WHEN the Maintenance Contest was started this year, the president of the Cleveland Railway, J. H. Alexander, sent out a letter to all department heads calling their attention to the terms of the contest and the desirability of making a special effort to not only win as many individual prizes as possible, but to earn the trophy for the company as well. The interest in the contest was further stimulated by discussion of the subject at meetings of the company's contact club, comprising executives, department heads and junior department heads, which meetings are held at irregular intervals for the purpose of keeping the organization familiar with company policies and at which time speakers discuss subjects of common interest.

That the result has more than justified the effort is well evidenced by the fact that the company was awarded seven prizes out of a possible twelve in the three groups of the contest; that it received three out of a possible four departmental certificates; that it earned the individual cash prize and honorable mention for the entire year's contest and was awarded the company trophy. The result emphasizes the *esprit de corps* which exists in the Cleveland Railway's organization and shows clearly what can be accomplished when an organization works whole-heartedly as a unit behind its executive head.

Prizes Awarded for Third Quarterly Period

PRIZE winners in each of the four departments for the three-month period ended July 15 were selected at the same time. In the department of rolling stock and shops the award was made to E. J. Jonas, superintendent of equipment Cincinnati Street Railway, for his article "Car Body Turn-

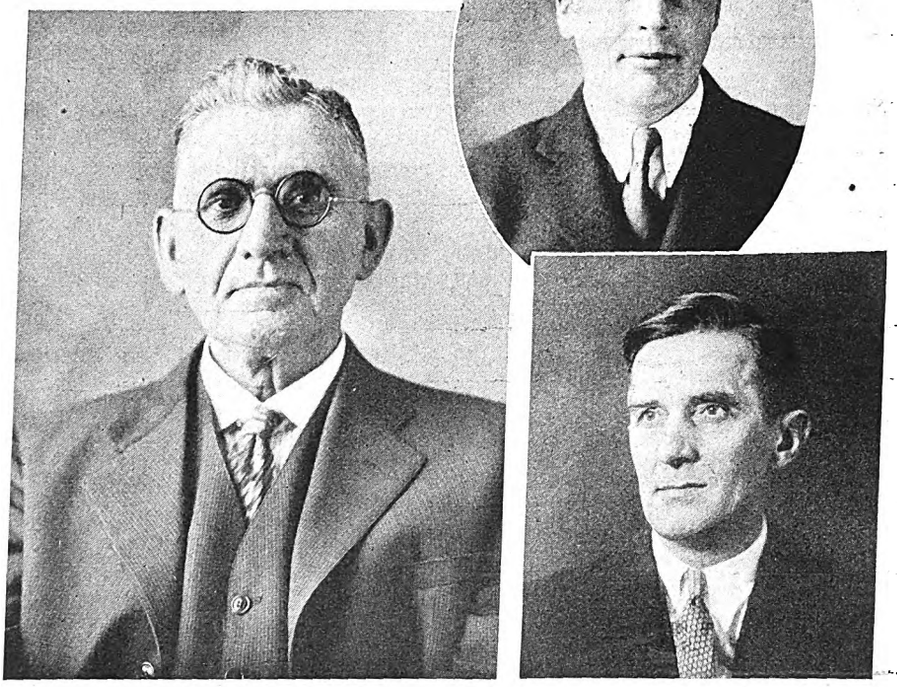
over Truck." A. G. McIntosh, superintendent of track Cleveland Railway, was awarded the prize in the department of way and structures for his article, "Safety Ground Device for Electric Equipment." In the electrical and line department, the prize went to Angus G. Scott for his article, "Efficient Method Developed for Stringing Trolley Wires." Leonard S. Rose was awarded the prize in the bus and garage department for his article, "Pit Jack for Removing Bus Transmission Units." All of these articles are published on the following pages in this issue.



Joseph Croyle (In Oval) Angus G. Scott Leonard S. Rose

A Worthy Trio of the Cleveland Railway

THE individual cash prize of $200 for the best single item submitted in the maintenance contest was awarded to Joseph Croyle, track foreman Cleveland Railway, for his article "One-Man Tie Nippers," published in the April issue, page 550. An article giving a description of Mr. Croyle's career appeared on page 673 of the June issue.

The departmental prize in the third period of the Maintenance Contest for the electrical and line department was awarded to Angus G. Scott, assistant superintendent of overhead lines, for his article entitled "Efficient Method Developed for Stringing Trolley Wire." An article describing the career of Mr. Scott will be found in the June issue, page 673.

In the bus and garage department the prize of the third period of the contest went to Leonard S. Rose, assistant superintendent motor coach department Cleveland Railway, for his article "Pit Jack for Removing Bus Transmission Units." A biography of Mr. Rose will be found on page 673 of the June issue.

Emil John Jonas

BORN in Cincinnati, Mr. Jonas was thrown on his own resources at an early age, and had to provide for his own living as well as his education. The latter was made possible by attending the night classes of the Ohio Mechanics Institute for several years. At an early age he was attracted to transportation, especially in connection with the slow-moving cable cars on which he sold newspapers. After he gained a vast amount of practical experience at Chester Park during a year with the St. Louis Street Railway as chief electrician, he went back to the Cincinnati, Georgetown & Portsmouth Railroad as superintendent of power and roadways at the time of its electrification. During his twenty years of service in various capacities with the interurban lines, much pioneering work was done in developing a demand for domestic and industrial electric service in Clermont and Brown Counties. Seeking a larger field, he joined the ranks of the then Cincinnati Traction Company in 1922.

When operation of this system was taken over in 1925 by the Cincinnati Street Railway, Emil John Jonas was assigned to the position of superintendent in charge of rolling stock and shops. His most notable achievement in this capacity was the designing and equipping of the new Winston car shop, which has been accredited by prominent equipment men as being the last word in shop design.

Emil John Jonas

Andrew G. McIntosh

ARRIVING in this country from Scotland in April, 1913, Andrew McIntosh started immediately to work for the Cleveland Railway as welder and on the maintenance of equipment. From 1917 to 1919 he was foreman in charge of welding and burning for the American Ship Building Company in Cleveland, and from 1919 to 1921 Mr. McIntosh was foreman in charge of electric welding for the American Steel & Wire Company. Returning again in 1921 to the Cleveland Railway he became equipment foreman of the way department. He has charge of all electric and thermit welding, burning, spot welding and grinding; also, the maintenance and operation of equipment, such as concrete mixers, concrete breakers, tampers, plows, rollers, sand-drying and sand-blasting machinery, etc., are under his supervision.

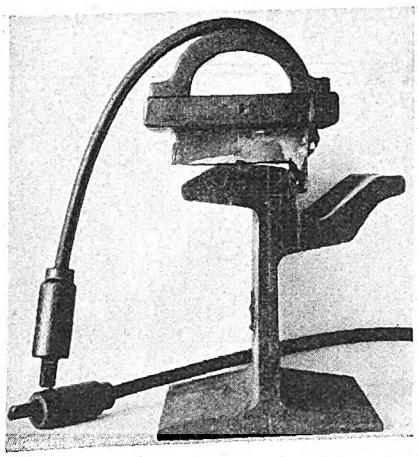
Safety Ground Device for Electric Equipment*

By A. G. McIntosh
Superintendent of Track Equipment, Way Department, Cleveland Railway

EXTENSIVE use of electrically-operated equipment on track work of all descriptions emphasizes the need for a safe grounding device. A new type of safety ground has been designed and used successfully



Safety of trackmen is promoted by use of this grounding device

by the Cleveland Railway. It consists of a wrought-iron plate as a contact shoe to which is fastened a ¾-in. fiber top, somewhat larger over all than the iron shoe, for protection from the latter. The handle is made of fiber and all screws are countersunk and the holes filled with sealing pitch. A 12-in. length of lead wire passes through the fiber top and is fastened to the iron contact shoe, terminating in a connecting plug. The wire leading from the machine being operated is equipped with a receptacle into which this connecting plug is inserted, so that the contact shoe may be changed from one machine to another without disconnecting the wire from the machine. This ground can be used on either T or grooved girder rail, and can be made in any machine shop at a very small cost. It can be handled in any kind of weather with perfect safety.

Efficient Method Developed for Stringing Trolley Wire*

By Angus C. Scott
Assistant Superintendent of Overhead Lines, Cleveland Railway

FOR several years a special trolley wire stringing truck has been in service on the lines of the Cleveland Railway. This truck permits the stringing out of the new wire at the tension desired and the taking down of the old wire in one operation. Formerly it was necessary to string out the new wire, attach the fixtures to it, and then either cut down the old wire in sections or reel it up. The cutting down of the old wire and reeling it up in the street is a hazardous operation at any time of the day or night. In stringing out the new wire, it was formerly necessary to pull the wire to the approximate tension desired about every thousand feet. This operation is now only necessary about every one-half mile.

With the new stringing equipment, a full reel of trolley wire is mounted on an arbor on the rear of the truck. A shaft to which two pulleys of pressed paper are attached secures the reel to the arbor. Brake bands lined with regulation automobile brake lining are then installed over the pulleys, and attached to a common crossbar by means of turnbuckles. When pressure is applied to the crossbar by means of a wing nut equal pressure is applied to both pulleys, and the tension at which it is desired to string the trolley wire is secured. The new wire is led over the top of the reel and spliced into the line. The old wire is led into the front of the truck through an opening equipped with rollers and secured to an empty reel. This reel is turned by means of hand labor, four men being required. While it would be possible to make this operation mechanical, it is felt that the initial expense would be too great to justify so doing.

To facilitate loading and unloading the reels, an overhead chainfall has been installed on a runway inside the truck. The truck is well equipped with lights for night stringing. The truck has been equipped with a winch and collapsible derrick which permits of its usage for other work than just wire stringing.

In actual usage, a line truck precedes the stringing outfit and removes the old wire. Behind the reel truck another line truck ties the new wire to the span wires. They also install about every fourth feed-in ear for safety. Another truck follows the stringing crew and clinches the ears and aligns the trolley wire. When a car approaches the stringing crew the three trucks pull off to the side, close

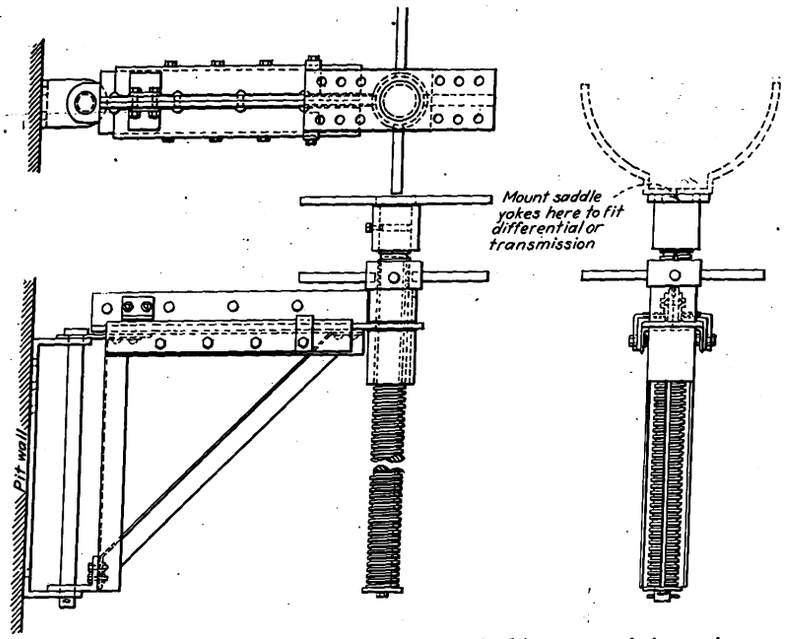
The Last Contest Period



Specially designed pit jack facilitates removal of bus transmission units in shops of Cleveland Railway

up, and the car coasts by. By this method a mile of wire may be taken down and new wire completely installed on hangers in 2¼ hours.

This method of wire stringing and the operation of the truck have both proved economical. One foreman can control the whole operation, there is very little vibration in the overhead due to the fine performance of the reel brake, and the wire may be restrung and taken down in a minimum of time.

Pit Jack for Removing Bus Transmission Units*

By Leonard Rose
Assistant Superintendent Motor Coach Department, Cleveland Railway

PIT jacks, suitable for use in installing or removing transmissions or differential carriers, are almost a necessity in a motor coach overhaul shop having any amount of this kind of repair work to do. The pit jack developed for this purpose by the Cleveland Railway is mounted on the pit wall by means of a hinge pin and wall bracket. By mounting one wall bracket at the front-center of the repair pit, just under the location of the transmission, and another at the rear of the pit at about the location of the rear axle, it is possible to place the jack in either of these two positions by simply removing the hinge pin and reassembling the unit in the desired location. With two brackets located in this manner it is possible to handle all of this kind of work in one pit. Since the brackets are neither bulky nor cumbersome, any number may be mounted along the pit wall at strategic points, to take units of various makes of coaches and different wheelbases.

In operation, yokes or a properly shaped saddle to fit the unit to be removed are mounted on the jack head. The jack is then raised into place, the unit dismounted and the jack lowered. By swinging it around to the pit wall, the unit may be rolled off onto the floor and a replacement rolled on to the jack.

While a jack of this kind is not essential on some equipment, it is almost a necessity on others. The installation of one similar to that shown in an accompanying illustration eliminates much of the difficulty encountered in handling heavy units under the coach, permits faster and more efficient work, and removes an accident hazard of no small importance.

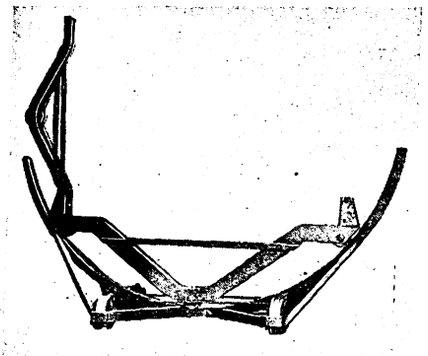
Car Body Turn-Over Truck*

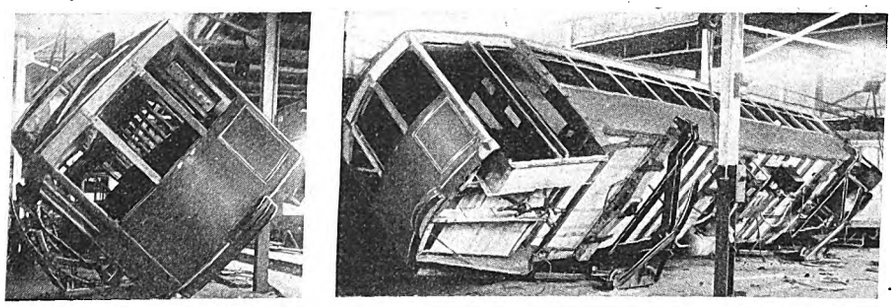
By E. J. Jonas
Superintendent of Equipment Cincinnati Street Railway

WORK on the underside of car bodies is made easier by means of a combination shift truck and car body turn-over device designed and built in the shops of the Cincinnati Street Railway.

All bearings are anti-friction, which makes it possible for four men to push a car body off or on the transfer table, while two men on chain blocks can turn the body over to an angle of 90 deg. to permit work on the roof if desirable.

The greater efficiency with which the men can perform their work—such as cleaning, painting, cable work, and piping on the underside of cars—has resulted in a saving of 25 per cent in time. Additional trucks are to be built and used as shift trucks with the idea that any car body undergoing repairs can be rolled over.





Trucks designed to permit turning over of car bodies in the shops of the Cincinnati Street Railway

Armature Tests and Testing Equipment Surveyed

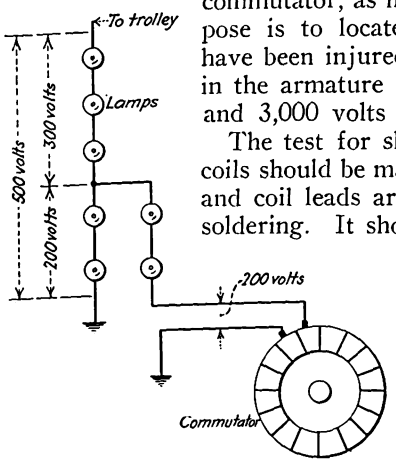
By R. S. Beers
Railway Engineering Department General Electric Company, Schenectady, N. Y.

ARMATURE testing equipment in railway repair shops varies from a minimum of a bank of lamps and a careful, skillful workman to a maximum of a complete testing laboratory where each rewound armature is given a stand test at full load. The minimum testing equipment seems inadequate, and the expense of the maximum seems unjustified. In an effort to strike a happy medium, a survey of the tests used by 30 representative electric railways throughout the United States has been made.

It was found that the tests commonly used when rewinding armatures include: (1) Bar to bar test of commutator; (2) high-potential test of commutator; (3) position of armature coil leads; (4) high-potential test of coils; (5) short and open-circuited coils; (6) high-potential test of complete armature, and (7) running test. Tests 5, 6 and 7 should be applied to overhauled armatures.

The bar-to-bar test of the commutator is a high-potential test to insure good insulation between adjacent bars. The customary method is to use a lamp or lamps in series with the testing terminals. Some operators use trolley voltage on new commutators, while the majority use 110 to 125 volts. This latter seems too low, and the trolley voltage too high for an old commutator. It would appear that a voltage of 200 to 250 would be better. This can be obtained readily by connecting lamps across the trolley, as shown in an accompanying sketch.

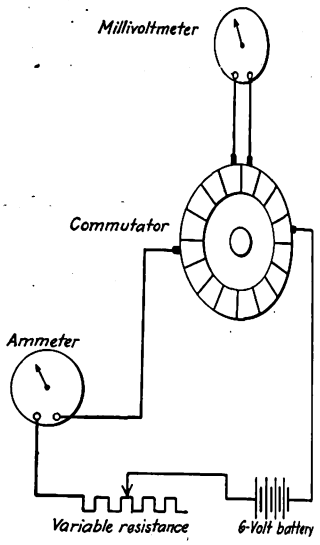
The high-potential test of the commutator is to make sure of good insulation between the commutator bars and the shell. A piece of bare wire is wound around the bars, connecting them together. High potential is applied between shell and bars. Between 2,000 and 3,000 volts should be used. To check the position of armature leads, each armature coil is rung out to insure that there are no connections between adjacent coils, and further to make sure the coil leads come out of the coil in correct order. The high-potential test of coils is made with the coils in place in the armature, bottom leads in place but top leads not connected. A wire is wrapped around the commutator, as in test No. 4. Its purpose is to locate any coils that may have been injured when they were put in the armature slots. Between 2,000 and 3,000 volts should be used.



Method of connecting lamps in a 600-volt circuit to obtain 200 to 250 volts

The test for short or open-circuited coils should be made first when all coils and coil leads are in place and before soldering. It should be repeated after the armature is completed and the commutator turned and slotted. Either a transformer (armature growler) or a millivoltmeter may be used. When applied to overhauled armatures the millivoltmeter will locate broken and partly broken armature leads much better than any other method.

A final high-potential test of the complete armature should be made when the final bindings are in place. A voltage of 2,000 to 3,000 should be used on rewound armatures, and 1,000 to 1,300 volts on overhauled armatures. After the armature is installed in the motor frame, a short run at full speed and load, or a run light at full speed, is very desirable. It tests the bearings and electrical connections in a way none of the other tests does.



Connections for making a bar-to-bar test with a millivoltmeter

The current lead should be located on the commutator so as to obtain a midscale reading of the millivoltmeter. The current should be from 6 to 10 amp. When the current value is determined it should be held constant by means of the variable resistance. The voltmeter will show the same reading between each pair of bars if the coils are right. A broken lead gives a higher reading and a shorted coil a lower reading.

The survey shows some railways believe that any potential test higher than trolley voltage spoils good apparatus. Their idea of testing is to locate existing faults. Those who apply a test voltage higher than trolley voltage believe a test should locate incipient faults as well as existing ones. The latter method is obviously the correct one and is used by the majority, although individual cases can be selected to show the former equally successful.

While high-potential tests vary from trolley voltage to as high as 3,000 for 600-volt armatures and motors, whether old or new, the majority of railways make a distinction between rewound and repaired or overhauled armatures. For the former 2,000 to 2,400 volts, and for the latter 1,000 to 1,300 volts, is the usual practice. The equipment for high-potential testing may be very simple and cheap if one is satisfied with two definite voltages, such as ten and twenty times the local lighting circuit voltages. Where it is desired to vary the test voltage by small increments over a range from 800 or 1,000 volts to 4,000 or 5,000 volts, high-potential testing equipment is required.

Transformer or "growler" testing for short or open circuits in armature coils provides a quick means of locating these defects. It does not indicate partial short or open circuits as effectively as a millivoltmeter. For this reason a millivoltmeter should be used for the final testing for open and short circuits in armatures. The millivoltmeter test of armatures for open and short circuits is the most successful test available for this purpose. When properly made, it will detect cracked and partly broken armature leads, as well as partly shorted armature coils, with more certainty than any other test.

Since this test is but a comparison of resistance values, it is obvious that the current should be held constant. This is best accomplished with a 6-volt storage battery, ammeter and a variable resistance. The customary practice of using trolley current through a bank of lamps, without an ammeter, for this purpose does not insure a sufficiently constant current flow for best results.

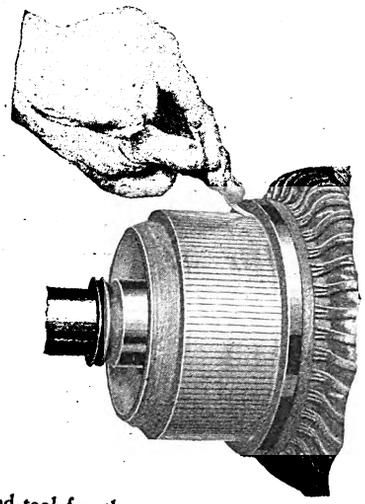
Devices and Practices Found Useful in Expediting

MAINTENANCE WORK

Time and labor saving devices used in electric railway shops and garages.



Hand tool for the removal of mica slivers from commutator slots

Undercutting Railway Motor Commutator Mica

By P. A. Pontius
Renewal Parts Engineer
Westinghouse Electric & Manufacturing Company

MICA between commutator bars on the brush wearing surface of commutators should be undercut to insure good contact between the carbon brushes and copper bars. It is desirable that all mica and mica slivers be removed $\frac{3}{64}$ in. to $\frac{5}{64}$ in. below the wearing surface of the copper bars. An undercutting machine should be used which holds both the armature and undercutting saw in their proper relative positions. The accompanying illustration shows a hand tool for removing the remaining mica slivers after the undercutting operation.

The undercutting saws should be equal to or about 0.003 in. thicker than the thickness of the mica segments. If the bearings in which the arbor for the saw runs are in good condition and the arbor rigidly supported, a saw 0.003 in. thicker than the thickness of the mica should be used. With a shaky arbor and worn bearings the thickness of the saw should be equal to the thickness of the mica. However, the saw should remove a small amount of copper along with the mica. A saw with twenty teeth regardless of diameter has given the most satisfactory performance. The outside diameter of the saw should be $\frac{3}{4}$ in. to $1\frac{1}{4}$ in., considering that the larger the diameter the more rigid should be the support of the saw carrying arbor. The diameter should be small, otherwise the saw cuts into the commutator neck.

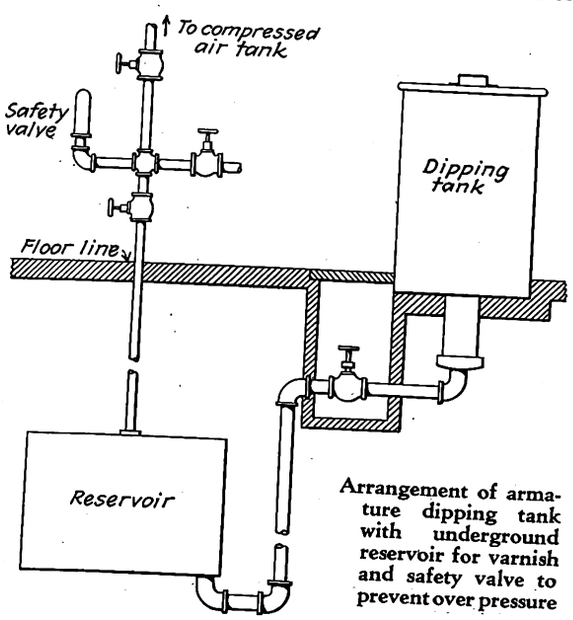
The best cutting speed is approximately 2,000 r.p.m. The saw should be made of high-speed steel. Carbon steel dulls quickly and does not produce a clean cut slot.

Armature Dipping Tank With Underground Reservoir*

By D. D. Wendel
Street Railway Engineer Alabama Power Company, Montgomery, Ala.

AT THE Montgomery carhouse of the Alabama Power Company an armature dipping tank with an underground reservoir has recently been designed and put into service.

This apparatus consists of a standard 55-gal. steel drum in the bottom of which is welded a short piece of 6-in. pipe. This is connected with a $1\frac{1}{2}$-in. pipe to the bottom of a similar tank buried several feet in the ground. The latter acts as a reservoir for the varnish which is brought to the dipping tank under air pressure. The section of 6-in. pipe acts as a well for the armature shaft. In the bottom of this well, a strainer is provided to keep foreign matter from entering the reservoir in the ground. A valve in the pipe line prevents evaporation, while a safety valve set to pop at 15 lb. prevents over-pressure. A vent valve releases air from the reservoir and allows the varnish to flow back after it has been used. Special precautions have been taken to insure that the air furnished to the reservoir is free from water and oil.



Arrangement of armature dipping tank with underground reservoir for varnish and safety valve to prevent over pressure

Simultaneous boring of motor and axle bearings is accomplished with this machine by the elevated railways in Hamburg, Germany

Boring Machine for Armature and Axle Bearings*

By A. Hansmann
Shop Foreman Hamburg Elevated Railway, Hamburg, Germany

A HANDY machine for boring armature and axle bearings simultaneously is in use at the main repair shop of the Hamburg Elevated Railway. All the motors on which this apparatus is used are of the same type. The boring tool has two definitely and unchangeably located arbors, one for the armature bearings and one for the axle bearings. These arbors are bolted against the machined surfaces of the motor cases and thus brought accurately in line.

Each of these two arbors carries two cutters that can be adjusted within .0004 in. shaft clearance. The arbors are driven from a jack shaft over extension couplings with universal ball joints. Mechanical connection with the driving motor is made by means of a clutch, operated remotely with a pull rope at the operator's stand. The feed of the cutters is automatic through a flexible shaft.

When these bearings were bored individually, the method formerly employed, their centers did not line-up, due to variations in the bearing bushing and inaccuracies of the set-up. To insure an accurate line-up so that both bearings fitted the shafts properly, subsequent filing and lapping were required. Too much play in the bearings resulted in a considerable loss of lubricating oil, and a reduction of the maximum life of such bearings to about 37,500 miles. With the present method of boring, a life of 75,000 to 93,750 miles is easily obtained. The savings resulted from this new method are primarily the 100 per cent longer life of the bearings, the reduced loss of oil, the small number of hot-boxes and the greater ease with which the two bearings are simultaneously bored.

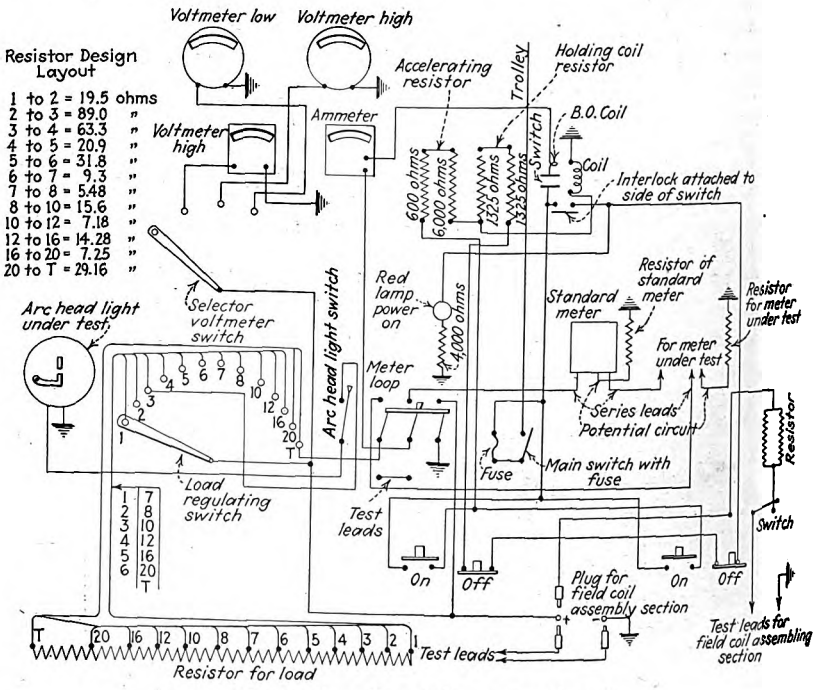
Equipment Test Board Proves Time Saver*

By Arthur E. Clegg
Foreman Electrical Department San Diego Electric Railway, San Diego, Cal.

ELECTRICAL apparatus used on cars is tested on a special board in the shops of the San Diego Electric Railway. The right-hand side is devoted to testing Economy meters. An element removed from an Economy meter is used as a standard rotating meter. This has been placed in a glass case to keep out dirt and to maintain its accuracy. The resistor of the potential circuit of the standard meter is mounted on the back of the board. The meter to be tested, together with its element, is mounted next to the rotating standard meter. A rack is provided in the upper right-hand corner of the board on which elements are placed for cleaning and repairing.

By throwing the circuit switch to its upper position, which is marked "meter loop," and with the regulating load switch set for the desired load on the ammeter, the meter is connected in circuit. With the switch thrown to the down position, which is marked "test leads," connection is made to place the leads in circuit. Additional tests can be made by pulling out the test lead marked with a plus sign and inserting the test lead which goes to the motor frame field coil assembling section. Other tests are performed by the aid of the load-regulating and



Connections for equipment test board

Digitized by Google

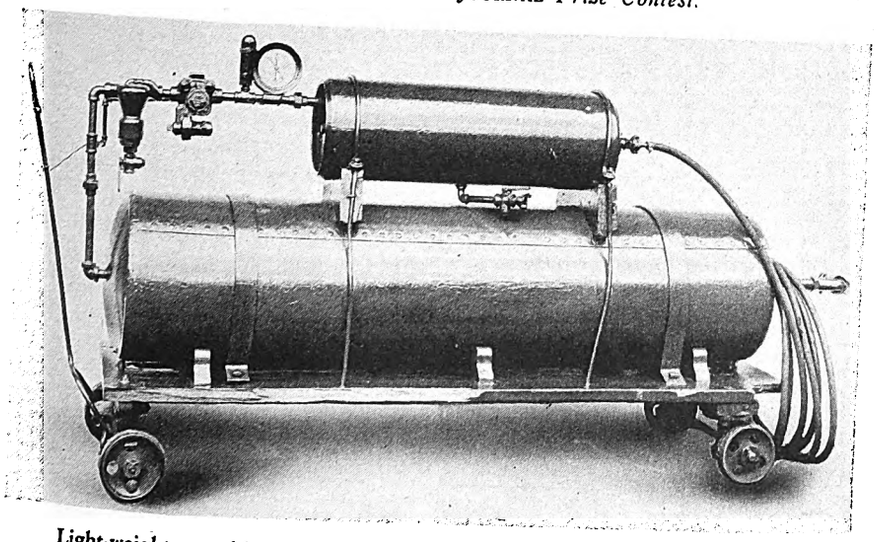
selector-voltmeter switches. Power is switched on or off the testing board by means of a push-button station located at the board and in the motor frame field coil assembling section. These push-buttons operate magnetic-type switches. It has been found convenient to use the trolley voltage without resistance at the test lead. By removing a stop marked T, the regulating load switch arm comes in contact with the trolley button and gives line voltage. Arc headlights are tested by setting the load-regulating switch to give the desired voltage at the arc and then by closing the arc headlight switch and switching power on and off by means of the push-button station. The testing board has proved a great time and labor saver as it enables testing operations to be performed quickly.

Auxiliary Tire Inflater

By Del A. Smith

General Manager Department of Street Railways, Detroit, Mich.

GARAGES of the Department of Street Railways in Detroit have long felt the need of a portable inflater which could be taken to any place whenever tires need to be inflated. To this end a truck was constructed on which was placed a 21-cu.ft. air tank built for a pressure of 300 lb. On top of this a smaller tank was placed designed for a pressure of 140 lb., and connected to the larger tank through a reducer valve. An air gage with two indicators showing the pressure in both tanks at all times was installed in the line. Air at 300 lb. pressure in the large tank is obtained from the adjacent carhouse, which carries high-pressure lines.



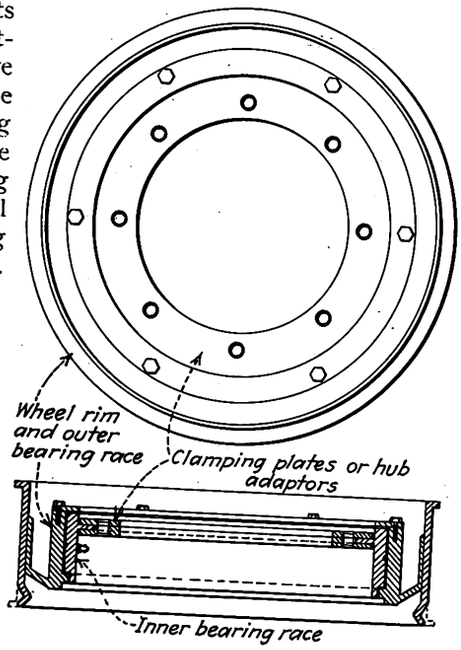
Light-weight portable tire inflater recently constructed by the Department of Street Railways in Detroit

Dummy Wheels for Towing in Disabled Buses*

By Hoy Stevens

Assistant Superintendent of Maintenance Cleveland Railway, Cleveland, Ohio

THE necessity of removing from the road quickly and economically a coach equipped with a semi-floating axle, which had suffered a differential failure, led to the development of dummy wheels by the Cleveland Railway. When such a failure occurs, any attempt to drag the vehicle often results in serious damage to the gears, bearings, the spider or even the housing itself. It is not always possible to lift the rear end of a bus, and for long hauls the so-called "towing dollies" are clumsy, and often useless. These considerations, coupled with a desire to get the coach off the road, and our practice of performing all repair work in the garage whenever possible, caused us to develop this spare set of wheels.



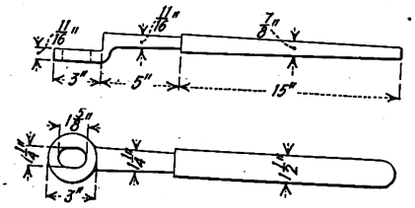
Dummy wheel used by the Cleveland Railway in towing disabled buses off the road

Essentially, these wheels are designed with integral bearings so that they can be bolted onto the hubs in place of the regular wheels. The service brakes are then locked and the coach towed in the customary manner. Of course, a spacing towbar must be used, because there are no brakes on the coach. When the front wheels are brake-equipped, the cylinders or cams must be disconnected. As may be seen from the illustration, the tire is mounted on a part of a standard wheel which has had the stud holes cut away and then welded to a large steel "bearing" ring which forms the outer race of the bearing. The inner bearing is a bronze casting, grooved for grease, and welded to a small flange. Various sets of adaptors are used to clamp on this flange and fasten it to the various hubs of different types of coaches.

*Submitted in the Electric Railway Journal *Prize Contest.*

Air Compressor Commutator Nut Wrench

LOSS of time, destruction of material and an increase in expense resulted in the shop of the Richmond Railways, Staten Island, N. Y., due to the practice of removing commutator nuts of Westinghouse D.H. 16 air compressors with improper tools.



This wrench has simplified the maintenance work of compressors

The wrench shown in the accompanying sketch was designed and constructed to eliminate this expense and simplify removal. The handle is made from $\frac{7}{8}$-in. x $1\frac{1}{2}$-in. stock, whereas the head stock is 3 in. x $\frac{11}{16}$ in. The overall length of the wrench is 23 in. The handle is provided with a $\frac{3}{4}$-in. offset and is $\frac{11}{16}$ in. thick and $1\frac{1}{4}$ in. wide for a distance of 5 in. from the head stock. The remaining 15 in. of the handle is $\frac{7}{8}$ in. thick x $1\frac{1}{2}$ in. wide. The head is designed with an oval slot $1\frac{1}{4}$ in. x $1\frac{5}{8}$ in.

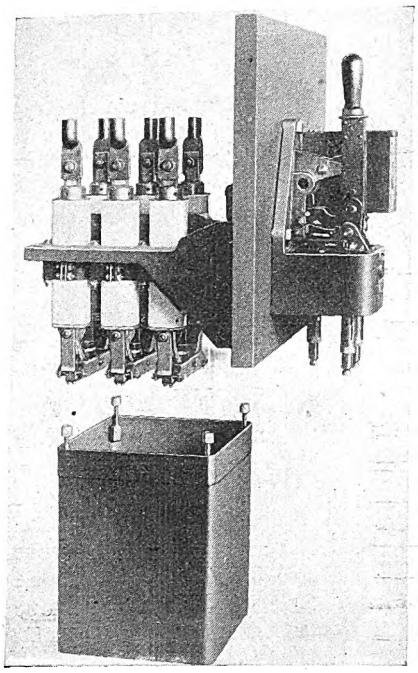
New Products

New Oil Switch

A NEW type of oil switch made in capacities from 200 to 2,000 amp., from 2,500 to 15,000 volts and with interrupting capacity from 20,000 to 40,000 kva. is announced by the Roller-Smith Company, New York City. The switches are made as two-pole and three-pole devices, automatic and non-automatic, single and double throw for switchboard, wall and cell mounting. They are also made for hand operation, normal and remote control, and electrical operation.

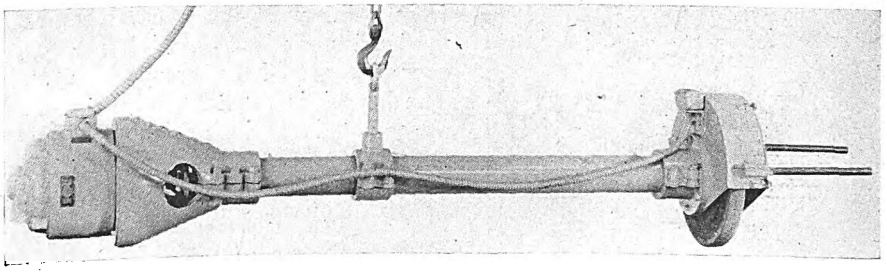
A few of the outstanding characteristics claimed for this new line of oil switches are, first, continuous laminated conductor from terminal to moving member; second, self-aligning contact of drawn copper gives a strong, highly conductive, light-moving, high-speed member; third, arcing tips are of large volume of copper and are designed especially to utilize electromagnetic stresses to increase contact pressures; fourth, the entire mechanism is completely inclosed and is the straight-line type; fifth, conductors are rigidly clamped in heavy wet process porcelain insulators; sixth, the frame is a heavy casting, internally ribbed and dome-shaped for strength; seventh, the heavy welded tank is supported on a frame by large short bolts; eighth, a double flange for the tank seat permits free venting between tank and frame, with great reduction in tendency to oil throw; ninth, the wooden contact rod is of specially treated material in one piece; tenth, the tank is lined with insulation material especially selected to resist the burning of the arc; eleventh, the volumes for oil and gas expansion are exceptionally large.



This new oil switch has a continuous laminated conductor

Heavy-Duty Swing Grinder

SIMPLICITY of design and ruggedness of construction are features of a new heavy-duty swing grinder recently put on this market by the Kinney Iron Works, Los Angeles, Cal. The motor is connected directly to the wheel through a flexible coupling and heavy shaft. Both ends of the shaft are mounted in heavy, dust-sealed ball bearings, while the motor also has ball bearings which are dust-proof. One of the important features of this new frame grinder is the absence of gears and the resultant wear. Another advantage is the continual observation of the work by the operator which is made possible by the position of the wheel which runs at right angles to the frame. The grinder is suspended by a sliding collar which permits a perfect balance as the wheel wears, and which facilitates suspension from any available hoist or chain block. Considerable flexibility is afforded by this coupling.

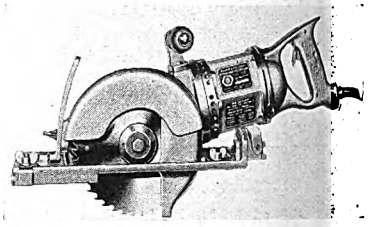


New swing grinder designed for heavy duty

Electric Hand Saw

ELECTRIC hand saws which will cross cut and rip lumber up to 3½ in. thickness were recently put on the market by Black & Decker Manufacturing Company. They will be sold in three sizes, 6-in., 8-in. and 10-in. — these sizes designating the diameter of the circular saw that each will accommodate. They can be used also with a special metal cutting saw for cutting light gage metal or with an abrasive disk for cutting slate, marble, tile, porcelain, etc.

The saw blades are inclosed in telescopic guards so that as the saw progresses in the work the guard automatically telescopes and when the cut is finished the guard snaps back, entirely covering the saw blade. The saw is arranged with an adjustable shoe which can be set to cut at any depth up to the capacity of the saw for cutting rabbets, etc. The shoe is adjustable also for cutting at any angle up to 45 deg. for mitering or for the jointing of long edges. It maintains the angle throughout the entire length of the cut, which is difficult, if not impossible, on a very long cut with an ordinary hand saw. The shoe is notched to make it easy to follow a pencil line on the work. These saws are provided with Universal motors, which will operate on direct or alternating current. They are shipped in substantial carrying cases as a convenience for men who take them out on the job.



Electric hand saw with telescopic guards

They are very light in weight and the "pistol grip and trigger switch" affords ease in handling and controlling. The saws are equipped with full ball-bearing with chrome nickel gears and shafts throughout. They are air cooled and will operate continuously without overheating. Gears

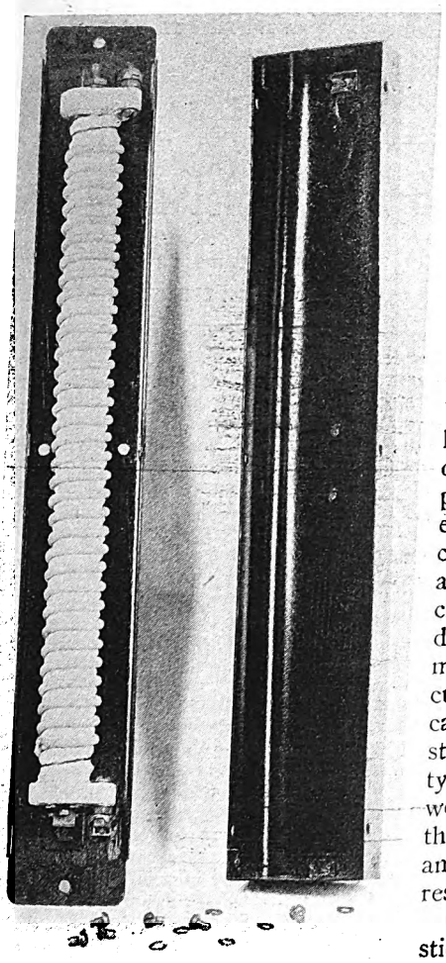
Products for the Railways' Use

run in grease in grease-tight compartment. Standard equipment consists of: one rip and one cross-cut saw; one adjustable saw fence; three-conductor cable with attachment plug (one wire for grounding); and substantial carrying case.

Sill Heater Prevents Ice Forming On Window



New electric window sill heater

ICE on windows is a serious menace to safe car operation and which often requires the motorman to stop his car and clean the window. To prevent this formation of ice, the Consolidated Car Heating Company, Albany, N. Y., has devised a new type electric heater. This apparatus is only 3⅞ in. wide, 2¼ in. high and 24 in. long. It is placed directly across the line voltage and rated at 300 watts.

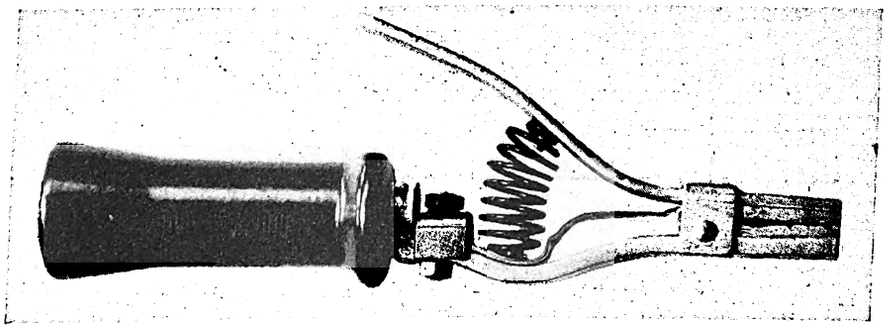
Powder for Cleaning Solution

FOR making a cleaning solution a powder with unusual qualities has been put on the market by the National Railway Appliances Company under the trade name of Soilax. In its original state, Soilax is a pink powder. In a proper solution with water it turns green. However, if too much powder is used, the solution will turn yellow. This feature prevents waste. The claim is made that 1 lb. of Soilax will do the work of 4 to 6 lb. of soap at a saving of 25 to 50 per cent in monthly cleaning costs. It is especially adapted for cleaning enameled or varnished surfaces, either inside or outside of street cars or buses.

Electrode Holder for Metallic Arc Welding

TO FACILITATE the operation of welding, a new electrode holder called model T has been developed by the Lincoln Electric Company, Cleveland, Ohio. The welding electrode is held firmly by a device consisting of a powerful clamp with an easy release to permit the rapid changing of electrodes. The grip is designed for easy holding and remains cool because the welding current is carried from the point of cable entry to the jaws by copper strips of low resistance. In the older types of holder, the high-amperage welding current was carried through the steel frame of the holder itself and uncomfortable heating frequently resulted under continuous service.

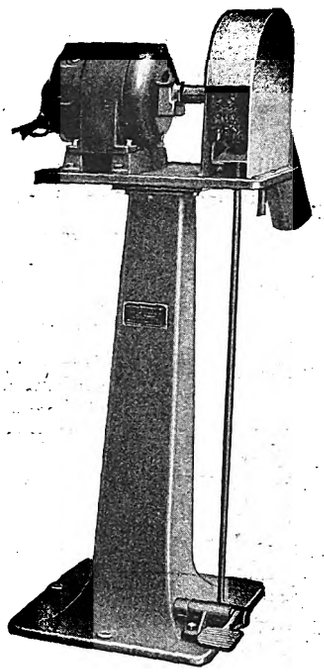
Copper tips on the jaws reduce the sticking of the electrode, resulting in quicker and easier change of electrodes and longer life for holders. The shape of the holding clamps has been altered to give greater compactness to permit working in closer corners. All metallic parts of the holders are coated with non-tarnishing plating.



This type of electrode holder has copper strips of low resistance which carry the current from the terminal to the copper

Machine for Removing Insulation From Wire

DESIGNED to reduce shop cost in removing insulation or skinning the leads of armature coils, the Type KP Peerless wire insulation remover is being placed on the market



This machine removes insulation from wires

by the Electric Service Supplies Company, Philadelphia, Pa. The machine has a special revolving brush, and by bringing the leads in contact with it, the insulation is removed thoroughly and effectively without damage to the copper wire. The revolving parts are guarded. Pressure is applied to force the wire into contact with the brush and is controlled through a foot-operated treadle.

NEWS *of the Industry*

Writing of Chicago Ordinance Begun

The actual writing of a new railway ordinance for Chicago has been begun early by the City Council subcommittee to which the task has been assigned. According to present plans, the work will be completed by Sept. 1 and the ordinance will be submitted to the voters at the election on Nov. 5. If the ordinance is to go on the Nov. 5 ballot, it must be passed by the City Council not later than Sept. 24.

While the ordinance is being written the subcommittee charged with doing that work will hold a series of public hearings on subways in the hope of acquiring more information as to how much additional track space is needed for rapid transit through the central congested area. At the present time the Aldermen have no definite policy on subways.

Every subway plan except one makes provision for a tunnel in State Street, but there has been no decision as to where any bores will be located. The number of tracks to be provided also differs in each plan. To aid them in their work, the Aldermen are studying the subways in other American cities and in Europe.

Two-Cent Wage Advance in Toledo

Employees of the Community Traction Company, Toledo, Ohio, broke a deadlock of almost three months' duration on July 20, when they balloted three to two in favor of a compromise proposal submitted after they had demanded arbitration and had previously turned down a 2-cent wage increase with modified working conditions. Steps will be taken immediately to draft the plan into contract form and sign it. The new contract will be retroactive to June 1.

Trainmen, bus operators and car shop employees will receive a flat increase of 2 cents an hour making the scale 52 cents an hour for beginners in the first three months, 54 cents for succeeding nine months and 57 cents an hour for all employees with the company more than a year. Five cents additional is paid to one-man car and bus operators.

A new feature of the contract this year will be a premium of 1 cent an hour for any month during which the employee shall not have had any accidents which cost the company money chargeable to him.

Watchmen will receive $5 a month raise.

Regular employees will receive not less than two hours' pay for any call for extra work.

In case of split runs, when a man is called for three periods in a day, he shall receive not less than 10 hours' pay, and all workers shall receive not less than nine hours' pay for a day.

In the garage expert mechanics will receive 10 cents an hour increase. Here the working day is changed from a nine-hour to an eight-hour basis.

The compromise terms were arrived at in a conference between union officials and company representatives in the presence of Hugh D. Friel, conciliation commissioner of the Federal Department of Labor.

It was estimated that the changes would add more than $75,000 a year to costs.

High-Speed Service in Kansas City

Kansas City Public Service, Kansas City, Mo., has been busy putting into effect high-speed service on three of its main trunk lines by a limited stop system and making of the routes of these lines stop streets. The speed of cars under the new plan has been increased more than 20 per cent. Company officials are said to feel that if they are able to hold the limited stop plan intact they will have accomplished, on these lines, at least, something really worth while.

The company laid its plans for a stop program before the Public Service Commission. That body approved the proposal before it went into effect, subject to future jurisdiction and revision by the commission. Patrons in general appear to be well pleased with the increased speed and increased service. Such petitions as have been presented for the restoration of stops have in practically every case originated with the local corner grocer, the drug store and the picture show operator. The plan went into effect on June 16. Up to July 11 the company had made no changes nor had the commission ordered any.

$33,000,000 Detroit Rapid Transit Project

Subway for surface cars suggested so designed as to permit ultimate conversion into a train-operated rapid transit line

MAYOR LODGE of Detroit, Mich., has received a report which proposes the construction of short sections on three routes of the four-line rapid transit system that the Detroit Rapid Transit Commission considers will ultimately be required, and the building of a section of subway for the special use of street cars, but so designed that trains ultimately may use all of its mileage except the loops. The report was prepared pursuant to the direction of the Mayor to the Detroit Street Railway Commission and the Rapid Transit Commission given shortly after the election held on April 1, when the rapid transit project submitted jointly by these two commissions was defeated at the polls.

The new plan, prepared jointly by the two commissions, is proposed as a means to afford immediate relief to the traffic congestion existing in the downtown district. At the same time it would mark the beginning of a rapid transit program involving the least possible mileage. According to the report, the two commissions have kept constantly in mind the necessity of having each section of the underground so located and so designed as to permit of ultimate conversion into a train-operated rapid transit line. The total milage is 5.44 and involves an expenditure of $33,000,000.

The Rapid Transit Act and the City Charter provisions permit the initial construction of a rapid transit system to be financed through the Rapid Transit Commission by the use of (a) direct taxation plus faith and credit bonds, (b) mortgage bonds, (c) special assessment or any combination of these methods. On the other hand, the street railway charter contemplates that all construction costs ultimately shall be paid out of the earnings of the system. The right is not conferred to impose special assessments upon property that may be specially benefited by the construction of subways for street car or rapid transit train operation. Neither is there provision for raising any part of such costs by direct taxation upon the city at large.

The report points out the enormous benefits to property due to rapid transit lines as contrasted with surface transportation, for which reason the finance plans always have included special assessment for special benefit as an equitable and just provision. The electorate approved this method of financing by an overwhelming majority in 1924 and again in 1925. As to the present project the report states:

"Whether underground construction is initiated now or five years from now, or is started by the Rapid Transit Commission, the D.S.R. or some other body, the city should not fail to preserve its right to specially assess for special benefit. In our judgment there is no question of the status of the present proposal as a rapid transit project even though it may temporarily be operated by street cars."

While the use of street cars in the tubes

COMING MEETINGS

Aug. 15-16—Wisconsin Utilities Association, Transportation Section, Hotel Northland, Green Bay, Wis.

Aug. 27—National Association of Railroad and Utilities Commissioners, Glacier National Park, Mont.

***Sept. 28 - Oct. 4*—American Electric Railway Association, 48th annual convention and exhibit, Atlantic City Auditorium.**

Oct. 23-24—Public Utilities Association of West Virginia, Wheeling, W. Va.

Nov. 6-7—Association of Electric Railway Equipment Men, Middle Atlantic States, Richmond, Va.

Nov. 21-22—Public Utilities Association of Virginia, annual meeting, Chamberlain-Vanderbilt Hotel, Old Point Comfort, Va.

Digitized by Google

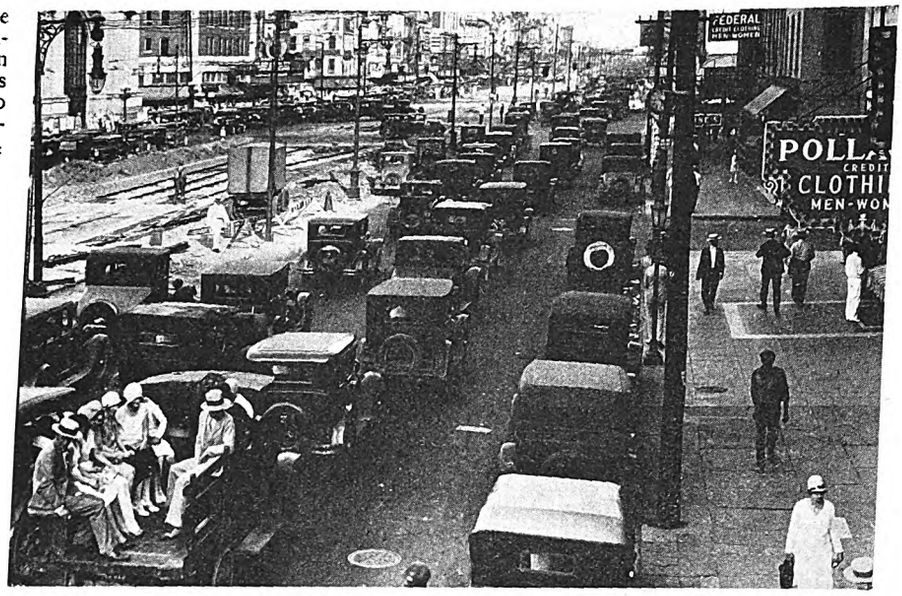
will not produce the full benefit to the downtown district, 83 per cent of the congesting surface car movement will be taken away. Accordingly the two commissions recommend division of the total cost into three equal parts, $11,000,000 each, one-third to the city at large, one-third to the locally benefited property, mainly in the central business district, and one-third to the car rider. While this division into three parts represents the recommendation of the two commissions, under the rapid transit act not more than 60 per cent of the estimated total cost may be raised by the first method. Accordingly the proposed financial plan involves the issue of faith and credit bonds to the extent of 60 per cent of the total, or $19,800,000, and the issue of mortgage bonds for the remaining $13,200,000. The faith and credit bonds and $2,200,000 of the mortgage bonds would be carried and retired by the contribution from the city at large and the locally benefited property.

Since the mortgage bonds can be secured only on the properties and revenues of the system, it is proposed that the revenues be secured by an inter-department operating contract whereby the D.S.R. pays a graduated rental to meet the interest and amortization of the $13,200,000 mortgage bonds, but for the full term of the contract will be equalized so that the car rider will finally have paid only the interest and amortization charges on his one-third share of $11,000,000. The plan outlined will accord completely with the intent of the Rapid Transit Act, states the report.

As to the merging of the Rapid Transit Commission and the Street Railway Commission, the report states that their legal powers are so widely distinct that it is not advisable. However, a Metropolitan Board is suggested which would have control of all transit matters in the region of Detroit to continue the work of the Rapid Transit Commission, and in which the Street Railway Commission would have representation.

SUMMARY OF DETROIT'S SUBWAY SUGGESTIONS

1. A line commencing at a portal at Woodbridge Street and running under Woodward Avenue to a portal at Temple Avenue. Three stations; length main line 1.16 miles. Estimated cost.....	$8,500,000
2. A line commencing at a portal on Michigan Avenue at Sixth Street and running under Michigan Avenue to Campus Martius to Monroe Avenue to Randolph Street to Gratiot Avenue and under Gratiot Avenue to a portal at Rivard Street. Four stations; length main line 1.55 miles. City Hall loop and connection to Fort Street, length 0.17 miles. Total, 1.72 miles. Estimated cost	9,700,000
3. A line commencing at a portal on Fort Street at Fifth Street and running under Fort Street to Cadillac Square to Randolph Street to Jefferson Avenue and under Jefferson Avenue to a portal at Hastings Street. Four stations; length main line 1.20 miles. Estimated cost	7,400,000
4. A line commencing at a portal on Grand River Avenue at Second Avenue and Elizabeth Street and running under Grand River West and Grand River East to Madison Avenue and under Madison Avenue to a temporary connection with the Vernor-Mack line at Gratiot Avenue and St. Antoine Street, with loop loading stations at Capitol Park and Library Park. Six stations; length main line 0.92 miles, loading loops 0.44 miles, total 1.36 miles. Estimated cost	7,400,000
Total estimated cost.....	$33,000,000
Total length all four lines, miles	5.44



What Happens When the Public Transportation Service Is Forced to Suspend

Twenty-two Main Lines Reopened

New Orleans company fast recruiting train force locally. Railway directors state company position. Comment by Labor Secretary Davis

SERVICE has been restored on the 22 main street car lines of the New Orleans Public Service Company and officials declare the situation so far as patronage is concerned is improving daily. The company also has stated that the employment of trainmen is progressing so satisfactorily that it will soon have its entire personnel made up again of local men.

The Commission Council made a last effort on Tuesday to bring about a settlement between the company and the strikers, but it proved futile. The Public Service, through A. B. Paterson, vice-president, Bernard McCloskey, and A. M. Lockett, directors of the company, definitely informed the Council that the directors had decided they would positively not negotiate with the union on a closed shop contract. The directors declared that they could not deal with an irresponsible labor organization. Officials of the union, augmented by international vice-president Fitzgerald, and Mr. Quinlan of Chicago, refused to make any concessions and what was considered as a last conference was brought to an end without accomplishing anything. The Council, however, announced that it would continue its efforts to bring about industrial peace in the city.

Jitneys are being permitted to operate during the period of the strike without any regulation; that is, the usual $5,000 surety bond for such operations is not being exacted.

Labor unions throughout the city have adopted resolutions requesting members not to ride the cars, and the public is being asked to support them.

Traffic regulations have been virtually shot to pieces as a result of the enormous number of machines on the streets.

The threatened general sympathetic strike of all union labor organizations in New Orleans was not called on Tuesday night. The meeting of delegates representing the various trades decided not to strike, but to help the car men financially. They voted to give the car men 5 per cent of their pay per month. As a result of the meeting union men, headed by leaders who arranged city-wide mass meetings, marched in a body to the City Hall on Wednesday and their spokesman questioned the Council regarding resolutions adopted by the mass meeting. One resolution provided that the city take over the railway. Acting Mayor Walmsley announced that the Council would take up the question of issuance of bonds with the Board of Liquidation. The Acting Mayor also announced that the Council would not interfere with the operation of the jitneys, declining, however, to pass an ordinance which would eliminate the $5,000 surety bond feature of the law.

The union had also requested that R. S. Hect, J. C. Butler, and J. D. O'Keefe, directors of the Public Service, who are also members of the board of liquidation, be requested to resign the latter offices. Acting Mayor Walmsley announced that under the Constitution the city banks are authorized to select the members for life. It is not a Council matter.

At the close of the meeting with the Commission Council on Tuesday officials of the union issued a statement expressing regret that the efforts of the Mayor and Council had been defeated. The union places the blame for continuation of the difficulty on the shoulders of the company. A statement by the men concludes:

"There is nothing for the men to do in this struggle but continue on until justice and fair play are acknowledged by the company."

After receiving word from the New Orleans Public Service Company that the differences between the management and the striking employees are fundamental and cannot be arbitrated, the Secretary of Labor stated on July 24 that there is nothing more that the Federal Government's Conciliation service can do for the time being at least.

Secretary Davis said that he would keep Conciliator Rodgers in New Orleans be-

Digitized by Google

cause he believes that there is always the possibility that the company may change its mind. Conciliator Dines is in Washington at present preparing a report on the strike and it is stated that he will not be sent out again until additional orders are given by the Secretary. It was admitted by the Secretary that he had discussed the issue in the strike informally with Charles Rosen, attorney for the Public Service Company.

Asked to explain his conception of the differences between the company and the strikers, Secretary Davis said that the men claim they are seeking better wages while the company contends that it is seeking to preserve its right of discipline.

One-Man Cars on Buffalo Interurban Runs

One-man cars are to be operated on the Buffalo-Lockport and Lockport-Olcott interurban divisions of the International Railway, Buffalo, N. Y. If the experiment proves successful, the company will rebuild the Buffalo-Niagara Falls high-speed line interurban cars for one-man operation, thus placing its entire system on a one-man car basis. All local lines of the company in Niagara Falls, Lockport and Buffalo now are operated by one-man crews.

No Parking Recommended on Fifty New York Streets

The abolition of parking in lower Broadway and fifty other streets and alleys from 7 a. m. to 6 p. m., and the prohibition of parking altogether in 65 streets throughout the city was recommended to the Board of Estimate of New York City at its meeting on July 25 by the Citizen's Street Traffic Committee of the City of New York, Inc. The proposals are included in Part II of a report by the traffic committee's sub-committee on parking.

Broadway between Bowling Green and Twenty-fifth Street has been singled out among all the north and south thoroughfares of Manhattan as the one on which parking restrictions are most necessary, according to Chairman Banham, because of the regular all-day parking by business men.

Dates of Meetings Changed to Avoid Conflict

The date of the November meeting of the Association of Electric Railway Equipment Men, Middle Atlantic States, has been changed from Nov. 20-21, to Nov. 6-7, 1929, to avoid conflict with the meeting of the Virginia Public Utilities Association, which convenes at Old Point Comfort, Nov. 21-22.

Chicago "L" Hearing Put Over Until Sept. 15

When, on July 16, Congressman Frank Reid, special counsel for the city of Chicago, announced that the city had no further evidence to offer against the Chicago Rapid Transit Company's appeal for a 10-cent fare, Master in Chancery Roswell B. Mason continued the hearing until Sept. 15.

Congressman Reid contended that the Rapid Transit Company, during its nine months of presenting evidence, had failed to make a case. The company is asking the federal court to restrain the Illinois Commerce Commission from preventing the collection of the present 10-cent elevated fare in Chicago. The higher fare is being charged under the protection of a temporary injunction granted by the federal court.

The Rapid Transit company's recent evidence has centered about an attempt to show that its lines are worth at least $160,000,000 instead of the $60,000,000 valuation set by the city.

Prize for Traffic Solution Suggestions in Atlanta

To encourage public interest in the solution of this important public problem of traffic congestion, *Two Bells*, published by the Georgia Power Company, has announced the following contest:

"For the essay outlining the best and most practicable suggestions for solving Atlanta's traffic problems, a prize of $25; with a second prize of $15, a third prize of $10, and five prices of $5 each. Eight prizes, totaling $75, for writing out the thoughts you, no doubt, long have had in your mind about improving the traffic situation."

Everyone is eligible to compete with the exception of employees of the company and professional traffic experts and traffic engineers. The contest closes on Aug. 10.

Compromise on Substitution in Houston

The attempt of property owners on Fannin Street in Houston, Tex., to force the Houston Electric Company to remove street car tracks from that thoroughfare and substitute buses, has ended in a compromise.

The City Council has ordered contractors to proceed with widening and paving of the street, making no mention of the car tracks. As the paving will necessitate improvements to the track costing the company about $40,000, it is generally understood that no further effort will be made to secure removal of the tracks.

Jeff Alexander, general manager of the Houston Electric Company, agreed to operate express buses on Main Street—the next parallel street—"as an experiment."

The controversy began eighteen months ago when contracts were let for the paving and widening of Fannin Street. Residents demanded tracks be removed and that a bus service be instituted. Oscar Holcombe, then Mayor, secured the services of John A. Beeler, who suggested removal of the tracks through about one-third of their length on Fannin and rerouting of the South End loop back to the downtown district over McGowan, a cross street, to the Travis Street line. No action was taken and the Holcombe administration was defeated, the Fannin Street matter being one of the chief campaign issues.

Efforts of the Fannin Street group to have the City Council pass a resolution setting out that service on Fannin with street cars is inadequate, and instructing the company to furnish such service were unheeded by Council.

Fannin Street residents then asked the City Council to grant a franchise to an independent company to operate a two-way bus service on Fannin. This proposal was side-tracked when Mr. Alexander offered to establish a bus service on Main Street.

With the paving of Fannin, service by bus will be substituted for the shuttle line which serves Rice Institute on the south edge of the Southern city. This bus service will not run to the downtown section, but will connect with the street cars at the end of the loop.

Late News Briefs

Richmond, Va.—It is reputed here that the Virginian Railway may continue its plan of electrification to Charleston, W. Va., if the New York Central bridge is constructed at Deep Water. While no announcement was made by the Virginian and nothing came out at the hearing to indicate the plans of the Virginian and the New York Central, the feeling is that this is the general scheme.

Omaha, Neb.—The safety campaign which the Omaha & Council Bluffs Street Railway is conducting in connection with the purchasing of new uniforms by all the trainmen is proving highly successful. The company has agreed to pay the entire cost of the uniforms for all men who operate for six months without an accident costing the company more than $15. From July 1 to July 20, there was only one such accident—a new safety record.

Toledo, Ohio—The last of the changes in routing contemplated by the transit ordinance of July, 1928, in Toledo was put into effect by the Community Traction Company when the East Broadway bus feeder line connecting also with the Oak Street car line in a loop operation was put on its new route during the week ended July 20. It replaces a portion of car line on East Broadway. Cars in city service continue out Woodville Road beyond the corner of East Broadway and Woodville following the Lake Shore Electric and Toledo, Fostoria & Findlay interurban routes.

Worcester, Mass.—Because operators of the 35-cent flat rate taxicabs established in Worcester sometime ago have been charging various rates the license board of that city has ordered the tariff to be printed on cards and displayed conspicuously in the cabs. The defense of the cab companies was that some of the drivers took an unfair advantage of their passengers.

Indianapolis, Ind.—Rates for commuters on all electric and bus lines operated by the Terre Haute, Indianapolis & Eastern Traction Company will be reduced from 1.65 cents a mile to 1.25 cents.

Waterloo, Ia. — Frank McDonald, superintendent of stores and purchases for the Waterloo, Cedar Falls & Northern Railroad, is chairman of the convention committee for the Iowa Electric Railway Association, which will hold its annual convention here Nov. 7 and 8. Terminal electrification will be one of the principal topics at the meeting, but the outline of the program has not yet been completed.

Detroit, Mich. — The Council has called a public hearing on parking situation as a result of demands from Business Property Association, Washington Boulevard Association and Retail Merchants' Association that police be directed to enforce strictly parking regulations in downtown district and be provided with sufficient men and towing equipment to do so.

Louisville, Ky.—Direct through service between Indianapolis and Louisville was resumed by the Interstate Public Service Company recently when the new

Digitized by Google

$3,500,000 Big Four bridge across the Ohio River was opened to interurban traffic. Passengers no longer need to transfer at Sellersburg as was necessary for a year while the bridge was under construction.

Richmond, Va.—School tickets will be issued for the bus service in the Ginter Park section of Richmond when the tracks on Chamberlayne Avenue, Laburnum Avenue and Brook Road have been removed and bus service installed, under a tentative agreement reached between the city and the Virginia Electric & Power Company. There is still a difference of 1 cent in the railway and the bus fares, the former being 7 cents and the latter 8 cents.

Hartford, Conn.—All persons, associations and corporations owning or operating taxicabs in Connecticut are now common carriers, subject to the jurisdiction of the Public Utilities Commission. A law to this effect has been signed by Governor Trumbull. Within 60 days, owners must have certificates from the commission in order to continue operation.

New York, N. Y.—The 25th anniversary of the Interborough Rapid Transit Company was celebrated on July 20. While the first train was not run for the public's convenience until October 27, 1904, July 20 was the day on which the first unit of the tunnel system was completed and instruction started for train crews. The first section completed extended from the Brooklyn Bridge to Grand Central Terminal.

Roanoke, Va.—A car of the Roanoke Railway & Electric Company painted according to an experimental color scheme has been placed on the lines for the criticisms and suggestions of the public. The car has an Abbott gray body with Cherokee gray trimming above the window posts. The border is trimmed in green. The company may make a change, if a color scheme satisfactory to the patrons and distinctive for Roanoke can be decided upon.

St. Louis, Mo.—The special committee of the Transportation Survey Commission headed by Erastus Wells, vice-chairman of the commission, has taken no action yet on the suggestion of Engineer Kelker made in May recommending the rerouting of thirteen railway lines, the discontinuance of six lines, the establishment of one new line and a reduction in the stops to an average of eight to a mile.

Chicago, Ill. — Plans for a circular street car subway in Grant Park connecting with the Roosevelt Road surface lines by a tunnel under Michigan Avenue to Wabash Avenue have been submitted to the City Council's committee on railway terminals by its engineer, Edward J. Noonan. The plans were drawn upon the instructions of the Aldermen to permit street cars to enter Grant Park without destroying the beauty of the park.

Indianapolis, Ind.—The State Supreme Court has reversed a decision in the Circuit Court, which would have forced the state highway commission to stand the expense of improving the right-of-way of the Terre Haute, Indianapolis & Eastern Traction Company in a public highway near Richmond. Litigation resulted from action of the commission in 1923 in paving approximately 1¼ miles of roadway in the National road, including the railway's right-of-way. The commission alleged that under the state law, the railway was required to improve the space between the rails and 18 in., on each side when the tracks are laid on the public highway.

Rockaway, N. Y.—Chairman John H. Delaney, of the New York Board of Transportation has assured a representative of the allied transit committee of the Rockaway section that plans for transit relief in that area would be made public "within a few months." Mr. Delaney's statement was taken to indicate that transit relief for the Rockaways would be embodied in the second "$600,000,000 subway building program," for which surveys are now being made. Residents of the Rockaways would like to see the branch of the Long Island Railway now serving their shore resorts made part of the city system.

London, Ont.—Employees of the London Street Railway decided on July 11 to accept the company's wage proposals for a two-cent-an-hour increase, effective on Sept. 1. The Ontario Railway and Municipal Board reported in favor of an increase more than seven months ago, but the company was unable to comply with the findings for reasons set forth at length in the ELECTRIC RAILWAY JOURNAL for April, page 555.

Cincinnati, Ohio—Sixty-eight formal meetings have been held with relation to the adoption of the four ordinances which, as finally passed permits the $41,000,000 Union Terminal project to be started to which reference was made in ELECTRIC RAILWAY JOURNAL NEWS for July 20. Not willing to incur any possible difficulties due to technicalities or typographical errors in so important a project as the terminal, it was finally decided to call a special session of the City Planning Commission to go over the printed ordinances. A special meeting of the City Council then followed, to receive the Planning Commission's final report. Favorable action by the Council was then taken on the adoption of the ordinances.

Toronto, Ont. — Additional motor-coach service to that at present in operation in conjunction with the radial railways has been suggested, should the radial service be abandoned.

St. Louis, Mo.—The last of the open bench coaches of the St. Louis Public Service Company were burned at the company's graveyard in St. Louis County recently. The "moonlight" cars were used until 1927 on the Creve Coeur Lake line between the end of the Delar-Olive Street line in University City and Creve Coeur Lake.

Pittsburgh, Pa.—A resolution has been presented to Council to authorize the Pittsburgh Railways temporarily to abandon one set of the double set of tracks on Water Street between Wood Street and Smithfield Street.

New York, N. Y.—President Menden of the Brooklyn-Manhattan Transit Corporation, and President Hedley of the Interborough Rapid Transit Company at a public hearing before the Transit Commission on July 10, said that enforcement of the commission's recent ruling against the "keying" of trains past danger signals and automatic tripper devices. would make impossible the "practical operation" of rapid transit lines. They admitted that literal compliance with the order of "keying by" would prevent collisions, but contended that the rule would seriously delay traffic. Chairman Fullen adjourned the hearing until a later date.

Joplin, Mo. — The Joplin-Pittsburg Railroad on July 15 applied to the Public Service Commission for authority to acquire, operate and maintain the tracks and right-of-way of the former Joplin & Pittsburg Railroad between Joplin, Mo., and Pittsburg, Kan. The company would operate as a common carrier of freight. It crosses the Missouri-Kansas line at a point 1½ miles northwest of Asbury, Mo.

Baltimore, Md.—The park tax paid to the city of Baltimore by the United Railways & Electric Company showed an increase of $7,000 for the second quarter of 1929 as compared with the corresponding period of 1928. The tax is 9 per cent of the money taken in for fares on most of the lines. The money is used to maintain the city parks. The tax for the second quarter was $277,000 as against $270,000 for the second quarter of 1928. Receipts of the United for April, May and June totaled $3,963,276 and the park tax was paid on $3,105,013, the remainder being receipts from lines not subject to the tax. The monthly receipts for the period were: April, $1,331,013; May, $1,365,530; June, $1,266,732.

Windsor, Ont.—An injunction to halt the projected transfer of the Windsor, Essex & Lake Shore Railway to the people of Windsor and eight other municipalities along its right-of-way is sought by a member of the East Sandwich Township Council. Consummation of the plan required the passage of enabling by-laws by the Councils of all communities interested. The East Sandwich Township Council did enact this legislation, but it is now asserted that business transacted at that session was unconstitutional.

Boston, Mass.—An early morning car is being operated to Elm Street on the Fellsway in Boston as a special service to night workers by the Boston Elevated Railway largely as an experiment. Early cars on other routes may be tried later if this trial is successful.

Ames, Ia.—The Fort Dodge, Des Moines & Southern Railroad has been permitted to discontinue its car line between the Iowa State College campus and the business section of Ames, Ia., until the opening of the school term in September. A bus line, also operated by the company, is furnishing service between the two sections of the city during the summer.

Toronto, Ont.—The question of salary and working conditions for employees of the Windsor railway is left open indefinitely as the result of a conference here on July 20 between representatives of the men and the Ontario Hydro-electric Commission, which operates the system for the local municipalities. At the close of the conference the only announcement was that another conference is to be held in "a month or so."

Recent Bus Developments

Twenty-Five Cent De Luxe Service for Baltimore

Plans to operate a de luxe passenger bus service between the fashionable Roland Park section and the downtown area are being made by the United Railways & Electric Company, Baltimore. The application is now before the Maryland Public Service Commission.

The route to be covered will be about 6 miles and the fare will be 25 cents each way. Seven de luxe buses will be used to start the service, probably about Sept. 1. Each bus will carry nineteen passengers.

In establishing the service the United expects to eliminate much of the parking nuisance with which many of those living in Roland Park are forced to contend. The company promises to maintain a 10-minute headway in the morning and evening rush hours and 20-minute headway during the rest of the day.

Adrian Hughes, Jr., superintendent of the bus department of the United, conducted a thorough canvass of residents who would be served by the line. More than 1,000 persons were interviewed and many of them said they would patronize the line. Part of the Roland Park section is served by two car lines.

Buses on Idaho-Washington Run

The last electric railway system in Idaho will pass into history on Aug. 1 with the removal of the tracks on the interstate bridge between Lewiston in that state and Clarkston, Wash., completed in compliance with orders from the City Councils of both cities. Mark Means, secretary-treasurer of the Lewiston-Clarkston Transit Company, operating the street railway, has received a permit to operate a bus line.

New Chicago-Alton Service Approved

Holding that the request of the Chicago & Joliet Transportation Company, Alton Transportation Company, and Illinois Traction, Inc., filed in September, 1928, should not be approved the Illinois Commerce Commission on July 16 cancelled the certificate of convenience and necessity granted to the Alton Company and issued to the Tri-State Bus Company a certificate to operate motor coaches between Chicago and East St. Louis and intermediate points. The commission held that "by rendering a local transportation service that will transport passengers from intermediate points to 'all trains stop' stations," the bus service would "have a further tendency—to increase the amount of travel on the steam and interurban railroads."

It also held "that the existing steam and electric carriers cannot render service of the type, quality, kind and character so as to meet the demands of the traveling public and the people living on or near the proposed route," and, further "that by virtue of the difference charged in the per mile rate of fare, the bus traveling public, as counter-distinguished from the steam and electric public, is, in the great majority of instances, an entirely different class of the general traveling public."

Another Route Sought by County Transportation

The New York Public Service Commission was petitioned by the Port Chester-Glenville Bus Company and the County Transportation Company, Inc., on July 19 for authority to transfer to the latter its certificate of public necessity and convenience. The village authorities of Port Chester have approved the transfer. The County company now owns 60 buses and it will be able to assign buses and co-ordinate the various routes with the trains of the New York, Westchester & Boston Railway, to which the County company is allied, and provide increased facility of travel to the inhabitants of the territory covered. The commission will give a hearing later.

Alliance-Canton Service Still a Matter of Controversy

Claims that an effort is being made to wreck the Stark Electric Railroad were made by William Klinger, a member of the Ohio Public Utilities Commission, in his opinion opposing increased service between Alliance and Canton, Ohio, asked by the Salisbury Transportation Company. Stark Electric has opposed the Salisbury's request to run hourly service. At a hearing some months ago when the Salisbury company protested a request of the Stark Electric for increased service over a part of the Alliance-Canton route, it was charged that the bus line was being subsidized. Overriding Mr. Klinger's opposition, Roscoe C. McColloch, chairman of the commission, and Frank W. Geiger, granted the Salisbury company permission to follow a one-hour schedule. The two companies have battled before the Ohio Public Utilities Commission and the various courts of the state for months.

Supervision of New York Taxis Recommended

Taking up the perennial subject of taxicabs, the Citizens' Street Traffic Committee of New York suggests a new bureau to have charge not only of licenses but of regulation. The hope is expressed that by constant supervision, with adequate co-operation by the police, many of the existing inconveniences or abuses may be measurably abolished. It has been found, for example, that the stands where taxicabs are allowed to wait for fares are not so fully used as they should be. At special locations, also, there is evidence of favoritism and even of intimidation with respect to certain cab lines. The citizens' committee agrees with the Mayor that in New York there are too many taxicabs when they are not needed, and not nearly enough when they are. Whether this condition can be remedied by the proposed Board of Taxicab Control, says the New York *Times*, cannot be predicted in advance of actual trial.

Buses Between Allentown and Reading

Preparations are being made by the Allentown & Reading Traction Company to substitute bus lines for the interurban passenger routes. The trolley lines in Reading proper would be retained. The falling off of business between the two cities, and the need for a general realignment have brought about the change, particularly the fact that a fine highway connects both cities, affording excellent opportunity to serve passengers on the 35-mile run between the two Pennsylvania cities.

Baltimore, Md.—Permission granted by the Maryland Public Service Commission to the Baltimore Coach Company, a subsidiary of the United Railway & Electric Company, Baltimore, to operate passenger buses on the Registerstown road, was opposed by the Park Heights Civic Improvement Association, which has now been refused an opportunity to present additional testimony.

Alameda, Cal.—The Citizens' Transportation Committee has applied to the Railroad Commission for an order directing the Key System Transit Company to abandon its franchises and remove its railway tracks from the corner of Park Street and San José Avenue, along Park Street and over the Park Street bridge, and to operate bus service in lieu of the railway service over Park Street and thence by the most direct route to East 14th Street in Oakland.

Columbus, Ind.—Two new buses of the Interstate Public Service Company intended to supplant street cars running from Columbus, Ind., to Maple Grove and East Columbus, have been put into operation.

Rochester, N. Y.—Authority was asked of the Public Service Commission by the New York State Railways on July 22 to substitute buses for trolley cars on the Rochester & Sodus Bay division of its line. It is proposed to use Mack and White parlor car type buses seating 29 passengers as well as two five-ton freight trucks and one tractor with two trailers. Ordinary baggage will be carried on the buses. The town boards of Irondequoit and Penfield and village of Webster have agreed to the substitution.

Worcester, Mass.—No decision has been reached by officials of the Worcester Consolidated Street Railway on the course to be pursued to obtain a permit to operate buses in Millbury and Bramanville in place of railway service. The Worcester license commission has authorized the Consolidated to operate in Worcester, but the Selectmen of Millbury have refused to permit the company to operate in that town. Consolidated officials probably will ask for a conference with the Millbury selectmen in an effort to settle the difficulty.

Newark, N. J.—The largest chartered bus order ever placed with the Public Service Co-ordinated Transport is that of the Wright Aeronautical Corporation, for an excursion of 120 buses from Paterson to Lake Hopatcong, N. J., on Aug. 2. This exceeds by nine buses the largest previous order, which was for a recent excursion of the Prudential Insurance Company.

Financial and Corporate

Earnings Improve in Baltimore

An increase in net over the corresponding month of 1928, after charging off the added amount for depreciation ordered by the Maryland Public Service Commission, is reported by the United Railways & Electric Company, Baltimore. It is the fourth consecutive month in which the company has shown increased net income. The increase in net for this June over the corresponding month of last year was $3,701, after setting up $67,794 more for depreciation than in June, 1928. Economies in management showed a saving of $57,766.92, or 6.70 per cent for June.

For the six months' period of 1929 passenger revenue increased $170,811, and economies in management saved $224,683, as compared with the first six months of last year. However, the increase in depreciation reserve amounted to $416,296 more in the first six months of this year than in the similar period of 1928, resulting in a net income so far this year of $195,687, as against $229,647.56 for the first six months of last year.

Insull Interests After Indiana Union Traction

Interests representing Samuel Insull are reported to be making final overtures to gain control of the Union Traction Company of Indiana. A bid of about $2,829,000 is said to have been made for properties of the company, now in receivership, against which more than $14,201,000 mortgage bonds are outstanding. It is understood that committees representing various bondholders' groups have been meeting the last few days in Philadelphia to sign an agreement with the Midland Utilities Investment Company, Insull holding corporation, for sale of the bondholders' rights on condition that 60 per cent of the outstanding securities be delivered.

Excellent Year in Toledo

The first twelve months of operation under the new transit plan at Toledo, Ohio, co-ordinating bus and railway service under direction of the Community Traction Company, and eliminating independent and competing lines, showed $3,900,274 revenue compared with $3,504,766 for the previous twelve months. This was a gain of 11.28 per cent, made during a period in which service was increased 16 per cent. Expenses increased only 5.20 per cent.

Some 52,596,378 passengers were carried, an increase of 5,016,859 over the previous year, or a gain of 10.54 per cent. Crosstown lines, operated for the first time by the company, carried 943,704 passengers. Special school buses carried 45,806 passengers in addition to those using regular lines.

The company is spending more than $100,000 a month now on its improvement program. This includes new tracks on all streets in which the city is laying new pavement.

The company has abandoned $1,500,000 of property since the Milner ordinance became effective and has increased its plant investment account $750,000 since 1921. It has outstanding $6,181,000 of first mortgage bonds and $1,226,000 of 7 per cent preferred stock. The city now owns $1,819,000, par value, of the railway's common stock.

During the last twelve months $160,504 was credited to the stabilizing fund.

The favorable showing of the company is one of the achievements claimed by Mayor W. T. Jackson in his campaign for re-election. Thus the city transportation system is injected into the city campaign for the first time in history to advertise its good record.

Holding Company Case at St. Louis Appealed

On July 19 the City of St. Louis and former Judge Henry S. Priest acting on behalf of certain minority stockholders of the St. Louis Public Service Company appealed to the Cole County Circuit Court from the ruling of the Public Service Commission on April 26, last, which authorized the City Utilities Company, a Delaware corporation, to acquire and control more than 10 per cent of the capital stock of the St. Louis Public Service Company. The city contested the holding company's application on the ground that it was not legally qualified to do business in Missouri and further that it was not adequately equipped to render the railway the financial and administrative assistance promised.

Review of Boston "L" Year

Careful economy made it possible for company to avoid deficit—Against further extensions at expense of car rider

FOR the year ended June 30, 1929, the Boston Elevated Railway was able to meet all operating expenses and fixed charges. No balance is available over and above the amount necessary to restore the reserve fund to the original amount of $1,000,000 as provided in the Public Control Act. At this time, therefore, no further payment can be made in reduction of the balance still due to the municipalities on the assessment made in 1919. Only through the most careful economy was the railway able to avoid a deficit. With respect to service rendered, the railway, during the last year, actually operated 65,000 more miles than in the previous year.

Receipts declined $697,127 for the year ended June 30, compared to last year. Partially offsetting this decrease in receipts was a reduction of $610,061 in operating expenses as compared with the actual operating expenses applying to the year ended June 30, 1928. From actual operations covering the year ended June 30, 1929, there was an excess of cost of service over receipts of $180,153 compared to an excess of receipts over cost of service of $82,811 from actual operations during the year ended June 30, 1928.

The deficit of $180,153 was met in part by a dividend of $150,000 from the Transit Mutual Insurance Company created in 1921 to carry the workmen's compensation insurance of the company. This dividend represents savings to the car riders through the operation of the Mutual Insurance Company. The balance was met by inventory and other profit and loss adjustments

Conspectus of Indexes for July, 1929

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Digitized by Google

incidental to the closing of the year's accounts.

Attention is directed to the reduction this year of $610,061 in operating expenses, a sum lower than for any year since that ended June 30, 1923, when a lower wage scale was in effect than at present.

The decline of $697,000 in gross revenue is attributed by Edward Dana, general manager, to two factors: First, continuing and increasing depression in summer riding; and second, the increase in automobile riding, especially during the open winter last year. Neither factor is one over which the railway has control.

As evidence of the increased need of mass transportation, Mr. Dana points out that in spite of the decline in total passenger revenues, there has been a substantial increase in weekday traffic for the eight months of the year from October to May, inclusive. This average weekday traffic during the eight months period is more than 1,120,000 passengers under the present 10-cent and 6¼-cent fare, compared to 984,619 in 1920, the first year of the 10-cent fare, and 1,088,548 in 1917, the highest point of the 5-cent fare.

The additional rental of $30,000 a month on the portion of the Dorchester Rapid Transit Extension in use when rental began in October, 1928, added to the burdens to be overcome during the past year. The total rental charges on subway, tunnel and rapid transit lines increased by $291,116 this year as compared to last year. In conclusion Mr. Dana says:

"Since it is very evident that present revenues are barely sufficient to meet the present cost of service, it should be apparent that further rapid transit extensions at the expense of the car rider alone cannot be undertaken."

COMPARATIVE DIVISION OF RECEIPTS AND EXPENDITURES OF THE BOSTON ELEVATED RAILWAY FOR THE YEARS ENDED JUNE 30

	1928	1929
Total receipts	$35,009,933	$34,312,806
Operating Expenses		
Wages	16,826,418	16,295,105
Material, supplies and other items	3,155,788	3,064,407
Injuries and damages	1,191,690	1,210,168
Depreciation	3,814,336	2,847,900
Fuel (does not include gasoline for buses)	1,094,966	1,055,746
Total operating expenses	$25,083,391	$24,470,322
Taxes	1,793,128	1,605,086
Dividends (including rent of leased roads)	3,149,857	3,139,874
Subway and tunnel rents	2,269,193	2,560,315
Interest on B. E. bonds and notes	3,553,097	2,538,583
Miscellaneous items	78,448	85,771
Total cost of service	$34,927,121	$34,492,959
Loss or gain not including profit and loss items	82,811	*180,153*
Profit and loss delayed items	812,706	180,153
Total loss or gain including profit and loss items	$895,518	$00

Terms of Tentative Key Plan

The reorganization committee of the Key System Transit Company, Oakland, Cal., has promulgated a readjustment plan whereby it is proposed to reduce funded debt to $4,675,000 from $19,436,000.

Holders of the $1,175,000 of 5½ per cent equipment bonds will receive 50 per cent in cash and 50 per cent in new 6 per cent equipment trust certificates plus $200,855 interest in cash. Holders of the $8,862,000 general and refunding second mortgage bonds will receive preferred stock of two series conditioned on bond interest. Holders of the $2,500,000 collateral trust 6s will receive convertible preferred. All of this stock is to be issued on the basis of one share for each $100 par of bonds.

Holders of the present prior preferred will receive 1½ shares of new Class A common for each share of prior preferred held. Holders of the present preferred will receive two shares of Class C for each share held. Holders of the common will receive one share of Class C for each share held.

In order to obtain the funds to cancel the first mortgage, every exchange below the first mortgage is conditioned upon the compulsory subscription to one share of the new preferred at $25 a share for each $100 par value of existing securities. The new preferred carries $1.50 dividend.

The present second mortgage bondholders will be required to subscribe to only such portion as may not be met by securities junior to this mortgage up to the limit of one share for each $100 par held.

The plan will be effected by foreclosure of the first mortgage. It is stated that the foreclosure price will undoubtedly leave no values for any undeposited securities junior to the first mortgage and failure to subscribe will result in the cancellation of such junior equities. Option is extended to the first mortgage holders to receive in full equipment trust certificates instead of part cash. The committee says a substantial amount of bondholders have so elected in advance.

Depreciation Accounting Reply

The St. Louis Public Service Company, St. Louis, Mo., on July 22 filed with the Public Service Commission a reply to the recent complaint of City Counselor Muench demanding an accounting of an $8,369,931 depreciation reserve which the city alleged the company took over from Receiver Rolla Wells of the United Railway on Nov. 30, 1927. Stanley Clarke, president of the Public Service Company, said:

"The property was sold at foreclosure free from all liabilities other than those set forth in the decree of the United States District Court. Receiver Wells was charged with the obligation of paying off the matured indebtedness of the receiver and the insolvent company. As a matter of fact there was an insufficient amount to pay off such obligations.

"As a result no depreciation fund whatsoever was acquired by the company from the receiver. Since Dec. 1, 1927, when it acquired the properties, the company has been setting up a depreciation fund pursuant to the orders of the commission."

The reply states that the present depreciation reserve as set up by the company is $756,331.

Mr. Clarke characterized the complaint of Counselor Muench as unwarranted and designed to mislead the people.

The company further asks the commission to increase the annual depreciation allowance to 3¼ per cent of the depreciable value of its properties, raising this item from $800,000 to about $1,400,000 annually. To sustain its request for a greater depreciation reserve the company pointed out that the city is now engaged in an extensive street widening program which will require the railway to remove or replace many miles of tracks imposing a burden heavier than it had ever faced before.

Dividend Action Criticized

Action of the Philadelphia Rapid Transit Company in declaring a $1 extra dividend on common was characterized as "a challenge to the people of Philadelphia" by Harold Evans, former Public Service Commissioner. He questioned the propriety of taking $600,000 out of the company's surplus. Criticism also was directed at the board's action because the Philadelphia Rapid Transit has been asking an increase in fares. S. Davis Wilson, city controller, urged action by the taxpayers in the event the City Council, acting under an agreement of 1907, failed to disapprove of the expenditure.

Action Soon in Indiana Merger

The $70,000,000 utility merger case in Indiana now pending before the Public Service Commission has moved a step nearer hearing with the completion of field work of the auditors who have been studying the books of the companies involved. Howell Ellis, a member of the commission, says the next step will be preparation of exhibits showing facts pertinent to the merger case. These exhibits will be made from the audits. Meanwhile engineers of the commission are at work investigating the condition of the physical properties of the various utilities sought to be merged. This investigation will not be completed for several weeks.

Among the companies involved in the merger are: Car Trust Equipment Company, Indianapolis & Northwestern Traction Company, Indianapolis, Crawfordsville & Danville Electric Railway, Indianapolis, Martinsville Rapid Transit Company, Indianapolis Street Railway, Terre Haute, Indianapolis & Eastern Traction Company, Terre Haute Traction & Light Company, and Terre Haute & Western Railway.

Chicago Railway's Principal

The Chicago Railways will begin paying off its $55,655,000 first mortgage bonds. On or about Aug. 1, the bondholders will receive about $5,565,000 as a 10 per cent payment on the bonds, which have been in default since Jan. 31, 1927, when the ordinances under which the Chicago Railways and the Chicago City Railway expired and the bonds matured.

This will be the first payment on the principal in the two and a half years the company has been in receivership. However, the semi-annual interest payments at the annual rate of 5 per cent have been kept up under order of Federal Judge Wilkerson, so that the bondholders will receive $1,390,000 additional as interest due on Aug. 1.

Albert W. Harris, chairman of the bondholders' protective committee, has appealed to holders who had not yet deposited their bonds with the committee to do so in view of the prospective reorganization.

Personal Items

Charles Gordon, Managing Director

Engineer, executive and journalist selected to succeed Lucius S. Storrs in American Electric Railway Association Post

CHARLES GORDON, editor of ELECTRIC RAILWAY JOURNAL, has been named managing director of the American Electric Railway Association, a post he is to assume on Sept. 1 next. He was selected for appointment by a sub-committee of the Advisory Council of the association on July 9 and the appointment was confirmed by the executive committee on July 12, at which time J. H. Hanna, who presided in the absence of President Barnes, officially notified Mr. Gordon of the recommendation of the Advisory Council and the action of the executive committee. Mr. Gordon succeeds Lucius S. Storrs, now chairman of the executive committee of the United Railways & Electric Company, Baltimore.

It is agreed that no editor can be an influence who is lacking in positive opinions and has not the power of reiteration. Dana, Raymond, Godkin, and in more recent times Cobb, were all men that met this measure, on which James Ford Rhodes, the historian, lays great stress. It is the measure that Charles Gordon meets. He has positive opinions. He has reiterated them time and time again, but not for the mere sake of writing. He expressed himself in the JOURNAL because his mind was full of the things to which he turned his pen—visions of the local transportation industry in its relation to city planning, its bearing on the terminal situation in our fast growing cities and in its other broad economic aspects.

Mr. Gordon has been nationally active in transportation affairs for a long period, and as editor of the JOURNAL he has traveled widely and spoken in the interests of modernization of local transit service. He has advocated modernization of electric railway properties and co-ordinated rail and bus service under single managements. Ever since he left the service of the Chicago Railways in 1923 to become Western editor of ELECTRIC RAILWAY JOURNAL he has carried on militantly as journalist and editor in advocacy of those things he recognized as likely to be for the greatest good of the industry. Recognition of the high editorial standards achieved in this activity came with the award to the JOURNAL in 1928 of the first Associated Business Paper medal for outstanding service by a business paper to its industry. In fact, it is doubtful if any other man in the industry has devoted himself with greater zeal and enthusiasm than has Mr. Gordon to the task of rehabilitating the electric railway as an agency of transportation and restoring it to its proper place in public esteem.

All the various phases of street railway and bus operation have attracted and held his attention. He has advocated the use of the bus not only as a supplement to the street car but to provide a service of its own wherever circumstances would warrant. In all these larger activities he has not, however, lost sight of the importance of personnel work, sound financial policy, the economics of street traffic, and the details of operation, maintenance and construction. Valuable in his new post should be his ability to express himself clearly, forcefully and candidly as a speaker.

Charles Gordon

Mr. Gordon was graduated from the University of Illinois, railway electrical engineering department in 1912. His first position was with the Chicago Railways Company. There he was engaged in electrical and mechanical test work under John Z. Murphy, then chief engineer. When the Chicago Surface Lines was formed as an operating entity he remained with that company until 1917, when he entered the Army Air Service. On his discharge in April, 1919, he joined the sales force of the Vacuum Oil Company as a special engineer. The following year he was appointed equipment engineer of the Chicago Surface Lines. In this capacity he served under H. H. Adams, superintendent of equipment, and was responsible for many phases of the development of rolling stock and maintenance practice on a system operating some 4,000 surface cars engaged in the most difficult of city service. He organized an equipment engineering department which quickly became a strong factor in the improvement of equipment department practice. From the Chicago Surface Lines he went to ELECTRIC RAILWAY JOURNAL as Western editor in 1923.

As this very brief review indicates, Mr. Gordon is an engineer by profession, an executive by training and a journalist by predilection. He will take to the task of managing director the broad, intimate contact that his work as editor has given him with all phases of community transportation, a type of experience it would be difficult to duplicate. In his new post he should loom even larger than he has in the past as writer and editor, as an influence in shaping the policies of organized mass transportation agencies in meeting their responsibilities as public servants, and in anticipating the opportunities for expansion offered by the growing problem of moving people and commodities in modern communities.

D. E. Druen in New Post

D. E. Druen, in the service of the Kansas City Public Service Company, Kansas City, Mo., since June, 1920, succeeds to the position of superintendent of equipment, made vacant by the resignation of R. S. Neal, who goes to the Texas Company in a street railway engineering capacity. In assuming the position vacated by Mr. Neal, Mr. Druen becomes the head of the mechanical department. In addition to the work he takes over at the Tenth and Lister shops he will still retain his title as superintendent of the bus and garage department.

Mr. Druen has been at the head of a special engineering department, at the Tenth and Lister shops, organized to carry on a widespread work of research, planning and inspection. In addition to this work, he has also remained at the head of the bus and garage department. His connection with the Kansas City property, as indicated previously, dates from June, 1920, when he entered the service of the Board of Control of the Kansas City Railways assigned to research and planning work concerned with the rehabilitation of the power plant at Second and Grand.

When R. W. Bailey became head of the power department, Mr. Druen was appointed assistant superintendent of power. This was in January, 1921. During the interval between 1921 and 1927, when the plant passed to the Kansas City Power & Light Company, the old power house, under Mr. Bailey's direction and Mr. Druen's supervision, was brought up from a questionable state of usefulness to one of the highest in efficiency. The scope of this work included the installation of a complete steam plant. The system of handling coal and ash was entirely revolutionized. The power producing facilities were also rehabilitated and the plant commenced to repay in the shape of savings to its owners. With the passing of the power plant, Mr. Druen was appointed superintendent of the bus and garage department. Here another job of planning and organizing confronted him. Thence he went to the special engineering department.

Don E. Druen was graduated from the University of Wisconsin with the class of 1913 with the degree of C.E. Immediately upon graduation he was appointed assistant city engineer at Miles City, Montana. In 1917 he was appointed city manager of Glendive, Montana, a position he resigned in 1920 to enter the services of the Kansas City Railways.

J. W. Welsh With Cleveland Railway

Executive secretary of American Electric Railway Association resigns to accept an executive position under President Alexander. To participate in work of co-ordinating surface and rapid transit operation

JAMES W. WELSH, executive secretary of the American Electric Railway Association since 1921, is to become engineering assistant to Joseph H. Alexander, president of the Cleveland Railway on Sept. 1. His appointment is the first major addition to the railway's executive staff since Metropolitan Utilities Inc., controlled by the Van Sweringens, took over the company.

As a specialist in engineering and traffic problems, Mr. Welsh is expected to devote much of his time to the problems which the railway will face in its great expansion period just ahead, when it must co-ordinate its surface and rapid transit lines and evolve policies of transportation to fit a changing situation. In this program Mr. Welsh will be called upon to assist in the development of a plan for the co-ordination of the company's present surface street car and bus lines and the rapid transit lines which the Van Sweringens will build to the east and west of the Public Square.

J. W. Welsh

As his first work at Cleveland Mr. Welsh will devote considerable time to a study of the railway's traffic problems, its co-ordination plan and particularly to transportation research. The traffic study will be of a dual nature, attempting to speed up traffic and eliminate congestion in now crowded districts, and to determine where traffic will originate in the future.

Since Mr. Alexander is an engineer, his contacts in the past naturally have been more with the engineering departments of the railway. He now expects to be able to devote more time to other departments and other problems, with Mr. Welsh giving his attention to engineering problems.

In tendering his resignation to the association Mr. Welsh said:

"I wish to express my regret in severing a relationship which has existed for eight years in my present office, and to record my high regard for the wide acquaintanceship throughout the industry, and the closer friendships among the officers and committee members which I appreciate more than I can tell you. I wish the ensuing management of the association a full measure of success, and I pledge my co-operation."

Mr. Welsh has been secretary of the association since 1921. Before that he was the association's special engineer. Until his appointment as engineer of the association, he was in Washington, D. C., associated with A. Merritt Taylor, manager of the passenger transportation of the Emergency Fleet Corporation of the United States Shipping Board. Mr. Welsh, who served on Mr. Taylor's staff, assisted in providing transportation facilities to the various shipyards on the Atlantic and the Pacific Coast as well as correcting existing shortcomings where they were present.

Previous to that Mr. Welsh was electrical engineer and traffic agent of the Pittsburgh (Pa.) Railways, with which he became associated in 1906 as assistant electrician. In 1910 he was made electrical engineer and in 1913 took charge of the traffic department. Some of his earlier electrical engineering experience was gained in the employ of the National Tube Company, Wheeling, W. Va., and also in the Westinghouse Electric & Manufacturing Company at East Pittsburgh.

Mr. Welsh was graduated from Wittenberg College in 1900, Harvard University in 1901, and Massachusetts Institute of Technology in 1903.

New South Wales Official on Tour

S. A. Maddocks is on a visit to the United States empowered by the New South Wales government to inquire into transportation administration and operation with a view to incorporating any methods he believes might be advantageously adopted by his home government, which has a traffic bill under consideration at the present time. He favors co-ordination of transportation so that the public might get the maximum benefit of each form. To illustrate his point, Mr. Maddocks mentioned Toronto, Philadelphia and Berlin as among the cities which have done most for co-ordination. He feels that the operation of the street cars and motor coach or bus systems under the one administration is infinitely wise. In New South Wales, he pointed out, the railways and tramways are government-owned, but the lack of co-ordination has led to an undesirable situation. Mr. Maddocks expressed admiration for the linked up transcontinental rail-air service.

A. L. Merritt Completes Twenty-Five Years as Superintendent

The twenty-fifth anniversary of Abraham Lincoln Merritt's connection with the Interborough Rapid Transit Company, New York, as general superintendent of the subway division was celebrated on July 20 when forty members of his staff surprised Mr. Merritt in his office. Mr. Merritt's well-wishers included some of the first corps of motormen, conductors and guards whom he had put to work in the original "Belmont Tube" in 1904. Mr. Merritt, in responding to the congratulations from his staff, described the first run made in the subway from City Hall to the Grand Central Terminal.

New Head of Columbus Property Has Had Varied Career

Benjamin W. Marr, who on July 1 was elected president of the Columbus Railway, Power & Light Company, of Columbus, Ohio, succeeding C. C. Slater, has had a varied business career. For a time he was a hardware merchant in Huntington, W. Va., and Catlettsburg, Ky. He later became vice-president and general manager of a company which manufactured hickory tool handles in Louisville, Ky. He is still a vice-president of the Gwinn Bros. Milling Company, Huntington, and was secretary of the Gwinn Milling Company, Columbus, for twenty-one years prior to last March, when he resigned to become chairman of the board of directors and chairman of the executive committee of the Columbus Railway, Power & Light Company. Prior to this he had been a director of the company for ten years.

C. C. Slater, retiring president, has been general manager, vice-president and president of the company. He was made president in 1928. During his régime the property was rehabilitated physically. He made one cut in light and power rates, placed new cars in operation, started bus service, inaugurated the skip stop system of car operation, raised the street car speed limit, rebuilt practically all the trackage and paved streets at a total cost of about $2,000,000.

B. W. Marr

Sir Felix Pole With Associated Electrical Industries

Surprise was caused in British railway and other engineering circles by the announcement in June that Sir Felix Pole had resigned as general manager of the Great Western Railway to become chairman of Associated Electrical Industries, Ltd. For the last eight years Sir Felix has been general manager of the Great Western Railway, a post which he has filled with great credit and distinction. He will still retain his connection with the railway as a consultant. Associated Electrical Industries, Ltd., of which he becomes chairman, is a holding company recently formed which controls the British Thomson-Houston Company, the Metropolitan Vickers Electric Company, the Metropolitan-Vickers Electrical Export Company, the Edison-Swan Electric Company and Ferguson Pailin. All these are names of importance in the world of manufacture of electric machinery and appliances, traction and other.

D. W. Pontius Heads Pacific Electric

Other changes in personnel include appointment of A. T. Mercier as vice-president and general manager of that company and F. L. Annable to the presidency of the San Diego & Arizona Railroad

HIGH and well-deserved honors were bestowed with the election of D. W. Pontius, formerly vice-president and general manager of the Pacific Electric Railway in Southern California, to the presidency of that property on July 1. He succeeds Paul Shoup, formerly president of both the Southern Pacific (Pacific System) and Pacific Electric Railway.

Advanced to the position formerly held by Mr. Pontius is A. T. Mercier. He leaves the post of president and general manager of the San Diego & Arizona Railroad, while the vacancy created by Mr. Mercier's advancement will be assumed by F. L. Annable, previously general superintendent of the Pacific Electric, who now becomes president of the San Diego & Arizona property.

Mr. Pontius made his start in 1891 as clerk in the roadmaster's office of the Pennsylvania Railroad in Ohio at $30 a month. Step by step he has advanced in his chosen field, having served successively as operator, agent district freight and passenger agent, traffic manager, general manager, and vice-president and general manager, serving during his railroad career with the Pennsylvania Railroad; Chicago-Great Western Railway; Northern Pacific; Union Pacific; San Diego & Arizona Railroad; Southern Pacific, and Pacific Electric Railway.

During the World War he was sent to San Diego as general manager of the San Diego & Arizona Railroad, which was under construction at that time. When this project was completed he returned to the Pacific Electric Railway as vice-president and general manager, a post he has filled until the resignation of Paul Shoup.

In addition to his efficient management of the world's largest electric interurban railway system, Mr. Pontius has for the past several years been active in civic affairs. He is president of the Los Angeles City Health Commission, executive vice-president of California's Mission Play, treasurer and member of executive committee of the Los Angeles Traffic Commission, and director of the United States National Bank.

One of Mr. Pontius' hobbies has been the promotion of social and group activities among employees of the company. Among his many accomplishments in this regard are the development of a $120,000 employees' mountain resort in the San Bernardino Mountains, and the erection of a $450,000 club building for the Pacific Electric employees, now being completed by the railway under his direction.

Mr. Mercier a Former Traffic Man

As vice-president and general manager, Mr. Mercier's addition to the executive forces of the Pacific Electric Railway brings to that property a man of many creditable achievements, both as an engineer in construction work and railroad operation. Mr. Mercier is a graduate of Rugby Academy, a preparatory school for entering Tulane University, in which institution he completed a course in civil engineering. He began his railroad career in 1904 with the Southern Pacific as traffic man, continuing until 1906 as roadmaster and assistant gang foreman at Los Angeles.

During 1906 and 1907 he was assistant engineer in charge of reconstruction work in the Colorado River District, following which he was engineer in charge of steel construction for the Southern Pacific in Southern California. From 1908 until 1917 he was assistant division engineer and later division engineer of several operating divisions of the Southern Pacific. In February, 1917, he was appointed assistant superintendent of the Shasta Division. In September, 1918, he was made superintendent of the Portland Division, where he remained until his appointment as general manager of the San Diego & Arizona Railroad. With the death of J. D. Spreckles about a year ago, Mr. Mercier succeeded to the presidency of the San Diego & Arizona Railroad, having held the office of president and general manager until his appointment as vice-president and general manager of the Pacific Electric Railway early last month.

Mr. Annable began his railroad career with the Atchison, Topeka & Santa Fé Railway (Coast Lines) at San Bernardino in 1893. He was later transferred to Los Angeles and then to Winslow, Ariz., with the same company. From 1904 to 1910 he held the position of chief clerk to the superintendent of the Los Angeles & Salt Lake Railroad in Los Angeles. For two years he was superintendent of the Arizona & Swansea Railroad at Swansea, Ariz. In 1911 he went to the Pacific Electric Railway as assistant superintendent. Later he was advanced to division superintendent, having served in that capacity during successive years on each of the Pacific Electric's three divisions. In 1913 he was made general superintendent, a position he filled capably until he was made president of the San Diego & Arizona Railroad.

R. S. Neal With The Texas Company

R. S. Neal has resigned as superintendent of equipment of the Kansas City Public Service Company, Kansas City, Mo., to become associated with The Texas Company as electric railway engineer. He will work out of Chicago, Ill. through Ohio, Indiana, Illinois, Missouri, Kentucky, and part of Michigan.

On March 16, 1918, Mr. Neal joined the Kansas City Power & Light Company in the way and structures department. He was transferred to the board of control on July 16, 1918, as assistant engineer for the installation of the Westinghouse stokers in the Missouri River Power Station at Second and Grand. He resigned on May 19, 1919, to go with the Burrell Engineering Company as mechanical engineer in charge of machinery layout. For a short period he was also assistant engineer of the Witte Engine Works. He returned to the Kansas City Railways on Nov. 12, 1920, to take charge of the engineering work for the mechanical department, organizing the original engineering department, which included designing work, making up of specifications, shop work, planning, and general drafting. This position he held until April 1, 1922, when he was appointed assistant superintendent of equipment in charge of the mechanical department. A few years later he was appointed superintendent of equipment, in charge of the maintenance of all equipment for the Kansas City Public Service Company, including the mechanical work at both the shops and divisions. The extensive car rehabilitation program during 1927-1928 was handled under Mr. Neal's administration.

Changes in Interurban Coach

An effort further to co-ordinate general management of the Mid-West Motor Coach Company and the Shore Line Motor Coach Company has resulted in the appointment of J. C. Johnson, general manager of the Shore Line Motor Coach Company, as general manager of both organizations. F. E. Snyder, manager of the Gary office of the Mid-West Motor Coach Company, will retain this position and take up the additional duties of assistant general manager of the Shore Line Company. Henry P. Bruner, Chicago, vice-president of the Mid-West Motor Coach Company, says the two bus lines will continue to operate as separate organizations, without any alteration in policy. No further changes in the management are contemplated.

R. H. Horton in Philadelphia Progress Movement

R. Harland Horton has resigned as assistant vice-president of operations of Mitten Management to take up his duties as executive director of the Philadelphia progress movement, the purpose of which is "to bring greater progress and prosperity to the city of Philadelphia."

Mr. Horton's immediate task will be to make a complete survey of all of the industrial advantages of Philadelphia; to collect and organize all of the important facts concerning the city, culturally, institutionally, geographically and socially, and to set forth how desirable a city Philadelphia is in which to live, to work and to play. An important part of Mr. Horton's responsibilities will be to make the three-year campaign now about to get under way beneficial to the city as a whole, to make it enhance the prestige of the city's present industries and to make it bring new, worthwhile profitable industries to Philadelphia.

Mr. Horton was born in Olean, N. Y., on Aug. 30, 1889. He received his technical education at the Carnegie Institute of Technology. He worked as a rodman for the Pennsylvania Railroad and later had practical experience in the shops of the Carnegie Steel Company. He came to Philadelphia in 1910 to work with a nationally known firm of consulting engineers in the investigation of the Philadelphia Rapid Transit Company for the Pennsylvania State Railroad Commission.

In 1912 he was engaged on further work of P. R. T. investigation and a plan for rehabilitation of the company. When this work was complete he remained in Philadelphia as traffic engineer for P. R. T. and in this capacity made studies of the city's high-speed transportation development with special relation to the Frankford Elevated, and of the company's intangibles in valuation proceedings. In 1921 he visited the principal cities of the United States to study each city's resources, its industries and its transit problems and methods. The following year he spent three months in Europe on a similar study. Upon his return he became vice-president of the International Railway, Buffalo, under Mitten Management, and held this post until 1925, when he returned to Philadelphia to set up the organization of the Philadelphia Rural Transit Company, operating buses. In 1926 he was made vice-president of the P.R.T. Air Service. In the summer of that year he took part in the conference of air-mail operators with Secretary of Commerce Hoover and subsequently was director of the Air Transport Survey, upon completion of which he returned to Mitten Management as assistant vice-president of operations.

Dean Kimball a McGraw-Hill Director

Prof. Dexter S. Kimball, dean of the College of Engineering of Cornell University, has been elected a member of the board of directors of the McGraw-Hill Publishing Company, publisher of the ELECTRIC RAILWAY JOURNAL. Dean Kimball has long been a leader in the field of engineering education and an active contributor to the scientific and engineering press. He became a member of the faculty of Cornell as assistant professor of machine design in Sibley College in 1898 and served until 1901. He again joined the Sibley teaching staff in 1904. From July to October, 1918, he was acting president of Sibley. In 1921, he became dean of the College of Engineering. Professor Kimball is a member of the American Society of Mechanical Engineers and the Society for the Promotion of Engineering Education and the author of several books.

Harold G. Morris in New Providence Post

The board of directors of the United Electric Railways, Providence, R. I., at its meeting on July 18 appointed Harold G. Morris assistant general manager. In announcing the appointment First Vice-President and General Manager Williams said:

"Mr. Morris is one of the outstanding figures in the modernized transportation industry. He is a man of tremendous energy with great ability for organization. Through his appointment the company should benefit greatly as it has in the past

Harold G. Morris

through his associations with it over these years. It greatly pleases me to make the announcement."

Mr. Morris previously held the position of assistant to the general manager. He has been with the United Electric Railways and its predecessors since Aug. 16, 1917. All of this time he has been in the executive offices of the company. At first he was stenographer in the office of A. E. Potter, president, and was later appointed clerk for the receivers of the Rhode Island Company on March 4, 1919, the duties in connection with this office he assumed in addition to the clerical position he held at the time.

In July, 1921, Mr. Morris was promoted to chief clerk and held that position until Feb. 1, 1929. With the appointment of Alonzo R. Williams to the position of general manager, Mr. Morris again was promoted, this time to the office of assistant to the general manager and assigned to Mr. Williams' staff.

On Aug. 1, 1928, Mr. Williams was elected to the position of first vice-president and general manager and thereupon Mr. Morris' scope of activities became greatly enlarged. He is thirty years of age.

Edward Jacobs Succeeds Captain Hearn at Shreveport

Edward Jacobs has been elected president of the Shreveport Railways, Shreveport, La., succeeding Capt. H. B. Hearn, who has become vice-president of the City Savings Bank Trust Company, Shreveport. He became a member of the staff of the company in 1918. He was elected secretary-treasurer in 1919 and vice-president in 1926.

Duties Reassigned on Indianapolis & Southeastern

W. A. Kirkpatrick, for six years freight agent at Rushville, has been made general freight and passenger agent of the Indianapolis & Southeastern Railroad. J. E. Ray, Indianapolis, who has been superintendent of transportation for the last year, will become head of the traffic department with the title of director of traffic and transportation. J. A. Rothermel and W. A. Patton, both of Indianapolis, formerly in train service, will become division traffic representatives in the reorganization of the traffic department. They will co-operate on both divisions of the railroad to give better freight and passenger service. L. E. Watkins, who has been division traffic representative, at Connersville, Ind., has resigned.

Temporary Appointments at Toronto

Toronto's Council has sustained the Board of Control's recommendation for the appointment of George Wilson, commissioner of finance, and George H. Ross, former commissioner of finance, as members of the Toronto Transportation Commission, in charge of the municipal railway and bus lines, for the balance of the respective terms of the late P. W. Ellis and George Wright, resigned.

C. W. Gifford, general superintendent of the Gary Railways, Gary, Ind., for the last four years, will assume charge of the Des Moines Railway, Des Moines, Ia., on Aug. 1. Before going to Gary, Mr. Gifford was connected with railway systems in the East, among them the Bay State Street Railway, and the Eastern Massachusetts, and the Brockton & Plymouth Street Railway. Under his supervision the operation of one-man cars has been extended over the Gary lines, and considerable additions have been made through incorporation of the Hobart and Valparaiso lines as part of the Gary system. A successor to Mr. Gifford at Gary has not yet been appointed.

Edward P. Warner, formerly assistant secretary of the Navy for Aeronautics, recently elected president of the Society of Automotive Engineers and formerly professor of aeronautical engineering in the Massachusetts Institute of Technology, has been appointed editor of *Aviation*. Appointment of the former assistant Navy secretary to head the oldest weekly in America devoted to aviation is the latest development to follow recent acquisition of the publication by the McGraw-Hill organization. Mr. Warner, in addition to his duties as editor, will serve as aviation advisor to the company's 26 engineering, industrial and business publications.

Gerard Swope, president of the General Electric Company, has been elected a director of the National City Bank, New York. The election marks the first occasion on which he has associated himself as a director in any enterprise outside the electric and power field and marks also the resumption of an active association between himself and Charles E. Mitchell, chairman of the bank, the

Digitized by Google

ground work of which was laid more than 30 years ago, when both were in the employ of the Western Electric Company.

Neil Currie, Jr., managing engineer of the motor department of the Pittsfield works of the General Electric Company for the past five years, has been named manager of the Philadelphia works of the company. Robert V. Good, section superintendent in the Schenectady works, has been named assistant to the manager at Philadelphia.

Charles E. Moore, Jr., since Sept. 1, 1926, junior assistant utilities engineer of the Maryland Public Service Commission, has resigned, effective on Aug. 10, to accept a position as planning engineer with the Western Electric Company.

Major R. J. Lockwood, assistant general manager of the St. Louis Public Service Company, was elected president of the Midwest Electric Railway Association at the closing session of the three-day meeting at the Chase Hotel, St. Louis, Mo., on June 15.

J. H. Shepherd, engineer and manager of the Dunfermline & District Tramways Company, has been appointed chairman for the ensuing year of the Scottish Tramways & Transport Association. L. Mackinnon, general manager of the Glasgow Corporation Tramways, has been appointed vice-chairman.

Obituary

John J. Russell

John J. Russell, supervisor of maintenance of way for the Lehigh Valley Transit Company, Allentown, Pa., is dead. Mr. Russell was born in Friendship, N. Y., 70 years ago. As civil engineer for the Erie Railroad he supervised the building of much trackage. He also helped to build the large yards at Salamanca, N. Y., for that company. He also had a part in double-tracking the Erie from Buffalo to Pittsburgh, and assisted in the construction of the Pennsylvania station, in New York City. He next worked with the Interborough Rapid Transit Company in superintending the construction of tracks. He went to Allentown in 1912 to supervise the maintenance of the Philadelphia division for the Lehigh Valley Transit Company. He was advanced until he exercised supervision over all but the Easton division of the Lehigh Valley.

Samuel M. Perry

Samuel M. Perry, vice-president of the Denver Tramway, Denver, Colo., died on July 21. Mr. Perry was born in Knoxville, Ill., 80 years ago. He went to Colorado in 1887 and in 1890 built an electric railway to Aurora. This line was later merged with the Denver Tramway, Mr. Perry becoming vice-president, a post he held at the time of his death. In 1902 when the Denver & Salt Lake Railroad was built, Mr. Perry became financially interested in the line and opened the Moffat Coal Company at Oak Creek on the railroad. He was also president of the Moffat Coal Company from its inception until he died. He was an enthusiastic sportsman.

John E. Davis

John E. Davis, trainmaster of the South Side Division, Chicago Rapid Transit Company, died in Chicago on June 27, at the age of 67.

Mr. Davis joined the South Side "L" on July 15, 1892, only a few weeks after this first unit of the present Rapid Transit Lines was placed in service. His first duties were as fireman on one of the steam "dinkey" engines then furnishing motive power for elevated trains on what was popularly called the "Alley." Shortly after he was promoted to engineer.

When the power was changed from steam to electricity in 1893, Mr. Davis likewise changed his title from "engineer" to "motorman." He rose through the various stages of promotion until his appointment as trainmaster in 1926.

George T. Chaffee, pioneer electric railway owner, manufacturer and banker, died on July 15 in Rutland, Vt. Mr. Chaffee entered the railway business in 1891 as owner of the Rutland Street Railway, then a horse car line. He was instrumental in its change to electricity in 1894, and was prominent in the industry for a number of years. Mr. Chaffee was connected with the F. Chaffee & Sons lumber dealers, and was a part owner of the Patch Wegner Company, machinery manufacturers, and a director of the Glens Falls Machine Company. He had been president of the Rutland Trust Company since 1904, and a director of the Killington National Bank since 1883. He was formerly State Senator.

John M. Sweeney, president of division 308, Amalgamated Association, Chicago, is dead. Mr. Sweeney was born at Belvidere, Ill., on July 3, 1870. He entered the employ of the Chicago Rapid Transit Company on July 13, 1917, as trainman on the south side division. His rise in union circles was rapid, culminating in his election as head of division 308.

Louis E. Bean, chairman of the Oregon Public Service Commission, died in Salem, Ore., on July 6, following a heart attack. For nearly three years Mr. Bean had served as a member of the commission and during the last two years had been its chairman.

James G. Murdock, son of the late Samuel T. Murdock, pioneer in interurban and power development in Indiana, died recently in Indianapolis. Mr. Murdock was born in Lafayette thirty-six years ago. He attended Wabash College and Yale University. He assisted in his father's business enterprises until the latter's death some months ago.

Book Reviews

Arc Welding

Lincoln Prize Papers Submitted to the American Society of Mechanical Engineers. Edited by Edward P. Hulse. Published 1929, by McGraw-Hill Book Company, New York City. Cloth, 6x9 in., 421 pages. Price $5.

Last year prizes aggregating $17,500 were awarded for the best three papers disclosing advancement in the art of electric arc welding. While these were financed by the Lincoln Electric Company, the contest was sponsored by the American Society of Mechanical Engineers and the awards were made by a disinterested committee of eight prominent engineers. This book, composed of the three prize papers, of two receiving honorable mention and two others of the 77 submitted, is ample evidence that the incentive was adequate. It is easily the most important contribution yet made to the literature of arc welding.

"Arc-Welding—Its Fundamentals and Economics," brought the first prize of $10,000 to James W. Owens. It reflects the author's extensive experience as director of welding for the Newport News Shipbuilding & Drydock Company, but he finds ample space in the 180 pages of his paper for the fundamental treatment of arc welding in general. The attention given to definitions, nomenclature, standards and specifications, and the author's definitely practical viewpoint throughout, add much to the value of the paper.

"Fundamental Principles of Arc Welding," for which Prof. H. Dustin of Brussels, Belgium, received second prize of $5,000, proceeds from systematic analysis and tests of the elementary welds to an experimental study of joints for structural work. His conclusions are general in their application.

Commander H. E. Rossell of the U. S. Naval Academy, who won third prize of $2,500 with his paper "Electric Welding of Ships' Bulkheads and Similar Plated Structures," makes a distinct contribution to the science and art of naval architecture. Incidentally he adds definitely to structural knowledge in general.

It is not generally realized that newly developed types of expansion joints make welding as applicable to the unpaved tracks of steam railways and interurban electric roads as to the paved tracks of street railways. The field for welded rail joints is therefore very large. In his paper on the "Theory and Application of the Base Plate Arc Welded Rail Joint," Frank B. Walker, chief engineer Eastern Massachusetts Street Railway, outlines extensive tests of rail joints in laboratory and field and gives designs and cost figures for commercial applications.

"Stable Arc Welding on Long-Distance Pipe Lines," by B. K. Smith, president of the Big Three Welding & Equipment Company, is mainly a brief history (with costs) of the laying of 45 miles of arc-welded pipe line for natural gas.

"Arc Welding as applied to Constructive Work at the Philadelphia Navy Yard" describes the construction of a steel pressure-resisting boiler test room and experiments on the welding of T bars to armor plate. The authors are M. M. Kennedy and F. H. Wieland of the Philadelphia Navy Yard.

In "Arc Welding of Duplicate Structures," W. G. Hines describes methods used in the publication of interchangeable arc-welded truck-switch frames.

Undoubtedly these papers, particularly the three prize papers, add much to our practical knowledge of the rapidly developing art of arc welding.

Industry Market and Trade News

Increased Activity in Car Buying

ESTIMATES made early in the year in the Annual Statistical issue of this paper to the effect that 1929 would be marked by heavier purchases of rolling stock than have been made for several years past have been confirmed within the past 30 days by authorizations which should lead to the placing of orders for more than 650 new cars by properties in this country and Canada.

As the result of the recent merger of the Brooklyn City Railroad with surface lines of the Brooklyn-Manhattan Transit Corporation into a new organization to be known as the Brooklyn & Queens Transit Corporation, the immediate purchase of 100 new cars has been authorized. While complete specifications are not available at this time it is announced that the new cars will be provided with high acceleration motors, special brakes, and other modern equipment, to insure the safety and comfort of the passengers as well as to maintain high speed operation under present day traffic conditions. They will be of the front entrance, center exit type, with seats for 50 passengers and equipped for one-man operation. It is estimated that the new cars will cost in excess of $15,000 each.

The approaching completion of the new subway system being developed under the direction of the Board of Transportation of the City of New York has led the authorities to ask for the submission by manufacturers of sealed proposals for the construction and delivery of 300 steel passenger cars. Bids must be in the hands of the Board at its office, 49 Lafayette Street, New York City, not later than August 20. For more than a year engineers of the board, aided by experts in car construction and design, have been studying the problem, with the result that the new cars will be faster and more commodious than any now in use in the city.

Preliminary specifications call for cars 60 ft. 6 in. in length, 10 ft. wide and 12 ft. high, with four double doors on each side. While the seating arrangement will be similar to that of the present B.-M. T. cars an attempt will be made to achieve greater passenger comfort by allowing more knee room. Each car will seat 60 passengers.

Authority has been granted by the Cleveland City Council to the Cleveland Railway to purchase 100 new street cars at an estimated cost of $1,800,000. The company had requested permission to retire 254 cars of an older type, replacing them with new equipment, but the Council would only consider the retirement of 100 at this time. It is understood that the cars will be of the single end, double truck, one-man, two-man, Peter Witt type, similar to the 50 cars ordered in 1928 from the G. C. Kuhlman Car Company. The cars previously supplied are 53 ft. 6½ in. in length, weigh 44,800 lb., and seat 55 passengers. Bodies are of semi-steel construction, with arch roofs, and doors at both center and end.

Following experimental operation extending over a period of several weeks with one of the small type of Brill standardized car, the Lynchburg Traction & Light Company, Lynchburg, Va., has placed an order with that company for twenty double-end, double-truck units. The new cars, which are ordered for city service, will be equipped with four motors, and will have an over-all length of 43 ft. 3 in., and will seat 50 passengers. Of more than usual significance is the fact that the cars are being purchased in accordance with builders' specifications.

With the appointment of two additional members on the board of the Toronto Transportation Commission, raising that body to its full quota, there would appear to be removed the last obstacle to the placing of an order for 55 motor cars and 55 trail cars for that property, recommendations for which have been pending for several months. Specifications have been agreed upon and bids have been submitted by several Canadian manufacturers of car bodies and supplies, consequently prompt action can follow any proper authorization from the commission.

According to preliminary specifications each motor car and trailer will form a two-car train, the motor cars to be provided with four motors each and the trailers with two. By the provision of auxiliary switching control it will be possible to move the trail cars around the carhouses under their own power. In general the cars will resemble the Peter Witt cars now being operated by the commission, with the exception that the new cars will be 50 ft. in length over all, with seats for 56 passengers, as compared with an over-all length of 52 ft. and a seating capacity of 60 passengers in the present standard equipment. The new trailers will seat 52 passengers each, the same as the present trailers. Cost of the new rolling stock and its equipment is expected to total in excess of $1,500,000.

Another Canadian order conditional upon the adjustment of certain franchise legislation, which now appears to have been satisfactorily disposed of, is that of the British Columbia Electric Railway, Vancouver, B. C., for fifteen cars of the one-man two-man front entrance, center exit type, similar to certain cars recently ordered for Cleveland and Toronto. Total cost of the new cars will exceed $300,000.

Lehigh Valley Considering Electrification

Engineering surveys recently have been made of a 75-mile section of the Lehigh Valley Railroad, extending from Mauch Chunk to Wilkes-Barre, with the view of its possible electrification. The estimated cost of the project is placed at between $7,000,000 and $10,000,000. The section under consideration runs through mountain territory, and the management believes that electrification would permit the movement of heavier trains at greater speed than is now possible with steam. It is thought that the maintenance cost of electric locomotives would be considerably below that of steam equipment. The relative advantages of direct and alternating current are under consideration, as well as the question of voltage. Lehigh Valley officials are also making a close study to determine whether the use of more powerful steam locomotives would compensate for the advantages promised by electrification.

Recent Bus Orders Numerous

Electric railways continued to be the dominant factor in the bus field during the past month by placing numerous orders for new automotive equipment. While there were no exceptionally large purchases the orders were widely representative and the aggregate was considerable. By the purchase of nine 40-passenger Twin Coaches, the Boston Elevated Railway increased its fleet of these vehicles to 35. Other purchasers of Twin Coaches were the Savannah Electric Company, The Burlington Rapid Transit Company, Burlington, Vt., and the Milwaukee Electric Railway & Light Company, each of which has bought five. The Capital Traction Company, Washington, D. C., and the Philadelphia & West Chester Railway have ordered eleven and three units respectively. The New Orleans Public Service, Inc., has placed an order with the Twin Coach Corporation for one 42-passenger trackless trolley, to be equipped with 50-hp. motors. An order for eleven trackless trolleys has also been placed with the Twin Coach Corporation by the Utah Light & Traction Company, of Salt Lake City.

The American Car & Foundry Motors Company reports the delivery of two 29-passenger parlor coaches to the Southern Michigan Transportation Company, of Jackson, Mich., three 29-passenger full headroom parlor coaches to the Motor Transit Corporation, Chicago, Ill., and an order of five 27-passenger and three 21-passenger parlor coaches to the Baltimore Coach Company, all electric railway subsidiaries.

The Indianapolis & Southeastern Railroad, of Indianapolis, Ind., has purchased four 22-passenger parlor observation cars from the Studebaker Corporation. Other Studebaker sales reported include seven 21-passenger buses of the de luxe street car type to the Eastern Massachusetts Street Railway, Boston, Mass., two 21-passenger street car type buses to the Fitchburg & Leominster Street Railway, Fitchburg, Mass., and one 21-passenger street car type bus to the Austin Street Railway, Austin, Tex.

Mack-International Motor Truck Corporation reports the sale of eighteen model AB four cylinder chassis to the Rochester Railways Co-ordinated Bus Lines, Rochester, N. Y., four six-cylinder model BK chassis to the Rochester Interurban Bus Company, and one six-cylinder model BK chassis to the Syracuse Railways Co-ordinated Bus Lines, Syracuse, N. Y. The three companies are all affiliated with the New York State Railways. Two six-cylinder model BK buses have also been delivered to the Boston, Worcester & New York Street Railway, Framingham, Mass.

Recent deliveries of the General Motors Truck Company include twenty-five type

Digitized by Google

Z-29 city service buses to the Department of Street Railways, City of Detroit, ten type W city service coaches to the Illinois Power & Light Corporation, six for Quincy and four for Galesburg, and two type Z-39 coaches to Coast Cities Railways, of Asbury Park, N. J. London Street Railway, of London, Ontario, has received five type W city service buses. Fifth Avenue Coach Company, of New York City, has taken delivery of eleven yellow coaches—five of the type W observation type, five type W's and one Z-240.

In addition to an order of eighteen Mack buses recorded above the Rochester Railways Co-ordinated Bus Lines, Rochester, N. Y., has also received ten White model 54-A six-cylinder buses. Other deliveries by the White Company include three model 50-B buses to the Alabama Power Company, Birmingham, Ala., fourteen model 54 buses to United Electric Railways of Providence, and six model 54 buses to the Penn-Ohio System, Youngstown, Ohio.

New Gas-Electric Bus by St. Louis Car Company

Tests have recently been completed by the St. Louis Car Company on a new type of gas-electric bus on which its engineering staff has been working for more than two years. The new vehicle will seat 40 passengers.

The gas-electric power unit is located in the rear end. It consists of a six-cylinder gasoline engine direct connected to a d.c. generator. The power is used in four 30-hp. motors, one geared to each of the rear wheels.

The tests show that the bus will attain a maximum speed of 45 m.p.h. From a standstill it will accelerate to a speed of 20 m.p.h. in eleven seconds. Dynamic braking is used, being controlled by a pedal, the rate of braking depending on the distance the pedal is depressed.

The doors are interlocked with the control, so that the bus cannot move unless all doors are closed. They are opened by push-button control, with a treadle for the exit door at the center of the vehicle. The main control has a dead-man safety feature which unlocks the doors and sets the dynamic brakes and automatically reduces the speed to not more than 2.5 m.p.h. on a steep down grade.

The bus is low hung, the floor being 26 in. from the ground and the step 13 in. The wheelbase is 210 in. The over-all dimensions of the bus are: length, 31 ft. 4 in.; width, 8 ft., and height, 8 ft. 11 in.

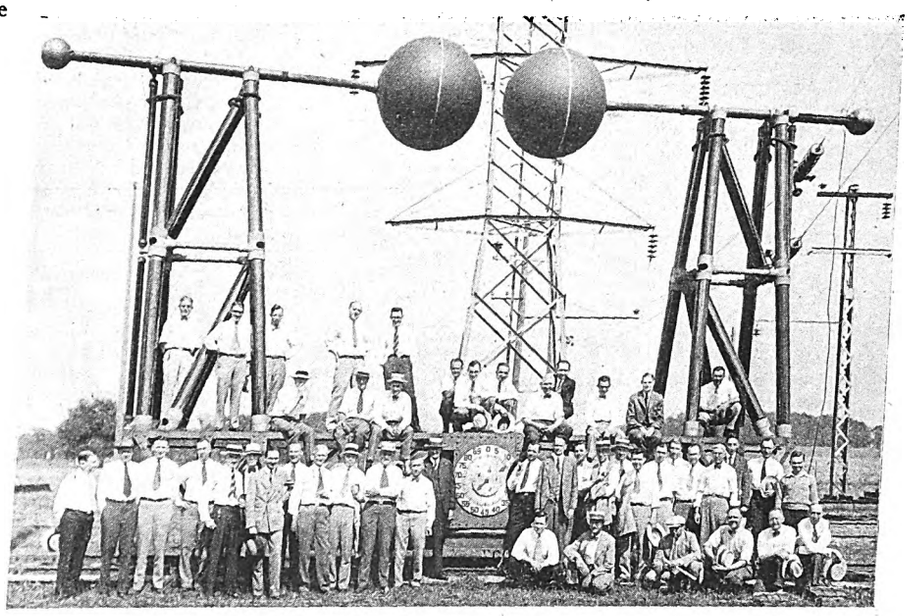
The bus was on display at the convention of the Electric Railway Association of Equipment Men, Southern Properties, being held at Lexington, Ky., on July 24-26. Following this it is planned to exhibit it at Louisville, Indianapolis and Terre Haute.

Brill Brings Out a Trolley Bus

A trolley bus, developed by the J. G. Brill Company, made its initial appearance at the recent convention of the Mid-West Electric Railway Association held in St. Louis. Through the use of aluminum alloy in body and fixtures the weight of the unit is kept down to approximately 14,500 lb. The side windows are fitted with single sash, with counterbalance spring. Circulating passenger load is accomplished by the provision of a rear exit door, pneumatically operated under control of the driver. Included in the equipment are four-wheel positive acting internal expanding air brakes, an emergency disk parking brake, pneumatic windshield wipers, cam and lever type steering mechanism designed expressly for balloon tires, two G. E. 35-hp. high speed motors, and PCM foot control. Seating capacity is provided for 30 passengers. Claims made for the new unit include economical power consumption, quick and smooth acceleration, noise reduction, flexibility in traffic and exceptional riding comfort.

Ohio Brass Entertains Electrification Engineers

Electrical engineers of many of the leading steam railroads that have electrified divisions or are contemplating electrification were the guests of the Ohio Brass Company at its Barberton plant on July 11 and 12. The two-day session was devoted to a study of problems of high-tension insulator design and catenary overhead construction, with special reference to insulation.



Steam railroad electrification men inspect high-tension laboratory of Ohio Brass Company at Barberton

The party inspected the insulator plant and saw the various manufacturing processes in the making of electrical porcelain. The indoor laboratory was then visited and a number of breakdown tests witnessed. The equipment includes a 750,000-volt transformer with a capacity of 750 kva. The transformer is excited by a special sine wave generator which is attached to the transformer case and is driven by a motor through an insulated shaft.

In the afternoon, tests were made at the outdoor laboratory, which is equipped with a set of similar generators that will deliver 3,000,000 volts at 25 or 60 cycles. Tests were made at normal frequency, as well as impulse tests using steep wave fronts, simulating lightning. Equipment for photographing the discharge in daylight was demonstrated.

In the evening and on Friday morning a discussion was held on means of obtaining reliability in catenary and transmission insulation. Various types of insulation were discussed and some were demonstrated at the evening session. Further tests in the indoor and outdoor laboratories were made on Friday afternoon.

Gear Inspection Standardized

The proposed American recommended practice "Inspection of Gears" has been completed by one of the sub-committees of the sectional committee on the standardization of gears. Copies of this proposed standard are now being widely distributed for criticism and comment. It is in tentative form for discussion, and criticisms should be mailed to C. B. LePage, assistant secretary American Society of Mechanical Engineers, 29 West 39th Street, New York, N. Y.

This proposed practice covering the inspection of worms, hobs and cutters was developed by sub-committee No. 9, consisting of 31 men representing manufacturers, consumers and general interests, in conjunction with a committee of the American Gear Manufacturers' Association. As here presented, it is a composite of several sections on the subject as developed and approved as "Recommended Practice" of the A.G.M.A.

Bender Body Increases Capacity

Through additions to and rearrangement of the present plant the Bender Body Company, Cleveland, Ohio, plans a 30 per cent greater production of Bender bodies in the near future.

Work is already under way on a new building to serve for final assembly purposes. This structure is 163 ft. x 100 ft., of brick and steel with walls chiefly of glass, also monitor glass roof, assuring a maximum daylight.

A 150 ft. x 80 ft., addition to the eastern end of the present building will be used for the paint shop. It will contain the latest type spray booths and other modern developments.

Wagner Electric Corporation, St. Louis, Mo., announces the addition of W. H. Kretz to its transformer sales division. Mr. Kretz will travel the Southwest. He was formerly with the Public Service Company of Oklahoma and more recently has been Texas district representative for the Jeffry De Witt Insulator Company.

New Cars of Montreal Tramways

Details of 106 new cars recently completed for the Montreal Tramways, Montreal, Canada, by the Canadian Car & Foundry Company, announcement of which was made in the July issue of ELECTRIC RAILWAY JOURNAL, are now available. The order consisted of 60 single-end two-man cars, seating 42 passengers; 40 single-end one-man cars, seating 40 passengers, and six double-end one-man cars seating 40 passengers, all provided with P.A.Y.E. features and all designed for city service.

The 60 two-man cars have an over-all length of 46 ft. 2 in., with bolster centers spaced 22 ft. 7 in., and length over the body posts of 31 ft. 4 in. The weight of the car body is 16,000 lb., trucks, 10,000 lb., and equipment, 9,900 lb. The 40 one-man cars and the six double-end cars have somewhat smaller dimensions, being 41 ft. 2 in. in length over all, with a length of body of 26 ft. 4 in., and with bolster centers spaced 17 ft. 7 in. The double-end cars are slightly heavier, with a total weight of 38,100 lb., as compared with 35,250 lb. for the 40-seat single-end cars. All three are of semi-steel construction with arch roofs. All have an over-all width of 8 ft. 5 in., and height, rail to trolley base, of 11 ft., and are provided with trucks with 5-ft. 4-in. wheelbase. Detailed equipment specifications, which are substantially the same for all three types, are as follows:

Air brakes	Canadian Westinghouse Company, straight air with full safety features
Armature bearings	Plain, bronze
Axles	A.E.R.E.A. E-2, with 3¼x7 in. journals
Car signal system	Faraday, 600 volt
Compressors	Canadian Westinghouse Company, D.H. 16
Conduit	Standard metal
Control	K-35 XB and Westinghouse Company type 806-J line switch
Couplers	Montreal Tramways, standard cast steel
Curtain fixtures	National Lock Washer Company
Curtain material	Pantasote
Destination signs	Keystone & M. T. Co.
Door mechanism	National Pneumatic Company
Doors	Folding
Fare boxes	Cleveland Fare Box Company
Finish	Enamel
Floor covering	Wood slats, with Kass safety treads
Gears and pinions	Nuttall, grade B. P.
Glass	Plate, 21 oz., double thick
Hand brakes	Peacock staffless
Hand holds	Rigid wood rail on aluminum brackets
Heat insulating material	Three-ply Salamander
Heaters	Canadian General Electric Company, Calrod with Railway Utility thermostatic control
Headlining	⅛ in. Agasote
Interior trim	Cherry
Journal bearings	Plain bronze, babbitt lined
Journal boxes	Cast iron, Montreal Tramways, standard
Lamp fixtures	Electric Service Supplies, compensating safety dome fixture
Motors	Four Westinghouse 510-A2, inside hung
Painting scheme, M. T. Co. standard green and cream	
Roof type	Arch
Roof material	Wood and canvas
Safety car devices	Door and power interlock dead man handle
Sash fixtures	Robt. Mitchell Co. Montreal
Seats	Ottawa Car Mfg. Company and Canadian Car & Foundry Company
Seat spacing	30 in.
Seating material	Rattan
Slack adjusters	American Brake Company, Type E
Steps	Irving Subway Company, folding
Step treads	"Saf-Kar"
Trolley catchers	Keystone
Trolley base	U. S. 20-A
Trolley wheels	Canadian Ideal Company
Trucks, Canadian Car & Foundry Company, F-790	
Ventilators	Railway Utility Company
Wheels	Cast iron, 26 in. diameter
Wheelguards or fenders	H.B.

Montreal Tramways has also placed an order for 25 two-car trains, each unit of which will be almost identical in construction with the standard single-end two-man cars described above, with the exception of the additional reinforcing made necessary to support the couplers. Full details of these cars are not available at this time, as motor equipments have not been determined.

Copperweld Steel Company, Glassport, Pa., announces the establishment of a northeastern district under the management of George F. Bain. The northeastern district includes all of the New England states and all of New York State north of Westchester and Rockland Counties. Mr. Bain's headquarters will be at 30 Church Street, New York City. Paul Van Wagner is now district manager for Greater New York City and for New Jersey, Pennsylvania and West Virginia.

F. L. Markham Advanced by Brill Company

F. L. Markham, identified with the Brill organization for 25 years, has been appointed sales manager of the American Car Company, St. Louis. In this capacity he succeeds the late Wirt L. Haymond. Mr. Markham started his career as a car salesman on July 15, 1904. On that date he joined the sales force of The J. G. Brill Company and was assigned to the Southern territory,

F. L. Markham

comprising nine states. Later he organized the Railway Supply & Equipment Company, with headquarters in Atlanta, Ga., which organization handled the sale of Brill cars, trucks, seats, etc., until September, 1918, when Mr. Markham joined the sales department of the American Car Company, the Brill associate plant in St. Louis. His recent appointment, therefore, is the culmination of eleven years of active service with the sales force of the American Car Company, of which he now becomes sales manager.

Johns-Manville Corporation, New York, has issued a 24-page illustrated circular entitled "Celite for Concrete." Celite, a product recently added to the company's line, is a specially prepared grade of diatomaceous silica which is said to improve the workability of concrete mixture, and at the same time to afford a maximum of water-tightness.

Lincoln Electric Company, Cleveland, Ohio, manufacturers of motors and arc welders, announces the appointment of B. W. Brown as district sales representative with headquarters at Milwaukee, Wis. G. O. Forseth, formerly sales representative at Detroit, has been promoted to sales representative at Minneapolis.

L. G. Avery, manager of the sales promotion department of the White Company since 1926, has been promoted to the managership of the Detroit district. Walter A. Maynard, White Company transportation engineer, has been appointed sales promotion manager. Mr. Avery goes to Detroit with seventeen years experience in automotive merchandising. Mr. Maynard has covered the country in the study of bus transportation and as manager of vocational sales promotion. He joined White in 1923. In the development of vocational sales he has become an authority on bus transportation and on warehousing and distributing operations.

ELECTRIC RAILWAY MATERIAL PRICES—JULY, 1929

Metals—New York

Copper, electrolytic, delivered, cents per lb.	18.
Lead, cents per lb.	6.75
Nickel, cents per lb., ingot	35.
Zinc, cents per lb.	7.15
Tin, Straits, cents per lb.	47.375
Aluminum, 98 to 99 per cent, cents per lb.	24.30
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	62.00
General service	45.00

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	$4.17
Somerset mine run, f.o.b. mines, net ton	1.82
Pittsburgh mine run, Pittsburgh, net ton	1.00
Franklin, Ill., screenings, Chicago	1.75
Central, Ill., screenings, Chicago	1.25
Kansas crushed mine run, Kansas City	2.50

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb.	2.80
Tie plates (flat type), cents per lb.	2.15
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.95
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	$2.70
Sheet iron (24 gage), cents per lb	2.90
Sheet iron, galvanized (24 gage), cents per lb	3.60
Galvanized barbed wire, cents per lb.	3.35
Galvanized wire, ordinary, cents per lb.	3.15

Waste—New York

Waste, wool, cents per lb.	13.
Waste, cotton (100 lb. bale), cents per lb.:	
White	12.5
Colored	9.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	12.9
White lead in oil (100 lb. keg), cents per lb.	13.2
Turpentine (bbl. lots), per gal.	$0.57
Putty, 100 lb. tins, cents per lb.	5.725

Wire—New York

Copper wire, cents per lb.	19.875
Rubber-covered wire, No. 14, per 1,000 ft.	6.85
Weatherproof wire base, cents per lb.	20.875

Paving Materials

Paving stone, granite, 5 in., f.o.b. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ½-in., carload lots, N. Y., per cu.yd., delivered	3.25
Cement, Chicago consumers' net prices, without bags, f.o.b.	2.05
Gravel, ¾-in., cu.yd., delivered	3.25
Sand, cu.yd., delivered	2.00

Old Metals—New York and Chicago

Heavy copper, cents per lb	14.375
Light copper, cents per lb.	12.375
Heavy yellow brass, cents per lb.	8.125
Zinc, old scrap, cents per lb.	3.15
Lead, cents per lb. (heavy)	4.75
Steel car axles, Chicago, net ton	$16.75
Cast iron car wheels, Chicago, gross ton	14.25
Rails (short), Chicago, gross ton	18.25
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.75

Electric Railway Journal

Consolidation of
Street Railway Journal and Electric Railway Review
A McGraw-Hill Publication—Established 1884

JOHN A. MILLER, JR., *Managing Editor*

Volume 73 New York, September, 1929 *Number 18*

An Advantage that Should Not Be Lost

IN THE forefront among the serious civic problems in America today is that of traffic congestion. Everyone suffers from it to some extent. Estimates of its dollars-and-cents cost run into figures that are almost incredible. Certainly the local transportation companies have been among the sufferers from this cause, but it has not been altogether an unmixed evil for them and the solution of the problem may not turn out to be an unmixed blessing. Although congestion has caused a serious reduction in operating speeds it also has diverted a certain amount of traffic from the private automobile to the public transportation vehicle. The passenger in the street car or bus has no parking worries and happily he is free from the nervous strain of driving in traffic. Numerous operating companies have emphasized these advantages in their advertising and undoubtedly many people, recognizing the truth of the argument, are now using their automobiles less than they did formerly.

Elimination of automobile parking is undoubtedly the most promising means of relieving traffic congestion. But if such measures were to be adopted tomorrow it is a question whether the patronage occasioned by congestion would be retained by the public transportation companies, or whether these patrons would go back to their automobiles, although it involved the extra cost of using a garage instead of free parking space in the street.

Even though there might appear to be some reason to believe that the business would be lost, that is not a reason why the transportation company should oppose measures designed to relieve congestion. Such an attitude would be exceedingly short-sighted. Selfish opposition will get nowhere. Means of relieving traffic congestion will be found; in fact, some of them already are available. They await only a sufficiently aroused public opinion to insure their adoption, whether or not the transportation companies like them.

Other and better means exist for retaining the traffic that has been brought to the transportation companies by congestion. Chief among these is improvement in service. Circumstances beyond the companies' control have given them this patronage, but their keeping it will depend on their own efforts. It cannot be done with dirty old cars running at irregular intervals over bumpy track. If, on the other hand, the company is prepared to meet the public with modern equipment run on frequent headways at a speed comparable with the demands of the public today, it is likely that not only will the present business be retained, but that even more riders can be secured.

EFFECTIVE Sept. 1 Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL since 1926, becomes managing director of the American Electric Railway Association. Throughout the period of his editorship of the JOURNAL his wide experience and untiring energy have contributed greatly to the progress of the local transportation industry in this country. The publishers of this paper feel keen regret at his leaving the post of editor and congratulate the association upon securing so capable a leader. The broad constructive policies initiated by Mr. Gordon will be continued in the future activities of the JOURNAL. After Sept. 1 responsibility for the editorial direction of the paper will be in the hands of John A. Miller, Jr., managing editor, who has been a member of the staff for seven years, following a similar period spent in actual electric railway operation.

MALCOLM MUIR,
President, McGraw-Hill Publishing Company, Inc.

Advertising Used in a New Way

NEWSPAPER advertising has been utilized for a variety of purposes by electric railways, but seldom has it been used in an endeavor to influence public sentiment regarding damage claims. Neglect of this subject in paid advertising probably has been due to the difficulty of presenting the facts in the brief space available in advertising columns, and to the danger of antagonizing the legal profession and the judiciary. Hazarding the possibility of unfavorable reactions which might outweigh the benefits to be derived, the Georgia Power Company recently issued a series of seven full-page advertisements frankly telling the facts of the situation. The story of the campaign is told in detail elsewhere in this issue.

Carrying the story boldly to the public, the undertaking has already been remarkably effective. Company officials sense an awakening standard of justice among those presenting and awarding claims, and company employees report increased understanding and appreciation of the service being rendered by the railway. The reaction to the advertisements has been almost wholly favorable. A large measure of the success of the series doubtless was due to reiteration that "This company will pay any just claim against it voluntarily." It asked the "same justice you would accord an individual—no more."

Changing Habits Create a Difficult Transportation Problem

MORE or less typical of the problem facing the electric railways everywhere is the situation at Boston. For some years past the total volume of riding has been declining slowly, as it has in many other cities. This has been due to the loss of off-peak business, which has suffered a marked reduction. On the other hand, rush-hour riding has been increasing steadily. Thereby an extremely difficult problem has been created.

Because the annual report of the Boston Elevated Railway is made as of June 30 the situation is prominently in the public eye just now. For the year recently closed there was a decline of $697,000 in gross revenue. This is attributed principally to the decrease in riding on Sundays and holidays and during the summer season, when more people than formerly are going away on vacations. As a typical instance of the trend of traffic, the month of June may be cited. A year ago the revenue of the Elevated system for June exceeded the cost of service by $179,791, but in the similar month of the present year the cost of service exceeded the revenue by $32,188. Some loss in revenue is attributable also to the open winter last year, which encouraged the use of automobiles.

Over neither of these factors has the management any control. Over the factors which it does control, however, the figures contained in the report speak eloquently. Expenses were reduced by $610,062—an achievement made without any apparent bad effect on the personnel or on the character of service rendered. Actually, this year, from operations there was an excess in cost of service over receipts of $180,153. This deficit was offset in part by a dividend of $150,700 from the Transit Mutual Insurance Company, created in 1921 to carry the workmen's compensation insurance of the Elevated. The rest of the deficit was counterbalanced by inventory and other profit and loss adjustments. In short, for the year ended June 30, 1929, the company was able to meet all operating expenses and fixed charges, but with no balance over and above the amounts necessary to restore the reserve fund to the original figure of $1,000,000, as provided in the public control act of 1918.

That is the situation. No effort has been made to conceal it behind a screen of complicated figures. Rather, the matter has been held before the employees and the public in the frankest manner. Under public control the trustees are directed to operate the road on the basis of service at cost, fixing fares to meet the needs of the situation. An easy way to meet the problem would be to follow this arrangement to the letter, but that the management never has done. Instead of ignoring costs, constant attention has been paid to keeping them down to a minimum. Service has not been impaired but, as in a recent instance, both the public and the management have agreed to forego service that would tend to increase costs unnecessarily. At the same time special thought has been devoted to securing new business. The latest move in this direction is a newspaper advertising campaign, with the idea of inducing more people to park their automobiles at points along the rapid transit line and use the Elevated to get downtown. How this will affect the situation cannot yet be determined.

All in all, the situation at Boston is a difficult one. The vital character of the service rendered by the Elevated is shown by the increasing rush-hour traffic. This, however, only adds to the complexity of the problem with which the management is faced. Eventually, however, the financial question will have to be solved on a basis that will preserve the transportation facilities of this great metropolitan area and permit their expansion to meet the needs of the many growing communities served.

New Evidence of Broader Thinking on Co-ordination

MORE and more are leaders in transportation becoming aware of the need for fully co-ordinating all transportation facilities within a city. Additional evidence of the expansion of this idea to include proper physical connection between through railroad and community local transportation facilities is furnished by the plans of the new $40,000,000 Cincinnati Union Terminal, made public only recently. The terminal is so designed that street cars, buses and taxicabs will all pass through the building. These vehicles will enter a north wing, discharge passengers on separate platforms under shelter, and then go underneath the main building to a south wing, where they will pick up outgoing passengers, also under shelter. The plan will allow the complete segregation, not only of incoming and outgoing passengers, but also of those using the three classes of local service. Since seven steam railroads are co-operating in the construction of this terminal, the completed project will tie in almost every transportation facility of the city. It is indeed a significant move and another forward step in the advancement of complete co-ordination.

An even greater degree of co-ordination may perhaps be achieved in Cleveland, now that the Cleveland Railway has combined with the Van Sweringen interests. The plans for the new union terminal include co-ordination of the rapid transit lines and the steam railroads, as well as local street cars and buses. It is not unlikely that some agreement will be reached between the Van Sweringens and the electric interurban lines in the city to use the terminal also. Moreover, a taxicab stand has been built into the station, so that it appears that every facility will be co-ordinated.

Further evidence of the extension of the idea to include proper physical connections between the railroad and community transportation facilities is furnished by the recent revival of the Hudson River Bridge project, connecting New Jersey with New York City at 59th Street, and including a great passenger terminal on Manhattan Island. The most significant features, from the viewpoint of community transportation, are the subway freight line to extend to lower Manhattan and the underground connecting link to join this new terminal with those already built, as well as with the Hudson & Manhattan Tubes, the Ninth Avenue Elevated, Eighth Avenue Subway, Seventh Avenue Subway, Broadway Subway, Sixth Avenue Elevated, Lexington Avenue Subway and the lines to Queens. In addition the underground loop would connect six north and south street car lines, three crosstown lines, the Fifth Avenue Coach lines and most of the intercity bus terminals. In short, the system would make all of the railroad terminals accessible to people reaching the city on any rapid transit line, and conversely, would aid arriving passengers at the terminals to get to their destination. The project reveals a broad vision on the part of those who conceived it and represents an attitude toward the problem which must, of necessity, guide the planning of all great terminal

Digitized by Google

projects. Plans of this sort naturally involve many intricate physical and economic problems, but none of these is impossible of solution when the authorities realize the importance and fundamental soundness of co-ordination.

Standardization That Is Dynamic

NATIONAL industrial standardization has been advanced greatly during the past year by the work of the American Standards Association. Building on the work of its predecessor, the American Engineering Standards Committee, the new association has so broadened the scope and improved the procedure that its first year of existence has marked a distinct step forward. As at present constituted, it is a federation of 40 national technical societies, trade associations and governmental bodies. The purpose is to bring together manufacturers, distributors, consumers, technical specialists and any others directly concerned with a particular standardization project. After being assured that a preponderance of these interests wish to have a national standard, the association brings about the organization of a technical committee composed of official delegates of all important bodies directly interested to formulate the standard. Finally, when such a committee has prepared the standard and given it substantially unanimous approval, and when the American Standards Association is definitely assured that the standard represents a real national consensus, it is made an "American standard."

Numerous branches of the federal government are participating actively in the work of the A.S.A. Six executive departments are member bodies. The Bureau of Standards was reorganized in 1927, with an assistant director in charge of the commercial standards group. This group comprises the division of simplified practice, the division of specifications and a new commercial standards unit. The last-named has for its objects the promulgation of commercial standards prepared by industry and the promotion of the use of such standards. The bureau and the A.S.A. are co-operating to prevent overlap and conflict. While the details of the arrangement between the two organizations have not been completed, it is understood that the Bureau of Standards, with the approval of a proponent group, will submit tentative standards to the A.S.A. for approval as American standards, provided there is sufficiently wide acceptance by the various industrial and technical groups concerned.

Although it is chance that places the American Electric Railway Association at the head of the alphabetical list of member bodies, it is no chance that makes it one of the leaders in the movement. The association has been one of the leaders in the new association, as it was in the predecessor organization. The association is represented on the technical committees determining no less than 50 different standards, and is sponsor of thirteen of these. It has representation in many of the activities of the A.S.A. The work of standardization thus accomplished had already proved of great benefit to the electric railway industry, even before the reorganization of this standards work. With the added prestige of the new association and the impetus that has been given to standardization and simplification by the Department of Commerce, the advantage will be more and more apparent. In this connection the slogan of the American Standards Association is significant: "Standardization is dynamic, not static. It means, not to stand still, but to move forward together."

Give the Pedestrian a Chance

PROBLEMS of the pedestrian seldom are given the prominence they deserve in the study of metropolitan traffic problems. While the most attention ordinarily is paid to the automobile, and the street car receives some consideration, those who use the sidewalks—and, what is more important to traffic movement, the crosswalks—are allowed to shift for themselves. But no matter what is done in the way of traffic movement, the pedestrian remains a very necessary consideration. Ultimately every rider in a vehicle, public or private, must get out and walk if he is to do no more than pass through the business district. Hence facilities and protection for the pedestrian are equally as important to the rider as to the person who continually walks in the business district.

In Philadelphia the recent traffic survey, which forms the subject of an article in the JOURNAL this month, showed that of all persons crossing the street intersections those afoot outnumbered those in vehicles two to one. In fact, this survey showed that first consideration must be given the pedestrian if real traffic relief is to be obtained. With adoption of any of the various plans for elimination of parking, persons must leave their automobiles still farther from their destination than they do at present, and the ratio of walkers to riders will be even greater.

The principal source of difficulty in handling pedestrians in traffic is due to interferences. While at a few intersections the available time is insufficient to permit both vehicles and walkers to go straight across, most of these situations can be cared for by special treatment. But where many vehicles make turns—and it matters little to those crossing the street whether they are right-hand or left-hand—there is bound to be the problem of movement and a hazard to life and limb that must receive the most serious thought. If the pedestrian waits for the "go" signal, as most authorities would have him do, he is likely to be confronted with what seems to be an endless stream of vehicles making turns, so that as like as not before he has had the opportunity to cross the street the signal has changed against him. Naturally he is tempted to jay-walk, and either attempts to cross against the light or to go to the middle of the block. In fact, many persons claim that it is safer to cross the street away from the intersections, solely on account of the interference caused by vehicle turns. The longer the traffic cycle the more this problem is accentuated.

Turning movements are made at one point or another by practically all vehicles. The real problem is to restrict the turns or if necessary prohibit them where they cause the greatest delay to pedestrians, and to provide vehicle routes that will result in the least interference to traffic. It requires careful analysis, and naturally there may be disagreement as to the locations at which turns should be eliminated.

An entirely different plan for the protection of pedestrians suggested in the same report advocates the construction of underground passages, either as crossings of the most congested intersections or as continuous thoroughfares. While the construction of such facilities ordinarily is expensive, the cost often is only nominal in connection with the building of subways. Sometimes it even is cheaper to leave an open gallery above a subway than to put in a back fill. Where this is possible sidewalks should be provided. Their construction in many places may well be justified.

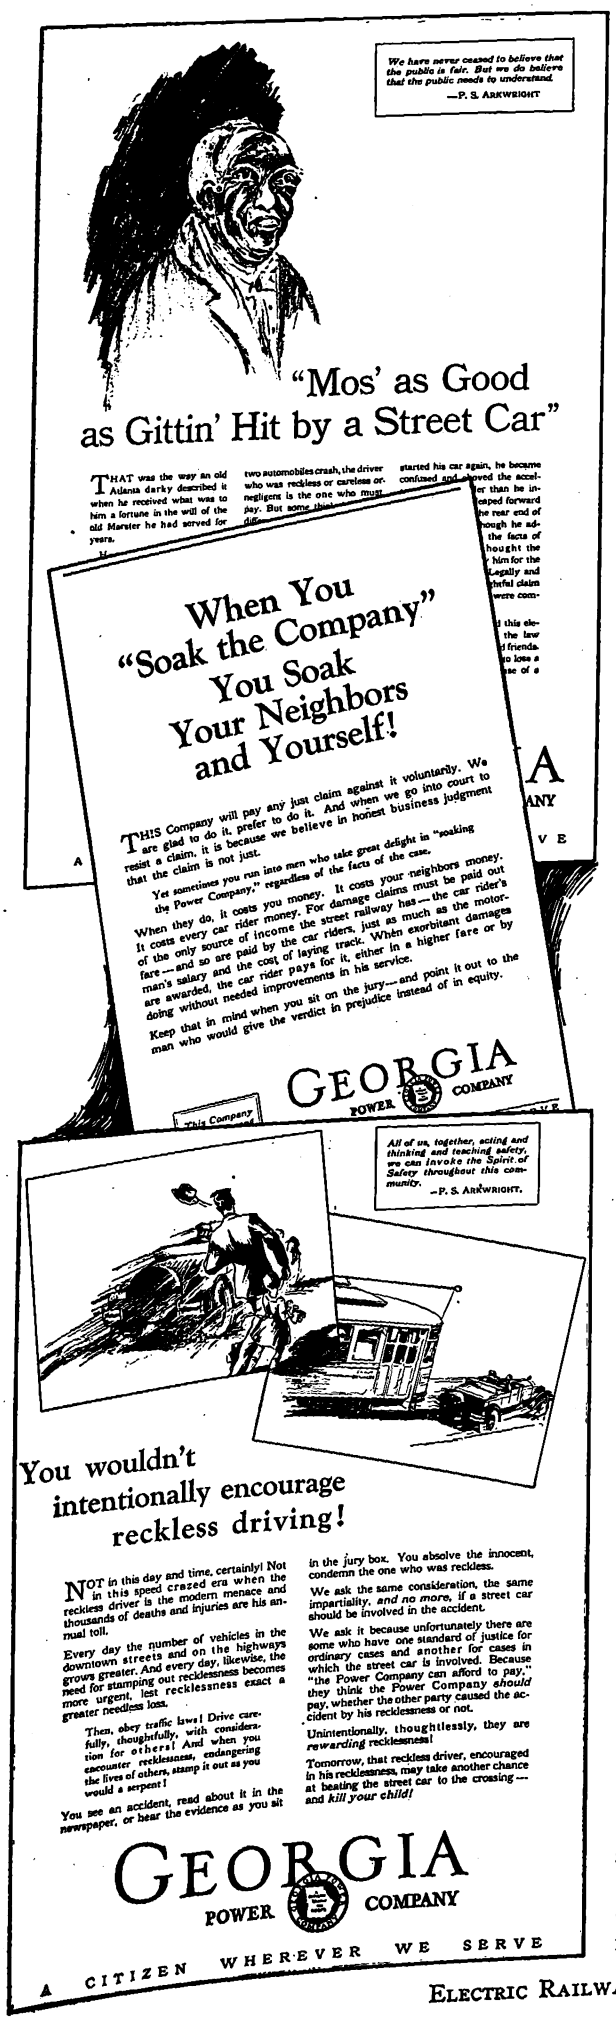
Advertising to

Good results have been obtained by Georgia Power Company from a series of advertisements designed to show the unfairness of the "double standard" of justice which allows ordinarily conscientious people to expect excessive damages from utility interests



STREET RAILWAYS long ago learned that it pays to advertise, but even with practical proof that newspaper advertising will help sell rides, improve operating conditions and build better public understanding, the damage and claim problem is one which has received scant attention in advertising. Occasional advertisements have been published by various companies but rarely has the problem been gone into as thoroughly as in a series of newspaper advertisements used by the Georgia Power Company. The advertisements, seven in number and ranging in size from 30 to 60 in. of newspaper space, were published in daily and weekly papers in Atlanta, Macon, Augusta, Athens and Rome, Ga., where the company operates street railways, and in several other towns served by the company's interurban lines. In addition, reprints of the advertisements were mailed to a number of citizens of the various communities, and each of the advertisements was reprinted in "Two Bells," the company's publication distributed on its street cars.

Contrasts Supervision of Motormen and Auto Drivers

The first of the advertisements was built around the trainman himself and showed that he is entitled to the benefit of a doubt in any street car-auto collision, simply because he has every reason for being habitually careful, by contrast with automobile drivers who are "supervised and controlled by no one, seldom disciplined for their errors, often responsible only to themselves, and not always sober." The advertisement further stated, "The trainman cannot be careless, reckless, negligent, indifferent to the rights of others, and keep his job. The automobile driver may be all of these things, and continue driving his car through crowded streets for years."

In the second advertisement, the obvious fact was pointed out that street cars can't leave their tracks and dodge around obstacles in their path. The public was asked to remember "in ordinary fairness" that the other party, autoist or pedestrian, had to place himself on the street car's tracks before the collision could occur. The public's attention was called to the fact that frequently accidents are prevented because "street cars can and do stop quickly to save some reckless or careless person in their path from injury or death," but asked fair consideration of the accident which could not be avoided.

In another advertisement figures were used to answer any charges that the company really was to blame for the increase in automobile-street car collisions. The figures showed that

tising Cure Prejudice

been obtained
pany from a se
designed to
e "double str
allows ordina
ple to expect
ages from
rests

from 1910 through 1928, accidents in this one classification increased 1,176 per cent, while the total of all other accidents was decreased 41 per cent, in the face of a greater number of car-miles traveled and passengers carried. "This trainman of yours can, and does, operate his street car safely! When you sit in judgment on him—in the jury box or as you read about an accident in the newspaper—don't you think he is entitled to the benefit of the doubt?" the advertisement asked.

Another advertisement pointed out that the jury member who decides the case in prejudice rather than on the facts, is "soaking his neighbors and himself" as well as the company, and that street railway budgets and family budgets are much alike. When an excessive jury verdict is awarded, it inevitably takes away money which otherwise might be spent in improving the service. Another made clear that the company is responsible legally only for its negligence. This advertisement was built around an old darky who remarked when he received a legacy from his Old Marster that it was "Mos' as good as gittin' hit by a street car."

Throughout the series the idea was reiterated that: "This company will pay any just claim against it voluntarily." A signed statement by P. S. Arkwright, president of the company, appeared in one of the advertisements as follows: "This company will not wrong anyone intentionally. If by chance it commits a wrong, it will right it voluntarily." When necessary to submit disputed claims to the courts, the company asked "the same justice and fairness you would accord an individual, and no more."

Much good has been accomplished by these advertisements by bringing about a better understanding of the problem on the part of the public and an improved spirit of fairness toward the company.

Improved Spirit of Fairness Established

The direct effect of the advertising on jury verdicts is, of course, not definitely traceable, and immediate results of this sort were not expected. The purpose was to establish a basis of mutual understanding out of which an improved standing in the courts would logically flow, and officials of the company are of the opinion that this has been accomplished.

Widespread discussion and comment was caused by the advertisements. It was almost invariably favorable. Several civic clubs and similar groups took up the advertisements for discussion, and letters and other comment indicated that a large number of persons had gained a new understanding of the situation. Several officials of steam railroads and of other large corporations with a similar problem stated that the company had done a service for all of them in publishing the advertisements. Unfavorable comment was almost exclusively from "damage suit lawyers," some of whom protested to the company against continuing the series and threatened reprisals which never came.

One of the most interesting effects was that on the company's platform men who warmly approved of the series and stated that it made it easier for them to obtain the co-operation of the public in safe operation, and also easier to obtain the names of witnesses when accidents occurred. They felt that the company was "backing them up" and making their work easier by educating the public that the trainman wasn't always to blame when an accident occurred.

Before laying track, the sub-grade should be well drained and thoroughly compacted

Small Details Important

Careful attention to the matter of details necessary in track design, construction and maintenance. Inspection and follow-up system assures proper execution of work

WHILE there are many factors entering into the design, construction and maintenance of a track structure, there is one extremely important factor which has been given too little attention. That factor is the importance of proper care and attention in the matter of details. This holds for every part of the track maintenance and construction organization and is not limited to any one phase. A design may be all that could be desired, but its success may be nullified by failure to give the proper attention to details in its construction, and, through the same neglect, the life of a repair job may be materially shortened. Particularly with track in paved streets, lack of attention to seemingly unimportant details is responsible for subsequent expensive maintenance costs, and this is true also in lesser degree to open track construction.

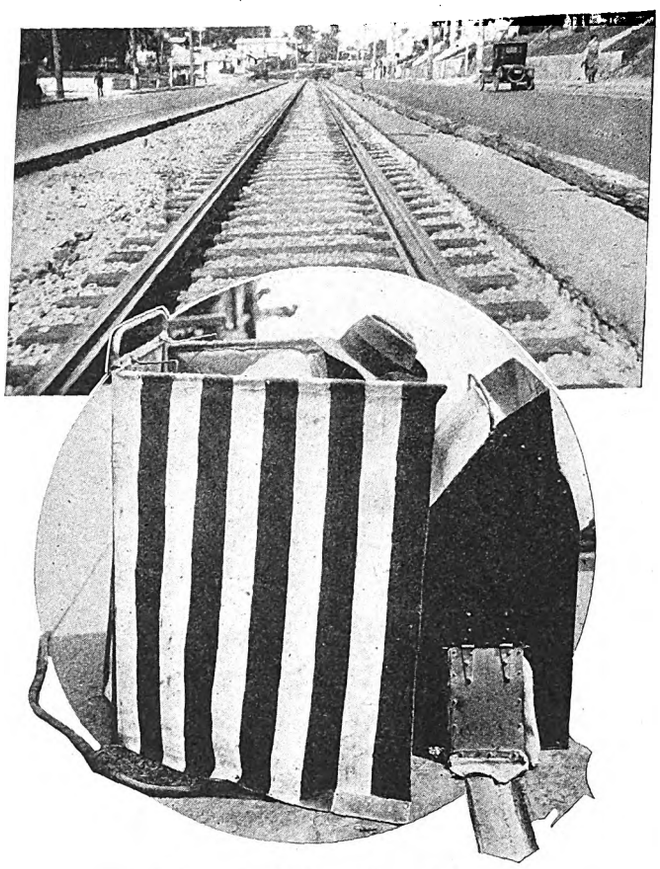
Design—In the design, there are several questions to be considered. Is the general design the best for your conditions that your available funds can provide? Does it lend itself readily to repairs when these finally become necessary? Does it provide a maximum of salvage value when the time for major reconstruction arrives? Does it provide a structure that will postpone the period of general maintenance expense for the longest time? Have you covered your materials with adequate specifications which will insure you the best of their kind for the money? If these questions can be answered to your entire satisfaction, the problem of design is taken care of, but to answer them truthfully involves a knowledge, not only of what you are doing yourself but what others are doing as well under similar conditions, and it will often be found that a page can be taken out of the other fellow's book to advantage.

Sub-grade—Assuming that the design has been taken care of satisfactorily, the next item is construction, and since the sub-grade is at the bottom of all track, it will be given first consideration. The sub-grade varies materially in its nature in different localities and frequently changes in a given stretch of track. Two things are essential with respect to sub-grade before track is constructed upon it: First, it should be well drained. Water is probably the worst enemy of the track main-

Digitized by Google

tenance organization. Second, the subgrade should be thoroughly compacted before the track is laid. Poorly compacted subsoil causes many track troubles, and the importance of thoroughly rolling the sub-grade, taking out all unsatisfactory material and replacing with material that will pack solidly, cannot be over emphasized. Of course, where subsoil conditions are of a poor character, the remedy lies in a design which will enable the entire structure to act as a unit in distributing the load over the base. This, however, generally means an increase in construction costs which would, under normal conditions, not be justified. While subsoil drains are not very effective for a protracted period in some soils, they are sometimes absolutely essential if the track structure is expected to last for any extensive period. It is often a case of choosing between two evils.

Ballast—Whether the track structure is built with wood ties on ballast or with either wood or steel ties encased in concrete, the attention to details still holds good. If stone, slag or gravel ballast is used, the main body should be rolled thoroughly before track laying is started, if possible to do so, leaving only about two inches under the tie for tamping purposes. The ballast itself should be well graded in size, so as to form, when rolled, the densest base consistent with good drainage. In no case should the ballast below the bottom of the tie be disturbed once the tamping has been completed. If the supporting base is concrete, then it is important that the proper proportioning of the aggregate be determined for the stone and sand actually used, and



Top view—The ballast should be well graded inside, so as to form, when rolled, the densest space consistent with good drainage. In circle—Since it is important to have rail joints properly welded, care should be taken in training the welders

n Trackwork

By

HOWARD H. GEORGE

Superintendent of Way Cleveland Railway
Cleveland, Ohio

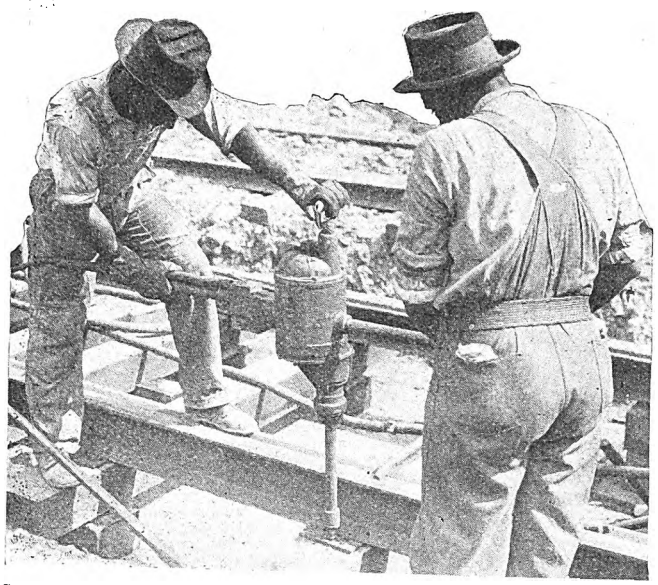
that the water-cement ratio be accurately determined and maintained. It is also important that the mixing be thorough and uniform, and that checks be made on strength, to see that design assumptions in this respect are being met. If reinforcement is provided for in the base, it is necessary to see that it is properly placed and not disturbed during the placing of the concrete, and last, care should be taken in the placing of the concrete to see that there is no undue segregation of the aggregate. Where the supporting base and pavement base are integral, too much emphasis cannot be placed upon the necessity for careful inspection of the tamping of the concrete around ties, under rails and under any bearing plates for which the design provides.

Joint Assembly—Where wood ties and stone ballast are used, the next step is joining the rails and fastening them to the ties. These operations may seem comparatively easy of accomplishment, but they both offer ample opportunities for subsequent trouble. It is generally recognized that the subsequent life of an electrically seam-welded rail joint is largely dependent upon the degree to which the gap between the rail ends is closed at the time the joint is first made. No matter how well a welding job may be done, a joint is certain to show early signs of cupping if the rail ends do not butt tightly together. This can be demonstrated by making a saw cut partly through the head of an unbroken rail at right angles to the gage, operating cars over it and observing the result. The conditions thus represented are those which would exist in a joint otherwise perfect, both electrically and mechanically.

Bolting Plates—In the assembling of joint plates care should be taken to see that both plates and rail are cleaned of all scale and rust, and that they are bolted up tightly and uniformly, to obtain the maximum wedging action in gripping the rails. Blows with a sledge are necessary to help this operation, but trackmen should never be permitted to strike a plate along its flanges in such a way as to mutilate that portion of the plate to which the seam weld is to be made. Heat-treated bolts should preferably be used on all rail joints, because their high elastic limit and ultimate strength permit them to develop a much higher pressure on the plates without stretching. Whether the bolts should be left in after the welding has been completed or not may be considered as optional if the welding operation has been properly done. However, they are the best possible insurance to cover the possibility of defective welding, and their value after removal, as compared with their value in the joint, is not sufficient to justify the expense of removal. It is even desirable to spot-weld all nuts as the final welding operation.

Preparing Seam for Welding—Of equal importance to the removal of scale and rust from the fishing

Digitized by Google



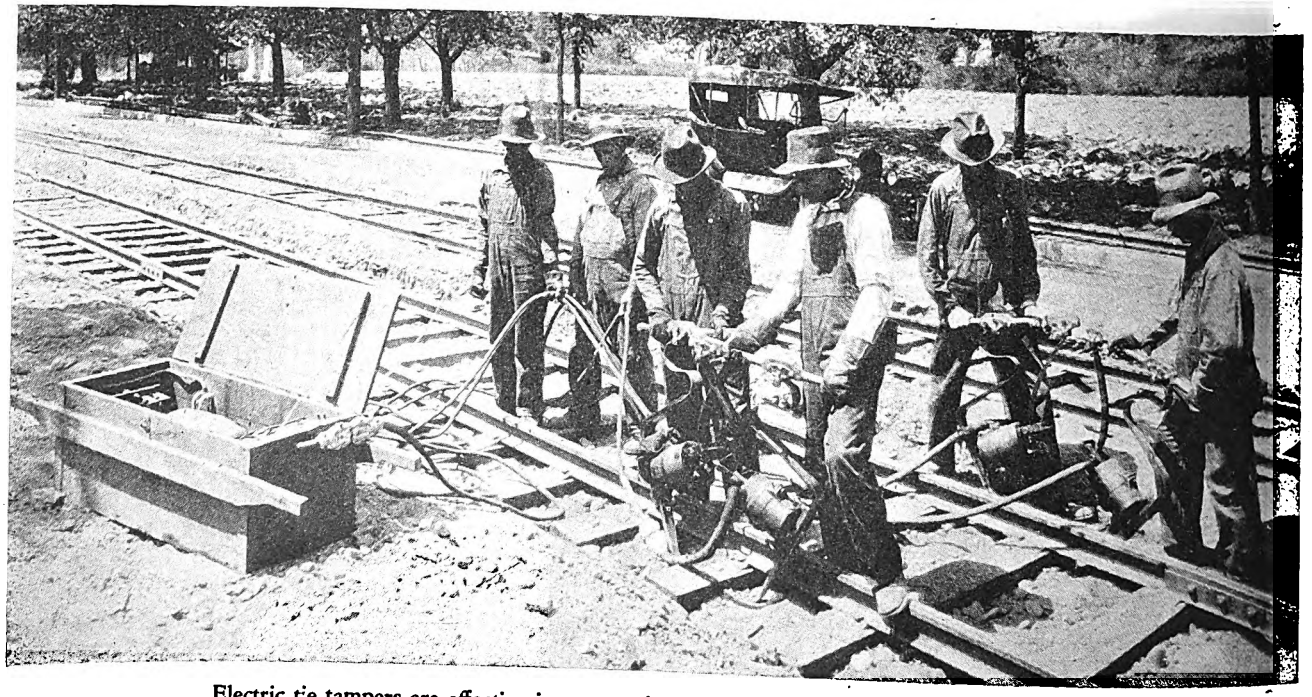
Screw spikes and clips used with a tie plate offer a decided advantage over the ordinary cut spike as a rail fastening device

surfaces of the rail and joint plates is the removal of all oil, grease, scale and rust from the surfaces to which the weld is to be applied. While it may be possible to obtain fairly satisfactory results by the use of a wire brush, there is only one practical way of insuring clean metal to weld on and that is by using a sand blast. This method is quick, inexpensive and thorough, and, if done just ahead of the welding crew, leaves the metal surfaces in perfect condition for welding.

Chemical Consideration—Recent experiments and tests on the seam welded type of joint have demonstrated the necessity of having a fairly ductile metal in the seam weld. The ordinary girder rail contains about 0.85 carbon, which is fairly high when weldability is considered. The destructive forces at work on a rail joint are largely of a vibratory character, and the number of repetitions is quite high. It is essential, to develop these stresses and to distribute them from the rail to the plate, that the seam metal be fairly ductile. This means that a very low carbon rod must be used, preferably not over 0.05 carbon. If the seam weld metal is to be kept low in carbon, it is also necessary that a relatively low carbon steel be used in the joint plates, preferably from 0.20 to 0.30 carbon. The reason for this is that, under the action of the electric arc, the tendency is to draw down into the weld seam metal, carbon from the high carbon rail steel, and, if the joint plates also are relatively high in carbon, some would also be drawn into the seam metal. With a low carbon rod and a reasonably low carbon steel plate, the seam has a fairly low carbon metal of relatively high ductility which is better able to withstand the vibration stresses to which it is subject in service than would the comparatively brittle seam which would result from the use of a higher carbon plate and welding rod.

Weld Plate Design—If it is expected to secure a sufficient amount of weld-seam strength to develop the joint plate and rail strength, the joint plate must have a place to apply the weld. This should be so planned as to prevent wear from car-wheel flanges or other outside sources. It should be such that it affords the easiest possible welding conditions for the operator. Welding conditions in the field are much less favorable than are those which prevail in a shop, and the welders should not be aggravated by introducing into the plate design some feature which a little thought and study would correct.

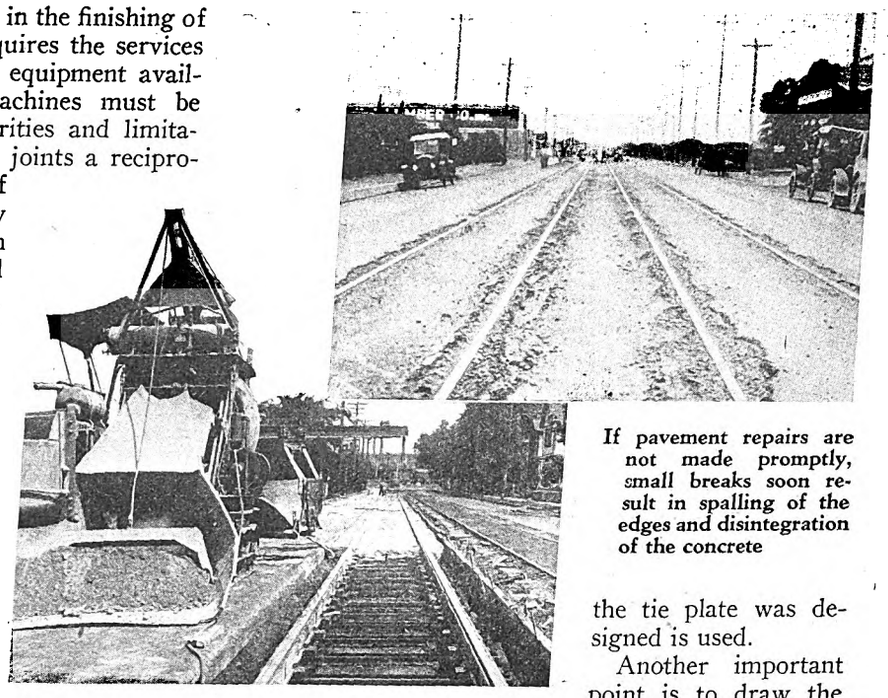
Training Welders—The proper training of welding operators and the frequent inspection and checking of their work by the engineer is very important. Almost every welder endeavors to follow the instructions given to him to the best of his ability, and to produce the best work he is capable of. If he is continuing with a practice that is fundamentally wrong, it can usually be attributed to lack of proper instructions or to inadequate inspection of his work by those directly responsible for such matters; but, whether poor results are attributable to faulty design or to poor workmanship can be determined with a reasonable degree of accuracy if an honest investigation and analysis of all the facts is made.



Electric tie tampers are effective in compacting the ballast material thoroughly under the ties

Digitized by Google

Grinding Joints—The final operation in the finishing of every rail joint is the grinding. It requires the services of carefully trained men and the best equipment available, and the men operating the machines must be thoroughly familiar with their peculiarities and limitations. With the ordinary seam-welded joints a reciprocating or so-called "scrubbing" type of grinder is best, as these joints generally require comparatively little grinding. In any event, this type of grinder should always be used to finish the grinding, the rotary grinder being used only for the rough grinding. The important thing, however, is that no joint, whether welded or not, should ever be put into service without grinding, and, if for any reason this is not found practicable, then the grinding should follow the joint installation within the shortest possible time. The grinding should be carefully checked with a steel straight-edge at frequent intervals during the period of the operation to see that too much metal is not being removed. It also is desirable that an attempt be made in grinding the rail head to retain as far as possible the original contour, as the grinding of a flat surface at the joint, where the remainder of the rail-head contour is a curve, will necessarily introduce different wheel to rail contacts at these points, and consequently change the rail-wear characteristics.

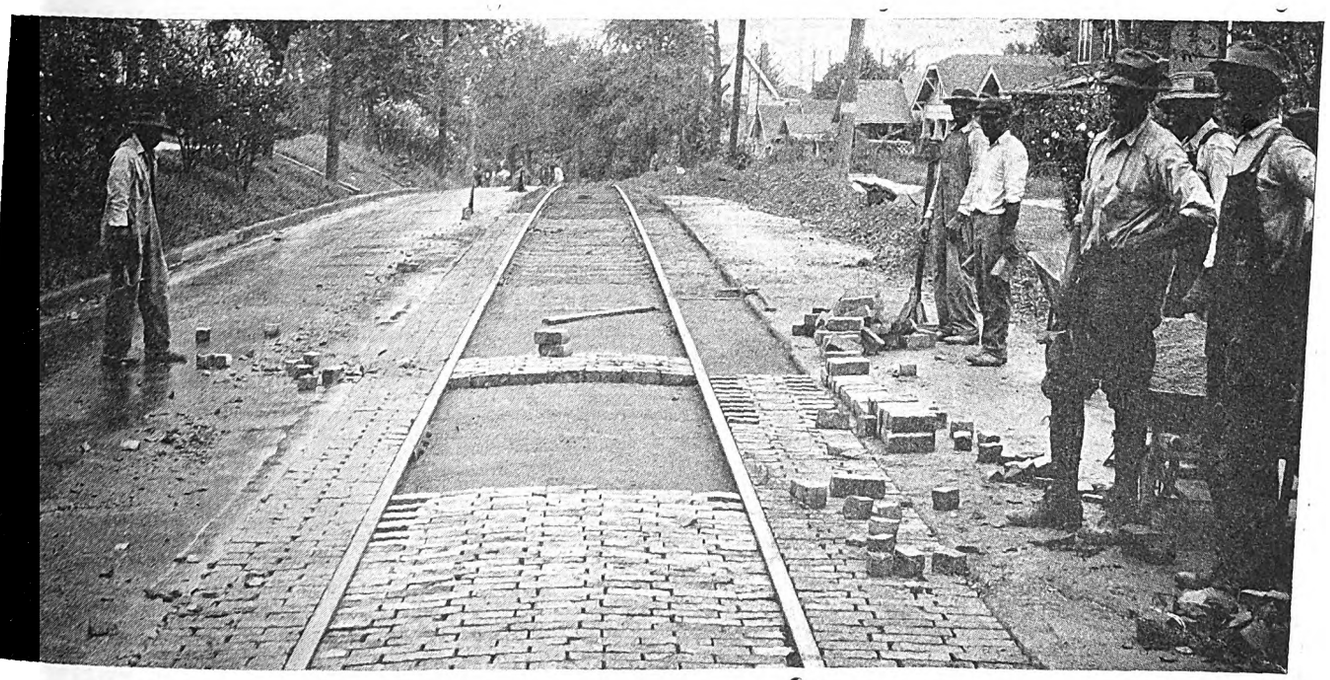


Track, all lined and surfaced, and receiving a concrete base

If pavement repairs are not made promptly, small breaks soon result in spalling of the edges and disintegration of the concrete

Rail and Tie Fastenings—Wood has a fairly definite, known crushing strength, and, in the design of the track structure, it is necessary that the unit loading on the wood tie be kept well within the allowable limit if rail cutting is to be prevented. This means that adequate tie plates must be used. It is for this reason that once a tie-plate size has been determined, a company should, as far as possible, use the one kind of timber in its ties, or at least take the precaution to see that no timber of lower crushing strength than that for which the tie plate was designed is used.

Another important point is to draw the rail base, tie plate and tie as tightly together as possible. It is not practical to draw the three units of the assembly so tightly together with the ordinary cut track spike that there will be no further compression under car loading, even with a sawed tie and flat tie plate, and this initial compression is exclusive of the effect which is commonly known as rail cutting. This is of equal importance in fastening rails to any form of steel tie. The fact is that no rolled surface is a plane surface, and when two rolled shapes are in contact with each other, the contact is not purely a uniform surface contact but a series of point contacts. Also, if fairly large area plates constitute the tie member to which the rail is fastened, where the thickness of the member is relatively small as compared with its surface area, the



Though a sand cushion is necessary in a block pavement to take up the inequalities in the blocks and to distribute the load uniformly over the base, it need not be very deep

Digitized by Google

surface is likely to be warped, and the probability of securing a uniform contact between the rail base and plate is practically nil. For this reason, where wood ties are used, it is highly inadvisable that a tie plate with a ribbed base be used, and, for the same reason, a sawn tie offers many advantages over a hewn tie which has not had the rail or tie plate seat adzed. If the top surface of the tie were planed, the conditions in this respect would be still further improved. This is also the reason why the screw spike and clip used with a tie plate offer such a decided advantage over the ordinary cut spike as a rail fastening device. Whatever the details of the design may be, every precaution should be taken to make sure that the fastening used has been drawn up as tightly as its practical limitations will permit.

Tamping—It is a well known fact that too much tamping is as bad as too little. In other words, it is easily possible to raise the entire track above grade by too much tamping. Also, the effective tamping of one tie may easily be spoiled by too much tamping on the adjacent tie. Then, too, it is quite possible to tamp a tie too much in the center, resulting in what is commonly known as a center-bound tie, which will be liable to rock under car loading and cause serious damage to both track and pavement surface.

When cupping appears, the rail should be ground immediately; otherwise, the depressions develop into deeper ones and cause much damage

Regarding mechanical versus hand tamping methods, it is sufficient to say that the former offers so many advantages over the latter method that there should be no question in anyone's mind as to which is the better. Mechanical tamping permits the ballast material to be compacted thoroughly under the tie, the two tamping tools working directly opposite each other under the tie, and also offers the only solution to the problem of thoroughly tamping ballast under ties in many of the more complicated special trackwork layouts where it is necessary to interlace ties at many points and where the interlacing comes at points requiring the most efficient consolidation of the ballast under the ties. Mechanical tamping also is effective where the space between the ties available for hand tamping is very limited. Whether track is tamped by hand or by mechanical tampers, all ties should be checked carefully before proceeding with the concreting, to find those which are not seated firmly on a well-tamped bed. An experienced track man can spot all such ties easily by tapping them with a bar or sledge, a hollow sound indicating a tie that is not properly tamped.

Tierods—While there is a difference in opinion among street railway engineers regarding the necessity for tierods, it must be conceded that, as track becomes older, there is an increasing tendency toward the development of wide gage. The tie rod is the best insurance against the premature appearance of wide gage, and the results obtained more than justify the slight expense involved. This conclusion is based on experience with track built under otherwise practically identical conditions, some of which were built with tie rod and some with tie plates but no tie rods.

Pavement—With the track lined and surfaced, and the concrete pavement base installed, there remains only the surface pavement to be considered. If this is some form of block pavement, either granite, vitrified brick or wood, a cushion is required, although a few companies make it a practice to bed their paving blocks, particularly granite, directly in the fresh concrete base. This is not very general practice, however. The purpose of a cushion is to take up the inequalities in the depth of the individual blocks, to provide a medium for bedding them uniformly over their entire area and to distribute the load uniformly over the concrete base. Therefore, any greater depth of cushion than is necessary to accomplish these purposes only increases the weakness of this part of the structure, which, incidentally, is probably one of the weakest links in the pavement chain. It is the place where the water goes first when it finds its way through the pavement surface, and it is where the heaving action of freezing and thawing causes the most damage to the pavement surface.

In laying the blocks care should be taken to make sure that all the blocks on a course are reasonably close to the same width. A good paver will do this without any attention on the part of the engineer, but some pavers will not give this the attention it deserves. It is also important that joints in opposite courses be well staggered. As to the width of joints, there is, again, a difference of opinion among engineers. Some feel that these should be wide, but the general practice seems to be to keep them to the minimum consistent with the requirements for installing the filling material. With the wider joints the advantage offered in the way of getting more thorough penetration of the grout or asphalt mastic is largely offset by the difficulties encountered in keeping the blocks in position and maintaining the general surface when ramming the blocks. But whether the joints are wide or close, the ramming of the blocks should be carefully and thoroughly done, and should not be permitted to proceed close enough to the point where the blocks are being laid to disturb them. The ramming locates all improperly imbedded stone, and seats each block firmly on the cushion. If it is slighted, the result is sure to show up in early pavement failures as soon as it is subjected to heavy vehicular traffic.

Since water finds its way to the track sub-structure through openings in the surface pavement, it is essential that the best possible job be done in filling the joints between the blocks with whatever material is being used.

Digitized by Google

This point cannot be emphasized too strongly. Every joint should be filled and traffic kept off until the filler has set sufficiently to eliminate the possibility of damage. This means going over the grouting more than once; it means adequate protection until it has set, and also proper curing until its full strength has been developed. It is one of the details, however, attention to which means so much, and which will pay such large returns in decreased pavement maintenance expense as compared with its cost.

Maintenance Requires Care Also

The same attention to details should be given to maintenance as has been urged for both design and construction. Whatever is worth doing at all is worth doing well. If a joint fails and requires repairs, insist that the same care be taken on the repair job as was required when the joint was first installed. Broken rails or joints with poor electrical conductivity only aggravate electrolytic troubles and should not, knowingly, be permitted to remain without attention. Where pavement repairs become necessary, do not permit any slipshod methods that would not have been tolerated in the initial installation. A slight cup in the rail head soon develops into a much deeper one and, if not taken care of promptly, may not only cause serious damage to the adjoining pavement but may even cause actual breakage of the joint plate and the substructure as well. Small holes in the pavement can be repaired at a small expense, whereas, if they are neglected the damage soon spreads over a large area, and is often not confined to the pavement alone but affects other parts of the track structure. Cracks that may develop in concrete pavement will, if not promptly filled in with a good asphaltic mastic, soon result in bad spalling of the edges of the track and rapid disintegration of the adjoining concrete, requiring more extensive repair.

Inspection and Follow-Up in the Field

There should be in every track organization an inspection and follow-up service, to see that the proper attention is being paid to every detail of the work. This does not mean that a man must be detailed for every job, but it does mean that there should be someone whose duty it is to visit at frequent intervals all the work under way, and to see that the work is being properly done. It is certain that the reason why some track of a given type will last so much longer than other track of the same design under practically identical service conditions is because in one case care was taken to see that every detail was adhered to as closely as practicable, while, in the other case, the execution of the work was left entirely in the hands of the track foreman.

Fatigue in Concrete

An Element to Be Taken Into Account in Design

By

D. D. EWING

Professor of Electric Railway Engineering
Purdue University, Lafayette, Ind.

Concrete, like steel, loses strength when it is subjected to repeated stresses, particularly when they are reversed. Stresses which may be repeated indefinitely may be less than half the laboratory strength

DOES the inanimate and apparently unyielding concrete that carries the myriads of feet that tread city pavements and the unending procession of wheels that roll along city streets ever become tired? If so, how is it affected by fatigue? Does it profit physically from the surcease from labor which comes when the work of men for the day is over? It is the object of this brief article to summarize experimental knowledge which bears upon these queries.

One does not ordinarily select concrete as a material for a spring, shaft or other moving part of a machine or structure. It might seem at first thought that the effect of repeated stresses on concrete would have little practical significance. On the other hand, concrete is becoming one of the most common of the paving and bridge materials. As such it must carry moving loads which, in their passage, cause a cycle of stress variation that ranges from some minimum to some maximum value. In street railway track work the important stress range would seem to be from zero to a maximum and the reversal of stresses from tension to compression would seem to be the unusual rather than the usual condition. As a pole material it might be subjected to completely reversed stresses.

How do such stresses affect the performance of concrete as a structural material? As with metals our most fruitful source of information is in the recorded researches dealing with the subject.

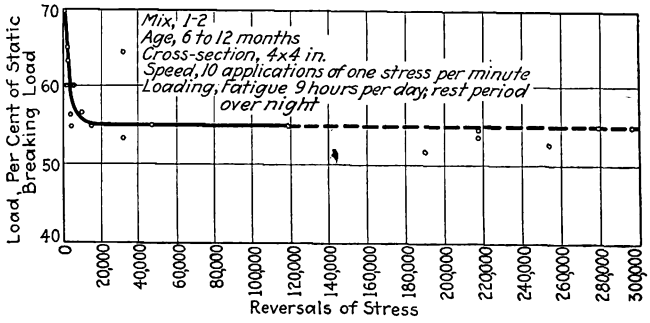
The test data and literature pertaining to concrete fatigue are not nearly so voluminous and so complete as they are with respect to fatigue in steel.

For one thing, the test specimens must be of considerable size so as to nullify the effect of small voids and large pieces of aggregate. This means that the specimens cannot be tested in small high-speed machines such as

Digitized by Google

are used in the fatigue testing of metals. The properties of concrete are affected by age, moisture and other conditions which make the fatigue testing of concrete a rather tedious and expensive matter.

One of the pioneer investigators in this field, J. L. Van Ornum, has reported tests before the American Society of Civil Engineers on several occasions (see Transactions of the A.S.C.E., p. 443, 1903 and p. 294, 1907). His tests show that for a stress range from zero to a maximum, the endurance limit—that is, the stress which may be repeated many times without rupture—of ordinary concrete is about 50 per cent of the ultimate compressive strength as determined in the ordinary so-called "static strength" test. He also made some tests on the strength



Tests on concrete beams show effects of fatigue

The beams were made with a 1:2 mix and were 6 to 12 months old at the time of test. The cross-section was 4x4 in. The speed of testing was ten applications of one stress per minute. The loading was carried out for nine hours per day with rest periods over night.

of the bond between concrete and steel. These tests showed that the average static bond strength of plain square $\frac{5}{8}$-in. steel reinforcing rods was 150 lb. per square inch and that under repeated loads this strength was reduced to 125 lb. per square inch, a reduction of 17 per cent or an endurance ratio of 0.83.

A study of the work of other experiments leads to the conclusion that the safe probable endurance limit for bond strength is about 60 per cent of the bond strength as determined by the static test. Several observers also have noted that the modulus of elasticity of concrete decreases under repetitive loadings, the decrease being relatively rapid during the first few hundred cycles and reaching a constant value after several thousand cycles.

Failures Increase Rapidly With Stress

The Illinois Highway Department has conducted a number of fatigue tests on concrete (Transactions of the A.S.C.E., 1924, p. 1196). In the course of these tests beams of 1:2 mortar, 1:2:3½ and 1:3:5 concrete were tested under loads which caused the stress to vary through a range from zero to a maximum. These tests indicate that where the stresses were below 50 per cent of the ultimate strength, as determined by the static test, the stress could be repeated an indefinite number of times without failure, whereas a stress of 60 per cent caused failure in about 30,000 repetitions, and a stress of 70 per cent caused failure after approximately 5,000 repetitions. The operating tests on the Bates, Ill., test road showed that the concrete paving laid on it failed when the loads caused stresses in excess of 50 per cent of the flexural strength of the paving. Experiments made at Purdue University by W. K. Hatt (Proceedings, Highway Research Board, National Research Council, December, 1924) on small beams show that the endurance limit of well-aged dry concrete for stresses which were completely reversed lies between 50 and 55 per cent of the ultimate strength. For wet concrete the endurance ratio was 37 per cent and the ultimate strength was 11 per cent lower than that of the dry concrete.

The accompanying graph sets forth the data for some of the tests on these beams. These figures are of interest to the track engineer, as wet subsoil under the track will apparently decrease materially the fatigue strength of the concrete. Also in the winter and spring, when the entire roadway is wet, the strength of the structure is considerably reduced, particularly with regard to its ability to stand up under the impacts resulting from dirt on the rails, low joints, flat wheels, etc.

It may be argued that the strength of track concrete is of no importance because the mass of material employed is so great that all unit stresses are low, even under modern vehicular and car traffic. In general this is true, but in going about over the country inspecting track one notices many points at which some local condition has caused stress concentration which, often repeated, finally produced failure.

Briefly summarized the present knowledge of the effect of repeated loads on concrete is:

1. The endurance limit of ordinary concrete is about 50 per cent of its ultimate strength as determined by the so-called static strength test.
2. When the load is such as to cause failure the deformation of the concrete continually increases until finally cracks appear and later complete rupture occurs.
3. If the applied load is less than the endurance limit the deformation approaches a constant value or decreases, thus indicating that the specimen will not fail.
4. Concrete, like steel, withstands somewhat greater repeated stresses if the test specimens are permitted to rest for definite periods. The rest period seems to be more important to concrete than it does to steel.
5. The endurance limit in concrete sometimes can be determined by as few as 20,000 cycles of stress.
6. Fatigue tests on concrete are more difficult to make than similar tests on steel, because much larger test specimens must be used and the frequency of stress repetition must be relatively low.
7. Laboratory fatigue tests in general differ from service conditions because the frequency of stress repetition is higher and the rest periods much shorter.
8. By loading test specimens under the endurance limit and later building up the load by small increments, the endurance limit can be slightly increased.
9. Wet concrete has a lower endurance limit than dry concrete.
10. Fatigue strength seems to increase with the richness of the mixture.
11. The endurance limit of reinforced concrete is higher than that of plain concrete.
12. Concrete specimens should be several months old before subjecting them to fatigue tests, in order that the test data be not vitiated by the natural gain in strength of the concrete.

New Equipment

Discussed at Meeting of Southern Maintenance Men

Semi-annual meeting of Electric Railway Association of Equipment Men, Southern Properties, held at Lexington, Ky., Well Attended

CHIEF interest at the semi-annual meeting of the Electric Railway Association of Equipment Men, Southern Properties, held at Lexington, Ky., July 24-26, centered on the subject of new equipment. The attendance was unusually large, more than 200 equipment men being present from the Southern and Middle Western states. Two extremely interesting papers were presented by railway men, and several others by manufacturers' representatives.

Re-equipment of the Kentucky Traction & Terminal Company's system with light-weight cars was the subject of a paper by F. W. Bacon, vice-president International Utilities Corporation, New York. Due to the inability of Mr. Bacon to be present at the meeting, his paper was presented by J. P. Pope, vice-president Kentucky Traction & Terminal Company, who elaborated on many of the important parts. Mr. Bacon's paper was published in the August issue of ELECTRIC RAILWAY JOURNAL.

R. H. Sjöberg, engineering department General Electric Company, discussed "Speed, with Comfort and Safety." Recent developments in the electrical equipment of street cars were outlined, specifically with relation to higher speed and better braking facility. E. M. O'Connor, label service department Underwriters' Laboratories, presented a paper on "The Inspection and Labeling of Electric Cars by Underwriters' Laboratories." He spoke of the advantages to the manufacturers of having their street car equipment inspected by Underwriters' Laboratories before making delivery to railway operators. This not only gives the operator the assurance that his equipment comes up to predetermined safety standards, but also safeguards the riding public from hazards incidental to inferior construction or assembling methods.

RECENT EQUIPMENT DEVELOPMENTS

On the afternoon of Wednesday, July 24, a paper was read by A. J. Manson, manager traction sales department Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., on "Recent Developments in Railway Equipment." He told of the great strides made in the recent years in the development of electric equipment, especially in connection with street railway operation. It was pointed out that the demand for high speed in railway service is now greater than some years ago, due to the effect of automobile competition. Various high-speed and light-weight construction requirements which must influence the manufacturer were discussed in detail by Mr. Manson. The next paper on the program was presented by Mr. McCune of the Westinghouse Air Brake Company, Pittsburgh, Pa., on the subject "Development in Modern Power Brake and Rapid Acceleration." This paper caused lively discussion. Members present used this occasion to obtain information as to the probable future development of the various types of brakes now in use on electric railway equipment. "New Developments in Carbon Brush Application" was the subject of a paper read by J. V. Dobson, chief engineer Stackpole Carbon Company. The characteristics of brushes were outlined in detail by Mr. Dobson, who explained the advantages and disadvantages of hard carbon and soft carbon brushes and their influence on current collection and wear on the commutator.

MAINTAINING ROLLING STOCK

An interesting paper presented by W. H. McAloney, superintendent of equipment Georgia Power Company, Atlanta, Ga., set forth the various difficulties encountered in keeping the rolling stock in first-class condition, at the same time keeping the maintenance cost down to a minimum. An abstract is published on the following page. The last paper on the program was read by T. J. Kauffeld, sales engineer De Laval Separator Company, who discussed "Reclaiming Lubricating Oils by the De Laval System." He told of the benefits which can be obtained if used oil is reclaimed by a special oil-separating equipment, enabling the operator to use oil several times instead of having to dispose of it after it has been used once only. The same procedure can be applied to waste, which can be cleaned thoroughly and be used over several times at a great saving in cost to the operator.

After all papers were read, the meeting was thrown open to discussion of a questionnaire which had been submitted previously by members of the association. The number of questions listed was 73, and it became impossible to finish the entire questionnaire. For this reason, only the most important questions were discussed before the meeting adjourned at 5 o'clock on July 25. In the evening the members gathered at a banquet at the Lafayette Hotel, with E. L. Carr, superintendent of equipment of the Kentucky Traction & Terminal Company, acting as toastmaster.

Digitized by Google

The last session, held on Friday morning, July 26, was adjourned at 10:30, after which an inspection trip was made over the properties of the Kentucky Traction & Terminal Company. Much interest was shown in a device which lifts a car body from the trucks, lowers it and tips it over to enable repair men to work on the under side of the car while they are standing on the floor in normal position. A demonstration was given of the new magnetic track brake used by the Lexington company, and various comparative tests were made with air brake and air-magnetic brake application.

The next meeting of the Electric Railway Association of Equipment Men, Southern Properties, will be held in Birmingham, Ala., Jan. 27-29, inclusive, where it will be decided whether the semi-annual meetings will continue or only one meeting a year will be held.

Organization Cuts Maintenance Costs

By

W. H. McALONEY
Superintendent of Equipment
Georgia Power Company
Atlanta, Ga.

ASSUMING that the stitch-in-time theory is correct for maintenance of electric railway equipment, to carry on that idea or any other worthwhile plan, it is necessary to have organization. Organize to the full extent so that the business in hand will stand. Of great value is personal contact, from the department head down along the line with each supervisor or foreman. It is of the utmost importance that we keep close to each man and get into working harmony with him. Another requirement is co-operation. It is difficult to get anywhere unless plans and methods are healthy and recognized as best practices under the circumstances, and unless we have united effort.

Education is now being recognized as an important factor. Individual study, or forming group classes for study, can be put across through our personal contact work, and to whatever extent systematic study can be advanced, in that proportion the quality of our work will improve. Better knowledge of their work and of their relation to other departments of a company will inspire men to give the best that is in them. Efficiency of personnel will doubtless be considered next essential, but if we have organization, personal contact, co-operation and education, then work will bring automatically the efficiency of which we hear so much of late.

In maintenance and inspection we spend about $2 in labor for $1 in material. Good fits, hardened surfaces, lubrication and close attention, with limit gages for getting maximum life, will help make the $1 go farther. We should keep in touch with improved machines and methods. The line breaker is a good demonstration of the value of spending money to save money. Likewise, modern babbitt equipment and dipping and baking machinery with temperature control has been an improvement and a decided factor in reduced costs.

One of the most important things in connection with maintenance of equipment is the matter of inspection. Unless the equipment is given a rigid and definite inspection at proper intervals and necessary adjustments made, failures in service are sure to result and frequent replacements will be necessary because parts will become badly worn before having served their normal usefulness. This is bound to increase the cost of maintenance. The cost of inspection and making minor adjustments is small as compared with the total cost of labor and material in making replacements.

The campaign on noise reduction has caused us to realize the importance of a high standard of maintenance. Loose brakeshoes, gear cases, pins and bushings in brake rigging not only cause excessive noise, but result in higher costs. Special attention should be given to prevent loose bearings in axle caps and too much end play in axle collars, as this causes wear in axle caps and results in shorter life of gears, pinions and gear cases. The caps can be numbered the same as the motor in order to keep caps with the same motor to avoid pinching when renewing axle bearings. Axle collars can be of a type that extends over the flange of the axle bearing, thus increasing the life of both bearings and axles.

Armature Maintenance Improved

The method of banding armatures has been improved with the new type tension regulator which is attached to the banding lathe. This enables the tension to be easily varied on core bands and the end bands. One of the factors in lower maintenance cost is dipping and baking of armatures, but the method of banding is a most important factor. Our present practice is to remove the bands and put a filler of some good heat-resisting material, such as treated duck, under the band so that the tension of the band would be on the coil and at the same time would be on the iron core to keep the band from becoming loose when the armature coil insulation started to shrink. Dipping and baking the armature will fill up the cracks and crevices with a thin film of varnish, which has a tendency to keep moisture from getting into the windings but is not sufficient to overcome vibration. The insulation used in the armature slots should be of a good grade with heat resisting and low shrinkage qualities, such as treated fish paper, which is also a factor in overcoming vibration.

We like to discuss our successes but hide the details of our errors. There is more to be learned from one clean, honest mistake, as a rule, than from a dozen successes. Be on the lookout for new ideas. Don't be afraid. What was considered the best method a year ago may be obsolete today. Yet it must be recognized that uniform methods, practices and parts are big factors in holding down costs.

Making the Work Easier

The place where we work should be comfortable, well lighted, properly heated, should have good drinking water, plenty of room—and then profit is in order. Make work easier, cut down the number of back-breaking operations.

If we looked over some cars it is possible that we would find apparatus which could be discarded. For example: On a certain type of truck, we have just recently discovered that the release spring (two to the truck, four to the car) was in a good functioning location but almost impossible to get at to keep it functioning. We are now considering placing the release spring on the top rod, one end fastened to the car-body, two to the car.

A manufacturer's representative once said that the greatest concern he had about his competitor was "that they kept him from sleeping in the daytime." On economy and performance our Southern Equipment Men's Association has been a big factor in gaining departmental co-operation and effective work on the several properties.

It is difficult to leave the subject of economy without calling attention again to the oft-repeated importance of the foreman. He is the key man. The foreman and his men—that is teamwork, and teamwork is vitally necessary. It takes a "Heap of livin' to make a home," and it takes a heap of time and experience to know all the kinks in the trade. With experienced men and a good leader foreman who is interested in our kind of work, the maximum of economy may be looked for.

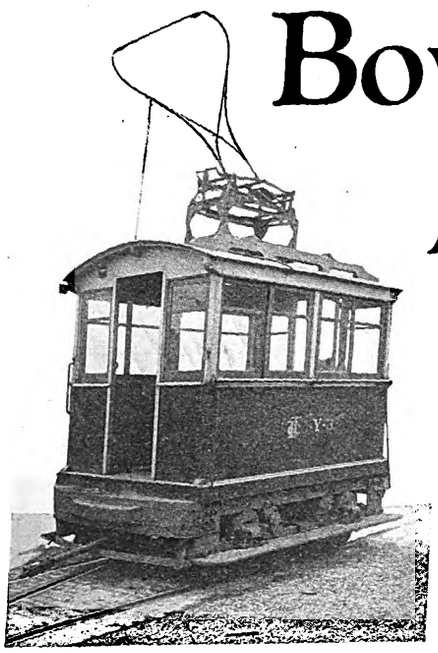
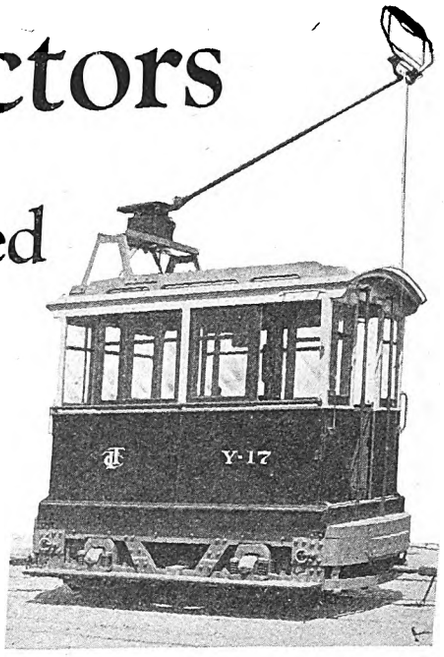
Bow Collectors Are Developed Successfully in Toronto



Original type of bow collector used for five years on Toronto shunters



Later type of collector used for the past year with satisfactory results

After five years' experience in car yards a number of cars on the important Yonge Street line have been equipped with a new type of sliding collector developed by the staff. If successful it may be adopted for the entire system

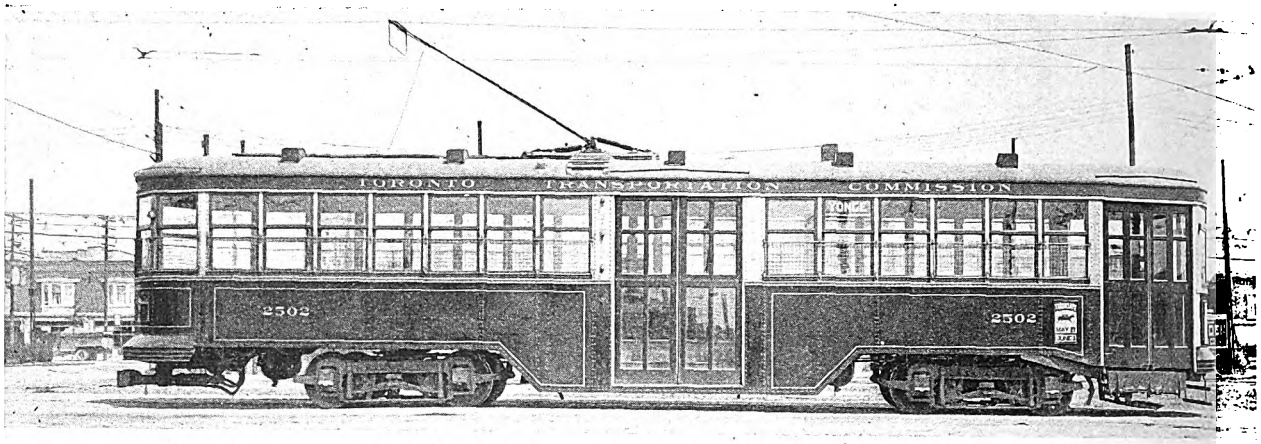
REALIZING that there is room for improvement in the overhead trolley wheel method of current collection, the Toronto Transportation Commission, five years ago, commenced to experiment with bow type sliding current collectors and, as a preliminary experiment, all the yard shunters were equipped with the reversing type of bow collector, as shown in one of the illustrations. This type of collector has given fairly satisfactory results in this particular service, but the rolled aluminum collector section, with its grease groove and comparatively narrow width, was found to wear too rapidly and so did not warrant any further extension to general service operation. About a year ago a shunter, No. Y-17, was equipped with the sliding plate type of collector as shown in another illustration. The performance of this type of collector, with regard to stability and wear of the plate, was so satisfactory that it was decided to rearrange the overhead on one of the shorter and lighter traveled routes to permit testing of the plate collector in actual service. As a result of these preliminary tests, a number of cars have been equipped with the new device and placed in regular service on the Yonge Street route, which handles the heaviest traffic in the system.

The bow collector used in Toronto is fitted with a special design of sliding plate. This is shown in the illustration of the car. This plate differs from conventional types in that the contact surface proper is mounted on an axle and is free to rotate. It is held in the normal position, with contact surface horizontal, by means of a counterweight of iron tubing, which is of such shape that, in the unlikely event of the plate striking an obstruction and tilting over, it cannot be caught in the overhead. It is, therefore, possible to use a wide plate giving a large area of contact as, irrespective of the angle taken by the bow itself, the plate for its entire width is always in contact with the trolley wire. The plate itself has a total length of 39 in. and is channel section, made of 14 U.S. gage sheet steel. In the center is a parallel section 24 in. long by $4\frac{3}{8}$ in. wide, and it is tapered toward each end to 1 in. wide. In relation to the horizontal it has a slight camber, the difference in height between the center and ends being about 1 in. In the wearing surface are two grease grooves running the full length of the parallel center section of the plate. The bow, constructed of steel tubing, is mounted on a non-swiveling base of such design that the upward pressure on the trolley wire is kept constant, irrespective of trolley wire height. In Toronto this varies from 13 ft. 6 in. at subways to 22 ft. 6 in. at railroad grade crossings.

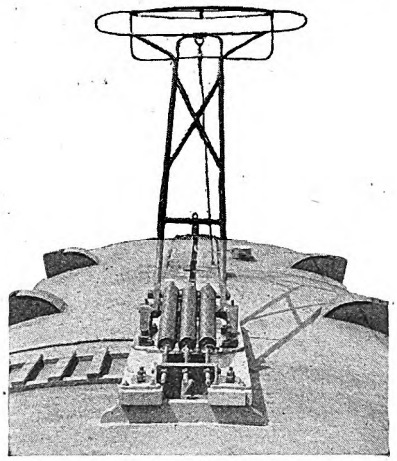
The bow is mounted on the car in such a position that the plate itself is located directly over the king pin of the rear truck at an elevation of 18 ft. This insures that the device will describe an arc along the center line of the curve when turning at an intersection, and permits the alignment of the trolley wire to follow the center line of the track curves throughout. The mounting of the bow in this position means the minimum of alteration in the present location of the trolley wire, eliminating one of the problems during the period of transition. So far as the tangent wires are concerned, it is essential that the trolley wire be staggered on either side of the center line to a maximum of 6 in. at every fourth span in order to spread the wear on the surface of the plate.

The T.T.C. is proposing to operate these collectors under the standard trolley wire construction after making a few changes on some fixtures, such as inverting pull-offs, clearing all obstructions below the under side of the trolley wire and changing the curve dressing at intersections. The section insulators must be of the single beam type so that there is no projection below the bottom of the trolley wire. All overhead frogs in Toronto are suspended on a special device clamped over the frog pan so that no insulators project below the level of the trolley wire. The trolley frogs can be run over in their present locations. It has been necessary to fill in the clearance

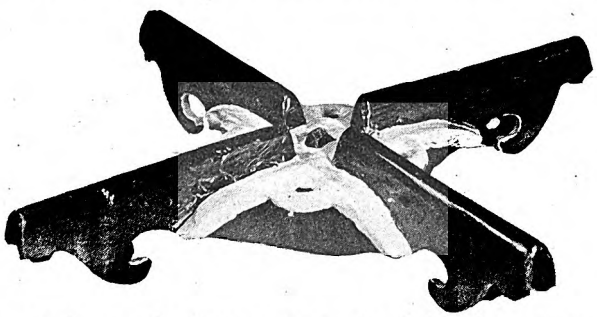
Digitized by Google



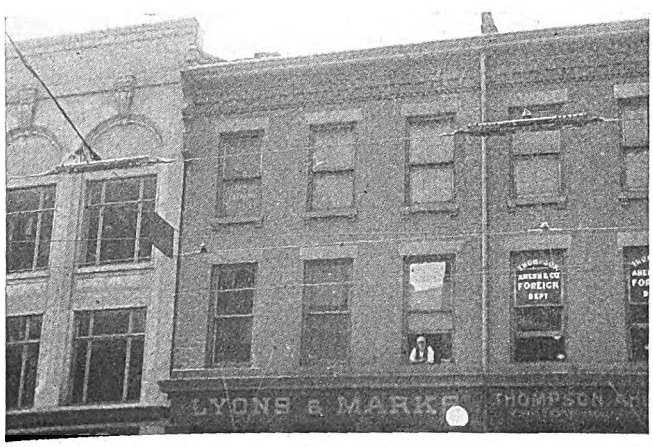
Several cars on the Yonge Street line are equipped with the type of sliding plate collector illustrated



The collecting plate is mounted on an axle and is free to rotate. It is held in position by a counterweight of iron tubing



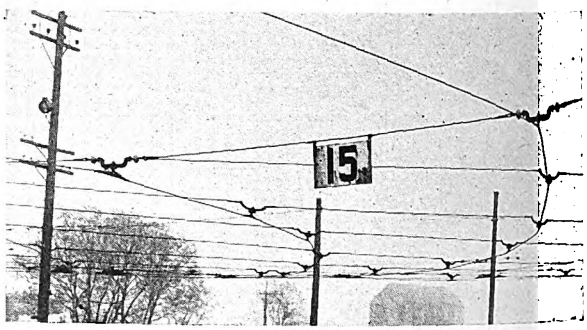
The 90 deg. overhead crossovers were redesigned to accommodate the sliding plate bow collectors by filling in the clearance gap somewhat and leveling the leads



Separate overhead contactors are used for actuating electric switches with trolley wheels and with sliding collectors

gap somewhat and level the leads on the 90 deg. crossovers.

Additions and modifications were necessary to the electric switch overhead contactor equipment, owing to the new position of the sliding plate, as compared with the location of a trolley wheel on similar types of cars. The sliding plate is located 13 ft. forward of the trolley wheel over the center of the rear truck. It was desired



Adaptation of a double track curve for bow collection. Note that the hangers are inverted so that no part of the overhead projects beneath the plane of the contact wire

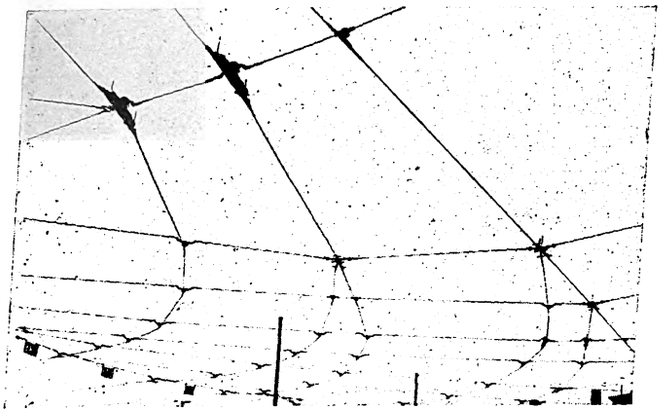
to continue operating the two types of current collectors over the same electric operated switches. To carry this out the switch contactor on the overhead for the trolley wheel was undisturbed as to location but modified so that the sliding plate in passing the contact could not in any manner cause the switch mechanism to be energized, but still be operated by the passing contact of the wheel. At a distance of 13 ft. forward another contactor was installed. It was so designed that the sliding plate in passing energizes the switch mechanism, but cannot be affected when the trolley wheel passes through it. With this special layout of contactors, as illustrated, the difficulty of operating the two types of collectors over the same electric switches has been successfully solved without any additional hazard, or diminution of safety factors.

While opinion is divided as to the relative merits of trolley wheels and sliding collectors, there certainly are features in connection with the type of sliding collector now being operated in Toronto which cannot be equalled by the wheel. The advantage that makes the heaviest score is that the upward pressure against the trolley wire is only 9 to 12 lb. as against 25 to 30 lb. with trolley wheels. Other features are the entire absence of arcing at the wire due to the large contact area and the feasibility of obtaining adequate greasing of the trolley wire.

Other advantages are that the collector cannot leave

Digitized by Google

the wire, as sometimes happens with the standard trolley wheel and pole, causing delay and annoyance, particularly in the case of one-man cars. These dewirements and their cumulative effect are frequently the direct cause of breakdown and expense on the overhead system. A feature that is important in the latitude of Toronto is



Overhead special work redesigned to permit of bow collection

that sleet will not readily form or accumulate on a wire coated with grease. If it does form it is removed easily by the sliding plate without any special devices.

At the present time it is not possible to state definitely the saving in cost of maintenance and renewals of the overhead structure with this type of current collector. But it must be apparent, with the low contact pressure of this sliding plate compared with the orthodox trolley wheel, the elimination of side wear, the ultimate abandonment of frogs in favor of a spot-welded splice, and many other such details, that the potentialities for saving maintenance costs are very great.

Trolley Operated Traffic Signals Prevent Delays

DELAYS to car operation caused by automatic traffic signal lights have been much reduced at one important street intersection in Louisville, Ky., by the installation of apparatus co-ordinating the lights with the movements of the cars. This apparatus consists of four trolley contactors and a relay box, which are connected with the ordinary signal lights and timing device without any change being required in the original apparatus. Overhead trolley contactors have been installed on each wire as far back from the intersection as the car will travel during the time of the red light. Leaving contactors are set at the crossing. The distance from the setting to the clearing contactor on each track constitutes a block.

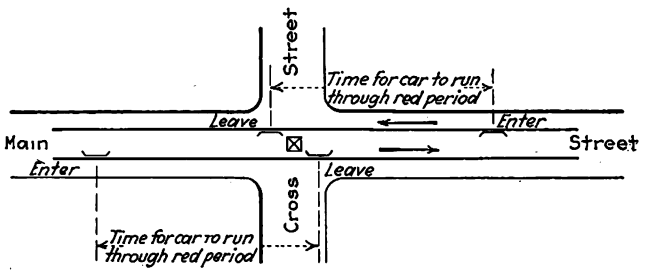
If the car is stopped by the signal at red, the control will not shorten this period, but it will prolong the green under certain conditions. In other words, the car does not change the indications at the instant of passing the entering contactor, but merely causes a prolongation of the green, if necessary. If a car enters and leaves the block within the normal green period, the special control will not be actuated, and the green will not be prolonged. This would be true if one or more cars on both tracks passed within the normal green period. The relays on the two tracks are connected as though all cars were on one track.

When the car stays in the block between the entering and leaving contactors longer than the normal green period, the traffic control causes the green display to be continued, so as to run into the next green period. This maintains the cycle without shifting it, which would be detrimental with progressive or wave systems. While this prolongation or extension may be longer than re-

Bardstown Road at the intersection of Eastern Parkway, looking east, Louisville, Ky., showing one of the Louisville Railway's new cars and trolley operated traffic signal. The relay box is on the pole at the extreme right, and the westbound clearing contactor is shown on the wire

Digitized by Google

quired for the particular car to pass, it is likely to be useful in releasing the accumulated or bottled traffic behind the car. When a car has caused a prolongation of the green, should another car enter the block at the end of the prolonged period, the green display will not be further prolonged, but the signal will change to red, permitting the cross traffic to be released. Thus if a

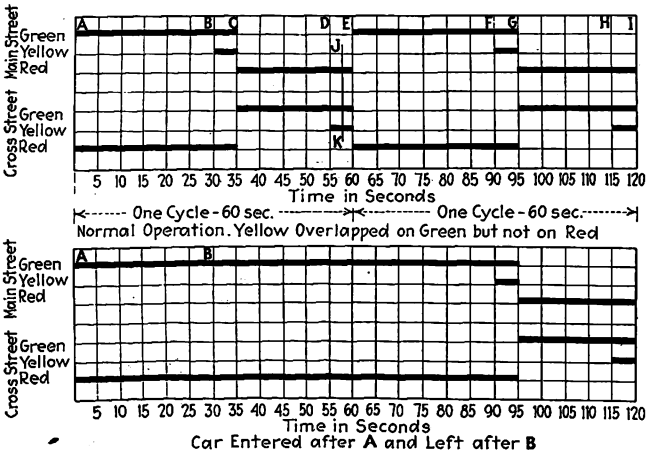


Arrangement of contactors for trolley control of traffic lights

car should for any reason stay in the block indefinitely, the green will not be held longer than one prolongation for each time the red is displayed. This places a limit on the restraint to the cross traffic.

The "Stop" and "Go" signal is at present adjusted for 25-second interval on Bardstown Road and 20-second interval on Eastern Parkway. It is possible to extend the time on Bardstown Road, on which the trolley line operates, by a complete cycle of the signal—45 seconds—thereby holding the green or "Go" period a maximum of 70 seconds.

The apparatus was furnished by the Nachod & United States Signal Company. It does not include the signal nor the timer, but only the overhead contactors and the relay box containing the relays actuated by the



Operation of Trolley Controlled Traffic Signal

A typical signal system has a traffic signal with three decks showing green, amber and red in the upper, middle and lower decks, respectively. The sequence of these indications is shown in the upper chart, and is known as the "split yellow over-lapped" system in which the yellow is over-lapped on the green at the end of the latter period, but not over-lapped on the red. For simplicity a 60 second cycle has been assumed, in which the green is displayed for 35 seconds, during the last 5 seconds of which the yellow is added; and then at the extinction of these the red is displayed for 25 seconds. The cycle then begins anew with green. The same indications are given for the cross street, but in opposing phase, the green with the red or vice versa. A vertical line JK drawn anywhere on the charts shows indications displayed to both streets at that instant. The yellow is used as a caution signal at the end of the green period to warn the moving autoist that the signal is about to go red; but no yellow is shown at the end of the red when it changes to green, so that the driver may not start on the yellow.

contactors and controlling the display of the signals in combination with the timer. There are two 600-volt d.c. relays in the trolley contactor circuit and two a.c. relays operated from the light circuit. Throwover switches are provided, so as to cut out the contactor control in case of trouble, and which permits the complete removal of the control panel. The trolley contactors are of the type without moving parts, as used in the company's standard block signal. They are non-directional, one normal-open and one normal-closed contactor being used on each track.

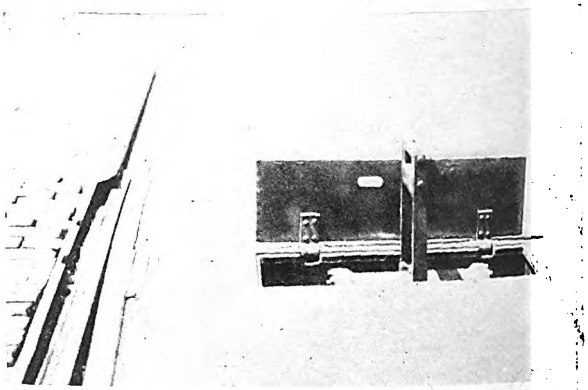
Installations of this nature are in operation also in the cities of Detroit, Mich.; Atlanta, Ga., and Pittsburgh, Pa.

Oil Buffer Eliminates Switch Tongue Slapping

By W. A. Underwood
Engineer Maintenance of Way,
Chicago South Shore & South Bend Railroad

NOISE made by the back slapping of spring-operated tongue switch points, long a cause of complaint by Michigan City residents, has been eliminated with the installation of spring switches with oil buffer shock absorbers by the Chicago, South Shore & South Bend Railroad. Due to heavy freight movement through Michigan City, the back slap of this particular siding used to cause considerable annoyance to the nearby residents, for when a freight train of 40 cars passed through the switch, as several do each day, the former switch tongue slapped 80 times.

The apparatus used is a modification of the "Mechanical Switchman," manufactured by the Pettibone Mul-



Oil-buffed spring tongue switch of the Chicago, South Shore & South Bend Railroad. Box open with manual control handle in neutral position

liken Company, of Chicago, designed for operation on sidings. When a car passes this switch, like any spring switch, the tongue normally returns to its setting. But the oil buffer retards the return of the tongue to normal position, the returning period being adjustable from six to eighteen seconds to suit conditions. This prevents the tongue slapping after the passage of each truck. When a freight train of 40 cars passes, the tongue never gets back to its normal position during the whole movement, eliminating the 80 slaps of the tongue. If it is desired to throw the points manually, the apparatus offers no resistance. The device is assembled in a cast-iron box 14 in. x 5 ft., located in the street.

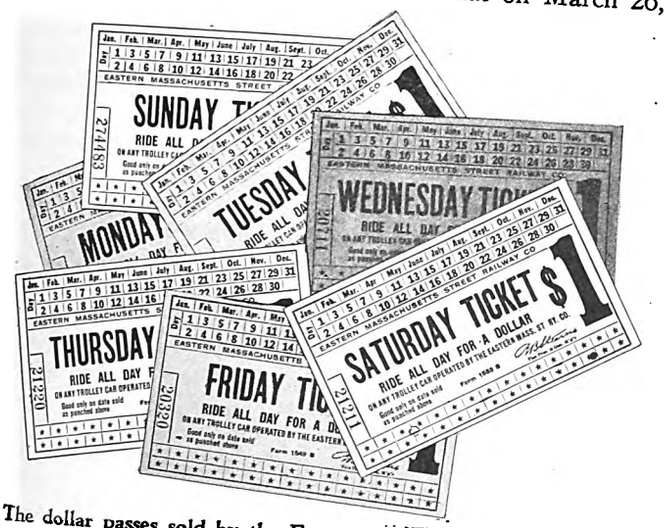
Building Riding with the Dollar Pass

IN AN endeavor to win back to the street car the patronage lost to the private automobile, the Eastern Massachusetts Street Railway decided to experiment with a Sunday pass selling for $1, good on any of the company's routes on the date of purchase. Accordingly, on Sunday, July 10, 1927, this pass was made effective, and in conjunction with it, new de luxe cars with air cushion seats and other improvements were placed in service on the interurban lines. The pass caused so much favorable comment that on March 26, 1928, its use was extended to every day in the week with the exception of Saturday. On May 5, 1928, it was made effective on Saturdays also.

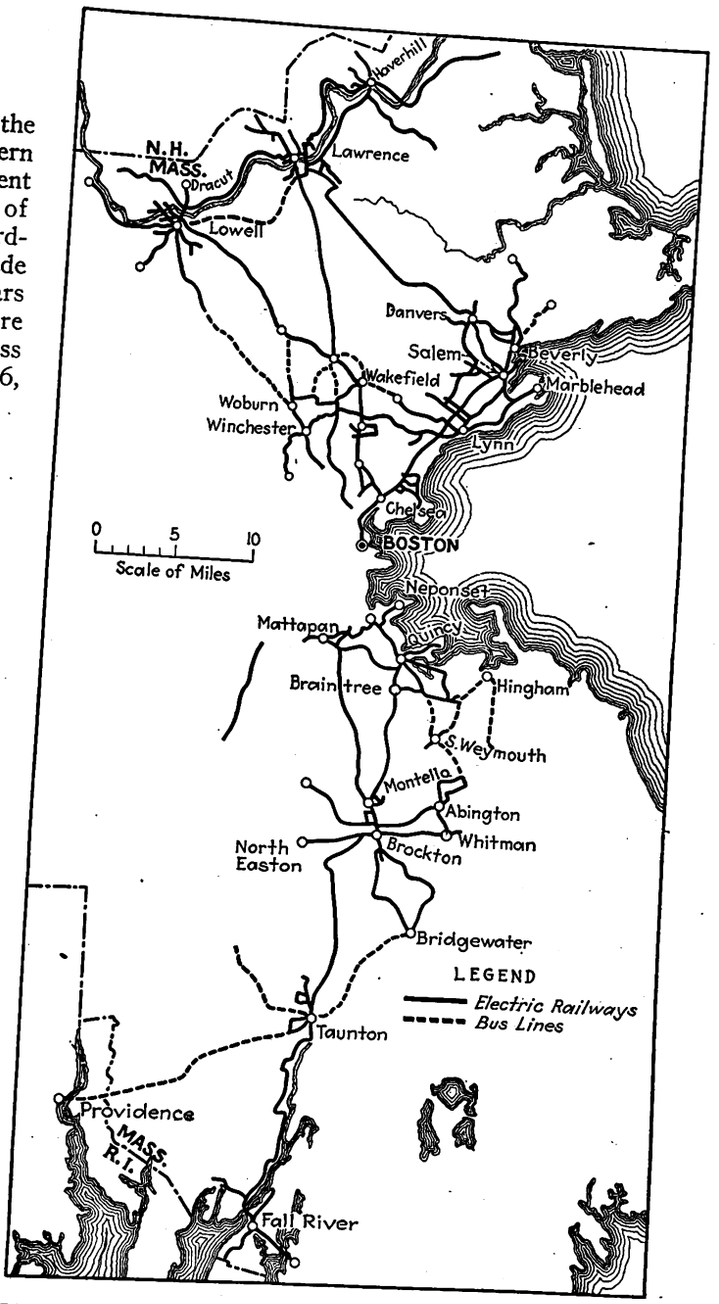


The dollar passes sold by the Eastern Massachusetts Street Railway are colored differently for each day in the week

The pass is particularly attractive since it can be used on any route of the system. The company's lines serve a total of 74 cities and towns, of which 15 cities and 27 towns are north of Boston and 4 cities and 27 towns are south of Boston. Along the lines there are numerous pleasure resorts and places of amusement, as well as many points of historic and general interest. Probably the most striking feature of the ticket is that the stopover privilege is unlimited. Passengers can board and leave the car wherever they please, stay as long as they like during the day, and then board a car in any direction and ride anywhere without the payment of an additional fare.

That the $1 all-day pass has met with the approval of the riders of the system is best shown by the volume of sales. The sales average $2,200 a week, or approximately $115,000 a year. The largest revenue obtained in one day was $2,400. On the interurban routes, particularly where riding had fallen off to a very marked degree of late, there have been crowded cars in the summer and increased riding in the winter.

Aside from enabling families in the summer to enjoy a clean, cool ride at a nominal cost, with a beach, lake, grove, or other amusement place as the destination, without the inconvenience of Sunday automobile driving, these tickets allow the same people during the colder months to visit their friends in warm, comfortable trolley cars at low cost and without the dangers of winter driving. The tickets find favor with salesmen and other business people who make a series of calls daily in a city



Lines of the Eastern Massachusetts Street Railway, serving 74 cities and towns. The $1 pass is good on any of the lines

or adjoining communities. For the person who merely desires to "see the sights" the slogan "trolley all day on a dollar bill" proves to be inviting, indeed.

When first instituted the all-day ticket was advertised for a period of thirteen weeks by a series of radio broadcasts from one of the principal Boston radio stations. The services of an excellent quartet known as "The Four Motormen" were secured, and interspersed with the songs of this quartet was a well-arranged advertising talk featuring the all-day $1 ticket. Small inserts were placed in all the envelopes of outgoing mail inviting attention to these broadcasts. Booklets were distributed containing time-tables as well as line sketches of the more important routes. System maps and divisional time-tables folded to pocket size, containing the same information in more detail, also were made available. Extensive advertising by means of dasher signs and center rack signs carried by every car over the entire system also proved effective in stimulating sales.

Pedestrians Dominate

PHILADELPHIA'S TRAFFIC

Report of Mitten Management shows that all traffic is impeded by the narrow streets, parked vehicles, and frequent turns of motor vehicles. Many proposals are advanced to bring relief immediately and in the future

PHILADELPHIA'S traffic problem in the central business district revolves very largely around the pedestrian, according to the report recently made to the Chamber of Commerce by Mitten Management, Inc. The report, which is the second of a series, makes a number of recommendations which, it is stated, should be advantageous to the entire community in speeding up the flow of traffic, as well as to the great majority who use the street cars and buses.

Chief among the recommendations made, as listed in the panel opposite, is revision of the existing parking ordinance. While the survey data indicate that the ordinance in general would meet conditions adequately if enforced, some concessions may be made on certain non-essential streets, while the principal streets should have their curb-space free at all times. It is recommended that parking should be prohibited between 3 a.m. and 6:30 p.m. on certain important business streets. On Market Street west of City Hall it is recommended that parking be prohibited at all times.

Signals which permit a continuous movement at a speed of 15 m.p.h. in the business district and up to 30 m.p.h. outside the business district are recommended in a separate report. Establishment of a bureau in the department of public safety, charged with the constant observation and study of city traffic conditions and with making recommendations, is urged. A traffic court and violations bureau, which has been considered by the Legislature, is unqualifiedly endorsed.

Complete co-ordination of Philadelphia's transportation facilities, which now requires only the tying in of the Broad Street subway, is recommended. It will be the subject of a subsequent report.

Construction of a concourse under City Hall and on Broad Street from Vine to Spruce, is the first step in a program of underground sidewalks for the protection and convenience of the pedestrian. Extension of these sidewalks by connecting the platforms of the Market Street subway to provide a continuous underground sidewalk from Fifth Street to Nineteenth Street is proposed. All future subways should provide for this facility, at least in the central business district.

At certain intersections in the business district the volume of pedestrian traffic greatly exceeds the vehicle turning movement. Pedestrians are inconvenienced and vehicular traffic is impeded by these movements. Elimination of all turns into and out of Market Street between Seventh and Juniper Streets, and of certain turns at other points is recommended.

With some 2,500 individuals, companies and corporations in the trucking business, a large part of their operations being in the central business district, consolidation and co-ordination of these interests would result in economies, as well as reduce traffic congestion materially. Placing all vehicles engaged as common carriers under the Public Service Commission would not only provide proper control but would tend to bring about in an orderly manner a gradual merging of these interests.

Legislation is recommended providing that, in the construction of any building in the central business district where merchandise is handled, facilities off the street be provided for the parking of vehicles carrying merchandise to and from such buildings. Legislation should further provide that within a reasonable time, say five years, all such buildings now in this district be reconstructed to provide similar facilities. Already 211 buildings are so constructed.

Rittenhouse, Washington and Franklin Squares present definite obstacles to through traffic. They should be reconstructed, so as to carry the abutting streets through or provide passages which will permit the free flow of traffic without right-angle turns. Logan Square already has been reconstructed, and the plan for Franklin Square was contained in the first report of this series. A comprehensive paving program should be adopted, which will not only care for present and future traffic needs but which will also adequately maintain and repair all existing paving. Standard uniform traffic signs and markings, in conformity with the recommended national practice, should be adopted.

Traffic control legislation should provide for the following regulations designed to relieve the traffic stream from various elements which prevent free flow: (1) Prohibit horse-drawn, slow-moving vehicles from center city streets; (2) require that coal deliveries, ash removals and all similar services in the central business district be performed outside business hours; (3) prohibit parades in central business district except on Sundays and holidays; (4) prohibit the storage of building material on the sidewalks or roadways; (5) mark definite traffic lanes on all wide streets; (6) install loading platforms for street railway passengers on all wide streets; (7) prohibit the moving of theater scenery, safes, heavy building material and similar material on all center city streets during business hours; (8) prohibit all street openings, either on the street surface or manholes, within the central business district during business hours, except in cases of emergency.

The report presents traffic conditions which are a direct

Digitized by Google

minate ROBLEM

TRA

result of the natural economic growth that has expanded Philadelphia to a community covering an area of 130 square miles, with a population of well over 2,000,000, and which draws daily from a normal commuting radius of 25 miles in which there is a population over 3,500,000. Probably the factor which has had the greatest influence has been the motor vehicle. There was an increase in registrations in the state of Pennsylvania from 1,246,126 vehicles in 1924 to 1,676,025 in 1928, or 34.5 per cent, while in Philadelphia there has been an increase in the same period from 168,417 to 271,347 vehicles, or 61.1 per cent. Meanwhile the population in the state has increased from 9,344,000 to 9,854,000, or 5.46 per cent, and that of Philadelphia has gone from 1,951,076 in 1924 to 2,064,200, or 5.80 per cent.

The central business district, bounded on the north by Callowhill Street, on the south by Pine Street, on the east by the Delaware River and on the west by the Schuylkill River, covers 56,810,944 sq.ft. or 2.04 square miles. Of this 11,157,574 sq.ft. (0.40 square miles) is roadway area, which is 19.6 per cent of the total, comparing with 29.5 per cent in Detroit, 29.0 per cent in Chicago and 25.0 per cent in Boston. Included in this street area are 1,648,596 sq.ft. (0.06 square miles) of unimportant disconnected streets and alleys and 380,584 sq.ft. (0.01 square miles) of roadway in street intersections.

The lineal extent of street surface is 79.52 miles, of which 25.55 miles is in the unimportant streets. The balance, 53.97 miles, includes many streets which, although narrow, are of use in moving traffic. The subdivision as to width is as follows: 20 ft. and less, 5.51 miles; 21-30 ft., 35.94 miles; 31-40 ft., 6.03 miles; 50 ft. and more, 6.49 miles. Of the total in this classification, 41.45 miles, or 76.8 per cent, are 30 ft. or less in width.

Summary of Philadelphia Recommendations

1. Revise existing parking ordinance.
2. Install signal system on main streets.
3. Establish a city traffic bureau.
4. Establish a traffic court and violations bureau.
5. Completely co-ordinate transit system.
6. Construct underground sidewalks.
7. Eliminate many right and left-hand turns.
8. Co-ordinate and control trucking.
9. Provide off-street loading facilities in new buildings and reconstruct old buildings within five years.
10. Reconstruct streets through certain squares to remove traffic obstacles.
11. Adopt comprehensive paving program.
12. Erect proper signs and markings.
13. Miscellaneous.

To determine the traffic flow into and out of the central business district, its direction and its characteristics, a cordon count was made covering a period of several days. Table I shows the figures of this count compared with a similar count made in 1925. The change in the various classes of traffic is shown in Table II. There has been an increase in the total of 18.6 per cent.

Total	1,591,347	1,726,897	135,550	8.5

*Taxicab drivers not included

The number of passengers carried by public and private conveyance is shown in Table III. The total number of passengers carried by mass transportation units on the street decreased from 846,198 in 1925 to 806,003 in 1928, a decrease of 40,195 or 4.8 per cent. The number carried by mass transportation, sub-surface or elevated, increased from 342,075 to 437,028, an increase of 94,953, or 27.8 per cent. The total increased 4.6 per cent. These mass transportation units carried 74.5 per cent of the total persons entering and leaving the district in 1925 and 72.2 per cent in 1928.

A similar cordon count embracing the district between Walnut and Arch Streets and the two rivers was made in 1919. A comparison of the three counts, with necessary adjustments for the difference in territory, is made in Table IV.

Summarizing the results of the cordon count, the outstanding facts are as follows: There is a daily flow into and out of the central business district of about 332,000 vehicles, or approximately 166,000 each way. This is an increase of 143 per cent during the past ten years. The principal element in the flow—the passenger automobile —increased 279 per cent and the smallest numerical element—the horse-drawn vehicle—decreased 65 per cent in the same period. From 9 a.m. to 6 p.m. the flow is fairly uniform, showing a total hourly movement of about 20,000 vehicles.

Comparison with the 1925 count shows the greatest change in movement has been the 127 per cent increase in flow to and from the east, due to the opening of the Delaware River Bridge. Seven streets handle 66 per cent of the traffic with North Philadelphia and 49 per cent of the traffic with South Philadelphia, the heaviest flow being on the Parkway and on Broad Street.

While the total number of passengers carried by mass transportation units on the street decreased 4.8 per cent in 1928 from 1925, the total handled by the surface, sub-surface and elevated increased 4.6 per cent, and while these services in 1925 carried 74.5 per cent of the total persons entering and leaving the district, in 1928 the proportion had dropped to 72.2 per cent.

TABLE IV —INCREASE IN TRAFFIC, 1928 OVER 1919 AND 1925

Kind of Vehicle	December, 1928, March, 1929 Number	Per Cent	Increase or Decrease from November, 1925 Number	Per Cent
Passenger automobiles*	139,702	279.0	45,582	31.7
Trucks	43,154	138.0	3,250	4.6
Horse-drawn vehicles	—20,645	—64.8	—8,592	—43.2
Total	162,211	143.0	40,240	17.1

*Includes taxicabs

Narrow Streets Make Movement Difficult

With streets that are only 26 ft. wide between curbs and carrying street car tracks in the center, the problem of movement is difficult. On account of the street car loading zones, the right-hand lane on one-way streets is of little use as a through traffic artery. Over 50 per cent of all vehicles in the narrow streets use the street car lane. Assuming a 50 per cent stop, 50 per cent go, distribution of time, the maximum capacity of such streets is 1,065 vehicles per hour. With two free lanes and a 10 per cent reduction due to unequal distribution and lag between the permissive signal and the actual movement of the vehicle, it can be assumed that the normal capacity of a free traffic lane is between 450 and 500 vehicles per hour.

A special investigation was made of Chestnut Street. A large proportion of the Chestnut Street traffic is made up of vehicles using it for only a few blocks. This is due in part to the system of one-way streets requiring vehicles to use several streets to reach their destination. Abolition of parking will not only increase the street space available for moving vehicles but will tend to reduce the number of vehicles due to elimination of the "cruising parking-space seeker." The elimination of turns into Chestnut Street would aid in reducing traffic in that street. Improved paving and complete elimination of parking in Sansom Street from Broad to Eighteenth would provide a bypass route for vehicles now making these turns.

A series of riding checks on both street cars and motor vehicles was made to determine the rate of traffic flow through the business district. It was found that on north-south streets, street car speeds range from 6.54 m.p.h. on Thirteenth to 9.79 m.p.h. on 22d over a distance of approximately one mile. On east-west streets speeds range from 5.83 m.p.h. on Walnut to 8.68 m.p.h. on Pine. The average speed for the entire district is 6.9 m.p.h.

Distribution of the running time of street cars was found as follows:

	Per Cent
Actual operation of car	70.6
Passenger stops	13.8
Delays due to cross-traffic and signals	13.7
Delays due to other causes	1.9

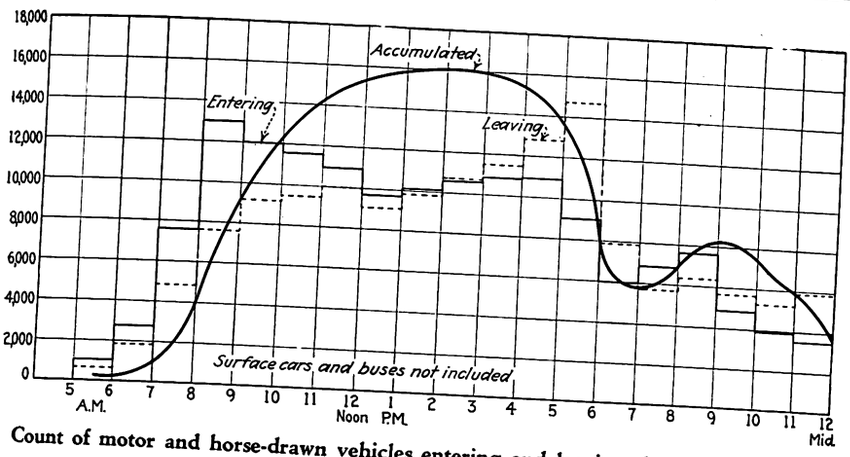
Thus 84.4 per cent of all time on the street is devoted to the transportation of passengers. Of the delays 88 per cent were due to cross traffic or signals.

Analysis of the automobile riding checks indicates an average over-all speed of about 9.5 m.p.h. Classification of the observed delays was as follows:

	Per Cent
Cross traffic	83.05
Congestion*	6.73
Auto or trolley loading or unloading passengers	4.47
Vehicle parking	1.99
Vehicle obstructing track	1.66
Loading or unloading merchandise	0.82
Street repairs	0.67
Stalled vehicles	0.61

*Delays for which the observers were unable to detect any readily apparent reason.

Digitized by Google



Count of motor and horse-drawn vehicles entering and leaving the central business district on a typical weekday

The actual time on east-west streets is divided as follows:

	Per Cent
Moving at speed greater than 5 m.p.h.	67.5
Moving at speed less than 5 m.p.h.	4.4
Stopped due to cross traffic or other causes	28.1

Three Groups of Conditions Affect Traffic Flow

The conditions which affect traffic flow may be classified into three groups: (1) The inclusion in the traffic stream of elements which tend to hinder its flow; for example, parking, and slow-moving elements such as horse-drawn and certain types of commercial trucks; (2) those conditions which tend to impose on traffic arteries loads which are in excess of their normal carrying capacity (the most outstanding elements of this sort is the increasingly dense concentration of business and even social life in small areas, due to the construction of high buildings; (3) improper or inadequate direction and control of the traffic stream, such as faulty signal installation or lack of proper directional regulation.

TABLE V—PARKED VEHICLES IN PHILADELPHIA BUSINESS DISTRICT

Length of Time Parked, Hours	Number of Vehicles Total	Per Cent
Less than 1	23,590	72.5
1–2	4,425	13.6
2–3	1,693	5.2
3–4	812	2.5
4–5	546	1.7
5–6	364	1.2
6–7	274	0.9
7–8	280	0.8
8–9	307	1.0
9–10	207	0.6
Total	32,498	100.0

To determine actual parking conditions a survey covering the period from 8 a.m. to 6 p.m. was made on Jan. 7, 8, 14 and 15, 1929. A maximum of 6,523 vehicles parked between the hours of 1 and 2 p.m. An interesting comparison between 1925 and 1928 may be made by taking the accumulation of vehicles in the district obtained from the algebraic summation of the ins and outs from the cordon counts, the 1925 showing 14,200, and the 1928 count showing 16,271. The increase in accumulated vehicles for 1928 is 14.6 per cent.

In September, 1927, a parked vehicle count was made, which showed a total of 3,650 vehicles as compared with 5,462 in 1929, an increase of 50 per cent.

A summary of the parking survey shows that the accumulated vehicles in the central business district have increased 14.6 per cent since 1925. In the district between Vine and Pine Streets, there has been an increase in parked cars of 50 per cent in the past two years. As seen in Table VI, 72.5 per cent of all vehicles parked for periods of less than one hour, and of the cars parking in excess of one hour 25.4 per cent were "repeaters," being found during both checks. The total number of vehicles using the streets for parking purposes during the business day is about 12 per cent of the city registration. These cars carry only 2 per cent of the people entering the central business district. Repeaters or regular parkers are long-time parkers, the percentage of the total repeaters for periods of from 4-5 hours to 9-10 hours varying from 45.5 per cent to 53.9 per cent. Of all repeaters, 73 per cent are evidently regular parkers as they were found in practically the same location during both checks.

TABLE VI—CHECK TO DETERMINE "REPEATERS" IN PARKING

Length of Time Parked First Check, Hours	Total Number Parked, First Check	Repeaters Total Number	Repeaters Per Cent of Total
1–2	4,425	751	17.0
2–3	1,693	345	20.4
3–4	812	260	32.0
4–5	546	202	36.9
5–6	364	196	53.8
6–7	274	133	48.5
7–8	280	145	51.8
8–9	307	140	45.6
9–10	207	94	45.4
Total	8,908	2,266	25.4

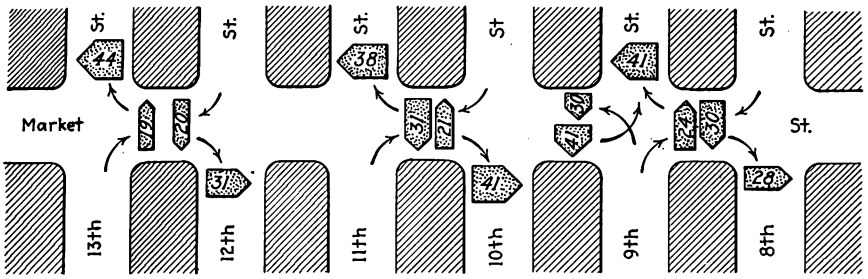
Through the co-operation of the Keystone Automobile Club, a survey of the actual garage and parking facilities was made. The summary is given in Table VII. It was noted that in certain sections of the business district there are not proper facilities for the garaging of automobiles. It is unreasonable to expect that any plan of parking regulation can be entirely successful unless suitable garaging facilities are provided, including reasonable and uniform rates. As this is a matter in which the city is directly concerned, it should encourage the construction of garages at such points throughout the city as will provide proper facilities.

Difficulties in Way of Parking Regulation

With regard to the regulation of parking, the report states:

> All attempts that have been made to regulate parking in this city have met with strenuous opposition from business interests, with the claim that such regulation seriously interferes with business. It is an open question whether this claim is justified. From the experience of other cities and from such information as we have been able to secure, we are inclined to believe that this claim is based on a state of mind rather than on actual facts, and an unbiased investigation of the facts would not sustain the claim. It is certain that in other cities where there is effective parking regulation business has been helped rather than hindered, and that such regulation has brought more people, more traffic and more business to the business districts.
>
> We secured the co-operation of a number of large and representative stores in making a three-day survey to determine facts. A total of over 56,000 customers were canvassed as to the method used in reaching the various stores, and the following tabulation

Digitized by Google



Conflicting movements of vehicles and pedestrians 8 a.m.—6 p.m. on a typical weekday in March, 1929

of transportation methods used by customers shows the percentage of the total using the means indicated.

	Per Cent
Auto parked at the curb	9.02
Auto not parked at the curb	8.32
Public conveyance	68.57
Walked	14.09

It will be noted that while the number of customers requiring curb parking space is considerably higher than shown by checks in other cities, yet it is a small percentage of the total and must represent a comparatively small number of the aggregate of customers using our central city shopping centers. It is doubtful whether it is to the advantage of the business houses to inconvenience the free movement of 91 per cent of their customers to provide free parking in the streets for the other 9 per cent.

A check of conditions made since the recent enforcement of the no-parking ordinance shows that while parking has not been entirely eliminated, vehicle speeds have been increased about 20 per cent. The number of parked vehicles on Chestnut and Walnut Streets has been reduced 90 per cent from the number observed during the parking survey made in January, and on north-south streets the number of parked vehicles has been reduced about 50 per cent.

Another reason for the inability of Philadelphia's streets to handle the traffic is the increasingly dense concentration of business and even social life due to the construction of high buildings. Of the buildings above ten stories in height approximately 17 per cent are 20 stories or over, 27 per cent are 15 to 19 stories and 77 per cent are 10 to 14 stories. A survey of 141 buildings in this district shows a total estimated population of 89,238 persons and a total daily traffic of 286,664 persons, or 4.4 times the population, and while the opening business hour is fairly well distributed, the closing hours are rather concentrated at 5 o'clock.

It has been estimated that during the closing hour—5 to 6 p.m.—people leave office buildings at the rate of 480 per floor, per hour. A 20-story building, therefore, discharges about 10,000. If one in 30 uses an automobile to get home, there would be required sixteen cars per floor or 320 cars for the building, or six times the number that could be parked in one city block, which would make the street impassable. Should all these people use street cars, on the basis of 100 persons per car, 100 cars would be required, which, stretched end to end, would reach almost a mile. No demonstration is necessary to visualize the effect of the sudden imposition of such loads on the narrow city streets. Only high-speed surface transportation could meet such requirements, and the continuing development of this nature is a powerful argument for a completely co-ordinated and comprehensive transit system.

TABLE VII—GARAGE AND PARKING LOT FACILITIES COMPARED WITH PARKING ON STREET

Number of parking lots	23
Number of garages	76
Total available parking places	99
Total car capacity	19,528
Number of cars stored	9,919
Available car space	9,609
Per cent of capacity available	49.2
Number of cars parked on street at peak hour	6,524

Observations were made of persons and vehicles entering certain selected intersections. The counts, made for an average weekday between 8 a.m. and 6 p.m., show only persons moving across the roadway and exclude those who turn the corner and remain on the sidewalk. The distribution of the persons and vehicles was: pedestrians, 65.8 per cent; passengers in street cars and buses, 25.2 per cent; passengers in other vehicles, 9.0 per cent.

Several charts indicate the conflicting movements between pedestrians and vehicle passengers in making turns at certain intersections along Market Street. One of these is reproduced. The conflict is most noticeable at Thirteenth, Tenth and Ninth at Market, where the number of pedestrians are 44, 41 and 41, respectively, for each passenger in private vehicles making the right turn from Market to the intersecting street. It was found that a well-defined cruising circuit used by private chauffeurs exists, including Chestnut, Fifteenth, Walnut and Sixteenth Streets.

The turning movements at certain Chestnut and Market Street intersections cause serious inconvenience to the greatly predominating pedestrian movement and very definitely slow up all vehicular traffic.

Other Sections of the Report

Other reports in the Philadelphia traffic survey already released are No. 1, which treats of the traffic conditions in the vicinity of the Delaware River Bridge Plaza: No. 3, on the traffic control signal system for the central business district, and No. 4, concerning accidents and the street traffic situation. In the first report it is recommended that Fifth Street be carried across the bridge approach through a tunnel, so that the through movements will not interfere with each other.

The third report recommends a progressive co-ordinated traffic control signal light system, which would be entirely automatic. It would be operated as a unit, controlled from one or more central points. The lights at each intersection would be so timed that a vehicle could move continuously through the district without stopping. This speed would be 15 m.p.h. on that section of Broad Street between South and Vine and at a materially higher speed beyond these limits. It is estimated that the proposed system would increase the average speed of traffic on all streets almost 50 per cent.

In the fourth report, on accidents and traffic, it is recommended among other things that a city traffic engineering bureau be organized to plan for future as well as present relief from traffic hazards and congestion; that there should be properly constituted traffic courts with adequate punishments; that further development of safety patrols and teaching of safety in the schools, and education of the police, be encouraged; that more playgrounds and other inducements to discourage play in the streets be established; that commercial vehicle movements and loading be controlled; that travel lanes and pedestrian crossings be marked; that loading platforms for street railway passengers be installed on all wide streets.

For heavy traffic lines, where short headways are economically justifiable, articulated units have definite advantages

Determining the Proper Vehicle

By
GEORGE M. WOODS
Westinghouse Electric & Manufacturing Company

Characteristics of large and small cars, multiple-unit trains and articulated units compared, and their advantages and disadvantages under various operating conditions outlined

ONE of the major problems confronting railway operators who are about to purchase new equipment is determining the type of rolling stock to buy. This question cannot be answered according to any fixed rule. There are so many variables involved that numerous exceptions can be taken to almost any general statement. The first choice must be between a rail vehicle and a trackless vehicle, that is, between car and bus. Next, if the car is chosen, should it be articulated, multiple unit, or single unit—double truck or single truck?

In determining the proper vehicle, the traffic conditions must first be analyzed to ascertain the number of persons to be hauled at the various hours of the day. The number of cars required or the number of buses required, with their tentative schedules, must be determined. The total investment for each can then be calculated within fairly close limits. The investment must include not only the cost of the vehicles themselves, but also such items as track construction, additions to substation and distribution systems, garages, shop additions, etc. Generally the investment for cars and the items which accompany car operation, will exceed the investment for buses. It is equally true that the operating costs of buses per seat-mile ordinarily will exceed the operating costs of street cars. If the annual fixed charges on the necessary investment are added to the annual operating costs, the total annual charges give a true comparison of the two systems from a cost standpoint.

The earning power of cars compared with buses is another factor that must be considered. Obviously it would be poor policy to select a method of transportation merely because it is cheap, if the public would not patronize it after it had been provided. Not only the present desires of the public but also its future attitude must be considered. While this phase of the analysis approaches the realm of prophecy, it cannot be ignored. In some instances bus operation was started a number of years ago with wholly unsatisfactory vehicles; the patrons became dissatisfied and today the street car is generally

Digitized by Google

favored. But such a comparison is fundamentally unfair if modern street cars are compared with out-of-date buses. On the other hand there are numerous street railways which have purchased few new cars in recent years, while at the same time they have been consistent purchasers of modern buses. It is only natural that many persons, comparing street cars of the vintage of 1900 with buses of the vintage of 1929, consider the street car an obsolete vehicle and can see no prospect of the street railways continuing in operation. Their judgment is biased just as much as that of the people who base their opinions on old buses and modern cars. Actually there is less fundamental difference from the passenger's viewpoint between street car and bus than there is between either and the private automobile.

Wages are such a large part of the total operating expense that every effort must be made to have each man operate as large a unit as is practicable. The electric railway man is always between the "devil" of high operating costs, and the "deep sea" of infrequent service. A street railway which operates large cars at long intervals can no more expect to prosper than an office building which would attempt to operate elevators at similarly infrequent intervals.

In considering this question, let us take for example a route with the following characteristics:

Length of line, miles per round trip	15
Schedule speed, miles per hour—non-rush	10
Schedule speed, miles per hour—rush	9.4
Running time, minutes—non-rush	90
Running time, minutes—rush	96
Headway, minutes—non-rush	5
Headway, minutes—rush	2
Number of cars—non-rush	18
Number of cars—rush	48
Equivalent hours of non-rush service	18
Equivalent hours of rush service	3

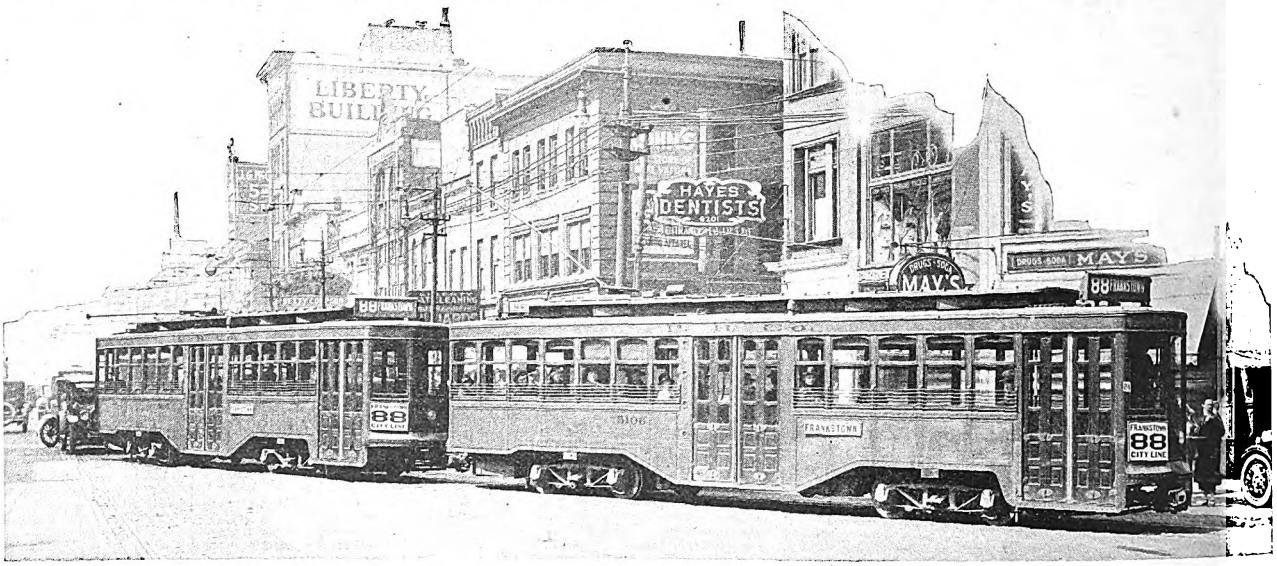
A typical modern car for this class of service would weigh about 35,000 lb. and seat 50 passengers. This car should be maintained for not more than 2.5 cents per mile and the energy cost should be approximately 4.2 cents per mile. A car of this type could readily be arranged for train operation. The platforms and couplers might be somewhat heavier but the increase in weight is so slight that the same weight may be used for the multiple-unit car without appreciable error. An articulated car with two body sections and three trucks would weigh approximately 66,000 lb. for the same seating capacity as two single units. The electrical equipment should have the same capacity per unit of weight. In the same service the maintenance would be expected to be 4.5 cents per car-mile and the cost of energy consumption, 7.5 cents per car-mile. For the purposes of comparison let it be assumed that motormen and conductors receive 60 cents per hour on single cars, articulated cars, or multiple-unit trains and 65 cents per hour on one-man cars.

Between single cars and multiple-unit operation, there would be little difference in operating expenses, except wages of conductors and motormen. During the rush hours the headway would be doubled with the multiple-unit trains, but since the resulting headway is only four minutes, fairly frequent service is afforded. Under the conditions previously outlined, taking two-man operation of all single cars and three-man operation of multiple-unit trains, the total daily wages would be $562 for the single cars and $519 for the multiple-unit cars, a saving of $43 per day for the latter.

If all cars were operated by one man during the non-rush hours, the wages per day would be $384 for single cars and $341 for multiple-unit cars. The relation between single-car and multiple-unit operation remains unchanged, but a saving of $178 per day in each case would be effected by one-man operation. If the service conditions were such that one man could run a single car successfully throughout the day, the total daily wages for single cars would be $304. The wages for multiple-unit cars remain unchanged at $341. Under these circumstances there would be a saving of $37 per day for the single cars.

When the operating costs of articulated cars are compared with those of single cars and multiple-unit trains the power and maintenance expenses differ and must be included. On page 845 is a comparison based on the provision of the same number of seats throughout the day with the three types of equipment. In some instances the larger units might have to make more stops, especially during the non-rush period, than the smaller units and, hence, would make lower schedule speed and have higher energy consumption per ton-mile. This tendency is neglected in order to avoid obscuring the main point to be developed.

Under these conditions the articulated cars save



Multiple-unit cars provide a convenient means of handling light traffic during the day and heavy traffic in the rush hours

Digitized by Google

$174 per day, compared with single cars and $131 per day, compared with multiple-unit cars. The former, however, have the disadvantage of affording 10-minute headways during the non-rush hours instead of the 5-minute headways furnished by the latter.

If the single cars and multiple-unit cars are operated by one man during the non-rush hours the wages are reduced, as previously mentioned, to $384 and $341, respectively. The articulated cars remain unchanged. The total expense for wages, power and maintenance become: single cars, $693; multiple-unit cars, $650; articulated cars, $697. On this basis the expenses for the articulated car are $4 per day more than for single cars, and $47 per day more than for multiple-unit cars of the same capacity.

Single-car operation under extremely heavy traffic conditions has many staunch advocates

Although some of the most recently designed articulated cars are arranged for three-man operation, there are a number of articulated cars in service which are operated by two men. If the latter plan is followed the expense of one man for the entire day is saved and the total cost of wages, power and maintenance of the articulated cars becomes $555. The two-man articulated cars, therefore, save $138 per day, compared with single cars, and $95 per day, compared with multiple-unit cars.

If it be assumed that the articulated car at ten-minute intervals affords a service which is too infrequent, and that, in order to retain the business, maximum headways should be five minutes, the three types of cars compare as given in the table below.

On this basis the multiple-unit cars save $295 per day, compared with the articulated cars. It so happens that in the example chosen the resulting non-rush headway, when the articulated cars provide the same number of seats as the single cars, is such that there may be a difference of opinion as to its adequacy. In some cities 10-minute headways are considered satisfactory even on important lines, in others they are regarded as too long to meet the demands of the public.

Multiple-unit cars are the most flexible means of providing service for varied traffic conditions. Operated singly they can provide frequent service on the lighter lines during the entire day and on the heavier lines during the non-rush hours. At periods of heavy traffic, the cars can be operated in trains of two or three. In the past multiple-unit cars have been looked on with disfavor in some instances because of the assumed complication.

COMPARISON OF OPERATING COSTS—SAME SEATING CAPACITY

	Single Car	Multiple Unit	Articulated Car
Car-hours per day non-rush	324	324	162

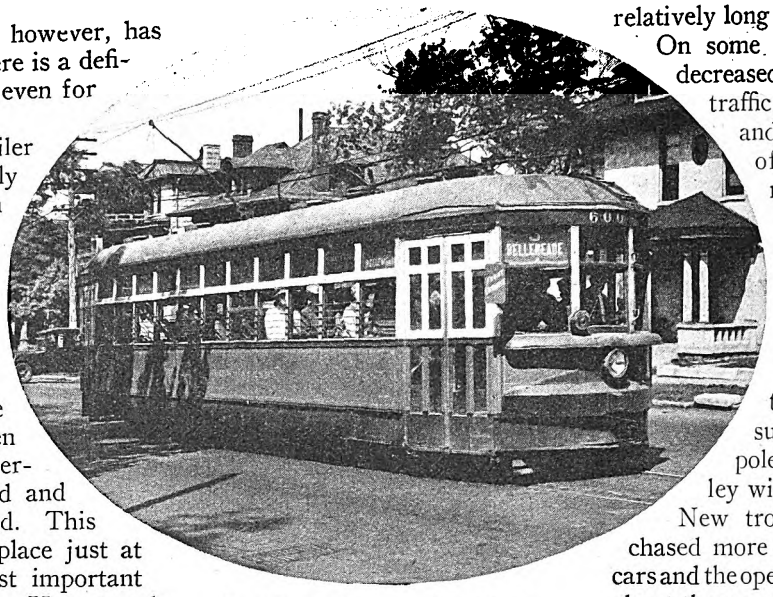
Excess per day compared with multiple unit	43	....	295

The single-truck car has a definite field of usefulness on light traffic lines

Digitized by Google

Modern remote control, however, has many advantages and there is a definite trend toward its use even for single units.

Motor car and trailer trains are less favorably regarded at present than formerly. It has always been known that the equipment of the motor car had to be heavier and less economical in operation than if designed for the motor car alone. When the trailer is added acceleration rates are decreased and the car speed is decreased. This decrease in speed takes place just at the time when it is most important to move traffic quickly. Unmotored trailers are difficult to handle in switching operations, and equipment to move them from carhouse to line and around the carhouse must be provided. If motor troubles occur on the car hauling a trailer, it is impractical to continue the train in service. However, the main objection to motor car and trailer trains is the fact that low rates of acceleration are too great a handicap today.



Double-truck cars of moderate size are frequently preferred to single-truck cars, even where traffic is light

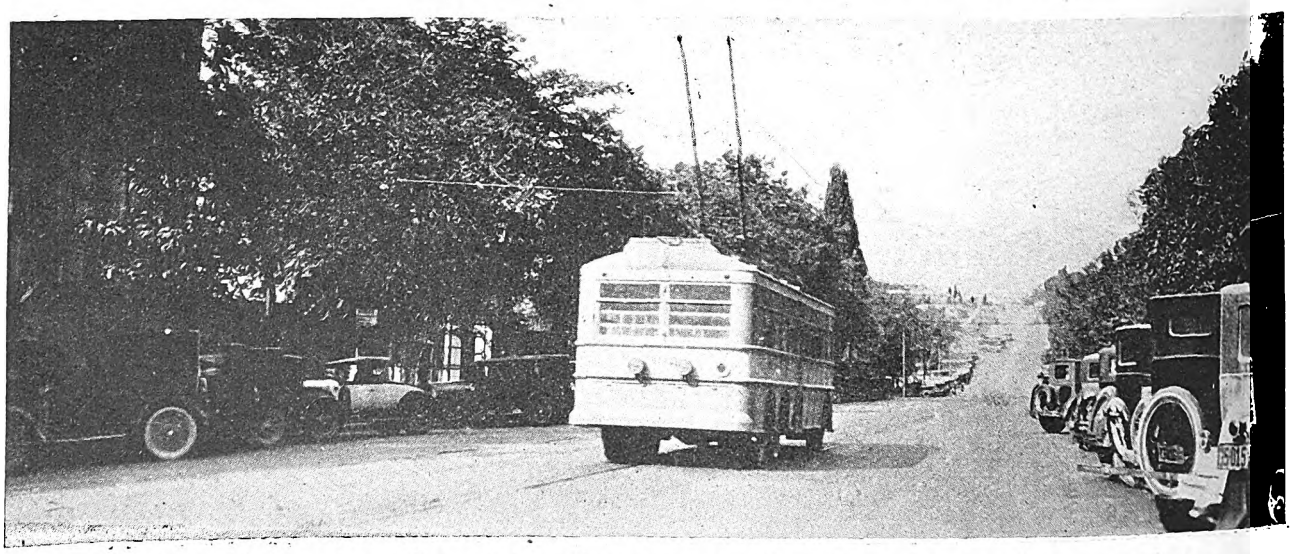
Single-car operation for almost all classes of service has many staunch advocates. Short headways can be maintained, and in these days of private automobile competition are a most effective weapon. Single cars operated by one man compare favorably in operating expenses with any other form of transportation.

In certain cities where vehicular traffic is dense and street intersections are close together, trains and articulated cars interfere with cross-street traffic. Under these conditions single cars are preferred, even if two-man crews are required.

The single-truck car has a definite field in small cities or on lightly traveled lines. Distances traveled are short and unless frequent service is available, patronage is sure to decrease. The single-truck car has never had as good riding qualities as the double-truck car, especially on poor track, and that sometimes has caused it to be unpopular. In many small cities double-truck cars, even at relatively long headways, are preferred. On some railway lines traffic has decreased or expected increases in traffic have not materialized, and the continued operation of street cars is not economical. The track may require high reconstruction costs. The cars also may have reached the stage where replacement is necessary. To these conditions the trolley bus is eminently suited. The substations, a pole line and one of the trolley wires are already available. New trolley buses can be purchased more cheaply than new street cars and the operating expenses should be about the same as those of the street car.

It is possible to make theoretical studies of the investment and operating costs of each of the various types of vehicles discussed, in service of various densities. From these studies deductions could be drawn as to the exact field of application of each type. But these studies usually ignor local conditions which quite frequently are the determining factors. No general rule can be applied to evaluate the earning power of the various vehicles. A slight change in assumptions of unit costs, changes the relative economy of various schemes. For instance, in the comparisons made between single cars, multiple-unit and articulated cars each could be shown to be most economical, depending on the number of car operators.

It is probably fortunate that definite divisions between the fields of application cannot be made. It is human nature to continue to do things in the same old way once a standard procedure is established. The urban transportation business is changing so rapidly that the industry cannot afford to over-standardize. By carefully studying each application of new equipment, the railway operator keeps in touch with new conditions and is better able to meet the requirements of the public. The best results can be obtained only by thoroughly analyzing each problem and by applying the correct vehicle.



Trackless trolleys involve smaller capital cost than street cars and are cheaper to operate than are motor buses

Gross Up; Expenses Down

DESPITE the advent of summer weather and the increased use of the automobile the earnings of electric railways reported for the most recent months compare quite favorably with similar reports for 1928. In the larger cities and in some of the smaller ones there is an increase of gross business. All the Canadian properties except one small one show increases in gross revenue. Approximately two-thirds of the companies for which returns are published show a reduction in operating expense for the current year, as compared with last year, so that more than two-thirds of these companies had a higher gross income for the month reported for this year.

The statement of the Brooklyn-Manhattan Transit Corporation for the month of July is the first one issued since the consolidation of the surface lines of that com-

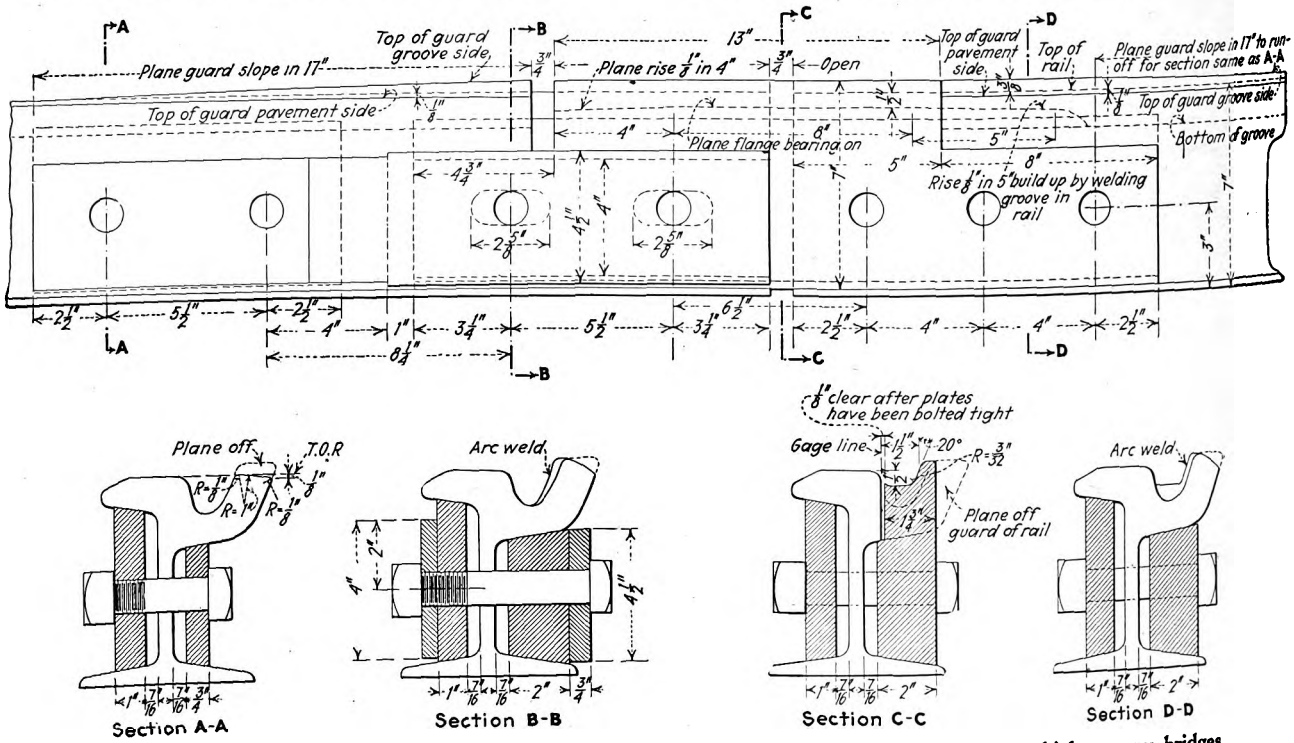
pany and the Brooklyn City Railroad into the Brooklyn & Queens Transit Corporation. The statement for the current year shows the combined results for the entire system. For purposes of comparison the results in July, 1928, for the two systems that were consolidated are shown both separately and together. Gross revenue, gross income and net income are all higher this year. The net income of $607,513 for July, 1929 for the system includes $99,400 accruing to minority interests in the B. & Q. T. Corporation, making a balance of $508,113 for July, 1929, for the B.-M.T. that compares with $507,475 net income for the B.-M.T. in July, 1928.

Flange Bearing Expansion Joint Used in Brooklyn

By H. F. Merker

EXPANSION joints have been installed at numerous locations on the lines of the Brooklyn City Railroad on bridges and approaches. Recently a joint was designed to permit expansion and contraction up to 1½ in. and having a flange bearing at the gap in the rails. In order to provide the flange bearing, the guard was cut away and in its stead a bar of steel was used so constructed as to serve as a splice bar, a guard and a floor of the flange-way, in one piece. This bar of steel was tightly bolted to the one rail end through round holes with reamed fit bolts. On the other end the combination splice bar and guard was equipped with slotted holes similar to the accompanying splice bar on the opposite side of the rail, permitting the two splice bars to slide along the fishing space of the adjacent rail end. In order to prevent the bolts through the slotted holes from changing the 90 deg. angle which they made with the rail, a bar was provided with a set of 2 in., equivalent to the thickness of the combination splice bar and guard. This permitted one end to be bolted against the web of the rail and the other end to be bolted against the outside of the combination splice bar and guard. It was fitted with round holes in order to hold the bolts firmly in their position.

The joint as designed provided ½ in. depth of flangeway where the flange bearing was desired, and while there is little need of any riser beyond the limit of the bar, the riser or arm was continued by arc welding into the flange-way of the guard rail to which the combination piece was bolted. The joint as designed was intended to be used where car speeds are not higher than is customary over such special trackwork. It is provided with flange bearings at frog intersections. The design also contemplated welding the floor of the flange bearing groove when wear made it necessary.



Straight track expansion joint constructed by the Brooklyn City Railroad for use on lines which traverse bridges

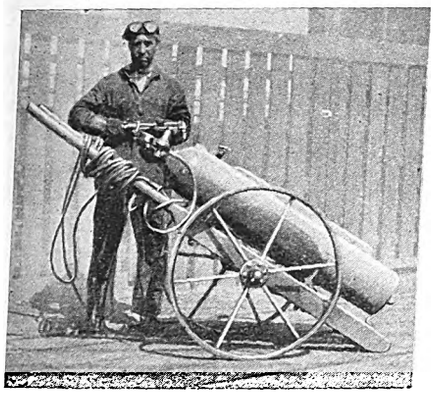
MAINTENANCE WORK

in Railway Shops

The Maintenance Contest $200 cash award and the departmental certificates of merit will be presented at the Tuesday morning meeting of the Engineering Association during the Atlantic City Convention



This truck for welding equipment is easy to move about and requires the services of only one man under the most unfavorable conditions

Truck for Welding Equipment

CONSIDERABLE trouble was experienced in transporting the welding equipment until the truck shown in the accompanying illustration was designed and constructed in the shop of the Staten Island Rapid Transit Railway, Staten Island, N. Y. The equipment is used throughout the shop and yards on cinder and dirt paths and passes over rails and rail crossings. Metallic frame trucks with small wheels of various designs were tried out but they were found unsatisfactory. The services of two men were required to transport these trucks and often the mechanical structure did not hold together.

The truck shown is made of wood and steel. Two longitudinal members of the frame of 3x4-in. oak are spaced 21½ in. centers and tied together by means of two ¼x1½-in. angles spaced 22 in. centers. A ¼x10-in. plate is riveted to each of these angles which are notched to receive the oxygen and acetylene tanks. These act as a support for the tanks. This construction takes care of any lateral motion of the tanks during transportation. The longitudinal motion is prevented by a ⅜x1-in. bar bolted to the oak beams near the end. Two iron wheels 31 in. in diameter with a rim 2½ in. wide by ½ in. thick are mounted on a 1½-in. square axle and spaced 30 in. centers.

The oak frame is 80 in. long and one end is rounded for a distance of 36 in. to provide for a suitable hand grip. The other end is beveled so that it will rest firmly on the ground. The axle is installed at about the center of gravity when the tanks are in position, and, as a result, little effort is required to maintain a balance. The oak beams are notched 1½ in. square for the reception of the axle, and a ⅜x1¾-in. plate fastened to the beams across the axle holds the axle in position.

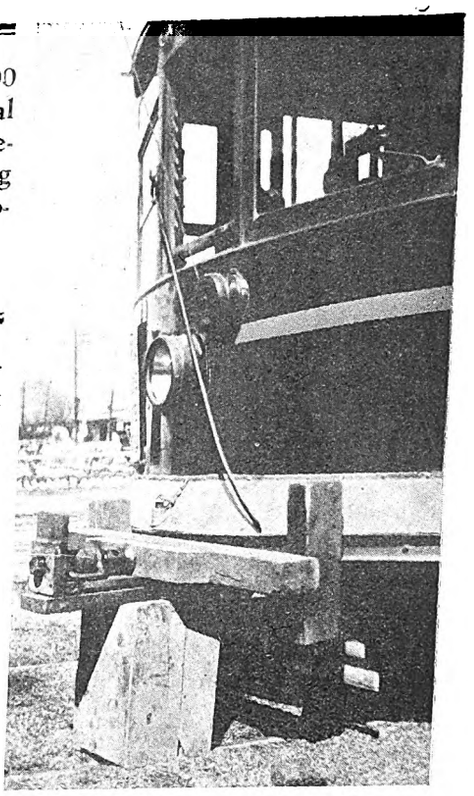
Straightening Front End Channel Irons*

By H. C. Pressler

Master Mechanic Eastern Texas Electric Company, Beaumont, Tex.

A TOOL for straightening the front end channel irons, or those on the sides of street cars, was recently designed in the shops of the Eastern Texas Electric Company. This tool consists of a 6-in. jack, one piece of 1¼ in. No. 5 iron, bent 4 in. at 90 deg. at one end and 12 in. also at 90 deg. at the other end, both bends made in the same direction 26 in. apart. When a bumper is to be straightened the long end of the iron is placed behind the channel to be pulled out. The jack is placed in a horizontal position between the short end and a wooden block or bar which rests against two blocks attached to the undamaged part of the bumper. When the apparatus is in position, supported by wooden blocks, if necessary, the jack is screwed out in the conventional manner, thus straightening the bumper.

**Submitted in* Electric Railway Journal *Prize Contest.*

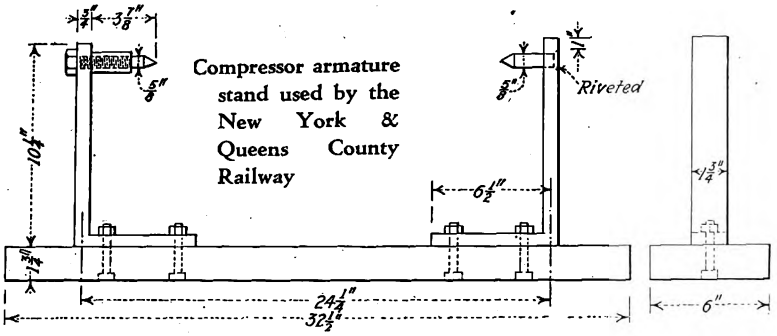


Jack for straightening bent bumpers

Special Winding Stand for Compressor Armatures

TO PROVIDE a special stand for compressing armatures that are not designed with a shaft extension on the commutator end, the device shown in the accompanying illustration is being used by the New York & Queens County Railway, Woodside, N. Y. This stand consists of oak

Digitized by Google



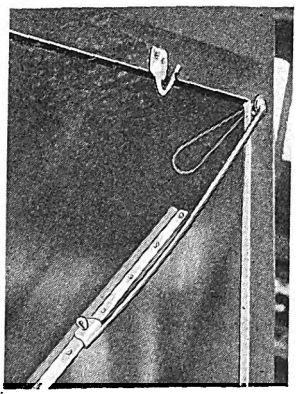
Compressor armature stand used by the New York & Queens County Railway

1¾ in. thick, 6 in. wide and 32½ in. long, to which are bolted two angles 10¼ in. high with centers spaced 24¼ in. These angles are made from ¾x1¾-in. steel. A supporting center ⅜ in. in diameter and 2¾ in. long is riveted to one of these angles. The other angle has an adjustable supporting center ⅝ in. in diameter and 5⅝ in. long.

Prolonging Life of Window Wiper*

By H. F. Rexroth
Master Mechanic Harrisburg Railway Harrisburg, Pa.

A SIMPLE device for prolonging the life of rubber windshield wipers has been devised by the Harrisburg Railway. It consists of a V-shaped hook attached to the upper window frame against which the wiper usually rests when not in use. When placing



V-shaped hook which holds window wiper off glass when not in use

the wiper in the rest position by turning the handle upward, the wiper will be pushed over the V-shaped hook and thus will be lifted from the window. This will relieve the rubber from the continual pressure and thus preserve the flexibility necessary to wipe the water thoroughly from the windshield. It has been found that wipers consisting of five plies of rubber give better service over the uneven glass than did the single heavy piece.

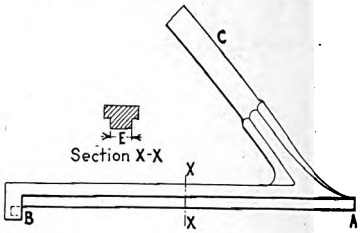
Driving Tools Speed Up Armature Stick Removal*

By S. M. Spindle
Engineer Power Department Cleveland Railway, Cleveland, Ohio

IN THE past the electrical maintenance division of the Cleveland Railway has used several methods for driving the coil-retaining sticks when repairing large armatures. Recently this division developed a simple driver, which does the work more effectively. This device is shown in an accompanying illustration. *B* is a shallow pocket, into which the rear end of the stick is placed as it is about to be driven. The distance from *A* to *B* is the length of the stick to be driven. The width *E* is just a trifle less than the width of the armature slot. A small air hammer is slipped over the round, case-hardened



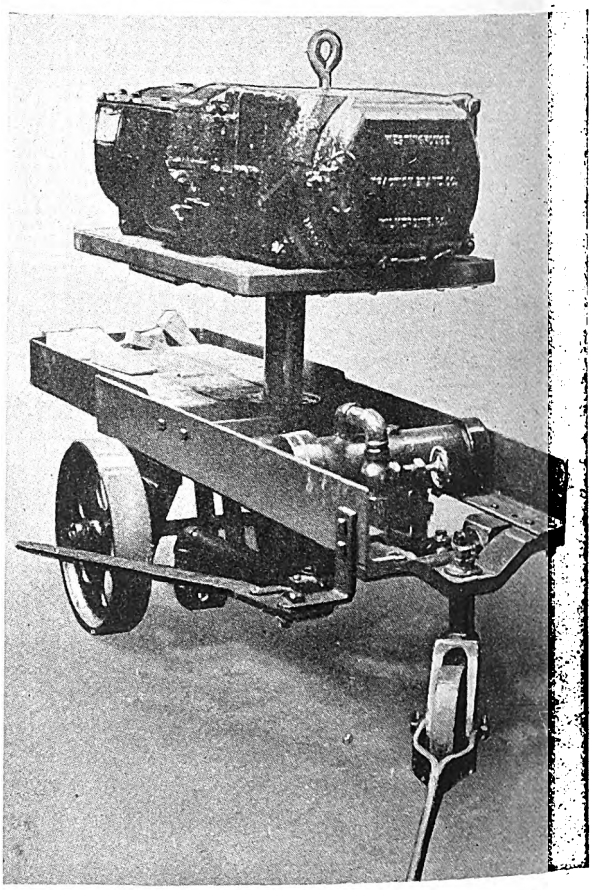
Handy tool designed by Cleveland Railway for removing armature sticks

end of the tool at *C*. As the point of the stick is held snugly against the coil by the point *A*, the long flat lower surface of the tool keeps the stick from buckling. Three times as many sticks can be driven in a given period with this tool, and the resulting job is more satisfactory than can be obtained from any other appliance formerly used.

Portable Hydraulic Lift

By W. L. Briar
Shop Supervisor Kansas City Public Service Company, Kansas City, Mo.

CONSIDERABLE labor has been eliminated in the shops of the Kansas City Public Service Company by the use of a portable hydraulic lift. The device is used to remove and install air compressors, resistance boxes, air tanks, brake cylinders, and other heavy equipment, when cars are in the shops for overhaul or repairs. Parts are also moved between the repair benches and the cars by the use of the same device. The lift is operated by a hand pump on the side of truck. Oil is used for lifting.



Hydraulic lift for heavy units in use by the Kansas City Public Service Company

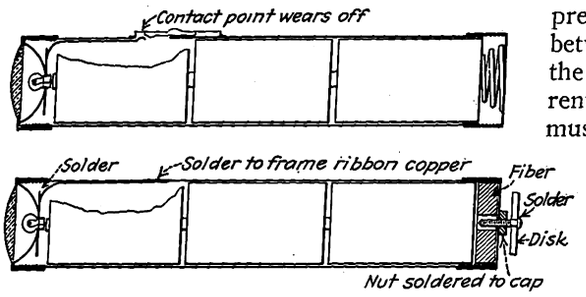
Improved Switch for Flashlights*

By Farrell Tipton
Electrician San Diego Electric Railway, San Diego, Cal.

A SIMPLE method has been devised by the Electrical Department of the San Diego Electric Railway to use a screw contact in the bottom of the case of electric flashlights instead of the sliding switch ordinarily used. The sliding switch is taken off the case and replaced by a piece of strip copper—the other end of which is soldered to the reflector. The tension spring in the cap of the flashlight is replaced with a fiber filler block, with a hole in the center large enough to permit the passage of a ¼ in. stove bolt. A hole is drilled through the center of the cap and a ¼ in. nut soldered to it. A disk of convenient size is soldered to a ¼ in. stove bolt, which is then used to control the light circuit through the cap.



Screw control used instead of sliding switch on electric flashlight

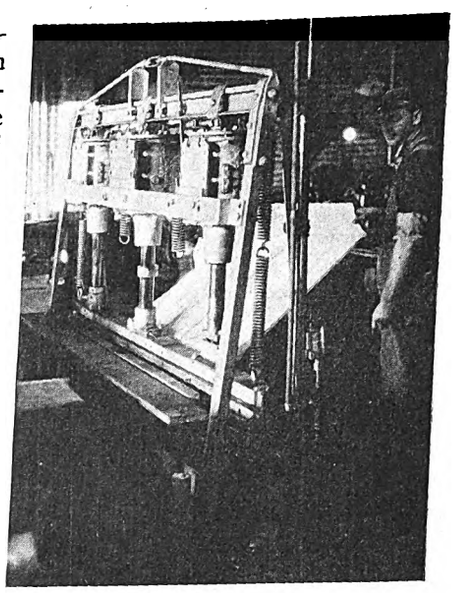
Special Tools Speed Up Heater Installation*

By Glenn S. Reeves
Assistant Master Mechanic
Omaha & Council Bluffs Street Railway
Omaha, Neb.

LAST fall electric heaters were installed on 67 cars of the Omaha & Council Bluffs Street Railway in a remarkably short time. The heaters were placed in ducts running the full length of the car on each side, and with openings at each heater unit for the heat to escape to the inside. Each of the ducts was about 27 ft. long with ten openings the size of a heater unit. Construction of the ducts was difficult, and the work had to be done quickly. It was evident that a spot welder and sheet-iron break and punch would speed work considerably, and it was decided to construct suitable equipment in the railway shop.

The spot welder contained a transformer coil which was built up from laminations salvaged from a substation transformer not in use. There were 290 primary turns made of No. 6 wire with two coil taps to vary the secondary voltage. The secondary consisted of two turns of 1x1.5-in. copper made from GE-57 motor field ribbon. Primary voltage used was 440 at 25 cycles.

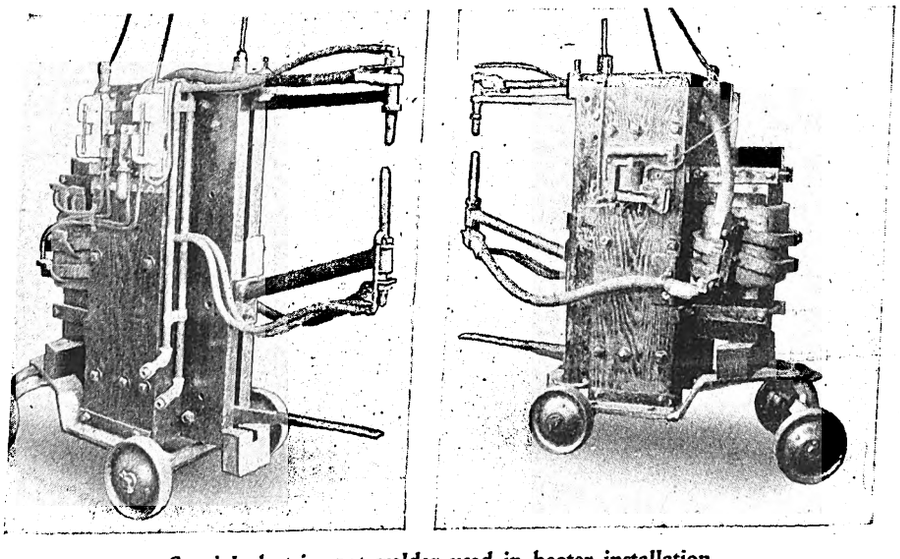
Satisfactory control was particularly important since the pressure contact must be made between the electrodes before the secondary welding current flows, and the current must be interrupted before the electrode pressure is released. If this is not done it was found that instead of making a weld the arc would burn a hole in the metal. A pedal-operated toggle switch connected with a magnetic switch in the primary circuit was used for control. The toggle switch operates only after the electrodes are together and under pressure. This was made possible by the fact that the pedal is not connected directly to the movable electrode but is connected to it by means of a heavy coil spring which stretches after the electrodes are brought together and the pedal is further depressed. The bottom electrode is stationary, and both electrodes are water cooled. In the accompanying illustration the primary tap switches are shown on the opposite side from the magnetic switch. At the bottom is the pedal, and the toggle switch is operated by it when the pedal is depressed sufficiently. Through the use of this welder the work was completed six times faster and at only one-sixth of the cost.



Sheet iron break and punch

For bending and punching the long lengths of sheet iron used for the heater ducts, a special sheet-iron break and punch was constructed. The machine consists of three 10x12-in. brake cylinders mounted on an A frame with a light T-rail at the top of the A reinforced by a truss. The three brake cylinder push rods attach to an inverted T-rail at the lower ends. The tread of this rail is planed to a male 90 deg. V and the tread of the stationary T-rail at the bottom of the frame is planed to a female 90 deg. V. The sheet iron to be worked is placed between the two V's. An ordinary engineer's valve controls the air.

This device can be converted also into a gang punch for punching sheets up to 9 ft. long. This is done by attaching a home-made gang punch in the two V rails.



Special electric spot welder used in heater installation

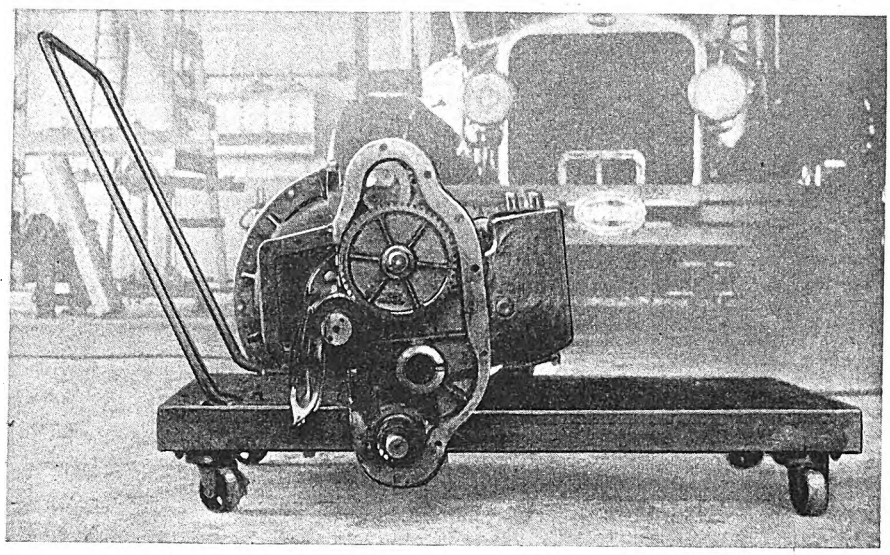
Handy Devices Used in Bus Maintenance



This truck has been found convenient for transporting bus engines around the shop and has facilitated maintenance work

Rugged Hand Truck

TRANSPORTING bus parts around the shop of the Surface Transportation Company, bus subsidiary of the Third Avenue Railway, New York, N. Y., has been facilitated since the design and construction of a number of hand trucks, as shown in the accompanying illustration. The side and end framing is made from 3¾x2-in. yellow pine joists and is surfaced with yellow pine planks 12 in. wide and 1 in. thick.

The length of the platform is 48 in. and the width 24 in. A swivel roller is installed on each corner of the platform. These rollers are 3½ in. in diameter and 1⅜ in. face. The height of the platform above the floor is 7½ in. The rollers are spaced 40 in. centers on the long sides of the platform and 20 in. centers on the short side. A U-shape handle made of ⅞-in. round iron and 40 in. long is bolted to one end of the platform.

Front Axle Assembling Stand*

By Hoy Stevens

Assistant Superintendent of Maintenance
Cleveland Railway, Cleveland, Ohio

IN AN overhaul shop the problem presented itself as to how to support the front axle most conveniently while various parts such as bushings, springs, steering knuckless and, in the case of newer equipment, brake shoes and diaphragms, were being assembled and adjusted. This was accomplished in a convenient manner in our shop by the stand shown in the accompanying illustration. The stand may be constructed so that it can be adapted to almost any make of axle. Our stand is built to fit a White Model 50 B and Safeway double-deck units. It was constructed from material on hand, which happened to be 1½ x 1½ x 3/16-in. angle iron.

The cost of the stand depends upon the material that is used and the efficiency of the labor, which, in our case, brought the expense down to a little less than $8.

Stand used in the Cleveland Railway garage supporting front axle during overhaul

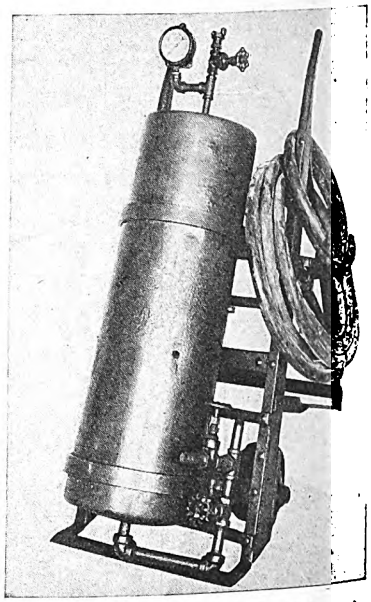
Cooling System Flushing Machine

By Del A. Smith

General Manager
Department of Street Railways
Detroit, Mich.

FOR thoroughly flushing the radiator and cylinder block of a bus engine, the Department of Street Railways in Detroit has designed a simple but effective machine. The device consists of a 4-cu.ft. air tank, supplying air under pressure at 40 lb., against a line of water under 30 lb. pressure.

The two lines, merging into one, are directed into the radiator or engine block, forcing air and water in the direction opposite to the regular flow of the cooling system. The result



Portable flushing machine for bus engine cooling systems

is a "thumping" effect of the water, caused by a greater pressure of the air against a heavier product, loosening the sludge, scales and other foreign matter which lodged in the cooling system. This machine can be

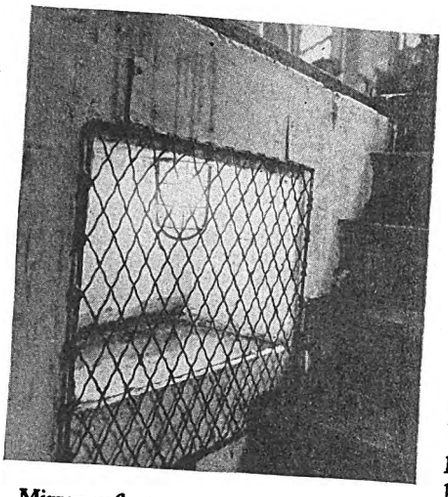
Digitized by Google

used to advantage also in conjunction with the well-known regular "boiling process."

Mirrors Improve Pit Lighting

MIRRORS are used in the base of repair-pit light recesses in the Walden garage of the International Railway, Buffalo, N. Y. As shown in the accompanying illustration, a ¼-in. plate mirror is placed directly beneath the 75-watt, inside, frosted lamp in the side-wall recess of the repair pit.

Three such recesses are spaced uniformly in each side of the pit, with a seventh pit light located in the short-end wall. The mirrors in these recesses reflect a large share of the available illumination upward to the underside of the bus which is run over the pit for inspection or repairs.



Mirror reflects upward the light of the 75-watt lamp in pit wall recess

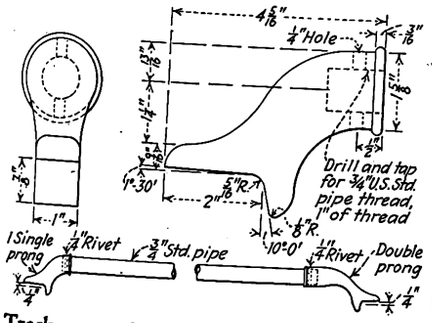
After experimentation 10 deg. was found to be the right angle at which to tilt the mirrors from the horizontal, to secure the maximum of reflected light. To prevent possible deterioration of the silver backing of the mirrors, a rubberized paint was applied to the cement base of each recess before the mirror was installed permanently. This system not only provides better light for the mechanics but it results in better workmanship also.

Track and Line Maintenance Practices

Track Gage Assures Exact Spacing of Rails*

By Joseph Croyle
General Foreman Cleveland Railway, Cleveland, Ohio

ADVANTAGES resulting from the use of a track gage designed by the Cleveland Railway are two-fold. First: the prongs conform to the contour of the rail on the gage side, thus making the proper contact between rail and instrument and insuring a true gage when the instrument is fitted snugly between the rails by the spikers. Second: the connecting bar to which the prongs are fastened is raised in order to clear the guard of all guard-rails, thereby eliminating interference and allowing the gage to rest firmly upon the rail.



Track gage designed by Cleveland Railway fits contour of the rail head

The Cleveland Railway has adopted as standard on tangent track a gage of 4 ft. 8⅜ in., and for curved track, 4 ft. 8¾ in. In order to avoid any confusion on the part of the spikers, two track gages are used: a straight track gage enameled black and a curved rail track gage enameled red. This arrangement enables the spikers to select the correct track gage immediately.

Previously, it had been the experience of this company that the spikers were unable to maintain an exact gage. The new gage was designed to overcome this difficulty, and, by its use, the company has been able to secure track built exactly to the desired gage.

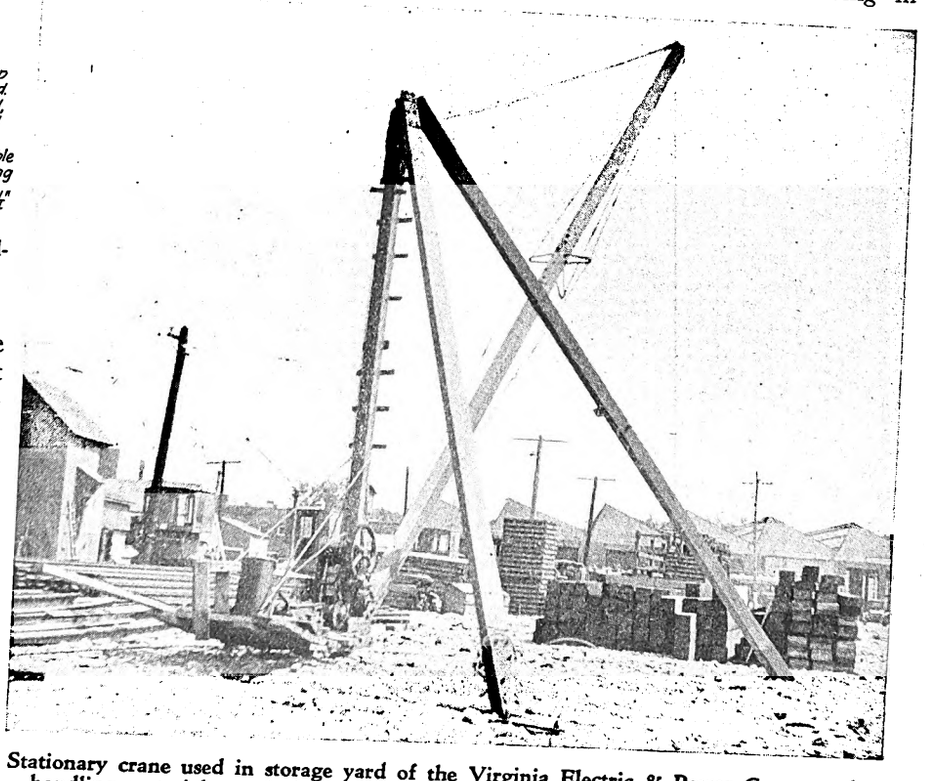
Stationary Track Department Crane*

By C. B. Hall
Chief Clerk Virginia Electric & Power Company, Norfolk, Va.

LOADING and unloading of heavy materials by means of a stationary crane, instead of by hand, has brought about a marked saving in



Stationary crane used in storage yard of the Virginia Electric & Power Company for handling materials resulted in a considerable saving in labor expenses, as well as a reduction in the number of accidents

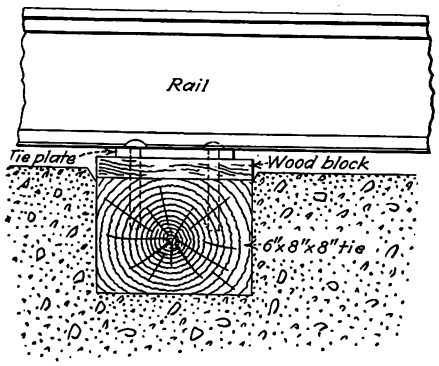
Digitized by Google

time and labor in the storage yard of the Virginia Electric & Power Company, and has also resulted in a considerable reduction of personal injury cases. The crane is equipped with a 55-ft. boom and has a lifting capacity of 3 tons at an angle of 45 deg. It is motor driven, an old GE-62 street car motor being used for this purpose, with a hand operated turning mechanism. Its cost was $225. The crane is used for lifting heavy bridge timbers, rails, frogs, switches, scrap materials, etc., in both loading and unloading from railroad cars to the ground, and on company cars for distribution on the road. Heavy materials are now being handled at from 12 to 15 cents per ton, whereas the hand method, prior to the crane installation, usually cost $1 per ton.

Raising Paved Track to Proper Grade*

By A. E. Gleason
Assistant Superintendent of Construction Louisville Railway

DURING the last several years a considerable amount of track in Louisville has been damaged by underground work, mostly sewer construction in the business section of the city. This sewer work was carried on by tunneling from shafts, at various points, and caused the tracks to sink in a number of places from ½ to 3 in. In most instances it was



Wood blocks on old ties used to raise track to grade

found that the entire track foundation had gone down and was solid at the new level. Because of the short headway of cars, repairs had to be made at night, and in a manner that would interfere as little as possible with traffic. Oak blocks were cut 8x12 in. ranging from ½ to 2½ in. in thickness. Two ½ in. holes were bored in these blocks for spike holes, as shown in the accompanying illustration. The low places in tracks were excavated to the top of ties. A block of the proper thickness with a standard tie plate bringing the rail to the proper level was placed on each tie and fastened with a long spike. Tie-rods were renewed where needed to hold track to gage. Concrete was placed and paving laid. In addition to the great saving in time, this method of repair saved the labor and material that would have been used had excavation been carried to bottom of ties and track tamped with concrete, as had been the practice in the past under similar circumstances.

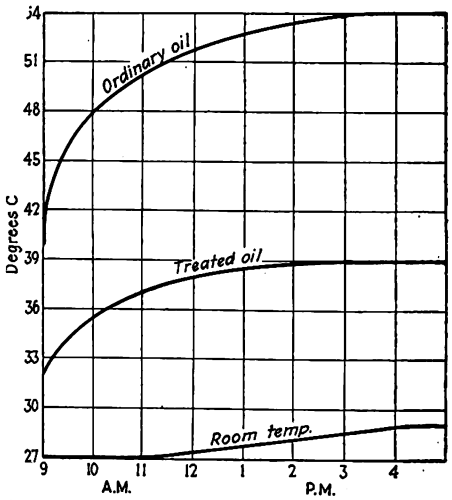
Synchronous Converter Lubrication*

By F. W. Braund
Superintendent of Power Conversion Cleveland Railway, Cleveland, Ohio

OVER a period of years a high grade mineral oil, with a life of twelve months, has been successfully used by the Cleveland Railway in



Treated oil for converter bearings showed lower temperatures than ordinary oil in test at Cleveland

synchronous converter bearings in manually operated substations. A fairly even temperature is maintained by the attendant by opening or closing doors, windows or ventilating equipment or stoking a boiler. In automatic substations, however, openings for ventilation are fewer, heating equipment is unnecessary, and, with no attendant available, extremely high and low operating and room temperatures are encountered. With the installation of the automatic control, the problem arose of furnishing the bearing during summer months with a heavy viscous oil, and then removing and storing this oil in the fall in order to supply bearings with a less viscous oil for winter use.

SUMMARY OF CONVERTER BEARING TEMPERATURE TESTS

Time	Room Temperatures, Deg. C.	Bearing Temperature Ordinary Oil, Deg. C.	Bearing Temperature Treated Oil, Deg. C.	Temperature Difference, Deg. C.
9:00 A.M.	27	40	32	8
9:15 A.M.	27	45	34	11
9:45 A.M.	27	47	35	12
10:00 A.M.	27	48	35.5	12.5
3:30 P.M.	28	54	39	15
4:00 P.M.	29	54	39	15
4:30 P.M.	29	54	39	15
5:00 P.M.	29	54	39	15

Many tests were made to discover an oil the viscosity of which changed but little between temperatures of 0 deg. F. and 160 deg. F. Such an oil finally was obtained and temperature tests were made, showing an average reduction in running temperature of 15 deg. C. in favor of the new oil. This oil, a treated product containing a portion of edible tallow, will function in extreme temperatures with a viscosity change of but 2 per cent.

The new Maintenance Contest will start after the annual convention in Atlantic City. Many equipment men have already indicated that they will submit contributions

Reclaiming Steel Tubular Span Wire Poles

Economical method of reclaiming span-wire poles by reinforcing sleeves

OXIDIZATION at the ground level has partially destroyed some of the steel tubular span wire poles on certain lines of the Third Avenue Railway System, New York, N. Y. These are being reclaimed by means of reinforcing sleeves. A tube 30 in. long and of the proper inside diameter is split longitudinally by means of a cutting torch. The halves are clamped over the oxidized surface. These clamps are made of ⅞-in. material and are 6 in. wide and 16 in. long. They are clamped together by means of ⅞-in. bolts. The splits are welded and the ends of the sleeve are welded to the pole.

Digitized by Google

New Products for the Railways' Use

New Dead-end Sling

MUTILATION of corner or dead-end poles has been eliminated through the development of a new type of dead-end sling by the American Cable Company, New York. This sling consists of a shackle and cotter-pin bolt which are

How dead-end sling is attached to post

merely steel cylinders slipped over the unseized ends of preformed wire rope, then by means of 100 tons hydraulic pressure so processed as to cold flow the steel into the interstices of the wire rope, thereby locking it to the rope with unfailing security. This new type of dead-end sling is being adopted by several public utilities and railroads.

Tap Grinder Newly Developed

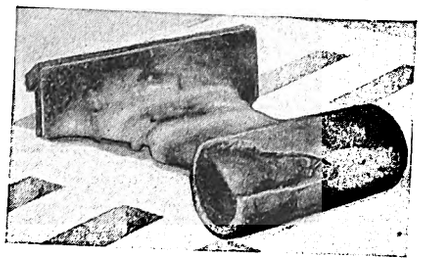
DEVELOPMENT of a new machine for tap grinding is announced by the J. G. Blount Company of Everett, Mass. This machine, driven by a specially designed 1¼ hp. Westinghouse type SK motor, is applied to the grinding of tap flutes by the use of a taper arbor on the end of a spindle, using various sizes of grinding wheels. For the grinding of small taps, wheels of small diameter and width are used, while, on larger taps, grinding wheels up to 6 in. in diameter and ½ to ¾ in. wide are employed.

These grinders are self-contained, being driven by a special direct connected totally enclosed, ball-bearing motor with a speed range of 4,000 to 7,000 r.p.m. The motor is controlled by a field rheostat, so that any grinding speed may be obtained up to 7,000 r.p.m. A smooth finish can be obtained by the inherently close speed regulation of the drive.

Carbon Paste Used in Welding

WHERE missing sections of metal parts are built up by welding, the use of carbon paste, manufactured by the Oxweld Acetylene Company, New York, has been found of advantage for supporting loose pieces and making walls so that the molten metal will stay where desired. It is necessary to pack the paste tightly to give a satisfactorily smooth job, and thus save grinding or machining after the welding is completed.

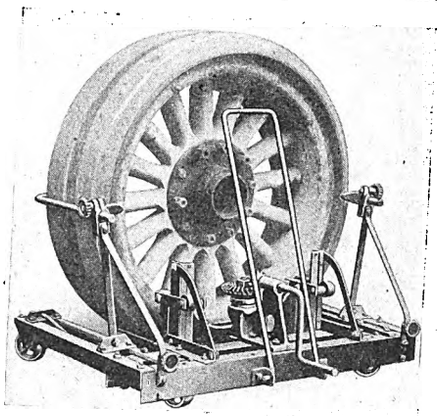
The accompanying illustration shows a cast-iron support for a drill table on which carbon paste has been used to form a bottom support for welding metal. Near the center of this casting is a ¼-in. threaded hole for a set-screw, part of which was broken out. This hole was filled carefully and after the welding it was unnecessary to redrill the hole. When cold the carbon paste is removed easily, and the inside is of correct contour so that no finishing is necessary.



Cast-iron support for a drill table on which carbon paste is used to hold welding metal

Wheel Dolly for Removal of Bus Wheels

THE use of this new dolly for handling bus wheels is said to make a job that is ordinarily difficult and dangerous, much easier and safer with a resultant saving in time and



Taking off wheels from buses or trucks is speeded up considerably with the use of a Manley wheel dolly

labor. This bus wheel dolly has just been announced by the Manley Manufacturing Company, Bridgeport, Conn., as an addition to its complete line of garage equipment.

Non-Corrodible Resistors for Railway Service

AN EDGEWISE-WOUND, non-breakable and non-corrodible resistor, weighing about one-half as much as cast grid resistors of corresponding capacity, has been introduced by the General Electric Company. It is particularly suited to railway application where vibration and exposure tend to shorten the life of the more fragile cast grid types.

The resistor units are of unbreakable, non-corrodible ribbon rolled from special alloy. The ribbon is wound edgewise over heat-resisting and mechanically strong insulation, which is fitted over the edges of reinforced punched steel bars. The units themselves are supported on

Digitized by Google

steel rods with secondary insulation of mica. The six-unit resistor weighs approximately 47 lb., and the four-unit one approximately 37 lb., about half the weight of cast grid resistors.

Space is conserved by having the units elliptically shaped. The special alloy ribbon has a temperature coefficient which results in only a slight variation in resistance whether hot or cold, and the specific resistance of the alloy is extremely high, so that it is possible to use a relatively large cross-section for the conductor. Rigidity, with sufficient thermal capacity to care for abnormal conditions such as large currents on grades, pulling in dead cars, etc., is thus obtained.

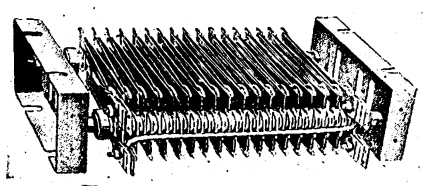
The few joints are copper to copper, affording minimum contact resistance. Terminals at the ends of the resistor frame simplify the connection of the leads, and clamp terminals for connecting intermediate turns of each unit permit accurate adjustment of each resistance step.

Any single-coil unit may be replaced without disturbing the others. Both the four-unit and six-unit resistors of the new style, known as Type EW, are interchangeable with Types CG and RG Form A and BG Form A-4 resistors, all having identically located supporting bolt holes. In many instances, however, fewer boxes are needed than are necessary with the cast grid types.

Unbreakable Resistor

DUR-RISTOR, a new unbreakable resistor with a continuous resistance element, is announced by Cutler-Hammer, Inc. of Milwaukee, Wis. Designed to meet the need for a resistor which would give maximum service under the most severe operating conditions, it is vibration-proof, unbreakable, non-corrodible, light of weight and compact.

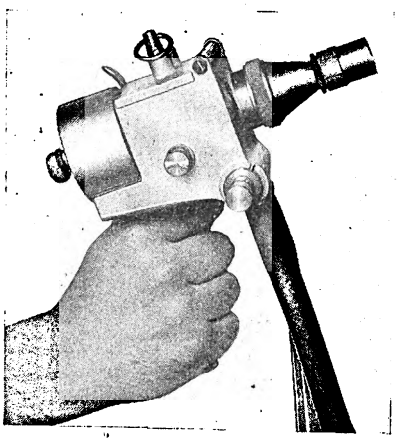
The main body of Dur-ristor—the resistance element—consists of two continuous, unbreakable strips, which are made of a rust-proof, non-corrodible alloy. They are proportionally ribbed on the sides as well as on the turning edges. A new method of supporting the strips, combined with the ribbing, permits the strips to expand and contract freely during temperature changes. The entire resistor is made unbreakable and permanent by the elimination of brittle material and by the use of mica for all insulation. All Dur-ristors, regardless of ampere rating, are of equal size. The thickness of the resistance strip is the only part that varies in size, i.e. according to ampere rating. Dur-ristor is adaptable for any standardization plan for resistor banks, and is used with equipment where minimum resistor maintainance is required.



New resistor designed to meet severe operating conditions

Metal Coat Applied by Spray Gun

A CONVENIENT means of applying a thin coat of metal to surfaces needing protection or resizing is offered by the Metals Coating Company of America in the form of a "MetaLayer" spray. It simultaneously melts, atomizes and applies a coating of molten metal of any desired thickness to metallic or non-metallic objects. The tool has been used to fill surface defects in castings, to build up undersize metal parts, to protect metal parts against corrosion, to apply decorative metal coatings, and for many special uses. The manufacturers claim that wood, metal, tile, pottery and even glass can be coated with the spray.

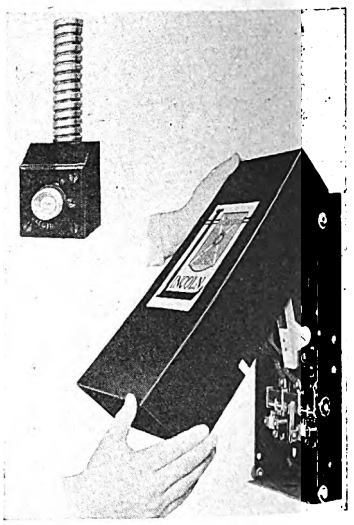


Metal in wire form fed into this gun may be sprayed on any metal or non-metallic material

The coating metal is fed into the spray in the form of wire, and any of the commercial metals may be thus applied. The tool combines the following elements in it: An oxy-acetylene melting flame; a compressed air turbo-motor which feeds the metal into the flame in the wire form; a compressed air jet which atomizes the metal and a 3-way valve which controls the burning gases, the motor and the spray, so that all operate in unison.

Safety Starter for Shop Motors

CONTROLLED by the new Lincoln safety push button, an improved starter which starts a shop motor directly across the line has been recently placed on the market by the Lincoln Electric Company, Cleveland, Ohio. Installation of the starter is simple. Only four screws are required to hold it in place. Releasing two other screws permits the contactor panel to swing out, thus making lead contacts easily accessible. A cover of the drop-hinge type incloses the entire mechanism and permits installation of starters closely grouped, a 2-in. clearance between starter boxes being ample for easy accessibility. Long life is assured to contact points by the wiping action, which prevents pitting, and by the cadmium plated steel shields, which provide an instantaneous thermal and magnetic quench for arcs. Arc chimneys are of heavy pressed magnesite. The relay armature has a cushion action and is provided also with replaceable bronze bearings and actuated by a coiled spring.



Starting switch and push-button control

The Lincoln safety push button provides an additional safety factor to the Lincoln across the line safety starter in that the red stop button encircles and protects the green starting button, so that it is impossible to close the starting circuit unintentionally. The push button can be mounted on the side of the starter box or arranged for remote control.

A.E.R.A. Program Announced

DETAILS of the program of the 48th Annual Convention of the American Electric Railway Association now are available. The convention will be held at Atlantic City in the new municipal auditorium.

The formal sessions of the American Association will open at 10 a.m. on Monday, Sept. 30, while the sessions of the Accountants' Claims, Engineering and Transportation and Traffic Associations will begin on Tuesday afternoon. As in former years there will be a series of luncheon conferences at which specific topics will be discussed.

The exhibit will be open beginning Saturday, Sept. 28, and will be available to delegates until noon the following Friday. Monday afternoon and Wednesday morning have been set aside for inspection of exhibits, and no meetings will be held.

Following is the program as revised up to the time of going to press.

American Association

Monday, Sept. 30, 10 a.m.
Auditorium Ball Room, Second Floor

JAMES P. BARNES, Chairman

General Subject—*Today's Transit Task*

Welcome.

Address of the President — James P. Barnes, president Louisville Railway, Louisville, Ky.

Report—Managing Director Charles Gordon, American Electric Railway Association, New York, N. Y.

Revision of Constitution and By-Laws.

Routine.

"At the Public's Service," by W. L. Willkie, general counsel Northern Ohio Power & Light Company, Akron, Ohio.

"Better Cars and Buses," by M. B. Lambert, transportation sales manager Westinghouse Electric & Manufacturing Company, New York, N. Y.

"Men and Machinery," by W. E. Wood, president Virginia Electric & Power Company, Richmond, Va.

Informal Round Table Luncheon Conferences

AMBASSADOR HOTEL, 1 P.M.

No. 1—"Fares," G. H. Clifford, sponsor.

No. 2—"Industrial Relations," Edward Dana, sponsor.

No. 3—"Interurbans," Charles H. Jones, sponsor.

No. 4—"New Cars," T. Fitzgerald, sponsor.

No. 5 — "Public Relations," Lucius S. Storrs, sponsor.

Inspection of Exhibits
2:30 p.m.

This afternoon has been set aside by the officers of the association for the inspection of manufacturers' exhibits. The official business of the afternoon is the inspection of exhibits, and every delegate is urged to take advantage of the opportunity to visit the manufacturers' booths, where the most modern equipment and latest appliances are on display.

Tuesday, Oct. 1, 10 a.m.
Auditorium Ball Room, Second Floor

JAMES P. BARNES, Chairman

General Subject—*Traffic Regulations*

Report—Committee on Nominations—W. H. Sawyer, chairman, president Stevens & Wood, Inc., New York, N. Y.

Election of officers.

"Increasing Street Capacity," by Elmer T. Stevens, chairman transportation section Chicago Association of Commerce.

"Basic Regulation Principles," by Col. A. B. Barber, manager transportation and communication department Chamber of Commerce of the United States of America, Washington, D. C.

Address, by E. F. Wickwire, vice-president Ohio Brass Company, Mansfield, Ohio.

Informal Round Table Luncheon Conferences

News *of the* Industry

Sliding Scale Fare Expected in St. Louis

The Public Service Commission is expected to issue a formal order permitting the St. Louis Public Service Company, St. Louis, Mo., to put into effect the new sliding scale fare plan suggested by City Counselor Muench at a public hearing held by the commission on Aug. 20.

Under the Muench plan the company will sell 12-ride books for 90 cents good for use in any one week. If a bookholder rides more than twelve times in the week he is to pay 5 cents for each additional ride. The single fare for adults will be 10 cents. The fare for children between the age of five and twelve years remains 3 cents. The universal transfer system now in effect on all of the cars and bus lines in St. Louis will be continued.

At the outset of the hearing Mr. Muench submitted a formal statement explaining the city administration's views. He said in part:

"Some means must be found to retain the railway. The problem of service at a reasonable cost that at the same time gives the operators a fair return on the value of their property, is one which has confronted every community in this country during the past ten or fifteen years. It still confronts most of them.

"To some extent increased expenditures and loss of patrons have had to be compensated for through an increase in rates; however, means should be found to retain a large number of the car riders, and to bring back those who are patronizing competitive means of conveyance, by innovations or improvements in the service and by fare concessions."

Company Prepared to Try Plan

The statement then reviewed how competition had eaten into the patronage of the company with nothing done in the way of a fare concession except the 25-cent Sunday pass.

It pointed out that shortly after the company applied for a flat 10-cent fare and four rides for 35 cents, and the commission suspended this schedule for 120 days from Aug. 1, the matter of making a concession in rates to the regular consumer came up for consideration. At the request of the commission several conferences were held and finally the company proposed a flat 10-cent fare for casual riders and 16-ride book for $1 and extra rides in any one week at 5 cents. He said:

"The reaction to this proposal on the part of the public and the press was that the regular car riders would be obliged to buy more rides than they would normally use in a week in order to obtain a reduction in the fare."

His proposal of 12 rides for 90 cents was made to meet this objection.

Stanley Clarke, president, said that the company is willing to try the Muench plan "although we are convinced that we have not more than a fifty-fifty chance that it will prove successful."

Pending the promulgation of the new schedule, the company has restricted the sale of tokens on its cars and buses. The company desires to have a minimum number of tokens in the hands of the public when the 10-cent fare for casual riders goes into effect.

Interstate Line Expands Its Freight Facilities

A permit for the erection of a new freight house at 443 South First Street, Louisville, Ky., to cost $30,000 has been issued by the city building inspector's office to the Louisville & Southern Indiana Traction Company, subsidiary of the Interstate Publice Service Corporation. The building is to be part of the company's new freight terminal at that point.

The company operates the interurban service between Louisville and Indianapolis. For several months it has been cut off from direct connection over its own rails into Louisville due to reconstruction work by the Big Four Railroad on its bridge, over which the interurban operated. Meanwhile passengers have been brought across from Southern Indiana by bus.

"Deadlock Committee" in Chicago

Every effort being made to reach settlement so new grant can go before voters in fall

THE appointment of a "deadlock committee" has offered what promises to be a satisfactory solution of an acute situation in Chicago's long drawn out struggle for a new railway ordinance. This committee was appointed on Aug. 16 by Col. A. A. Sprague, acting chairman of the citizens' committee, whose help was solicited when the Council sub-committee reached a deadlock in its efforts to write an ordinance in which the rate of return is the principal bone of contention between the city and the transit companies.

As matters stood early in the week commencing Aug. 19, unless an agreement was reached during the week it will be impracticable to submit the franchises to a referendum at the judicial election in November. In that case a referendum will have to go over until the next Mayoralty election, unless a special election be held not later than Feb. 1.

Prof. Charles M. Thompson, dean of the college of commerce at the University of Chicago, is chairman of the new committee. Other members are David A. Crawford, president of the Pullman company; John A. Carroll, head of several south side banks; Victor A. Olander, prominent labor leader, and John Stuart, president of the Quaker Oats Company. The last named takes the place of George A. Ranney, vice-president of the International Harvester Company, who was originally named, but was unable to accept. Both Dean Thompson and Mr. Carroll are members of the citizens' traction settlement committee.

Negotiations came to a deadlock on Aug. 13. Colonel Sprague pointed out the chief reasons for the lack of progress as: the construction of subways, the rate of return to the company, and its financial structure. Since the engineers have as yet made no report, no difference of opinion is involved over the subway matter. The other two points he defined as "purely financial problems" to be weighed and tested by men versed in financial matters. As the result of Colonel Sprague's suggestions, the committee was appointed and held a preliminary session on Aug. 19.

On Aug. 20, the new committee, together with the present transit sub-committee of the City Council, opened public hearings. After collecting expert data and information on financial structure, rates of return and the ratio between stocks and bonds, the committee will express its views, acting in an advisory capacity to the City Council, which is charged with the duty of writing the ordinance, subject to review by the voters.

As stated before, the real bone of contention is the rate of return. The companies' attitude, set forth in a written statement at the beginning of negotiations, asks a "just and reasonable return" on all money invested in the property, that return to be determined by the local transit commission which would be appointed by the Mayor, with the approval of the City Council. The city, represented by Walter Fisher, stands for an agreed rate of return on the present investment, which is

about $260,000,000. On new money put into transportation, the Fisher plan provides that only its actual cost be paid, plus a reward for economy and efficiency in service. Alderman E. L. Frankhauser, chairman of the Council sub-committee, supports this view.

When Mr. Fisher asked information concerning the financial structure of the new corporation, the lawyers for the companies replied that details had not yet been worked out. Mr. Fisher desires that the new financing be by issuance of bonds. Company attorneys say that the Fisher plan is a new and untried scheme, that no utility company in the country is now operating under such a system, and that under the Fisher plan it will be difficult, if not impossible, to finance the many extensions needed. For the first ten years it has been estimated that $135,000,000 will be spent for extensions, and another $100,000,000 for the following ten years.

For three weeks the city and company representatives have debated only "basic principles" and "fundamentals."

One-Man Car Proposal Rejected by Des Moines Men

The union, by an almost unanimous vote at a special meeting, has rejected a proposal made by Walter J. Cummings, president of the Des Moines Railway, Des Moines, Ia., which would have given the city one-man operation and would have provided a maximum hourly increase of 8 cents for the trainmen.

The present maximum wage for trainmen is 59 cents an hour. The proposed agreement was for a flat increase of 5 cents an hour, with 1 cent additional each year for three years.

The position of the union is that the 25-year agreement signed with the Des Moines City Railway in 1915 is binding upon the new owners of the property in spite of the fact that under the terms of the receivership sale, held on June 22, the Federal District Court approved the transfer of the property to Mr. Cummings and associates without the famous two-man car contract.

Apparently the one-man car clause in Mr. Cummings' proposal was the only objectionable feature, as the men expressed themselves in favor of the pension and life insurance provisions, as well as the check-off and several other clauses relating to working conditions.

The company agreed to set aside $18,000 annually for retirement and disability pensions. Any member of the union who had served twenty years or more and had reached the age of 65 years was to be eligible for a monthly pension of $58. The same payment was to be made in a case of total disability in the company's service. The proposed agreement provided that in case of death of any member of the union his beneficiary was to receive $1,000 life insurance, to be provided by the company.

The negotiations between union leaders and railway officials have been carried on with good will on both sides. J. Ben Wiley, veteran secretary of the union, in addressing the 600 members of the union, complimented Mr. Cummings and General Manager Gifford on their "square dealings" and credited them with "laying their cards on the table."

Conferences have continued since the rejection of Mr. Cummings' proposal, but were declared off for the time being on Aug. 21.

Eighth Week of New Orleans Strike

Company Maintains Its Position and Increases Service on All Lines. Council Battles Jitneys

NO PROGRESS has been made toward a solution of the deadlock at New Orleans. The most recent offer of the union to accept John A. Ryan, Washington; Rabbi Stephen Wise, New York; or Secretary of Labor Davis, as an arbitrator was refused by the New Orleans Public Service, Inc., which declared that the company itself must be the only judge of whether its property shall be operated on an open or closed shop basis.

Failure of this offer to receive more favorable consideration has dampened much of the still current hope that an amicable settlement of the strike could be reached. As a result, persons in touch with the situation were of the opinion that the final outcome will depend largely on the result of the present jitney fight. If the city is sustained in its warfare against the jitneys, it will mean the elimination of this mode of transportation in the face of the costly indemnity bonds. If this happens, it was pointed out that the lot of the striking carmen, many of whom have already been replaced by permanent employees, will be altogether hopeless.

With the strike entering its eighth week, interest is centered in the outcome of a court battle instituted by jitney drivers in an effort to prevent police from interfering with the operation of the 10-cent automobiles. The jitney war came as an aftermath to last week's riotous scenes at the city hall when a mob of 1,000 striking car men and union sympathizers attacked acting Mayor Walmsley and members of the Commission Council in the Council Chamber. A police captain shot and slightly wounded three men before the mob was controlled and the hall cleared of fighting men. Next day the Council ordered the law enforced to compel jitney drivers to obtain $5,000 indemnity bonds, and otherwise to conform to the city and state traffic regulations.

Police arrested hundreds of jitney drivers, the majority of whom later obtained their release in the Recorder's Court when the city was unable to offer conclusive proof that the jitney drivers were charging or accepting fares from passengers.

The police activity, however, resulted in the elimination of a considerable number of the jitneys and in a corresponding increase in the number of street car riders.

In their perplexity the jitney drivers filed suit in the civil court for an injunction to restrain the police from interfering with the operation of the jitneys. The city lost the first round in this battle when the court overruled a motion to dismiss the suit and ordered it tried on its merits. The case was being heard by the court on Aug. 22, but a decision will probably not be reached before the end of the week.

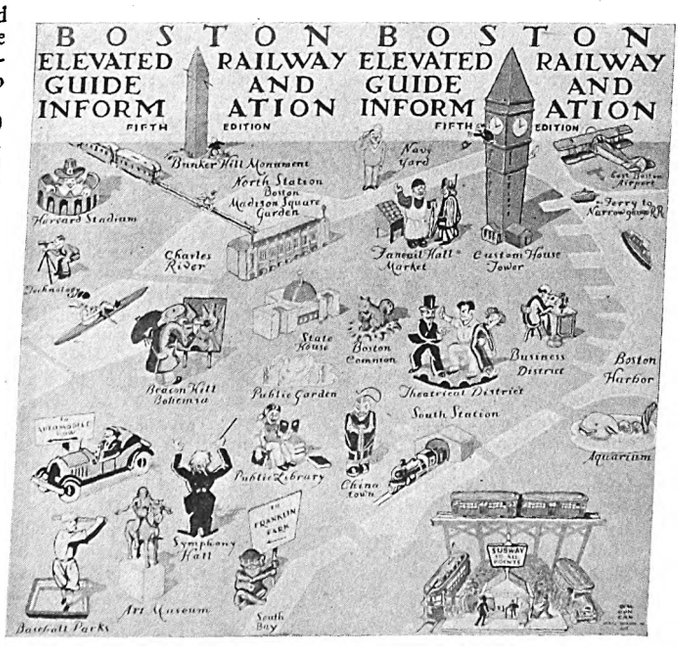
While attorneys for the city and the jitney drivers are exchanging verbal blows, the merry game of hide-and-seek between police and the jitney drivers continues, with the traveling public still making limited use of the jitneys and of private conveyances in going to and from their work. Many cars continue to operate empty in off peak hours, but during the peak most of them carry capacity loads.

Fast Work at Mount Tom

The temporary waiting room, restaurant and observatory on the summit of Mount Tom, recently erected by the Holyoke Street Railway following the loss of the large Summit House by fire, is 40 x 60 ft. in dimensions and the height, from the first floor to the 8,000,000-cp. beacon light on the tower, is 65 ft. The first floor contains the restaurant and the second floor is used as an observatory. From the tower a searchlight is thrown on the Barnes Airport, between Holyoke and Westfield. In the event of the erection of a larger building, the present structure will be turned into a pavilion on Little Mountain or some other part of the Mount Tom property.

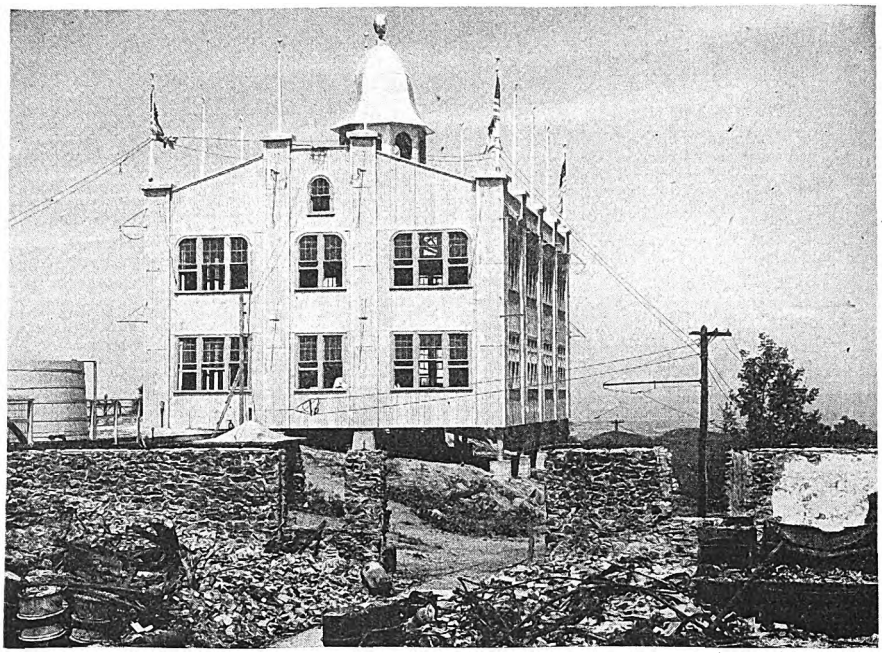
Erection of the new building is re-

Telling Bostonians What Goes On in Their Own City



The front page of the fifth edition, just out, of the Boston Elevated Railway guide book is a cartoon-style presentation of Boston with some of the principal features and their approximate location. This design, printed in several colors, was drawn by William Duncan of the Massachusetts Art School, the students of which were invited to enter a competition for designs for the cover.

Digitized by Google



Fast work was done on temporary structure on Mount Tom

garded as notable for speed, considering the conditions encountered. All the material was transported up the mountain in the two cars ordinarily used for passengers. Steel was fabricated in dimensions to permit of this handling and special fastenings were used to bind the metal to the cars. The steel was delivered by the Palmer Steel Company, Springfield, at the carhouse in Holyoke and conveyed by the railway to the site, where it was erected by the Casper Ranger Construction Company, Holyoke. The outer walls are faced with corrugated sheet metal, covered with asbestos. George E. Pellissier, chief engineer of the railway, designed the structure.

The fire occurred on May 2, the vote to erect the new building on May 11, plans were in preparation May 13, construction started on May 16 and work was completed on June 1. The building was officially opened on July 1. It was necessary to build a new water tank and connections.

There are 28 spotlights on the building and long parallel strings of light from the building to the upper station, 500 ft. distant, to light up the premises as viewed from a distance.

The dining room contained in the old building is much missed as a place for large meetings, but the receipts at the new building for July were about the same as at the old house in July, 1928.

Many Topics Discussed

Competition afforded by gasoline driven vehicles hour, holds place of interest at meeting of Wisconsin Utilities Association

AUTOMOBILE competition was discussed in practically all the papers and reports presented at the seventh annual convention of the Transportation Section, Wisconsin Utilities Association, held Aug. 15 and 16 at Green Bay. In his opening address Chairman Henry Cordell, Chicago, North Shore & Milwaukee Railroad, urged that street traffic be regulated with more sympathetic regard for public transportation patrons, rather than to conform to the wishes of the individual motorist. Cars must be made more inviting architecturally and must be more harmoniously furnished, said A. F. Tegen of the Milwaukee Electric Railway & Light Company, in developing the argument that the industry problem today is to furnish rail equipment that will surpass the comfort and convenience of the automobile.

Ways and means of attacking the parking problem were described by J. B. O'Connell, Chicago Surface Lines. For their own interest and for the good of the community, railway properties should take the initiative in analyzing the use of the streets. Parking restrictions should be tightened gradually, Mr. O'Connell said, meanwhile showing business men that the process is an asset rather than a liability to them.

The very success and popularity of the automobile is proving its undoing, according to C. Edward Thorney, Chicago, North Shore & Milwaukee Railroad, who outlined the advertising campaign being conducted by the North Shore and associated companies. Newspapers, car cards and billboards are directing the attention of the public to the number of automobiles on the roads and their badly congested condition, and the convenience of high-speed electrified transportation. Free parking at terminals is intended to encourage the use of automobiles between stations and points not served by electric railway lines. In every conceivable manner of publicity, the campaign is hammering home the slogan "The Steel Highways Are Always Open," together with "Go the Carefree Way."

The second day's session was opened with an address by President G. W. Van Derzee of the Wisconsin Utilities Association. After referring to the unwarranted abuse and unscrupulous attack directed against the utility industry as a whole during the past year, Mr. Van Derzee emphasized the importance of employee education. The human element, he said, is the most important in the long run. "If contacts between the men and women who are responsible for the service and those who use it are not up to or better than the standards of public contact which one expects to receive in successful merchandising organizations of today, our job of service is not well done."

Many Pointers on Car Cleaning

Considerable discussion followed the presentation of a report on car cleaning, by John H. Kuony of the Milwaukee Electric Railway & Light Company. The report was concluded with a set of instructions for performing the various cleaning operations. It costs on the average $100 a year to keep each car clean. The problem is of doing the best possible job at the least expense. A cleaning agent other than water must be used at frequent intervals, the report held. A carefully planned method must be followed on a regular time or mileage schedule. Mr. Kuony told of a promising scheme being tried out in Milwaukee. This consists of the application of wax to newly finished jobs or on any cars with a good finish. More time is required at first than for normal cleaning, but afterward the car can be cleaned merely by wiping off the waxed surfaces with a dry cloth. Waxing every six months is sufficient, he said, to maintain the necessary protective film.

A rotary brush type of washer, used with gratifying success by the North Shore system, was described by Kenneth M. Wilkins of that company. The cars are driven through, under their own power, in three minutes, when both sides are cleaned with a solution and rinsed with water at 300 lb. pressure. An additional five minutes is required for hand washing of the two vestibules. With one man at the hose and one motorman, the machine handles fifty units a day, Mr. Wilkins said, at a total cost of 47.5 cents each. The quality of the cleaning is uniform, whereas with the manual method it falls off at the end of the day when the cleaners become fatigued. The cost is 63 cents a car for hand work where long-handled brushes are used.

An outstanding feature of the convention was the report of the committee on standard maintenance practice. This took the form of a maintenance guide, submitted as an 84-page printed pamphlet containing complete and yet simple instructions for the foremen and employees actually doing the work. The guide can be secured by properties outside the association at a price of $1 a copy, to cover the cost of printing. This guide was merely a start, to be adapted to local conditions, and was not intended to destroy initiative. It was compiled primarily by the supply members of the committee, but their suggestions were reviewed and approved by the operating members.

A paper on safety—the essential in transportation—was presented by A. A. Oldfield. This urged adequate recognition of the safety expert. He should be permitted to function without undue interference and should have the wholehearted co-operation of other departments. A. L. Thomas described the conference work being done by the Chicago, North Shore & Milwaukee Railroad to improve relations between the platform men and the passengers. This was carried on by the conference method. In 2½ years complaints from the public had been cut down from an average of ten to two a week.

Two-Cent Fare Advance in Miami

The City Commission of Miami, Fla., on July 29 signed a one-year agreement with the Miami Beach Railway for the collection and payment to the city of the additional 2-cent fare which went into effect on Aug. 1. The new agreement includes a clause protecting the railway from operating deficits should the number of passengers riding the cars decrease.

The commission also has agreed that the railway shall receive a fee of not more than 5 per cent for collecting the additional 2 cents, and that the company shall make an accounting to the city on the tenth of each month and pay the money by the fifteenth of each month for the collections made during the preceding month. Fares collected in corresponding months of 1927 and 1928 will be used as the basis for computing the payment to be made to the company by the city in the event of operating deficits.

Another provision of the agreement states that the company shall collect a 5-cent fare from pupils attending school "up to the age of eighteen years between the hours of 7 a.m. and 5 p.m. on school days." Provision is further made that school pupils must purchase school tickets from the company in order to obtain the 5-cent fare.

Receipts of the 2-cent increase will be placed in a municipal sinking fund for retiring a $1,018,000 bond issue, the money of which was used for the purchase of railway equipment.

Some time ago, Commissioner Reeder made it plain that the interest charges and the sinking fund payment, called for under the terms of a bond issue made by the city to provide funds under which the railway was extended at the city's behest and with city funds, had become a dead weight on the tax payers. Apparently the hope is to ease this burden on the city through an advance in fare.

New Working Agreement Arranged in Providence

Members of the Amalgamated Association at Providence, R. I., have voted to accept the new contract between the union and the United Electric Railways which has been the subject of negotiations between officials of both organizations since June 1.

The executive board of the union recommended five demands, regarded as of minor importance, relating to working conditions on cars and buses and two questions pertaining to power house employees. The members concurred in the opinion that these seven points be laid before the railway officials by the union's agreement committee. The five demands pertain to the work of spare men on cars and buses, and the points relating to the power house employees stipulate that the last man hired be the first man laid off, and that the company use no discrimination against union men in the matter of vacations and the six-day week.

The principal changes in the agreement include an increase in wages for all employees ranging from 1 cent an hour for motormen, conductors and bus drivers to 7½ cents in the bridge building department, a readjustment and shortening of hours, a guarantee of seven hours' work in not more than two shifts daily for spare motormen and conductors, and the elimination of the requirement that men transferred from cars to buses shall have had a driver's license for at least two years.

The contract is for two years and is retroactive to June 1. Under its terms employees will receive back pay ranging from $5.60 to about $21, with a few of the men drawing sums in excess of the latter figure.

The contract adopted in 1927 expired at midnight on May 31 of this year. Since that time the men have continued to work under the terms of the old contract with the expectation that any changes in wage scales embodied in the new agreement, would be retroactive.

Change in Gary Fares Sought

The Gary Railways, Gary, Ind., has asked authority to readjust its fare structure in the city. It would establish a cash fare of 10 cents, a rate of twelve tokens for $1, and a weekly "nickel" ticket for regular patrons to be sold for 40 cents and entitling the holder to ride as often as desired during the week for a 5-cent cash fare. The company would issue free transfers to connecting car and bus routes. School childrens' tickets would remain at six for 25 cents.

The proposed schedule of fares calls for the elimination of the three fare zones in Gary, Hammond and East Chicago, thus doing away with the present double fares in these cities. Such a step would reduce the fare between Gary and Hammond, for instance, from 24 cents, or three 8-cent fares, to 20 cents, or two 10-cent cash fares, and would permit Gary passengers to ride anywhere within the city limits for a single fare.

Under the rate structure now in effect, riders in Gary pay a cash fare of 8 cents. Tokens are sold at fourteen for $1 and a charge of 2 cents is made for transfers between cars and buses. No change in present cash or commutation rates on the Hobart, Crown Point and Valparaiso divisions is proposed by the company.

According to the petition, net earnings show a return of only 4 per cent on the present value of the company's properties. Present net earnings, it is declared, are insufficient to attract the additional capital needed for improvements and extensions demanded by the riding public.

"Stolen from the T.C.C."

Officials of the Toronto Transportation Commission, operating the municipal railway and bus lines in Toronto, Ont., have had "Stolen from the T.T.C." frosted on the glass of every electric light bulb used in the 38,000 or more sockets from which electric energy is drawn in an ordinary day's operation of the system. "Stolen from the T.T.C." has also been burned deep in the wooden legs of the camp stools used during periods of emergent traffic conditions on the Grey Coach Lines, Ltd. According to Eustice Smith, secretary, the commission was losing quite a few bulbs. They were even being removed from the street cars. Since the personal little statement has been affixed on every electric light bulb the losses have become practically negligible. Mr. Smith is reported to have said:

"We figured that if the average person has to sit at home night after night on a stool marked 'Stolen from the T.T.C.' and see 'Stolen from the T.T.C.' on his electric light bulbs he is going to feel rather guilty sooner or later. At night the lettering looms up like a barn in a fog when one of the bulbs is turned on."

Labor Federation on New Orleans Strike

The executive council of the American Federation of Labor, in a public statement issued on Aug. 20 at Atlantic City, N. J., at the closing session of its quarterly meeting, declared the federation "will co-operate in every possible way" with the Amalgamated Association in carrying the New Orleans strike to a successful conclusion. The executive council directed the officers of the federation to investigate the policies of public service corporations in general, to determine their attitude toward labor, and, in consequence, the attitude of the federation toward them. A statement issued by William Green, president of the federation, said in part:

"The executive council is deeply interested in the strike situation in New Orleans. It expresses the hope that the strikers will continue the strike until a satisfactory settlement is reached. It calls upon all the people of New Orleans to assist the striking street car men in every reasonable and honorable way. The executive council will co-operate with the Amalgamated Association in every possible way in carrying on the strike to a successful termination.

"In view of the attitude of the utility at New Orleans toward labor the executive council directs the officers of the American Federation of Labor to conduct an investigation of the policies of public service corporations, including holding companies, in order to determine their general attitude toward labor and the settlement of labor disputes. The future attitude of the American Federation of Labor toward public service corporations and holding companies will be determined in the light of such facts as said investigation may disclose."

Union Charges St. Louis Award Terms Are Not Met

Members of the Amalgamated Association employed by the St. Louis Public Service Company, St. Louis, Mo., in a letter to Mayor Miller on Aug. 15 charged that the company has failed to live up to certain provisions of an arbitration award made by the Missouri Public Service Commission on May 20 last. The union says the company failed to grant a 4-cent an hour increase provided for shop men. It also charges that the company failed to comply with the state commission's stipulation that the tripper runs should not exceed 10 per cent of the regular runs.

Road Builders to Study Traffic

M. O. Eldridge, assistant traffic director, Washington, D. C., as chairman of the committee on traffic of the American Road Builders' Association, has named sub-committees to study every phase of the traffic problem. The findings will be presented at the association convention and road show in Atlantic City next January. The collection of accident statistics and analysis of accidents will be in charge of a group headed by Burton W. Marsh, Pittsburgh, Pa., which will also study traffic flow maps and spot maps, the necessity for uniformity in state and city vehicle laws and the question of why and where parking should be restricted or eliminated entirely. All questions dealing with regional planning will be in charge of the group headed by Dr. J. Gordon McKay, Cleveland, Ohio.

Franchise Discussion Reviewed at Columbus

At the invitation of Benjamin W. Marr, president of the Columbus Railway, Power & Light Company, Columbus, Ohio, Harry Allensworth, accountant and consulting engineer, has been inspecting the books of the company on behalf of the Council. Mr. Allensworth, his task completed, is now assembling the figures so they can be digested by members of the Council. After the Council has a clear picture of the status of the company's finances and volume of business, company officials will confer with the City Council to work out a franchise acceptable to both.

As matters stand at present it appears likely the railway franchise proposition will again come before the Council for discussion during September. The company has been operating without a franchise for several years, due to a lack of agreement between the Council and the company as to the fare.

When an ordinance is finally passed by the Council it must be placed before the voters for approval.

Briefs Filed in New York "L" Fare Case

In a brief filed on Aug. 16 with the New York Transit Commission the Interborough Rapid Transit Company renewed its plea for an immediate temporary fare "in excess of 5 cents" on its elevated lines, pending final decision on its application of June 19 for a 10-cent fare on that system. The brief declared that the commission has jurisdiction and power to alter the elevated fare regardless of the decision of the United States Supreme Court against a 7-cent rate on the combined subway and elevated network.

Dismissal of the application was urged in a joint brief filed by Samuel Untermyer, special counsel for the commission, and Corporation Counsel Hilly. It declared that the commission was without jurisdiction because the fare was contractual by virtue of the elevated extension certificates of 1913, which were executed at the same time as the subway fare contract.

Binghamton's Color Contest Successful

The Triple Cities Traction Company, Binghamton, N. Y., successor to the Binghamton Railway, has been conducting a contest for a monogram for the new company. A prize of $10 was offered to the winner. The contest closed Aug. 1, but the winner has not yet been selected. One hundred and sixty-five persons submitted 294 designs. Most of them came from the Triple Cities, Binghamton, Johnson City and Endicott—but New York City and Buffalo were on the list.

The company also asked for suggestions for color for cars and buses with the following result:

Sixty-six persons made 78 suggestions, 24 of which favored the company's present color, red. Among the comments contained in the replies were the following:

"You cannot find a better color."

"Have never seen better."

"It seems to me the present color is as good as any."

"I think the present color is much more attractive than dingy green and yellow seen in other cities."

"The present color scheme of your cars and buses is in every way most desirable."

The present color, therefore, will be used for the body of the car, but the color of the upper part may be changed.

Other suggestions were: Dark green, 8; light green, 11; orange, 9; yellow, 7; blue, 11, still others suggested chocolate brown and cream, olive green with cream trim, royal purple with white trim, canary yellow with dark trim, apple green with lemon yellow trim, dust gray with burnt orange trim.

Special School Fare Arranged in Duluth

A 5-cent fare for school children has been agreed upon by the Duluth Street Railway, Duluth, Minn., and city officials. The regular rate in Duluth is 10 cents cash and six tokens for 45 cents. Starting Sept. 3 school children will be able to buy ten tokens for 50 cents good between the hours of 7:30 a.m. and 5 p.m. The new plan is an outgrowth of a recent increase in fare for Duluth. The city appealed, and a citizens' committee was appointed to study the question. The result was the suggestion that the appeal be abandoned if the company would agree to a special rate for children.

The Radial Railway Issue at Toronto

Reeve Fred Lundy, a member of the county traffic committee, authorized by the York County Council to inquire into the proposed action of the Toronto Transportation Commission of discontinuing the Metropolitan Radial service on Sept. 30, says that, according to the evidence already at hand, the county would be able to present a strong case to the Toronto City Council when the committee appears before that body next September and registers opposition to the proposal of the Toronto Transportation Commission to substitute service by bus for that now furnished by the radial railway. The county is said to feel that the deficits said to exist in the operation of the radial line have been overestimated, and to be convinced that a definite contract "forbids the closing of the service without the consent of the county." Colonel Lennox, counsel for the county, has intimated that the county will seek an injunction to prevent the stopping of the service on Sept. 30, if a satisfactory agreement had not been reached by that time.

Late News Briefs

Philadelphia, Pa.—The Public Service Commission has agreed that the hearing on the Universal Cab Company's application for a certificate of convenience should be adjourned until the Philadelphia Rapid Transit Company has had an opportunity to prepare its case in opposition.

Detroit, Mich.—Del A. Smith, general manager of the Municipal Street Railway, and Police Inspector Edward A. Mitte, director of traffic, have informed the Council that removal of the Soldier's and Sailor's Monument would expedite traffic on Cadillac Square.

Los Angeles, Cal. — The Board of Public Utilities and Transportation has approved the application of the Los Angeles Railway for a 21-year franchise to double track Grand Avenue for its electric line, from Jefferson Street to Santa Barbara Avenue, a distance of about 1 mile, instead of operating over its private right-of-way east of Grand Avenue, as at present.

St. Louis, Mo.—Sam W. Greenland, vice-president and general manager of the St. Louis Public Service Company, has sailed from New York for Europe to join Mrs. Greenland, who is ill in The Hague. Mrs. Greenland was touring Europe with the Advertising Club delegation to the international convention of that organization held in Berlin recently.

Baltimore, Md.—To provide faster and more convenient car service from the Guilford and Homeland sections of Baltimore to the downtown area, the United Railways & Electric Company has consolidated the Gilmor Street and Guilford Avenue line, known as No. 1, and the Guilford line, known as No. 11. On the new route the No. 11 cars use the Guilford Avenue elevated road, which saves considerable time. Moreover, residents of the Guilford section now reach the downtown shopping district without transferring. The company has cut the headway of the line from fifteen to ten minutes.

New York, N. Y. — Samuel Untermyer, special counsel for the city, has refused the proposal of Justice Frankenthaler to send the Interborough Rapid Transit fare case before a referee. Mr. Untermyer stresses his intention to restrict the case to the simple issue of the Transit Commission's power to alter the contract rate fixing the fare at 5 cents.

Louisville, Ky.—The Public Utilities Bureau has announced that it has suggested to the Louisville Railway that several stops be eliminated on various lines, since these stops are close to other stops and comparatively few passengers ever enter or leave cars at the locations. The Louisville Railway is studying the situation with a view to increasing speed on all its lines. Dropping of stops where they are not absolutely neecssary is a help in faster schedules.

Boston, Mass.—Rapid transit service to Milton will be started at the Ashmont end of the Cambridge-Dorchester tunnel on Aug. 26. The opening had to be postponed from Aug. 17 because of the inability of the Boston Elevated Railway to complete track construction on the high-speed line between Ashmont and Milton. The transit department is pushing the work to provide rapid transit all the way from Harvard Square to Mattapan Square, using trains of the Boston "L" from Harvard to Ashmont stations, and high-speed trolleys from Ashmont to Mattapan.

Montreal, Que.—A recent meeting of the local executive committee and the Tramways Commission has revived talk about possible subway construction. The general impression prevails that neither the company nor the city is ready to subscribe to a project involving the expenditure of $100,000,000. It is learned that, because of the heavy cost, the city might be called upon to help finance the project and possibly to grant exclusive concessions to the Montreal Tramways for the building of the underground system.

Recent Bus Developments

350 Miles of Route in Puget Sound System

The transportation department, consisting of North Coast Transportation of the Puget Sound Power & Light Company, Seattle, Wash., Pacific Northwest Traction Company and Portland-Seattle Stage Company, is now settled in its new headquarters on the second floor of Central Terminal.

This new organization consists of all major transportation units belonging to the Puget Sound Company. It includes the two interurban lines between Seattle and Everett and between Bellingham and Mount Vernon; operates over 350 miles of main line stage routes reaching from Vancouver, B. C., on the north to Portland, Ore., on the south, and 42 miles through the White River Valley to Auburn and on into the hills at Enumclaw. Eighty stages are operated, and a check of the payrolls on April 15 shows 384 employees.

It is estimated that the combined gross revenue from the interurbans and stages for the year 1929 will be $2,225,000.

At the start of the summer season eight new stages were placed in service on the Seattle-Vancouver, Portland-Seattle routes, to help materially in the handling of vacation business and give equipment sufficient to permit many of the stages now in operation to be placed in the paint shop. All of the stages will be known as the North Coast Lines.

Work on the new depot at Tacoma, which will be known as Central Terminal, was completed so that the structure could be opened for business by June 1. The opening of this depot permitted stages to be loaded under cover instead of on the streets as at the present time. It also helped the company in handling the Tacoma business, as practically all passengers come to the terminal to board the stage instead of being picked up along the streets, the method employed at present.

New Buses for Gadsden

Delivery has been made to the Alabama Power Company of four new buses recently purchased for use in Gadsden to meet the additional demand for transportation facilities resulting from the industrial activities at the Goodyear Plant and for the replacement of the old bus now in use on Ewing Avenue Line. The chassis are equipped with 29-passenger street car type bodies. A feature of the buses is the Tropic-Aire heating system, which utilizes the heat from the cooling water of the engine. A radiator is installed in the front of the bus and is so connected to the cooling water circulating system that the water from the engine jacket can be bypassed through this radiator before it passes to the radiator in front of the engine. The heat is then circulated through the bus by means of a fan placed behind the radiator. This system gives a clean, odorless and uniform heat. The color scheme is a yellow body trimmed in orange. The fenders and bead are blue and the top gray-green. The inside of the body has a cream colored ceiling, cherry panels and a brown linoleum floor. A garage and shop is now under construction for the maintenance and storage of the new buses. A 15,000 gallon gasoline tank and pump are also being installed at the garage to carry a supply of gasoline for the buses and for other automotive equipment in use in Gadsden.

De Luxe Bus Service in Baltimore

The United Railways & Electric Company, Baltimore, Md., has been authorized by the Maryland Public Service Commission to establish de luxe bus service between the fashionable Roland Park section of the city and the downtown district. The route will be 6½ miles each way and the fare will be 25 cents one way. Seven de luxe White buses will be used on the line. They will be the last word in comfort. Each will seat nineteen passengers. Company officials hope to have the line in operation by Oct. 1. The Public Service Commission made a slight change in the downtown section of the proposed route, but this met with the approval of the company. A ten-minute headway will be maintained during the peak hours and a twenty-minute headway during the rest of the day. The finish will be Alexandria blue with trimmings of desert sand.

Big Chartered Bus Business

During the last two months the number of buses of the Public Service Co-ordinated Transport, Newark, N. J., chartered by organizations and groups of friends for summer outings has shown a large increase over any similar period since the chartered service was organized. On July 18, the Prudential Life Insurance Athletic Association and its friends chartered 111 Public Service buses to carry some 3,300 persons on an excursion to Asbury Park; on Aug. 2, employees of the Wright Aeronautical Corporation of Paterson chartered 107 buses to take some 3,000 persons on an outing to Lake Hopatcong. Another large order has been received to take members of the Hudson County Republican Club on an outing to Sea Girt. In addition to these large orders several hundred buses have been chartered to individuals and groups of friends for outings.

By Bus and Limited from Indianapolis to Cincinnati

Service over the old Indianapolis & Cincinnati Traction Company's line never did penetrate closer to Cincinnati than Connersville, Ind., but the new company, the Indianapolis & Southwestern Traction Company, which purchased the old road some months ago at receiver's sale, has established fast bus connection between Cincinnati and Connersville to connect direct with the new railway service, particularly "The Southeastern Limited" trains, which provide unsually fast service. Southwestern limiteds make no local stops, but no extra fare is charged. Seats may be reserved by telephoning the ticket offices. Porter service is provided. Through service by electric railway from Indianapolis to Cincinnati was the dream which circumstances conspired to prevent the late Charles L. Henry from realizing.

Contractual Factory Service Upheld

Employees of the Mount Hope Foundry in North Dighton have a right to associate together and hire a bus to transport them to and from their work. In the action in which this right was established the Eastern Massachusetts Street Railway sought to prevent John Ingham, Dighton, from transporting men to and from their work, but Judge Lummus of the Suffolk Superior Court ruled they were within their rights as was Ingham. Many of the men at the plant live in Somerset. Five years ago they formed a club and hired Ingham to carry them to the foundry in his bus. They said the service by railway was not dependable, but this was denied by the company. While he decided Ingham had the right to transport the employees of the foundry to and from their work, Judge Lummus ruled Ingham should be enjoined from accepting other business. The route of the Ingham bus parallels that of the railway.

Railroad Protests New Service

Contention that the Hart Motor Coach Company secured local licenses for operation of buses in fifteen towns and one city between Winchendon, Mass., and Williamstown, Mass., by way of the Mohawk Trail, for the new corporation known as the Hart Mohawk Trail Lines without divulging the true owners was made when the Massachusetts Department of Public Utilities heard the petition of transfer of the certificate of public necessity to the new concern. Winchendon Selectmen and representatives of the Boston & Maine Transportation Company appeared as objectors.

Counsel for the Boston & Maine said he understood the Hart Mohawk Trail Lines was a subsidiary of the Boston, Worcester & New York Street Railway. He opposed the granting of permits in Western Massachusetts territory because the Boston & Maine operates trains in that territory. The Boston & Maine Transportation Company expressed a willingness to tie up its Gardner and Greenfield line with Winchendon and serve the town.

Substitution Before State Commission

The Westchester Street Transportation Company, Inc., has applied to the Public Service Commission for authority to substitute buses for electric cars on a portion of its route in Tarrytown and Elmsford; town of Greenburg and White Plains. It also seeks to operate buses in Tarrytown and White Plains not included in but forming a route connecting with the White Plains-Tarrytown line.

As noted previously in the ELECTRIC RAILWAY JOURNAL, the various municipalities have consented to the proposed substitution of buses and these will be filed with the commission when it conducts a hearing on the petition.

The extension of routes was formally authorized by the board of directors of the Westchester Street Transportation Company on July 30. The rate of fare proposed is 10 cents for a ride in zone one; 15 cents for transportation between zones one and two, and 25 cents for a continuous ride from zones one to three.

Digitized by Google

The franchises granted by the several municipalities provide for the removal of tracks on streets where they are not imbedded in the pavement and their removal when the municipalities do paving or repaving.

At any time after ten years the company is to be permitted to terminate the operation of buses and to exercise its rights to operate electric cars on tracks.

No More Meterless Cabs in Worcester

The Worcester, Mass., license board has decided that operation of flat-rate taxicabs, which have been competing with the Worcester Consolidated Street Railway through a 35-cent rate to any place in the city, has proved unsuccessful. The board has not acted to require all cabs to meter the service, but it has refused to grant any more licenses for meterless cabs. The companies that operate cabs on the flat-rate basis are said to be ready to return to the meter basis, but each is waiting for the other to take the initiative.

New Carrier Rules in Oklahoma

Electric railways operating buses over the public highways of Oklahoma, outside of incorporated cities and towns and all other bus carriers, are affected by House Bill No. 19, which considerably increases the taxes on bus operators carrying persons and property between fixed termini or over a regular route. House Bill No. 19 amends Chapter 113. Session Laws of 1923, repeals Sec. 5 of that act. It was approved by the Governor on June 24, and became effective immediately.

The section of the present law which is repealed provides that no vehicle weighing more than 15,000 lb., including its load, shall be permitted to operate over the public highways of the State without special permission of the Corporation Commission. The new schedule of taxes for regular motor carriers operating between fixed termini or over regular routes designated as class "A" follows: Each passenger motor vehicle seating capacity not to exceed seven, 3 mills per mile seating capacity from 8 to 11, 5 mills per mile; seating capacity from 12 to 17, 7 mills per mile; seating capacity from 18 to 23, 9 mills per mile; seating capacity from 24 to 29, 11 mills per mile; seating capacity from 30 to 36, 12.5 mills per mile; seating capacity in excess of 36, 15 mills per mile. The tax is computed on the basis of the number of miles covered in schedule per day for 30 days per calendar month, regardless of whether motor carrier carries out such schedule.

Motor carries engaged in the transportation of property will pay two-fifths of a cent per mile on distances traveled, mileage to be determined on the same basis as applies to passenger motor carriers. Lower taxes are provided for class "B" and class "C" motor carriers. In addition to the above each motor carrier upon filing application with the Corporation Commission for a certificate of convenience and necessity shall pay the commission a fee of $100 and upon filing an application for transfer of certificate shall pay the commission a fee of $50.

Direct Service by Bus to Iowa Fair Grounds

The Tri-City Railway, Davenport, Ia., will provide model transportation to and from the Mississippi Valley Fair and Exposition this year, and with the added advantage to riders of transfer privileges, involving a saving in fares. R. J. Smith, general manager, said a few days ago:

"We believe we are in a position this year to realize what has been our desire ever since the fair was inaugurated. The advent of the fair was coincident with the wane of street car travel. Our car lines were not near enough to the grounds to provide direct service, and the bus was still an experimental vehicle of transportation, particularly mass transportation. Nevertheless we were not neglectful in providing motor coach service, such as was possible with the equipment at hand. This year, however, with our reserve fleet augmented by seven new coaches, we will be in a position to offer fairgoers regularly scheduled, dependable service.

"Furthermore, we have found it possible to provide transfer privileges which we think will be attractive. While the regular fare of 25 cents on the fair motor coach is not disturbed, yet with returning passengers a transfer is issued to any local line in Davenport. Upon payment of the established fare on any local line a transfer will be issued which on presentation to the motor coach operator reduces the fare to the grounds to 25 cents.

Mount Vernon, N. Y.—There was a brief ceremony in front of the new City Hall Building on Aug. 17, following which representatives of the South Westchester Bus Company, a subsidiary of the Third Avenue Railway, owner of the franchises, and city officials inspected the four routes which were opened for service the following morning. The fare is 10 cents, with a number of transfer points connecting with trolleys.

Pittsfield, Mass.—Early substitution of buses for trolley cars by the Berkshire Street Railway in the southern part of Berkshire County, Massachusetts, is forecast by the action of municipal authorities of Pittsfield, Lenox, Stockbridge and Great Barrington in granting the company's petition for the change. Other towns are expected to take similar action.

Worcester, Mass.—The local license board has rejected the petition of the Boston, Worcester & New York Street Railway for a permit to operate through the city on a Boston-Albany bus route. This is the second time the request has been refused. It was made in behalf of the Hart Motor Coach Lines, a Boston, Worcester & New York subsidiary. The Boston & Maine and the Boston & Albany Railroads opposed the application of the Hart lines.

Indianapolis, Ind. — The Greenville Transportation Company has asked the Public Service Commission to remove limitations in the company's certificate for a bus route between Winchester and Union City, in the event the Union Traction Company's petition to abandon its railway line between Muncie and Union City is granted. At present the company operates under a limited certificate issued in deference to the Union Traction Company protest.

Worcester, Mass.—Under an agreement reached between the Selectmen of Millbury and the Worcester Consolidated Street Railway a bus line will be substituted for the present railway line between Millbury and Worcester, the first suburban trolley line built out of this city.

Medford, Mass. — The Boston Elevated Railway has announced restoration of three bus lines in Medford. The North Cambridge-Medford Square bus, the Riverside Avenue line and the North Street Medford-Arlington Center services were changed on Aug. 3 in consequence of operating losses. Officials say the lines as restored must pay if they are not to be withdrawn permanently.

Columbus, Ohio—Sept. 23 has been set by the Public Utilities Commission as the date for the hearing on the plea of the Columbus Railway, Power & Light Company for permission to discontinue railway service between Columbus and Westerville. If the abandonment is authorized, the company will substitute buses. The company says that its losses on the railway line which for years it has operated to Westerville have been steadily increasing. Westerville is about 15 miles from Columbus.

Fitchburg, Mass. — The Department of Public Utilities has ordered that the certificate of public convenience and necessity, granted the Suburban Bus Lines, Inc., in 1926, be revised and amended to restrict the buses from discharging passengers on Main and Summer Streets in Fitchburg between Upper Common and the Lunenburg line. While operating in the opposite direction they are not to stop to take on passengers between the points mentioned. The Fitchburg & Leominster Street Railway asked this restriction.

Bennington, Vt.—The Vermont Public Service Commission has granted the Berkshire Street Railway's petition for a permit to replace trolley service between Bennington and the Massachusetts state line with a bus service. Four buses will be put in service soon, to run every two hours through the day and evening.

Indiana Harbor, Ind. — A temporary injunction restraining Frank Dolatowski, local bus owner, from operating his buses over any of the routes of the Shore Line Motor Coach Company within or between East Chicago, Hammond and Whiting has been granted by Judge Greenwald of the Lake County, Superior Court. The Shore Line contended that Dolatowski is offering it competition in violation of a ruling by the Indiana Public Service Commission.

Pasadena, Cal.—The Pacific Electric Railway has applied to the Railroad Commission for a certificate of public convenience and necessity to operate an auto stage service between Montana Street and Lincoln Avenue in Pasadena, and Woodbury Road and Lake Avenue here, a distance of 4.3 miles. The application is the result of conferences held with representatives of the Altadena Chamber of Commerce and other associations and of the engineering department of the Railroad Commission, at which the company agreed to furnish the proposed service.

Financial and Corporate

O'Fallon Ruling Reflected in Indiana

Commission there modifies its stand in regard to evidence in pending consolidation case

EVIDENCE of a change in attitude in the matter of its consideration of valuation factors is contained in order No. 9499 issued by the Indiana Public Service Commission, the purport of which is to rescind, set aside and declare of no effect that portion of an order issued on Oct. 24, 1928, which stated that the commission in the matter of the petition of the Indiana Electric Corporation, Central Indiana Power Company, Terre Haute, Indianapolis & Eastern Traction Company, et al., "will consider only valuations based upon original cost" in connection with interurban, bus and railway properties.

Order No. 9499 points out that the recent decision of the Supreme Court of the United States in the O'Fallon case makes it clear "that in a matter of this kind it is necessary to consider all pertinent evidence as to the value of the property, as to the cost of reproduction and the cost of reproduction depreciated."

The issue goes back to Oct. 24, 1928, on which date the commission approved an order outlining procedure to be followed in the conduct of the cause looking toward the consolidation of the companies mentioned. In regard to the valuation of interurban, bus and railway properties involved, the order included the following provision:

"As to the interurban, motor bus and street railway properties involved, the commission will consider only valuations based upon the original cost. Appraisals on the basis of the cost of reproduction for the transportation properties would result in valuations too high to be used as the basis for any issuance or exchange of securities. The historic cost of utility property of this kind certainly ought to be a sound basis for consideration of this cause, representing as it does the actual money invested in the property. Appraisals on the cost of reproduction basis reflecting only present day prices would be far in excess of the actual money cost of the property. The commission within the last few months has had an appraisal made of certain interurban property with the result above indicated."

As the commission now sees it the declaration that it would consider only valuations based upon the original cost of the interurban, bus and railway properties obviously is not in harmony with decisions of the Supreme Court of the United States which must be regarded as controlling in the valuation of public utility property, particularly the recently decided O'Fallon case. In order to arrive at a legal valuation in a matter of this kind, it is necessary to consider all pertinent evidence as to the value of the property involved, including evidence as to the cost of reproduction and the cost of reproduction depreciated. The O'Fallon case makes this very clear.

The commission is now of the opinion that in the conduct of this cause it should hear all pertinent evidence as to the value of all property involved and should not, before the hearing of any evidence, be committed to a policy which would confine it to an original cost basis only. It is of the opinion that the portion of the order approved Oct. 24, 1928, relating to a consideration of valuation upon an original cost basis only as to interurban, bus and railway properties should be rescinded and ordered that the previously quoted section be deleted.

Louisville Brief Filed

Arguments to uphold its contention for a fare of 10 cents with three tickets for 25 cents are contained in a brief filed by counsel for the Louisville Railway, Louisville, Ky., in the Federal District Court. The brief is the second filed since the hearing, the first being devoted to argument on the jurisdiction of the court. The brief concludes with the statement that should the company earn all that the city's testimony suggests and a fair rate of return is no more than 7 per cent, the company would barely earn a fair return on as much as $21,105,850, "the lowest fair value that could be justified even upon the prejudiced testimony of defendants' witness Hubley. On every other basis of computation suggested by the testimony the proposed rates will afford far less than a fair return upon the fair value of plaintiff's property which it has devoted to the public service. . . ."

The brief said the favorable rate of return of 1926 is not likely to be equalled in the immediate future at the present rate schedules and cited the falling off in passengers carried in the last five years. The decrease in the period was from 70,204,876 to 66,997,370, the brief said. It set up the value of the property used and useful on the basis of testimony by the various experts as being from $24,486,000 to more than $28,000,000.

Only Liberal Terms Will Promote Flow of Capital

The St. Louis Transportation Survey Commission on July 11 decided to direct its future consideration to the formulation of a contract ordinance which will meet the city charter's provisions relative to street railway and bus company franchises.

Since Governor Caulfield vetoed the terminable permit bill, passed by the last General Assembly, and as he will be the head of the state government until 1933, there is no hope of putting through a similar law in the meantime. The Governor suggested that if the people of St. Louis want the terminable permit plan they can adopt it by amending the city charter, which restricts franchises to a 50-year period. The commission asked Rudolph Kelker, its consulting engineer, to draw up a report on the operation of the bus lines of the city.

At the meeting Mr. Kelker read a statement recommending the improvement and modernization of railway equipment, track extensions to newly settled sections and the use of high-speed buses equipped with pneumatic tires. He said that the flow of capital to permit needed improvements to be made will be largely determined by the conditions under which the companies are permitted to operate.

New Haven Finances Its Trolleys

The Department of Public Utilities in Massachusetts has authorized the New Haven Railroad to purchase from time to time Worcester Consolidated Street Railway first and refunding mortgage 20-year 4½ per cent gold bonds, dated Aug. 1, 1910, and similar bonds of the company dated Aug. 1, 1910, bearing extra coupons, making the rate of interest thereon 6½ per cent per annum at not more than the face value of the bonds and accrued interest thereon, for the purpose of facilitating the refunding of Worcester Consolidated Street Railway's funded debt. The department has also approved the purchase by the New Haven of $300,000, face value, of demand notes of Springfield Street Railway at not more than face value of the notes, plus accrued interest, for the purpose of providing Springfield Street Railway with funds for rehabilitation of its transportation system.

What Will Boston Do About It?

The Boston *Herald* is asking what, if anything, has been done about co-ordinated transit. It will be recalled that the big job done by the last General Court was the passage of an Elevated bill which creates a Transit District made up of the cities and towns served by the Elevated, its affairs to be managed by five trustees who would study proposed new routes and report on them to a Transit Council. This Council, also created by the act, is to be made up of the mayors and chairmen of selectmen of the communities of the district; recommendations from the trustees, if approved, to be referred by the council to the General Court. The act also authorizes the district to acquire from the city of Boston, with the consent of the Mayor and City Council, all the subways and rapid transit lines which the city now owns in its "proprietary capacity," and thereafter to acquire from the commonwealth the Cambridge tunnel. In other words, the act contemplates the unification of the transit system of Greater Boston under centralized management. As the *Herald* sees it, the big item in the program is the taking over of these facilities by the new Transit District. That cannot be done without the favorable action of the Mayor and the Council. The *Herald* says:

"We have been waiting these many weeks for some sign of interest on their part in this extremely important proposal. We do not argue the merits of the plan now, but we do raise the question if it is not high time for the city authorities to take the public into their confidence and let us know their views and probable intentions. Does the city accept, or reject, the act?"

Deal for Twin City Company Rumored

According to the Canadian *Financial Post* rumors are current in St. Paul and Minneapolis that a change in stock control of the Twin City Rapid Transit Company is impending, and it is said that the H. M. Byllesby interests, which control the Northern States Power Company, centering in the cities mentioned, will acquire control and become the dominant factor in a short time. Canadian directors say no hint of any such change had previously reached them. They were unable to offer an opin-

Digitized by Google

ion as to whether or not the plan was likely to go through. Twin City Rapid Transit Company owns the entire railway systems in St. Paul and Minneapolis. The total mileage of the lines in the cities and throughout the surrounding urban districts, when reduced to single track, covers more than 516 miles. The company also owns all the local bus lines operating in coordination with the railway service. Several suburban bus lines are also under the same ownership.

Relocation Hearing at East Chicago

Public hearing on the appeal of the Chicago, South Shore & South Bend Railroad from the refusal of the City Council of East Chicago, Ind. to permit the railroad to relocate its tracks there were conducted by the Public Service Commission on Aug. 6.

Notice of the company's intention to prosecute its appeal, which was filed last May, recently was served on the East Chicago board of public works after officials had been advised by the board that, in view of the City Council's refusal to take any action in the matter, it would be futile to pass a new franchise.

Negotiations looking toward the removal of the South Shore Line tracks from Chicago Avenue, the principal business artery, and the construction of a new right-of-way through the south portion of the city were begun nearly a year ago. The original franchise, providing for removal of the tracks to grade location along the Grand Calumet River, was approved by the board of works last December and was sent to the City Council with favorable recommendations. During the ensuing months, however, the franchise has been held in committee.

Property at Hammond to Be Sold

Suit for foreclosure and application for the appointment of a receiver for the Hammond, Whiting & East Chicago Railway has been filed in the United States District Court in Hammond, Ind., by the First Union Trust & Savings Bank, Chicago, and Emile K. Boisot of California, trustees under the mortgage.

The bill was filed by F. C. Crumpacker of the law firm of Crumpacker & Fredricks, counsel for the trustees. He alleges that the street railway has defaulted in payment of interest on its first mortgage bonds since Feb. 1, 1923.

It is expected that sale of the property under the foreclosure proceedings will result from the filing of the suit by the trustees. A syndicate of local business men of East Chicago, Whiting and Hammond has been formed to bid for the property if it is put up for sale in the Federal Court. The Midland Utilities Investment Company has a minority interest in the syndicate.

The Hammond, Whiting & East Chicago Railway operates a system of electric railways in Hammond, Whiting, East Chicago and Indiana Harbor. The service of the railway is interconnected with that of the Chicago Surface Lines.

Minnesota Road Sold at Foreclosure

The Minneapolis, Anoka & Cuyuna Range Railway, Minneapolis, Minn., was sold on Aug. 20 to W. D. Lovell, contractor and engineer, for $25,000, subject to approval by the Federal Court. Mr. Lovell announced no plans for the road, which operates as a trolley line between Minneapolis and Anoka, Minn. The sale was conducted by E. P. Burch, who has operated the line two years or more under receivership. The sale was to satisfy claims of bondholders, the trustee being the American Mortgage Company of Boston, Mass. The road started in 1913 as the Minneapolis & Northern equipped with gas-electric engines. It has 16 miles of trackage and operated 12 under lease. It has two electric locomotives, six electric cars and shops and stations. It is now fully electrified.

Railway and Bus Associates Buys Pennsylvania Properties

The United Power & Transportation Company, Philadelphia, Pa., has sold its interest in the Schuylkill Valley Traction Company and the Lebanon Valley Street Railway to the Railway & Bus Associates. Unofficially the purchasers are believed to be Associated Gas & Electric Company.

Oakland, Cal.—The period for the deposit of securities of the Key System Transit Company under the reorganization plan has been extended to Sept. 20.

Philadelphia, Pa. — The disputed extra dividend of $600,000 announced by the Philadelphia Rapid Transit Company several weeks ago has been distributed, the way having been cleared by the withdrawal of a taxpayer's suit seeking to block the transaction.

Hudson, N. Y.—Application will be made to the Public Service Commission by the Eastern New York Utilities Corporation for authority to abandon the trolley line between Albany and Hudson, as a result of action taken by the directors of the New York Power & Light Corporation.

Pensacola, Fla. — The Gulf Power Company plans to suspend operation of trolley cars on the Belt line, which serves the residential section of Pensacola near Pensacola Bay.

Newark, N. J.—A hearing will be held here on Sept. 25 by the Public Utilities Commission on the application of the receivers of the Morris County Traction Company for permission to dissolve the company. Public Service Co-ordinated Transport is now furnishing service by bus over the route of the supplanted trolley between Newark and Dover.

Plattsburgh, N. Y.—The Public Service Commission has consented to the abandonment by the Plattsburgh Traction Company of a portion of its route known as the north loop of the Belt Line here, a distance of 1.52 miles. The city authorities were in accord with the plan and permission to discontinue service and remove the tracks has been granted by the Common Council.

Dover, N. H.—The Central Park Theater here, owned by the Massachusetts Southeastern Railway, was destroyed by fire on Aug. 6 with a loss of $20,000. The stock company playing at the theater lost costumes and scenery.

Salem, N. H. — The Massachusetts Northeastern Street Railway will sell Canobie Lake Park at Salem, N. H., at public auction on Sept. 14. The park covers about 50 acres. There are many pavilions, buildings and a dance hall. The railway will also sell the brick carhouse and other property at the park.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Brooklyn Surface Lines Personnel Announced

William Siebert, long in service, in charge under Mr. Menden. Many other changes made

INCIDENTAL to the unification of the surface lines of the Brooklyn-Manhattan Transit Corporation and the Brooklyn City Railroad as the Brooklyn & Queens Transit Corporation on July 1, many changes were made in the surface transportation department. William Siebert continues at the head of this department; S. S. Hamilton remains assistant superintendent of transportation; C. A. Drew as superintendent of schedules; W. E. Box as superintendent of employment and instruction, and William Luhrssen as chief clerk. F. J. Brennan joined Mr. Siebert's staff as assistant to the superintendent of transportation. Mr. Brennan previously was assistant superintendent of transportation of the Brooklyn City Railroad. The activities of the employment and instruction divisions for the surface lines have been centralized under Mr. Box, except as to badges and photographs. This change eliminates the separate employment, instruction, badge and photograph divisions of the Brooklyn City Railroad. In connection with the merger of the surface lines, a number of changes in the assignment of division superintendents, day depot masters and night depot masters were made by Mr. Siebert. These were noted in detail in ELECTRIC RAILWAY JOURNAL NEWS for Aug. 3, page 115.

MECHANICAL DEPARTMENT UNDER W. G. GOVE

The mechanical department of the Brooklyn & Queens Transit Corporation is headed by W. G. Gove, and L. J. Davis is engineer of car equipment. Mr. Niles Persons continues as superintendent of surface line shops and P. S. Scott is made general inspector. S. Engebrethson, formerly general foreman at 52d Street shop, was transferred to Fresh Pond shop in the same capacity. The new foreman at 52d Street shop is W. F. Platt, formerly foreman carpenter there. In the inspection shops, George Siebert as foreman was placed in charge of both the 9th Avenue and Franklin Avenue shops. C. L. Knight also is foreman in charge of both the 24th Street and Nostrand Avenue Garage.

H. J. Kolb becomes chief engineer, way and structure, for the new company. The Surface Roadway Division has its headquarters at 849 Nostrand Avenue and F. L. Finch is head of the division. The former headquarters of Mr. Finch, as head of the B.-M. T. surface track division at Smith and 9th Streets, will no longer be used as track division headquarters. W. H. Wharton is superintendent of buildings for the new company and retains his headquarters at 1130 Atlantic Avenue. T. Neilson becomes assistant superintendent of buildings. C. E. Wilcox joins Mr. Kolb's staff as office assistant in charge of records and correspondence and J. A. Rosenberger as special inspector.

Interest naturally centers around Mr. Siebert, the man who will direct the operating of the 500 or more miles of surface lines with their 1,200 cars, and who presumably will be responsible for the operation of the company's motor bus lines when the event of their operation emerges from the tangled meshes of consideration by city officials. Mr. Siebert is one of life's mystery men—men known widely and favorably in their own communities but still escaping the spot light of publicity. Not even Harding, Pulitzer prize-winning cartoonist, when he was on the Brooklyn *Eagle*, discovered Mr. Siebert, or if Harding did discover him then the elusive Mr. Siebert had his own way again and succeeded in escaping publicity. It is a way that has made Mr. Siebert camera-shy to the extent that the ELECTRIC RAILWAY JOURNAL could not secure any portrait of him suitable for half-tone reproduction. That's how diffident is Mr. Siebert.

But about the man. Over in Brooklyn in 1928 at a banquet to him, more fragmentary facts about him came to light than ever before. The occasion was the completion by him of 40 years of service with the surface lines there. Many of the men who attended had worked with Mr. Siebert for years, but in addition there were the county clerk, Supreme Court justices, and others prominent in public life.

From this, that and the other sources, it appears that Mr. Siebert began his railroad career in 1887 as a conductor on the Nostrand Avenue horse-car line. His advance through the ranks was steady until he finally was in charge of the Ridgewood Depot. Then came the turning point—his appointment to the post of superintendent of transportation of the surface lines in 1907.

MR. SIEBERT'S APPRECIATION OF THE WORK OF THE RANK AND FILE

Out of a clear sky one day about twenty years ago, Mr. Menden, now the president in Brooklyn, sent for Mr. Siebert to come downtown and see him. When Mr. Siebert arrived at Mr. Menden's office, he told Mr. Siebert he wanted him to take the job of superintendent. Here's Mr. Siebert's own version of what took place:

"I told him I did not want the job as nobody seemed to last long in that job, and I had a family to take care of. He said he thought I would be able to handle myself satisfactorily in the job and finally told me to take a week to think things over and then come back to see him. I went back a week later and told him again that I didn't want the job. But I didn't know he had been talking with Harry Crowe and some of the others who knew me downtown and they had told him just to tell me to try my hand at the job and I would stick at it. At any rate, when I told him I still didn't want the job, he simply said he'd have to have someone downtown and asked me to go inside and help him out temporarily. That was more than twenty years ago and I'm still helping out."

He has no mistaken notions about things. He can do most anything in railroading, has done most everything, and, when occasion requires, still does most everything, but knows that as a policy that is a mistaken one. He can delegate tasks and he does delegate them. In a gracious compliment to the men under him, Mr. Siebert once said:

"One man cannot run a railroad. We sometimes say we are running it but that isn't true. We must have the co-operation and support of every man in the organization from switch-boy to president, and unless we have that our efforts to run the railroad to satisfy the public and the management are bound to fail. I have been fortunate in having enjoyed that loyalty and support in a generous degree and I owe all of whatever success I have achieved to each and every one of you."

No encomium to the man could possibly give a better clue to the underlying philosophy that is Mr. Siebert's than this statement made on one of the very few occasions on which he broke his customary silence.

B. C. Cobb Elected to Commonwealth & Southern Board

B. C. Cobb, New York, chairman of the board of the recently organized Commonwealth & Southern Corporation, has been elected a director of the Georgia Power Company; Magor Car Company; Pullman E. Patterson, Macon, Ga. Mr. Cobb also is the chairman of the board of the Allied Power & Light Corporation, and for three years served as chairman of the advisory council of the American Electric Railway Association.

Mr. Cobb is president of the Tennessee Electric & Power Company and a director of the Nashville Railway & Light Company. He is also president of the Commonwealth Power Company and the Penn-Ohio Edison Company, which, together with other public utilities, were recently consolidated with the Southeastern Power & Light Company.

Mr. Cobb was born in Boston on Aug. 13, 1870, and after leaving school was first employed by the Pennsylvania Railroad. Later he was one of the organizers of Hodenpyl, Hardy & Company. In 1928 this company and Stevens & Wood, Inc., were acquired by the Allied Power & Light Corporation, of which Mr. Cobb became chairman.

C. C. Brown in the Quarter Century Club

Chester C. Brown, auditor of the New York State Railways at Syracuse and Utica has completed 25 years of service. Mr. Brown entered the employ of the company on July 1, 1904, when, under Hague, Comstock & Walker, managers and construction engineers of the Rochester & Eastern line, he accepted a position in Canandaigua. His first job was that of freight handler. After about six months, he was promoted to freight agent at the Canandaigua office. Still later the same year, Mr. Brown was appointed general freight and express agent of the Rochester & Eastern, which position he held for about two years. Following this, he occupied the position of paymaster on the Rochester & Eastern and Rochester & Sodus Bay lines.

In February, 1907, following the change of ownership, Mr. Brown was placed in

Digitized by Google

charge of the Canandaigua office, where he remained until 1909, when he was transferred to the Rochester office. In August, 1919, he was appointed chief clerk by J. M. Joel, general auditor, and served in that capacity until Dec. 1, 1923, at which time he was appointed auditor of Utica, Oneida and Syracuse lines, with headquarters at Utica. He becomes the 341st member of the company's Quarter Century Club.

Darius E. Peck Elected Vice-President of General Electric

Darius E. Peck, assistant manager of the law department of the General Electric Company since 1920, has been elected vice-president and general counsel of the company. At the same time Allen H. Jackson, vice-president and general counsel since 1922 and associated in the company's law department since 1902, retired from active service, having served the company wisely, ably and loyally.

Mr. Peck was born at Hudson, N. Y., in 1877. He is a graduate of Williston Academy at Easthampton, Mass., and of Yale University. He was admitted to the bar in 1901. He practiced law in New York City from 1902 until 1913, when he became a member of the law department of the General Electric Company and moved to Schenectady. Seven years later he was named assistant manager of the department, a position he held until his promotion to vice-president and general counsel.

Mr. Peck has also had considerable experience in the public utility field. In 1915 he was elected secretary, treasurer and a director of the Schenectady Illuminating Company, the Mohawk Gas Company, and the Schenectady Power Company, succeeding James O. Carr. In 1920, at the time of the organization of the Adirondack Power & Light Corporation, he was elected a director and secretary and served for several years. When the Mohawk Hudson Power Corporation was formed in 1925 he became secretary of that company, serving until April of this year. He is at present a director of the New York Power & Light Corporation.

Mr. Jackson was born in Schenectady in 1864. He was graduated from Union College in 1886 and from the Albany Law School two years later. He entered the office of his father, Judge Samuel W. Jackson, of the State Supreme Court, and practiced law in his home city until 1892, when he went to New York with the law firm of Chanler, Maxwell & Philip. Three years later he returned to Schenectady and entered into partnership with his father. This association continued until 1902.

Beginning about 1900, Mr. Jackson had his first contact with General Electric affairs, previous to his actual entry into the company's organization. It was at this period that the National Electric Lamp Association was undergoing organization at Cleveland. At the request of the late Hinsdill Parsons, general counsel of the General Electric Company, Mr. Jackson assisted in bringing about the formation of the national association. His work at that time was a forerunner to his direct employment by the General Electric Company in December, 1902, as one of its attorneys, under Mr. Parsons. Mr. Jackson became counsel to the company in 1911, and after Mr. Parsons' death in 1912, he became the head of the law department.

In 1922, the year in which Gerard Swope succeeded E. W. Rice, Jr., as president of the company and Owen D. Young succeeded the late Charles A. Coffin as chairman of the board, Mr. Jackson was made vice-president and general counsel.

Coach Company Promotes J. E. McCarthy

John E. McCarthy has been elected a vice-president of the Fifth Avenue Coach Company, New York. He will continue to serve as secretary and his title is vice-president and secretary. Mr. McCarthy's career with the Fifth Avenue Coach Company began when he started to work as a stenographer in 1914. Within two years of his entering the service he was appointed general bookkeeper. In that capacity he handled the accounts of four corporations and became so thoroughly familiar with the business that he was made chief clerk in 1918. In 1922, Mr. McCarthy was transferred to the president's office and received the title of assistant to the president. On Nov. 5, 1924, he was appointed assistant secretary of the company, and on March 1, 1925, he became secretary, succeeding in that capacity Samuel E. Morrow, who retired at that time.

B. G. Noah General Superintendent at Duluth

B. G. Noah has been appointed general superintendent of the Duluth Street Railway, part of the Duluth-Superior Traction, in charge of all departments of operation in Duluth, Minn., and Superior, Wis.

G. B. Noah

For the past two years Mr. Noah has held the position of assistant to the vice-president, going to Duluth from Chicago where, for ten years, he was connected with the Chicago Surface Lines as electrical engineer in charge of power station design and electrical testing. Mr. Noah received his technical training in electrical engineering in Chicago.

The principal departments of operation which will be under Mr. Noah's direction are: Engineering and roadway department under John Carson, chief engineer and T. A. Armstrong, roadmaster; mechanical department under R. J. Crawford, master mechanic; the operating departments in Duluth and Superior under William S. Byers, superintendent, Duluth division, and Alfred Williams, superintendent, Superior division, and schedules and publicity under R. B. Thompson, superintendent of schedules.

Herbert Warren, vice-president and general manager of the company, explains in a bulletin announcing the appointment, that "the increasing burdens of management other than operation, make the change necessary."

Preston S. Arkwright, president of the Georgia Power Company, has been elected president and member of the directorate of the Columbus Electric & Power Company. The Columbus company is a subsidiary of the Commonwealth & Southern Corporation, which, through the Southeastern Power & Light Company, likewise controls the Georgia Power Company.

Harold Smith Elected Vice-President of Westinghouse

Harold Smith, general solicitor of the Westinghouse Electric & Manufacturing Company, has been elected vice-president. Mr. Smith entered the legal department of the Westinghouse Company in 1919 and was appointed general solicitor in 1926. Prior to that time he was engaged in the practice of law in Chicago being a member of the firm, Glennon, Cary & Walker. He is a graduate of Northwestern University (LL.B. in 1905), and at Yale (LL.M. in 1906), and he also studied at the University of Chicago. He is a member of the bar of the States of New York and Illinois.

John C. Higgs, for five years chief engineer of the power station of the Jacksonville Traction Company, Jacksonville, Fla., is to be transferred to Tampa, where he will become assistant superintendent of the power station of the Tampa Electric Company. The Jacksonville Traction Company and the Tampa Electric Company are under executive management of Stone & Webster, Inc. T. J. Hunt, chief engineer of the Winter Haven Power & Ice Company, will succeed Mr. Higgs at Jacksonville.

Frank J. Miller, appointed by Governor Patterson as a member of the Oregon Public Service Commission to fill the vacancy caused by the death of Louis E. Bean, has been elected chairman, the post occupied by Mr. Bean at the time of his death. Mr. Miller was the first secretary of the original Oregon Railroad Commission, serving from 1891 to 1893. In 1909 he was elected as a member of the Railroad Commission, and later was appointed to serve out an unexpired term. In January, 1910, Mr. Miller took office on his election as commissioner, serving continuously until January, 1919.

E. D. Spicer, superintendent of the refrigeration department of the General Electric Company, has been made assistant manager of the Schenectady works. Mr. Spicer was graduated from Cornell University in 1912 with the degree of mechanical engineer. In 1924 he went to the General Electric Company in the manufacturing general department. In December of the same year, he joined the staff of James A. Smith, superintendent of the Schenectady works, and, in March, 1925, he was placed in charge of the insulator and carbon brush department.

H. W. Olcott, Jr., has been transferred to Indianapolis and promoted to the position of manager of publicity and advertising there for the Interstate Public Service Company and Central Indiana Power Company subsidiaries—a group of electric, gas, and local and interurban railways, absorbed early this year by the Midland Utilities Investment Company, with which he is now associated as assistant publicity director.

J. K. Bruce Under New London Scale

The London County Council has decided that the scale of salary attaching to the position of general manager of the Council's tramways shall in future be £2,000 a year, increasing after four years service at that remuneration by annual increments of £250 to £3,000 a year. J. K. Bruce, who has been general manager for several years, is transferred to the new scale, and his salary is now increased to £2,500, increasing thereafter in accordance with the scale.

C. E. Eveleth Vice-President in G. E. Engineering Department

Charles E. Eveleth, who since 1927 has been a vice-president of the General Electric Company associated with C. C. Chesney and W. R. Burrows in the management of the manufacturing department of the company, has been transferred to the engineering department, and, as vice-president, will be associated with E. W. Allen in the direction of that department's affairs.

Mr. Eveleth will give special attention to the problems of the designing departments and works laboratories. Mr. Allen will direct his attention to the work of the commercial engineering, the contract service and district engineering departments.

Mr. Eveleth has been in the employ of the General Electric Company since 1899.

H. R. Cranford, the Toledo Edison Company, Toledo, Ohio, has accepted the chairmanship of a new committee of the National Association of Purchasing Agents, Inc., to be known as National Committee To Co-ordinate Activities of Affiliated Associations. The object of the committee will be to assist affiliated associations in the several districts to schedule their various activities to co-ordinate with those of other associations in the same district.

Fred N. Wardwell, formerly assistant engineer of the New York Central Lines, has joined the Rome Wire Company, Division of General Cable Corporation, as railroad sales engineer. He will be located at the division's executive office at Rome, N. Y. Mr. Wardwell has had wide railroad experience. During the past eleven years with New York Central, he has been closely identified with the electrification and equipment projects of its lines, having had direct supervision of the material inspection bureau of the electrical department. He was also technical advisor to the purchasing and stores department.

Obituary

Charles Currie

Charles Currie, former vice-president and general manager the Northern Ohio Power & Light Company, Akron, Ohio, with which he was actively connected from 1901 to 1916, died on Aug. 14 while on a motor trip in Massachusetts.

Mr. Currie was born in Toronto, Ont., on March 8, 1868. The family moved to London, Ont., and at an early age Mr. Currie went to work for the London Street Railway. Later he became superintendent of that company.

When the Everett-Moore Syndicate took over the London Street Railway and a number of other utilities in Canada and the United States, Mr. Currie was made superintendent of railways at Lima, Ohio. Later he was transferred to Cleveland as superintendent and went thence to Akron, finally becoming vice-president and general manager. When the Hodenpyl-Hardy interests took over the Northern Ohio Power & Light Company in 1916, Mr. Currie returned to Cleveland to join the Cleveland Trust Company. At the time of his death he was a director of the Northern Ohio Power & Light Company, president of the London Street Railway and a director of the Lake Shore Electric Company. Mr. Currie was 61 years old.

Gaylord Thompson

Gaylord Thompson, general manager of the Trenton & Princeton Traction Company, Trenton, N. J., died on Aug. 15. He had been ill for a long time and had been confined to his home for the past two years.

Mr. Thompson was a native of New York City. He was graduated from New York University in civil engineering. He later became affiliated with the Ohio Electric Company in Cincinnati. Sixteen years ago he removed to Trenton and was made general manager of the Trenton & Princeton Traction Company. He was a member of the American Society of Civil Engineers and the Trenton Engineers' Club.

Ora Taylor

Ora Taylor assistant superintendent of the southern division of the Pacific Electric Railway, Los Angeles, Cal., died on July 28. Mr. Taylor was 59 years of age. He went to Los Angeles 28 years ago from Knoxville, Ia. He entered the service of the Pacific Electric Railway in August, 1912, as a conductor's instructor on the western division. One year later he was appointed trainmaster of the western division, which position he held until January, 1920, when he was appointed assistant superintendent of the southern division.

A. K. Baylor

Armisted K. Baylor, General Electric commercial engineer and veteran of the electrical industry, died suddenly on Aug. 1. In 1891 Mr. Baylor went to the Thomson-Houston Electric Company at West Lynn, Mass., and moved to Schenectady, N. Y. in 1894, when the headquarters and main offices of the company were established there. In 1896 he became manager of the traction department of the British Thomson-Houston Company, later becoming general sales manager abroad. After fourteen years he re-entered the General Electric organization in the United States, and for several years was in the commercial general department. Mr. Baylor was 61 years old.

Daniel Corliss Frost

Daniel Corliss Frost, manager of the Lynchburg Traction & Light Company, Lynchburg, Va., died on July 23. He had been in a coma for several days when he suffered a second attack of a malady which had affected him since last April.

Though exceedingly modest in demeanor, Mr. Frost was widely known and held in high regard locally. He went to Lynchburg to manage the plant known as "The Spoke Works," which, after a few years' operation by the Philadelphia owners, was closed. He held several positions as manager of industrial plants in Lynchburg and was for a short time with the Chesapeake & Ohio Railway before taking the position as superintendent of the local railway late in 1902. This position he held until about a year ago when the gas company was separated and he became manager of the railway service.

He took an active interest in public affairs in his early years in Lynchburg and during the incumbency of Mayor G. Woodson Smith was a justice of the peace. He was a member of the Rotary Club, Oakwood Country Club, Sphex Club, Chamber of Commerce, a director in the Interstate Fair Association and the Commercial Savings & Loan Bank. He was interested in the collection of first editions and particularly interested in books on Virginia and Abraham Lincoln.

He attended the public schools in Philadelphia but went to work early in life with the Charles Scott Wheel Manufacturing Company, which sent him to Lynchburg. He was born at Laurel, Delaware.

Edward Early

Edward Early, assistant treasurer of the United Railways & Electric Company, Baltimore, Md., died on Aug. 2. He was 64 years of age. He was stricken with a heart attack while in his office in the Court Square Building and died soon afterward. Mr. Early was a native of Baltimore. He was educated in the public schools there. A number of years ago he entered the treasurer's office of the Western Maryland Railway and in 1913 joined the treasurer's office of the United. He was made assistant treasurer about a year later.

New Franchise Draft in Jacksonville

Austin Miller, city attorney of Jacksonville, Fla., has been requested by the public service committee of the City Council to prepare a "fair and legal" Jacksonville Traction Company franchise for the committee's consideration.

The text of the letter to Mr. Miller follows in part:

"In view of the fact that you are familiar with the former franchise, which was repealed, this committee feels that it is your province to prepare a draft of a proposed franchise that will be fair, just and equitable to the city and to the Jacksonville Traction Company. To the end, therefore, that this important matter may be disposed of without unnecessary delay, the committee requests that you prepare a franchise you think fair and legal, and that you furnish the committee with a draft thereof within the next 30 days."

Since the repeal of the former ordinance each side has made concessions, the attitude of the company toward a new grant being reviewed in ELECTRIC RAILWAY JOURNAL NEWS for Aug. 10, page 118.

Bids Received for Equipment for New York's New Subway

Final bids for steel cars, substation power and motor equipment on New York's new Manhattan subway were opened on Aug. 20 by Commissioner Daniel L. Ryan of the Board of Transportation and referred to the engineering department for computation.

For the installation of motors and control equipment, the Westinghouse Company bid $2,532,470 and the General Electric Company $2,547,070.

Bids were received for the 300 steel cars to be used from the following five companies: The American Car & Foundry Company; Magor Car Company; Pullman Car & Manufacturing Corporation; the Pressed Steel Car Company, and the Standard Steel Car Company.

These five bids were made on tabulated items and not for a lump figure. They will be computed by the board's engineering department and the total bids in each instance announced as soon as computed.

The delay in specifying the amounts entailed in the bids by the car manufacturers, it was explained, results in the fact that this is the first time in history that the city of New York has received, opened and computed bids for its own rapid transit.

Four bids were also received for installation of power equipment for substations of the new subway. These bids, tendered by the General Electric Company, Westinghouse Electric Company, Fishbach & Moore, Inc., and the Erickson Engineering Company, Inc., were also referred for computation to the engineering department.

All bids for the subway work are now in, with the exception of the one for the illumination of the new circuit.

Examination will begin before the Board of Transportation within a day or two on the reliability and experience in such construction work of the concerns involved in the bidding.

Recent Bus Orders

The electric railway industry continues to be one of the principal purchasers of bus equipment, and new orders are being placed without interruption. The Wheeling Traction Company, Wheeling, W. Va., recently ordered five 20-passenger Studebaker parlor car buses, while the Eastern Massachusetts Street Railway, Boston, Mass., ordered four Studebaker 21-passenger de luxe street car buses. The Brooklyn & Queens Transit Corporation of Brooklyn, N. Y., accepted delivery of four A.C.F. 33-passenger street car type buses, leased for a period of one year, and to the Boston Elevated Railway of Boston, Mass., were delivered five A.C.F. 40-passenger Metropolitan coaches. The Virginia Electric & Power Company recently placed an order for ten Twin Coaches of the 40-passenger urban type with the Twin Coach Corporation of Kent, Ohio, while the Denver Tramway Corporation ordered one 23-passenger A.C.F. urban coach from the A.C.F. Motor Company and one Mack 29-passenger city type bus.

The El Paso Electric Company recently placed an order for one White 54-A bus. Yellow Coaches were ordered by various bus divisions of electric railway companies, and the following deliveries were made: The Atlantic City & Shore Railroad, Philadelphia, received four Z-29 passenger buses; the City Light & Traction Company, Sedalia, Mo., one W city service type bus; the Wisconsin Gas & Electric Company, of Kenosha, Wis., took delivery of one Z-29 bus. Two Z-29 coaches will go to the Illinois Power & Light Company of Champaign, Ill., and the Wisconsin Power & Light Company of Janesville, Wis., took seven W city service type buses, while four W city service buses were delivered to the Sioux Falls Traction Company at Sioux Falls, S. D., and six buses of the same type were accepted by the Potomac Edison Company of Hagerstown, Md. An order of one bus of the same model was placed by the Erie Coach Company of Erie, Pa.

The Capital Traction Company of Washington, D. C., contemplates ordering three 21-passenger buses. Mack buses were ordered extensively also by several electric railway properties, and some recent orders follow below:

The Lehigh Valley Transportation Company, of Allentown, Pa., two model AB four-cylinder 29-passenger, city type buses; the Tompkins Bus Corporation of West New Brighton, N. Y., 24 Mack model AB four-cylinder 29-passenger city type buses; the Connecticut Company, New Haven, Conn., three Mack model AB four-cylinder 29-passenger city type buses; the Northampton Street Railway, Northampton, Mass., two Mack model AB four-cylinder 25-passenger, city type buses; the Boston-Worcester & New York Street Railway Company, of Framingham, Mass., one model BK 29-passenger parlor car bus and the Buffalo & Erie Coach Corporation of Fredonia, N. Y., has accepted delivery on two model BB four-cylinder 177½-in. wheelbase chassis.

Cleveland's New Electric Locomotives

The first of the 22 electric locomotives for use in the newly electrified railroad zone in Cleveland has been completed at the Erie, Pa., works of the General Electric Company. The locomotives, being constructed by the American Locomotive and General Electric companies, weigh 204 tons each, with 150 tons on the driving wheels, will handle the equivalent of seventeen 75-ton cars, and will have a maximum speed of 70 m.p.h.

W. B. & A. Orders Trailers

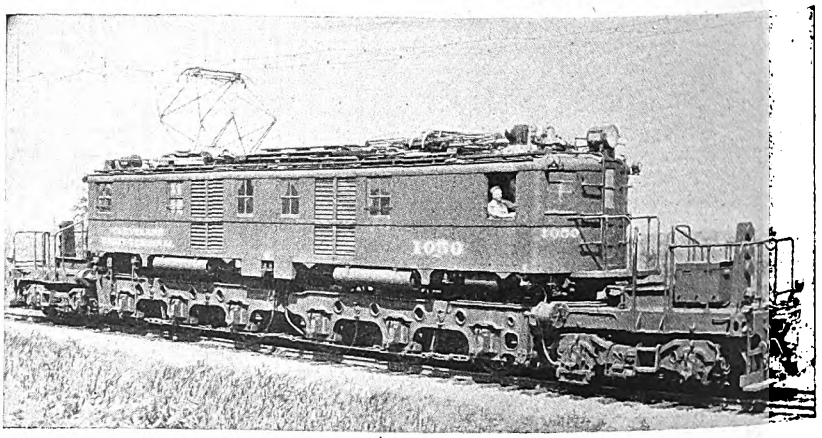
Detailed description of the nine trail cars ordered last April by the Washington, Baltimore & Annapolis Electric Railroad for service between Baltimore and Annapolis, announcement of which was made in the June, 1929, issue of ELECTRIC RAILWAY JOURNAL, is now available and is published below:

Air brakes	Westinghouse ATM
Axles	Brill A.S.T.M. A-20-27
Car signal system	Westinghouse electro-pneumatic
Couplers	Tomlinson MCB tight lock
Curtain fixtures	Excel No. 40
Curtain material	Pantasote
Destination signs	Keystone
Doors	Folding
Floor covering	N. Y. Belting & Packing Co.
Glass	3/16-in. plate
Hand brakes	Peacock
Heat insulating material	Salamander
Heaters	Railway Utility Company
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Brill semi-steel
Lamp fixtures	Electric Service Supplies Company
Painting scheme	W. B. & A. standard green
Roof type	Arch
Roof material	Poplar, canvas covered
Sash fixtures	O. M. Edwards
Seats	Brill No. 201
Seat spacing	2 ft. 11 in.
Seating material	Genuine leather
Slack adjusters	American Brake Company, type J
Steps	Stationary
Step treads	Kass
Trucks	Brill 27-MCB-3
Ventilators	Nichols-Lintern
Wheels	36 in. diameter

St. Louis Car Company Builds Electric Locomotive

A combination electric switching locomotive was delivered July 16 by the St. Louis Car Company, St. Louis, Mo., to the Illinois Central Railroad for use at the Chicago terminals. The locomotive weighs 90 tons and is designed to utilize any of three different types of power. It cost $70,000, and was built in 60 days at the St. Louis shops of the car company. The new unit is 45 ft. in length and is provided with 1,000 h.p. in traction motors. It can utilize oil-electric power, trolley or third rail and storage battery.

Although the Illinois Central plans to use the locomotive for switching purposes, it can be used for road freight and will attain a speed of 35 m.p.h. Two 155 h.p. oil engines are used to drive the electrical generators. In its switching operations the locomotive will pull a 3,000 ton train, or the equivalent of 55 loaded freight cars.



Electric locomotive to be used in the electrified zone of the Cleveland Union Terminal

The new Greensboro cars are 41 ft. 5 in. over all and seat 40 passengers

Five Cars for Greensboro, N. C.

The North Carolina Public Service Company, Greensboro, N. C., recently placed an order for five new cars with the Perley A. Thomas Car Works, High Point, N. C. These cars are now being delivered to the railway by the car builder. They are of the double-end type, arranged for one-man service, with front entrance and rear treadle-controlled exit doors. A feature of this car is that the motorman will be seated when operating the controls. The window spacing in front of the car is so arranged that he has a clear view of the street in front of him, and the visibility is not obstructed by wide posts. The flooring of the cars is made up of 1½ in. square rubber tiles of two colors. The total weight of the car is 33,200 lb., and the length over all is 41 ft. 5 in. The length over the body posts is 27 ft. 10 in. and the width over all is 8 ft. 6¼ in., while the height from rail to trolley base is 10 ft. 7 in. An all-steel construction is used for the body. The type of car is one-man, double-end, double-truck, and the seating capacity is 40 passengers. A detailed list of the equipment follows:

Air brakes	Westinghouse
Car signal system	Consolidated Car Heating Co.
Conduit	Duratube
Control	K-75
Couplers	Car builder's
Curtain fixtures	Adams & Westlake Company
Curtain material	Pantasote
Destination signs	Hunter Sign Company
Door mechanism	Consolidated Car Heating Co.
Gears and pinions	Nuttall
Hand brakes	Peacock staffless
Heaters	Consolidated Car Heating Company
Headlights	O. B. illuminated type
Headlining	Agasote
Lamp fixtures	Dome, Dayton Manufacturing Co.
Motors	Four Westinghouse No. 510—35 H.P.
Painting	Enamel
Registers	R-11 with electric back
Roof material	Wood slats, canvas covered
Sash fixtures	Adams & Westlake Company
Seats	Double deck reversible
Seating material	Leather
Slack adjusters	American, type E
Step treads, "Kass"	Morton Manufacturing Company
Trolley catchers	Ohio Brass Company
Trolley base, form 4	Ohio Brass Company
Ventilators	Railway Utility Company
Wheels	Davis

Gears on Montreal Cars

On page 818 of the August issue of ELECTRIC RAILWAY JOURNAL it was stated that the 106 new cars for the Montreal Tramway were to be equipped with Nuttall, Grade BP gears. This statement was inaccurate in that only 76 of these cars are to be equipped with Nuttall and 30 with Tool Steel gears, the latter being manufactured by the Tool Steel Gear & Pinion Company, Cincinnati, Ohio. The 25 two-car trains recently ordered will be equipped with Tool Steel gears.

Automatic Block Signals for Illinois Terminal System

The Illinois Terminal System has ordered from Union Switch & Signal Company materials for the installation of automatic blocks signals of the colored light type on about 240 miles of track between Staunton and Peoria, Ill., and from Springfield to Mackinaw Junction, Ill.

Lackawanna Contracts Let

Car and meter awards have been made for equipment for the electrified line out of New York

CONTRACTS for the construction of 141 all-steel electric vestibuled motor cars, equipped with roller bearings, by the Pullman Car & Manufacturing Company, Chicago; the construction of 230 horsepower motors and the necessary control equipment for each of these cars by the General Electric Company, Schenectady, N. Y., and for the conversion of a similar number of the latest model of the present suburban coaches as vestibuled trailer cars by the American Car & Foundry Company, Berwick, Pa., have been made by the Lackawanna Railroad. This equipment is for use on commuter trains connecting Hoboken, Montclair, Gladstone and Dover, N. J., comprising 70 miles of route or 160 miles of track, the electrification of which is now under way. The delivery of completed cars is promised, beginning in June next year. President J. M. Davis of the Lackawanna announced the placing of the contracts on Aug. 23.

This equipment can be operated in units of two cars—a motor and a trailer or coupled to form trains of two, four, six, eight, ten or twelve cars. Each motor car will be 71 ft. long and weigh 148,000 lb. complete with electrical equipment, while the trailers will weigh 113,000 lb. each, making the weight of a complete unit 261,000 lb., exclusive of passengers. Each motor car will seat 84 passengers and the trailers 78 or 82 passengers, making a total of 162, or 166 passengers for each unit.

Commuters have repeatedly declared the present coaches are the most satisfactory suburban cars the Lackawanna ever had, but the new equipment will be an improvement over that now in service. They will have the same well distributed lighting arrangement, the same ample knee room between cross seats, slightly wider aisles and be equipped with the most modern type of inclosed electric heaters.

Digitized by Google

Two-Car Trains for Montreal

Of the 156 new cars which are being ordered by the Montreal Tramways during the present year, the last 50 are to be equipped as complete four-motor units for regular all-day service if necessary, with provision for coupling together for train operation at rush hours. Each of the units of the train is a standard new type car, uniform in size, construction and appearance, with the exception of the straightening of the vestibule platforms for the coupling equipment.

It is intended to operate the second unit as one-man safety cars in all-day regular service on lines suitable for such, but which have very heavy rush-hour traffic. At such periods the units will be coupled to the one-man cars to form the train, the operator of the one-man car taking the duties of conductor of this unit for the time being. These cars are being equipped with the recently developed Westinghouse variable automatic master control system, Westinghouse 510-A2 motors and Tomlinson mechanical and electrical coupler. An acceleration of 3 m.p.h.p.s. and a correspondingly higher rate of braking will be obtained by these cars.

Twenty-five of the units will be of the single-end, double-truck, one-man safety type, seating 54 passengers each and weighing approximately 37,600 lb. The other 25 cars will be of the single-end, two-man type, seating 42 passengers. Over-all dimensions of the two types are the same, with a length over the corner posts of 46 ft. 2 in.; width, 8 ft. 4 in., and height from rail to top of trolley board of 11 ft. 1 in. Bolster centers are spaced 22 ft. 7 in., and the wheelbase is 5 ft. 4 in. Equipment specifications, which are substantially the same on both types, are as follows:

Air brakes	Canadian Westinghouse Company Safety car equipment type E relay and quick release
Armature bearings	Bronze—babbitt lined
Axles	4-in., 4½-in. gear seat
Bumpers	Hedley anti-climber
Car signal system	Faraday, 600 volt
Compressor	Canadian-Westinghouse Company DH-16
Conduit	Standard metal conduit
Control	Westinghouse variable automatic master control
Couplers	Tomlinson form 10
Curtain fixtures	National Lock Washer Company
Curtain material	Pantasote
Destination signs	Keystone
Door mechanism	National Pneumatic Company GOF, 4½-in. M. engine
Doors, folding	Front—air operated Rear—treadle air operated
Fare boxes	Cleveland Fare Box Company
Finish	Enamel
Color scheme	M. T. Co. standard green and cream
Floor covering	Wood slat and Kass tread
Gears and pinions	Tool Steel Gear and Pinion Co.
Glass	Selected 21 oz.
Gong	12-in., foot operated
Hand brakes	Peacock staffless
Hand straps	Rigid wood hand rail
Insulating material	Three ply salamander
Heaters	Canadian General Electric Company, No. 1285, double element four circuit, 6-in. series
Headlining	5/16-in. Agasote
Interior trim	Cherry
Journal bearings	3½-in. x 7-in. bronze, babbitt lined
Journal boxes	Cast iron M. T. Company standard
Lamp fixtures	Safety Car Company, type DA comp. fixture
Motors	Canadian Westinghouse No. 510-A2, 42 hp.
Gear ratio	13-69
Roof, type	Arch
Safety car devices	Canadian Westinghouse full safety equipment
Sanders	O. W. Meissner Company, pneumatic
Sash fixtures	Metal—Robert Mitchell Company
Seats	Ottawa Car Mfg. Company, and Canadian Car & Foundry Company
Seat spacing	2 ft. 6 in.
Seating material	Rattan
Slack adjusters	American Brake Company, form E-1
Steps	Irving Co., Saf-Kar
Step treads	Kass
Track scrapers	M. T. Company standard
Trolley base	Nuttall Compay US 20-C
Trolley catcher	Keystone
Trolley wheels	Lyman Tube & Supply Company, Canadian Ideal wheel
Trucks	Canadian Car & Foundry Company Type F-790
Ventilators	Railway Utility Company Honeycomb
Wheels	Cast iron, 26 in. diameter
Fenders	HB fender
Notes	Heaters have Railway Utility Company, tnermostatic control.

Fifteen Trackless Trolleys for Salt Lake City

The last part of the first paragraph under "Recent Bus Orders Numerous," appearing on page 816 of the August issue of ELECTRIC RAILWAY JOURNAL, states that an order of eleven trackless trolleys have been placed with the Twin Coach Corporation by the Utah Light & Traction Company of Salt Lake City. This statement should read as follows:

"Seven trackless trolley coaches have been ordered from the Twin Coach Corporation, while eight trackless trolleys were ordered from the Cincinnati Car Corporation by the Salt Lake City Company, making a total order of fifteen vehicles of this type."

Details of New Bedford Cars Announced

Additional details are now available covering the twelve cars recently ordered by the Union Street Railway, New Bedford, Mass., mention of which was made in the July issue of ELECTRIC RAILWAY JOURNAL. The cars are being built by the Osgood-Bradley Car Company, Worcester, Mass., and are practically identical in design with cars ordered from the same builder by the Altoona & Logan Valley Electric Railway, Altoona, Pa., and by the Scranton Railway.

The principal items are as follows:

Air brakes	Westinghouse straight air, variable load
Armature bearings	Plain
Axles	4½-in.
Car signal system	Consol. Car Heating Company
Compressors	DH-16
Conduit	Metal
Control	Westinghouse "UM"
Destination signs	Hunter-226 RB
Door mechanism	National Pneumatic
Doors	Folding
Energy saving device	100 Amp. Economy Meters
Finish	Lacquer
Floor covering	Flexolith
Gears and pinions	Westinghouse
Glass	Plate in car body, non-shatterable in vestibules
Hand brakes	Peacock vertical
Hand straps	Porcelain rail only
Heaters	Gold Car Heating Company
Headlights	O.B. dash illuminating
Headlining	Agasote
Interior trim	Aluminum
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Electric Service Supplies Company, Twenty 30-volt lamps
Motors	Four 510 E, 35 hp., inside hung
Painting scheme	Pullman green and gold
Registers	Rooke
Roof type	Arch
Roof material	Wood—canvas covered
Safety car devices	Passenger emergency valve
Sash fixtures	Brass sash
Seats	Heywood Wakefield de luxe
Seating material	Monkey grain brown leatner
Steps	Stationary
Step treads	"Kass" safety
Trolley base	Nuttall lightweight
Trolley wheels	Kalamazoo
Trucks	Osgood Bradley
Ventilators	Osgood Bradley exhaust
Wheels, type	Steel, 27 in. diameter
Wheelguards	Bradley truck guard

New Des Moines Cars Received

Delivery was recently made of ten new cars purchased by the Des Moines Railway, Des Moines, Iowa. They are of double-truck, single-end design, arranged for one man operation. Individual leather upholstered seats are provided, arranged in pairs. Special attention has been given to interior decoration and lighting. Artificial illumination is provided by two rows of shaded lamps, directly over the seats. After arrival the cars were placed on public exhibition on a downtown street, where they aroused much comment as to their appearance and interior finish.

Ohio Brass Company, Mansfield, Ohio, announces the opening of its new office at 505 Insurance Building, Dallas, Tex. This office will be the headquarters of T. B. Jones, district sales manager for the company in the Dallas territory.

ELECTRIC RAILWAY MATERIAL PRICES—AUGUST, 1929

Metals—New York

Copper, electrolytic, delivered, cents per lb.	18.
Lead, cents per lb.	6.75
Nickel, cents per lb., ingot	35.
Zinc, cents per lb.	7.15
Tin, Straits, cents per lb.	46.50
Aluminum, 98 to 99 per cent, cents per lb.	24.30
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	48 00
General service	31.50

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	$4.17
Somerset mine run, f.o.b. mines, net ton	1.87
Pittsburgh mine run, Pittsburgh, net ton	1.80
Franklin, Ill., screenings, Chicago	1.50
Central, Ill., screenings, Chicago	1.10
Kansas crushed mine run, Kansas City	2.50

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb.	2.80
Tie plates (flat type), cents per lb.	2.15
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.95
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	$2.55
Sheet iron (24 gage), cents per lb.	2.85
Sheet iron, galvanized (24 gage), cents per lb.	3.55
Galvanized barbed wire, cents per lb.	3.25
Galvanized wire, ordinary, cents per lb.	3.15

Waste—New York

Waste, wool, cents per lb.	13.
Waste, cotton (100 lb. bale), cents per lb.:	
White	12.5
Colored	9.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	13.3
White lead in oil (100 lb. keg), cents per lb.	13.2
Turpentine (bbl. lots), per gal.	$0.57
Putty, 100 lb. tins, cents per lb.	5.725

Wire—New York

Copper wire, cents per lb.	19.875
Rubber-covered wire, No. 14, per 1,000 ft.	6.15
Weatherproof wire base, cents per lb.	20.875

Paving Materials

Paving stone, granite, 5 in., f.o.b. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd., delivered	3.25
Cement, Chicago, in carload lots, without bags, f.o.b.	2.05
Gravel, ¾-in., cu.yd., delivered New York	3.25
Sand, cu.yd., delivered New York	2.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	14.00
Light copper, cents per lb.	12.00
Heavy yellow brass, cents per lb.	8.50
Zinc, old scrap, cents per lb.	3.15
Lead, cents per lb. (heavy)	5.00
Steel car axles, Chicago, net ton	$16.75
Cast iron car wheels, Chicago, gross ton	14.25
Rails (short), Chicago, gross ton	18.50
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.25

Getting Down to FUNDAMENTALS

ACHIEVEMENT that is lasting can be built only on a solid foundation. A structure may serve its purpose for years but may not be fitted for the demands the future will put upon it. This is just as true in the local transportation business as in any other. Were this industry content merely to stay where it now is, the old foundation might serve. Almost certainly, however, the foundation used in the past will be unsuitable as a base upon which to build for the future, as the industry must do.

The cornerstone of the transportation structure is the franchise. Too often fundamentally unsound franchises are tolerated merely because of a time-hallowed sanctity attached to them. How best to change them to meet the needs of the future is one of today's fundamental problems.

OF almost equal importance is the fare structure. Practically no commodity other than local transportation is sold at a flat rate regardless of quantity. Determination of a proper rate structure involves far more than simply fixing the fare at a certain point. The time is ripe for a thorough analysis of the whole situation.

Similarly, a need exists for a national program of relief from burdensome taxes. While there are some isolated instances of progress toward more reasonable imposts, no concerted effort has been made toward this end. It is time to pause and take stock of the situation.

WHEN several forms of transportation are needed they should be co-ordinated to obtain best results. In those localities where electric railways formerly enjoyed a monopoly, a network of well-paved highways now provides ideal routes for bus operation. If the railways do not undertake this service, other interests undoubtedly will. The almost universal demand for rapid transit raises many technical and economic questions. Then, too, the place of the taxicab deserves careful consideration. Co-ordination implies more than common ownership of vehicles; the service rendered by each must be given its place in relation to the others.

No less fundamental in its way is vehicle design. In this age things are moving rapidly. Styles change. Much progress has been made in the endeavor to keep vehicle design abreast of the times, but the full possibilities are only beginning to be realized.

More and more the interurban railways are turning to the transportation of freight to augment their revenues. In this field, too, conditions differ much from those of a few years ago. The motor truck, properly used, can become an invaluable adjunct to the rail carrier in handling freight.

After the technical problems of providing the best possible service at a reasonable rate of fare have been mastered, the service must be sold to the public. The transportation industry must follow the example of others and merchandise its wares. Here again is a problem that demands fundamental thinking.

SOLUTION of nearly all these problems requires full understanding on the part of public authorities and the people of the community at large. Before they can be made to understand the transportation company's position, however, it is necessary for the transportation man so to study the problem that he himself has a full knowledge of the fundamentals. It is necessary to dig down deep to the basic elements. This consideration prompted ELECTRIC RAILWAY JOURNAL to select "Getting Down to Fundamentals" as the topic of this Annual Convention Number. In it these vital problems are discussed in a broad way. While no single formula is given to solve all the problems of the industry, the articles which it contains shed a clear light on the fundamentals involved. Upon the principles laid down by the authors the industry can build achievement that is lasting.

Preparing for Greater

By JAMES P. BARNES
President Louisville Railway, Louisville, Ky.
President American Electric Railway Association

IT IS not without significance that the American Electric Railway Association this year, for its 48th annual convention, returns to Atlantic City. It is there that have been born many of the new ideas and practices which have advanced us in the public service.

This year we come to a new house with a new vision. The house is larger and brighter than any we have known before. The city which is our host has matched the progress of the industry by building a convention hall in keeping with the spirit and courage of the transportation men who come to exchange their views, record their progress in the past year, and make their plans for the future.

Visitors who attend the convention surely will carry away a new impression of the enhanced facilities as well as of the magnitude and energy of our industry. They will realize that the business of carrying the people of this country has been conducted in a way that has been abundantly justified. As the visual impression obtained from this convention will transcend that of any convention of the past, so the inspiration given to those who attend it will be correspondingly higher. There is the same contrast between the old quarters in Atlantic City and the new as there is between conditions in the industry, past and present. We gave up the old quarters mainly because they were not so equipped that we could function properly. So we have given up our old attitude toward our conditions and our problems. In the past several years we have progressed because we have grown out of our old mental and physical housing.

It is only a few years ago that we had, right in Atlantic City, an animated discussion as to the advisability of entering the bus business. On all sides we were persecuted by jitneys and competing buses. We did not know just what to do. What we needed at that time was a better set of facilities for our riders in the way of cars, with buses in supplemental service. But at that time we did not all see the light. Now we have made our readjustment, and are reaping the benefits of wise additions to our facilities through supplemental bus service. Our action has demonstrated the wisdom of co-ordination as it now is being practiced generally.

Right now traffic congestion is giving us a great deal of concern. It is useless to rail at traffic congestion, as useless as to rail at the increasing use of the automobile. Ways to ameliorate the difficulties that have arisen because of it will be found. Our major problem is to adjust ourselves and our industry to a new order of civilization that is built upon new vehicular conveniences which have brought with them new traffic conditions. It has long been my conviction that the way to benefit a transportation property lies in benefiting the community which it serves. Hence, when it comes to dealing with traffic congestion, we should first of all think of the good of the community and, by serving that, reap the resulting benefits it will bring to us.

One of the greatest needs of the industry today is to get the viewpoint of the merchant. Of all our neighbors there is none with whom we should cultivate closer contact. Merchants and transportation men are interdependent to a large degree. Too often in the past each has kept aloof from the other. True, when danger threatens either one the other would extend a hand. But afterward each of us retreated into his shell. That was shortsighted. This year we are fortunate in having for one of our speakers a great Chicago merchant. If his coming results in bringing about closer relations between merchants and transportation men throughout the country that one result alone will be worth many times the whole cost of the convention.

This year the meetings will carry less burden of formality. Few if any of the speeches will be read; all will be concise. General subjects will be dealt with at the big meetings, and specific topics, of interest to a more limited number, will be discussed in group conferences. There is real meat in the program. We hope to accomplish a full day's work every day.

Following the report of the Advisory Council and the presentation of the Coffin Award on Tuesday night, there will be shown the most interesting series of motion pictures ever brought together. They will depict the progress of the transportation industry all over the world. They will give us a chance to observe and to compare conditions, and surely will leave impressions that can only be of benefit in our future endeavor.

We have found new quarters. We have brought ourselves into a new frame of mind. We have taken a new viewpoint. We have accumulated new energy. The watchword of this new convention will be "Let's Go."

Progress

By PAUL SHOUP

First Vice-President American Electric Railway Association

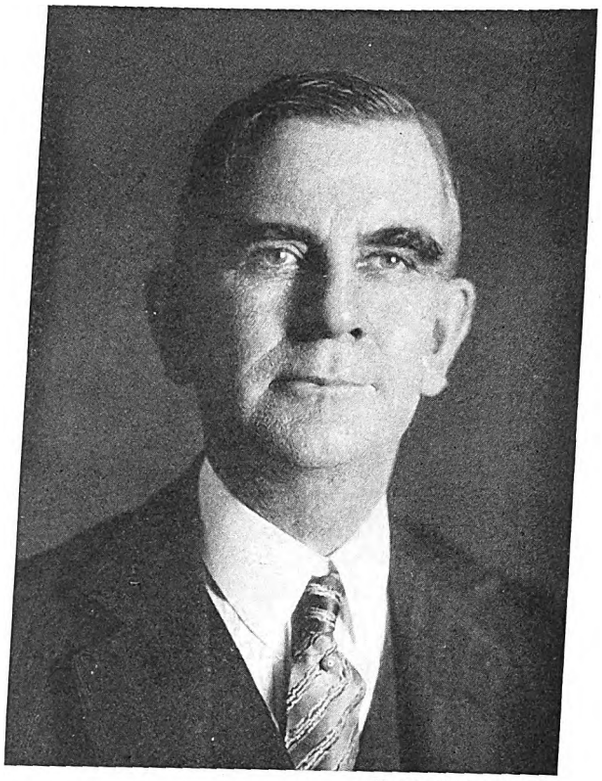

Photo by Blank-Stoller, Inc.

WHEN we of the electric railway industry think of basic problems we usually have in mind: (1) the increasing competition of the automobile; (2) community co-operation; (3) traffic control; (4) modernization of equipment and facilities; and, (5) the acquirement and retention at an equable charge of a sufficient volume of business to sustain the investments required by the industry.

Many theories aimed at the solution of these problems have been evolved and put into practice, only to be overturned and disproved. Some have met with pronounced success while other promising ideas are still undergoing the experimental tests of practical application. On the whole, however, we are justified in believing that a distinct advance has been made by the industry during the last ten years. To an impressive degree this advance has been furthered by a growing conception of the patron's desires, and by the whole-hearted effort which the industry has made to adjust itself to these desires.

That our relationship to the community is essentially a partnership to advance general development and prosperity is a fact that should be more widely comprehended. Harmful conditions, such as excessive taxation, poorly regulated street traffic, unwise competition of jitneys and various other unregulated carriers, all tend to restrict community development by limiting the ability of the electric lines to render fast, efficient and modern service.

The problem of street traffic control so that cars may operate more efficiently is being attacked in ways which give promise of satisfactory solution. Chicago, prohibiting automobile parking in the Loop, not only has increased sales for downtown merchants, but has reduced hazards of operation, speeded up street car service and increased patronage for the electric lines. In other cities the construction of pedestrian subways at busy intersections also has facilitated traffic.

Modernization of equipment and facilities, in spite of the large investments of new capital required, has been generally successful. Efforts to make the electric railway car comparable to the automobile in comfort and convenience are demonstrating their worth in increased patronage gained by electric railways which have made this admittedly daring experiment.

It may be stated that the one fundamental problem encompassing all other problems facing the industry today is that of acquiring and holding a sufficient volume of business to sustain the requisite investment.

The solution apparently is not to be found in a continual increase in fares and rates, for beyond a certain point losses in volume of business occur that would more than offset revenues derived from such upward revision of rates. Experiments have shown very clearly that no rate or fare increase will produce added revenue unless the revision is in practice accepted by the patron as reasonable for the service rendered.

If public desire and demand for service and comfort refinements is to be met to the financial advantage of the electric railways, we must look more closely into the industry itself to find the wherewithal with which to justify the required improvements.

Avenues through which further gains may possibly be made include: Reduction in inventories; standardization of equipment and facilities; elimination of non-essentials of every character; adequate equipment for peak hour movements; rigid economy of cars, mileage and intervals during sags; discontinuing expensive rejuvenation of already obsolete equipment; consolidation of departmental activities and elimination of overlapping duties and authority; conservation of time, material and effort in every channel of operation; education of employees in new methods and stimulation of constant effort to produce effective short-cuts in manual and mechanical practice, and intensive supervision of every activity, with the purpose of not only producing more effective and economical operation, but of winning the real co-operation of all engaged in the work.

Another very important step is the cultivation of better public relations so that there may be amelioration of the so-called "legal requirements" of communities, fewer demands for non-essential improvements, and a more friendly community attitude toward the industry.

At no time has the spirit of optimism which inspires and sustains the industry been so well justified as it is today. The trials and tribulations of a serious readjustment period are being successfully weathered. The outlook is hopeful and there is no reason to doubt that the electric railway is destined to win increasing recognition as an essential element in urban and interurban transportation.

Youngstown, Ohio, has just adopted the most modern franchise ever given a local transportation agency

New Era Beginning in

Electric Railway

By

LESLIE VICKERS

Economist
American Electric Railway Association

THE transportation man does not turn to the dictionary for a definition of a franchise. To him it is the fundamental of his business, the prerequisite of doing business; it is the compass that guides him or the rock that shatters him, according to whether its provisions are good or bad.

The electric railway industry is one of the oldest of the public utilities. It depends for its existence on the use of public property and only in comparatively rare cases does it own the land over which it operates. It needs to use public streets because that is where the public of a community calls for transportation. But, originally, because of the fact that it had to place its rails in the streets—a condition not imposed on other forms of transportation—it sought a "franchise," also called a "grant," a "privilege," a "location," a "contract" or a "permit." As the public street served as the foundation for the tracks, so the public franchise served as the foundation for the street railway business.

The hopes of the early transportation men ran high. There was spread out before them the vista of a great network of urban and later on of interurban railways. The prospective profits were so alluring as to cause them to give little heed to the details of the franchises or grants under which they were to operate. Indeed, in many cases they scrambled for permits and competed with one another in what they would offer to the public body from which they sought their certificates. Thus were the first millstones hung around their necks.

A typical instance of this strenuous competition occurred in New York City, following the passage of the famous Cantor act of 1886, which required competitive bidding for all electric railway franchises. Particularly desirable territory in The Bronx was under consideration, and bidding became so spirited that percentages of gross receipts pledged in payment for the franchise ran up to ridiculous figures. The People's Traction Company finally obtained the privilege by agreeing to pay the city, in addition to the 3 per cent required for the state, 95 per cent of the gross receipts. Needless to state no lines were ever built by this company.

The terms of the grant in 1906 to the New York & Port Chester Railroad required payment of $8,000 annually for the first five years, $13,000 during the next five years and $35,000 annually for the remaining fifteen years of the period, in addition to a payment, from beginning of operation, of 5.4 cents per lineal foot of single track of all kinds for the first five years, 7.7 cents for the second five years and 20 cents per foot for the last fifteen years of franchise duration.

Companies, for instance, accepted perpetual franchises, contracting to serve the transportation needs of a city for a "fixed fare" (usually the nickel) and embodying provisions for paving in perpetuity. But cities unexpectedly extended their boundaries, frequently to the dismay of the franchise holder. The value of the nickel, in terms of purchasing power, declined to less than half its previous rate, and in the march of progress the industry discarded its horses, the only disturbers of the

Digitized by Google

pavement. However, the railways were bound by franchises calling for a fixed fare and containing short-sighted paving provisions.

At the other extreme, and no less unfortunate and short-sighted, were those who accepted "term" franchises. Could they expect to get a reasonable return on their investment and their money back during the life of the contract? If they could all was well, but in most cases they could not and their dilemma was increased when public regulation became the vogue and their returns were strictly limited. Faced with the necessity of going out of business in a short time and accepting junk value for their property, there was no incentive to improve service, maintain equipment or seriously to cater to the transportation needs of the city. Often the only recourse was to go into politics and secure by the customary methods of that science a new lease of life. Much of the political oppression to which the industry has been subjected has come from the "term" franchise.

But no useful purpose would be served here by dwelling too long on the short term or the perpetual franchises. The former have mostly gone by the board because they did not guarantee continuous transportation service, and the latter because the perpetual alienation of the property of a body politic is now abhorrent to the present idea of social justice and civic procedure.

An Ideal Franchise should provide for:

1. **Indeterminate or terminable tenure.**
2. **Just compensation, in case of termination.**
3. **A reasonable return on a fair value through service-at-cost agreement.**
4. **A monopoly of common carrier transportation.**
5. **Relief from unfair and obsolete imposts.**
6. **City supervision or participation.**
7. **A fair share only of taxes.**
8. **The right-of-way for street cars.**
9. **Arbitration of disputes.**
10. **Flexibility of provisions.**

Franchises

The proper length of life of a franchise seems now to have been almost universally settled by the acceptance of the "terminable permit." This feature of a franchise is mentioned first of all because it is the most important. Given security as to tenure and given the assurance that the contract will be binding on both parties indefinitely while good behavior lasts, the first basic necessity or fundamental of a good franchise is secured.

Apparently the honor of granting the first indeterminate concessions belongs to the state of Massachusetts. But in that state no provision was made in the franchise for recapture by the public, and it remained for the state of Wisconsin in 1907 to incorporate a clause without which the Massachusetts procedure could never have gained universal favor. That clause was the one which makes provision for the municipality to purchase a public utility at a reasonable price, or fair valuation, or just compensation. Taken together—the right to do business indefinitely (while good behavior continues) and the right to expect a reasonable price for its property if taken over—these two provisions form the groundwork of most modern franchises, and have been accepted with almost universal approval by the advocates of municipal

In Toledo, Ohio, the Milner ordinance of 1922 has recently been amended to the great benefit of the city and the company

Digitized by Google

as well as those of private ownership. These principles have had the indorsement of as widely varying groups as the National Association of Public Utility Commissioners, the Investment Bankers Association of America, the American Bar Association, the National Municipal League, the National Civic Federation, and numerous individual advocates of municipal ownership, such as the late Delos F. Wilcox.

The advantages of these two principles are apparent to all. They serve to do justice to the public body which issues the franchise, to those who use the services of the utility as well as those who provide them, and to that increasingly widespread group of people who invest their savings in public utility securities.

The merits of this plan, under the name of the "Standard Service Permit," are summed up in vigorous language by J. W. Dana, lawyer, of Kansas City. He says:

The standard service permit, erroneously called an "indeterminate" franchise, is merely the right to exist and do business subject to all the laws of the state during good behavior and until purchased, condemned or taken for public use—a right common to all property owners, except a very few public utilities.

* * *

The standard service permit is approved by all courts . . . all public service commissions, all investors and utility owners, all statesmen, economists and well-informed consumers and citizens.

It is economically sound. . . . . It guarantees supervision, regulation and control of utilities and assures efficient and sufficient service at minimum rates. It equalizes the cost of the utility plant between the present and future generations . . . and minimizes the depreciation and amortization charges against the consumers. . . . It secures the investment against confiscation at the end of the franchise term, invites capital into the state and encourages business. It also affords ample opportunity for municipal ownership when desired.

It is the fundamental principle underlying the right of the state and the power of a commission to regulate rates. Without the standard service permit . . . all attempts at rate-regulation are fruitless and the power of the commission is an empty form without substance, for the reason that any rate ordered would be confiscatory of the investment and therefore violative of the federal Constitution.

In certain states there is still a constitutional provision against the granting of any other than a "term" franchise. Where this is the case the uncertainty of tenure can be offset by some such provision as the following, which appears in the franchise granted on May 22, 1929, to the Youngstown Municipal Railway:

The company shall have the right, whenever the unexpired term of this grant or any renewal thereof shall be less than fifteen years, to have sole control of betterment, extension and permanent improvement. For the purpose of creating an amortization fund the company is granted the right at any time, when this ordinance or any renewal thereof has less than fifteen years to run, to charge such a rate of fare, that, after paying operating cost, maintenance, repair and renewal and the same return on the capital value as is heretofore provided, sufficient reserve may be set aside annually so that such reserve, together with the accumulated interest thereon at the rate of 7 per cent per annum, shall be, at the expiration of this grant, equal to a sum corresponding to the then capital value as herein defined, less the estimated salvage value of said property at the expiration of this grant, and during such fifteen-year period the city shall have the same power as prior thereto, except as herein limited, and any disagreement as to the rate of fare to be charged and as to the amount to be deducted for such salvage value shall be arbitrated.

The company may, during any such period of fifteen years, use any part of such amortization fund to retire any bonded indebtedness, and at such time the then capital value shall be correspondingly reduced.

Present State Situation Regarding Terminable Permit Legislation

States in Which Favorable Legislation Now Exists	States in Which Neither Constitution Nor Statutes Prevent Favorable Legislation		States in Which Constitutional Provision Prevents Unlimited Grants, and Their Limits in Years		States in Which Legislature Statutes Prevent Indeterminate Permits and Their Limits, in Years	
California	Arkansas	New Jersey	Alabama	30	Arizona	25
Colorado	Connecticut	New Mexico	Kentucky	20	Florida	30
Illinois	Delaware	North Dakota	Michigan	30	Idaho	30
Indiana	Dist. of Columbia	Oregon	Mississippi	99	(For cities under commission form of government)	
Louisiana (Cities over 100,000)	Georgia	Pennsylvania	Virginia	30	Illinois	40
Massachusetts	Idaho (Except cities under commission government)	South Carolina (Railways not specified)			Iowa	25
Minnesota	Maine	Tennessee			Kansas	35
New York	Missouri (Terminable permit legislation for St. Louis only, vetoed by Governor)	Texas (If not contrary to City Charter)			Maryland	25
Ohio	Montana	Utah			Mississippi	25
Oklahoma	Nebraska	Vermont (Perpetual)			Nevada	20
Wisconsin	New Hampshire (Franchises perpetual)	Washington			North Carolina	60
		Wyoming			Rhode Island	25
					South Dakota	30
					West Virginia	50

The present state situation regarding terminable permit legislation is summarized in an accompanying table.

If it be granted that these two provisions—terminable tenure and just compensation for the property in case of termination—form the basis of an ideal franchise, then it is possible to proceed to an analysis of the other provisions deemed necessary for the successful operation of a public utility. Foremost among these is an expression in the franchise of the right of the utility to earn a reasonable return on its value—using that term in the sense defined by the courts of today. But not only must the right to earn such a return be expressed, but a means of doing so be definitely set forth in the contract. This is best achieved by a service-at-cost arrangement, though there are other methods that may be followed and are in fact in operation in several cities. The best known and probably the earliest service-at-cost plan is that embodied in the Tayler grant of the Cleveland Railway. The same principle was afterwards introduced in Chicago, Cincinnati, Philadelphia, Montreal, Boston and a long list of other cities. Originally the service-at-cost principle was inserted into the franchises, not because of a general need for increased revenue, but because of the imminence of the expiration of franchises and of the need for reorganization. But in the last ten years the service-at-cost principle has usually been conceded as a means of retaining public transportation services and of increasing revenue. (An excellent study of the earlier service-at-cost franchises was made by L. R. Nash of Boston and the findings formed the basis of an article that was published in ELECTRIC RAILWAY JOURNAL of Jan. 4, 1919. Reference should be made to this article for comparisons of valuation, supervision, taxes and imposts, fare schedules, cost of service, etc., in these earlier franchises.)

The rising costs brought about by the war and the establishment of a new level of prices after the war placed street railway operators face to face with the necessity for increased revenue. Some municipalities, insisting on the complete fulfillment of the contracts

Digitized by Google

entered into during much earlier days and under much different circumstances, found themselves faced with the loss of all public transportation facilities because the companies could not continue to operate indefinitely at a loss. Others took advantage of the situation to write into the new franchises a provision for service-at-cost, with a fixed and usually low rate of return to the company, and frequently on a scaled down valuation of the physical property. No longer was there any fear of the holder of a street railway franchise making too much money; the fear in the minds of the authorities was whether he could keep going at all without this modification of his permit.

While this economic situation was unfortunate in most respects, it brought two undoubted benefits in its train. The first was that it made many communities recognize the essential nature of their local transportation service and the second was that it disposed them towards fair and equitable dealings with the holders of the franchises. The result is today that in almost every city, even where service-at-cost franchises have not been granted, generous fare increases have been allowed in the interest of justice and of continued service.

The following cities have service-at-cost franchises in one form or another: Boston; Canton, Ohio; Chicago; Cincinnati; Cleveland; Columbus; Dallas; Detroit; Grand Rapids; Hamilton, Ontario; Kansas City, Mo.; Louisville; Memphis; Montreal; Pittsburgh; Rochester, N. Y.; St. Louis; Sioux City; Toledo, and Youngstown.

Negotiations are under way to provide a modern franchise ordinance in Chicago

It may be noted in passing that in the Youngstown franchise of 1929 a 6 per cent return is allowed on the present capital value and 7 per cent on all additions to capital. This is a healthy recognition of the essential part that capital plays in public service financing today and of the increasing cost of money. In addition to this there is a provision to the effect that the company may retain one-half of any excess above the permitted return after $100,000 is accumulated in the surplus fund of the company. This provision in the franchise is an encouragement to the company to operate with efficiency and economy.

Again, every franchise for the operation of a local transportation system should contain a provision for the maintenance of monopoly rights. It has come to be generally recognized that public services become costly under competition and that they can only logically be supplied through the services of a legal, regulated monopoly. It is easy to understand the fallacy of allowing two telephone companies to erect poles and establish exchanges in the same city; or of allowing two gas companies to dig up the streets, lay duplicate mains and compete for business. Likewise it is easy to understand the impracticability of allowing two street car companies to lay tracks in the same streets, or as a rule, to operate over the same tracks and compete for patronage. But the point has not been reached where the licensing powers are convinced of the fallacy of allowing any other public conveyance to compete with the established one, or of the desirability from an economic and service point of view of bringing all public transportation under one jurisdiction. But we are coming to it. Sec. 14 of the Saginaw franchise provides:

> The city agrees that . . . it will prohibit and prevent the operation of jitneys, buses and motor vehicles in competition with the service to be rendered hereunder by the grantee. The City Council shall, within the earliest possible time allowed by the Charter of Saginaw, enact such legislation as shall be necessary to provide for the elimination of all such competition. The city agrees that, during the term hereof, it will not permit or allow any jitney, bus or motor vehicle to operate in competition with the service to be rendered hereunder by the grantee.

There is no longer the same tendency on the part of local councils to grant franchise rights to bus operators to skim the cream off the business and so render the railway service more difficult to perform. The "jitney" menace, once so alarming, seems to have passed in most places. Even the newest development, the "flat-rate taxi," is looked at askance by licensing bodies, who have before them the records of disaster of this form of transportation. For "disaster" aptly describes their history. Purchased on a shoestring, operated without proper regard to the necessities for depreciation and maintenance reserves, they have nowhere established themselves as a reliable transportation service. But during all the time they have been allowed to run—usually until the junk pile claims them or the day's takings will not meet the repair bill—they have been sapping the life of the well-established transportation system and creating, at most, a nuisance value. Licensing bodies generally realize today that competition in local

Digitized by Google

Digitized by Google

Service at cost has been adopted in Cincinnati within the last few years. The excellent results are now becoming apparent

Whenever any street in which the company's tracks exist shall be paved or repaved, the company shall be assessed only that amount which represents the increased cost of paving foundation under its tracks in excess of what the cost would be to the city in paving in case there were no car tracks in the street.

In the case such cost shall be made necessary by the construction of extensions to the present lines of the company the cost of the same shall be added to capital value; otherwise the cost of such portion of the foundation of street paving and repairs shall be paid out of maintenance, repair and renewal account.

Of almost equal importance and coupled with this provision is one which reads as follows:

All expense of change in tracks, pole lines and paving necessitated by public improvements shall be borne by the city of Youngstown and paid by said city.

Such a provision is calculated to make the city authorities hesitate before they undertake improvements which will be costly to the transportation company. Where no such provision exists the railway can be saddled at almost any time with a burden which has nothing to do with its business, and the weight of which has been felt in reduced profits of many a company. This provision makes for security and security makes for service.

Another clause of the ideal contract should relate to the use of bridges, culverts, grade separations, etc., that are the property of or in control of the city. Under some franchises public bridges, used only in small part by the car rider, are paid for in large part by him. Electric railway cars are part of the ordinary transportation service of a city, just like the trucks, automobiles and horse-drawn vehicles. The only real difference is that they run on rails, due to the fact that they use flanged wheels. Without the flanged wheels they would need no special roadbed. The electric cars seldom constitute the heaviest vehicles that use a public bridge, and it is futile to argue that the cost of construction of the bridges is greater because of their presence on them. If the railways pay for the cost of installing the ties, rails and such immediate extra foundation as may be necessary, together with the overhead wires, that is all that justice or logic can call upon them to do. But some communities seem to want them to pay for the whole bridge if they can, or bear the whole brunt of the cost of a grade separation. A modern franchise should express not only an unwillingness to do so, but the definite duty and obligation of the city to assume this burden.

Although there may be some difference of opinion on the subject, it seems that a model franchise rightfully should contain a provision regarding city supervision of a railway's services and to some extent of its finances. This seems to be necessary, for, to a greater and greater extent, a tendency is developing to make the city a partner in the enterprise, and as a partner it should have some degree of supervision. The "public be damned" policy has been superseded completely by one of the "public be

Digitized by Google

served," and the unwise struggle between licensing bodies and transportation corporations has given place to the wise one of co-operation. The railway need not surrender its autonomy; it need not accept as an arbiter of its affairs and a director of its business a political appointee who will hinder and not help; it need not admit in even the vaguest way the right of the municipality to regulate its affairs. But there is a degree of city supervision which can be encouraged as the surest means of avoiding disputes and the quickest means of achieving such operating conditions as will allow the best service to be given.

This result is achieved under the Youngstown franchise by the following section:

> The company shall place and continue upon all of its lines cars and/or motor coaches of modern design, equipped and furnished with such improvements and appliances as shall be deemed by the city to be necessary and proper for the safety, convenience and comfort of the passengers and the public, and shall run such cars and/or motor coaches in such numbers and at such intervals of time (subject to the limitations hereinafter provided) and under such rules and regulations as the city may from time to time require, and shall cause such cars and/or motor coaches to stop at such places as the city may designate for passengers to leave or enter the same. The city reserves to itself the entire control of the service, including the right to fix schedule and routes, character of new cars and motor coaches and the right to increase or diminish service, but the commissioner may, pending the determination of any such question or questions by the Council, and to meet emergencies, temporarily approve changes in schedules and routes, but such schedules and routes so changed shall continue in force only until Council shall have otherwise directed. The right of the city to prescribe service shall not, except as by this ordinance provided, be limited in any way so long as the rate of fare in force and effect permits the company under the service prescribed to receive the full return provided in this franchise, but in case such service as prescribed prevents the company from receiving the rate of return provided herein, then and in that event the right of the city shall be limited to prescribe only such service as shall permit the return to be earned. Disagreement between the company and the city as to prescribed service interfering with such return at the rate of fare in effect shall be arbitrated in the manner herein provided.

Furthermore, under this ordinance, a city street railroad commissioner may be appointed by the Council, to be paid (after Jan. 1, 1930) by the city. His functions are set forth in the following section:

> Upon the taking effect of this ordinance the city may in any lawful manner suitable to Council designate a city street railroad commissioner. . . . The street railroad commissioner shall act as an adviser of Council of the city of Youngstown in all matters affecting the interpretation, meaning or application of any of the provisions of this ordinance and in all actions thereunder affecting the quantity or quality of service or the cost thereof or the rate of fare. He shall keep informed as to all matters affecting the cost or quantity or quality of service furnished, the receipts and disbursements, property and equipment of the company, the rate of fare and the vouchering of expenditures. . .
>
> The submission by the company to the street railroad commissioner of information concerning purchases, contracts, leases and other expenditures shall be only for informatory purposes, except in the case of transactions between the Youngstown Municipal Railway and affiliated or subsidiary companies of the same ownership. Such transactions, including the joint purchase of materials and supplies, shall be submitted to the city for approval in advance of their consumption.

Attention is drawn expressly to the first sentence of the last paragraph, which allows the retention of the full corporate rights of the company.

Some day electric railways may look forward to seeing a franchise which will explicitly classify street railways in the same category as schools, churches, hospitals, court houses and jails and which will, by this classification, relieve them of all taxation, or rather relieve their riders of all tax burdens which they bear as car riders. But this is too much to expect at the present. The best the transportation companies can hope for is that they will be relieved from discriminatory taxes and that they will cease to be used as unofficial though highly convenient tax gatherers for the cities. Who would defend today the provision of the Baltimore franchise which imposes a burden of 9 per cent of the gross of money collected on public streets by the street railways for the upkeep of public parks? The relation of the modern street car rider to a public park is a negative one—he seldom sees it and still less frequently uses it. But the man in the automobile drives through it and perhaps halts his car there to enjoy the lakes and the shrubbery paid for by street car fares. It is satisfactory to note that recent legislation in Maryland has now made it possible for the city of Baltimore to remove this anomaly.

Or who would defend the logic of having the street car riders in the capital city of the country, Washington, D. C., pay the wages of a large number of traffic policemen who direct 100 automobiles and more for every street car that they send on its way? These taxes and many others that might be mentioned are discriminatory to a degree and should no longer be tolerated. Franchises should provide that if riders are to be taxed as such, their taxation should be defensible and reasonable and based to some extent at least on benefits received. For certainly the principle of "ability to pay" does not prevail, since patrons are to a large extent drawn from classes that are unable to have their own private conveyances.

An ideal franchise in these days of crowded streets and swarming motor cars ought to contain provision for street cars and buses being given right-of-way over private conveyances. The street car provides mass transportation; traffic surveys in different cities have shown repeatedly that street cars transport approximately 80 per cent of the people who enter the downtown districts. It is unthinkable that the vast majority of the public should continue to be delayed and annoyed by careless motorists who use the car tracks and bus zones for their runways. A few cities have already recognized the rights of the car rider by either franchise provision or traffic ordinances, among them being the large cities of Cleveland and Philadelphia. In Baton Rouge, La., the franchise states:

> The cars of said railroad shall be at all times entitled to the track, and the drivers of vehicles shall promptly turn such vehicles out for the passage of the cars so as to leave the tracks unobstructed. . . .

The two larger cities regulate the right-of-way by ordinance, and all traffic policemen are instructed to keep the tracks clear of motor cars, with a resulting speeding up of street car service.

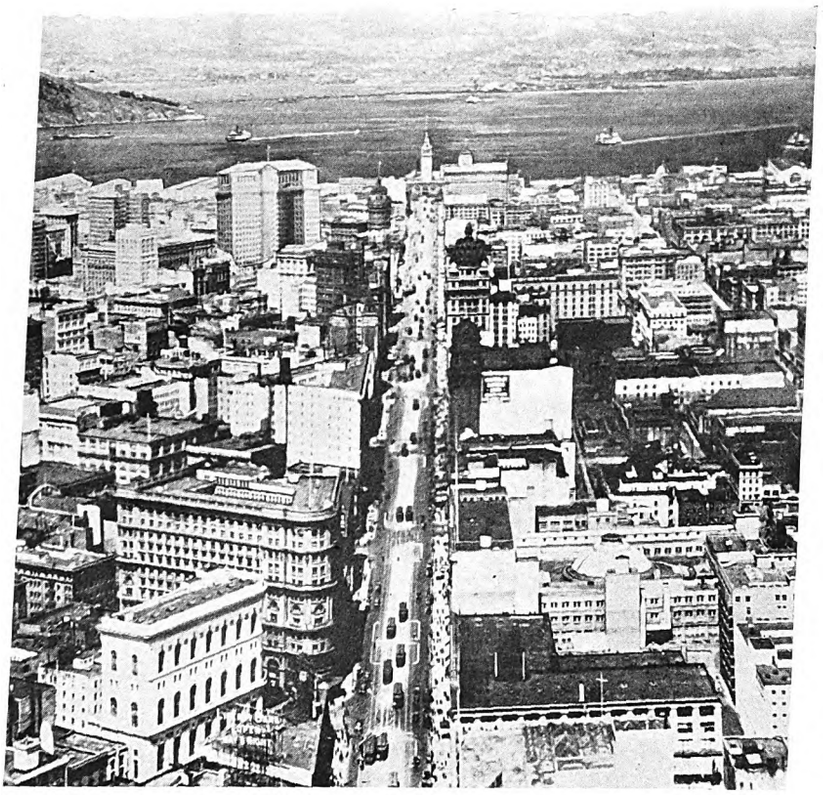
The right-of-way provision ought to be backed by a penalty, as is done in the Freeport, Ill., and Newark, Ohio, franchises, where a maximum fine of $50 is assessable for violation. Some companies, notably the Georgia Power Company in Atlanta, are attempting to educate motor car drivers to consider the street car patrons' rights. They use large posters illustrating examples of motor car drivers' carelessness and thoughtlessness in regard to street cars, displaying the posters prominently or publishing them at intervals in local newspapers. How effective these efforts are has not as yet been definitely determined; the fact remains that the sure way is to insist that new franchises protect the street car rights and back those rights with traffic ordinances and penalties.

An important provision of the modern franchises of Cincinnati, Cleveland and Youngstown is that which provides for the arbitration of matters not specifically covered by the franchises or disputes between the city

Digitized by Google

and the company. Such debatable subjects as increased fare, extensions, betterments and excessive taxation are excellent material for the consideration of arbitration boards. The most prevalent and probably the most efficient form of board is one which consists of three representatives, one chosen by the company, one by the city and a third by the first two. Provisions are included to prevent undue delay in forming the board and getting it into action. Its decisions are binding, and the board is empowered to set a time limit in which its findings shall be accepted and put into practice.

Such a provision for arbitration would do much toward removing antagonism and misunderstanding between street railways and municipalities, would prevent political manipulation by setting up definite machinery for disputes rather than haphazard or emergency methods, and would prove considerably more satisfactory than processes of lengthy argument and litigation too often practiced in the past. Arbitration is rapidly becoming recognized as the quickest, least costly and most advantageous method of settling disputes.



The four tracks on Market Street, San Francisco, are a direct outcome of the anomalous situation created by expiration of limited term franchises

Without question one of the most important features of any modern franchise should be flexibility. Railway franchises of the past and of the present are too often characterized by provisions unchangeable until the expiration of the agreement, or changeable at the expense of lengthy litigation and public misunderstanding. In the modern organization of business no such conception of a hard and fast contract, irreparably fixed for a long term of years, can be tolerated. Economic conditions change rapidly, and any industry, if it is adequately to meet new situations, must change correspondingly. Practically no other industry of major importance has had to face the inflexible contracts represented by franchises as has the electric railway industry; no other industry, with the possible exception of agriculture, has had to pay vastly increased costs of operation without being able to increase income accordingly, or, at best, battle desperately for mere existence. A franchise is nothing more than an operating agreement, and as such should be as flexible in its provisions as is possible to make it. Until such flexibility is an integral part of the agreements with municipalities and the state commissions, the industry will continue to be hampered in comparison with other business.

Without entering into a detailed analysis of franchises throughout the United States, it is almost impossible to state exactly what the trend of such agreements is. However, it is quite evident that, taking the country as a whole, a new era in street railway franchises has begun. City after city is becoming increasingly aware of the great importance of adequate transportation and is recognizing that if such transportation is to be provided the railway must be treated fairly. These more modern towns have, in many instances, already relieved transportation of unjust burdens, have granted increased fares and have shown an excellent spirit of co-operation. In less enlightened municipalities it is up to the industry and the particular railway concerned to make a real effort to educate the people, to insist upon fair treatment and recognition of the problems.

An example of the interest and attention which is being given electric railways is the recent legislation passed by the Legislature of Illinois, designed to facilitate the settlement of the Chicago transit problems. Bills were passed providing, in substance, for consolidation of all rapid transit companies, a terminable permit with purchase by the city in case of termination, a city regulatory commission, and for subways to be built by the city and operated by the company. However, since no definite franchise has yet been worked out, it is too early to discuss the final results of this legislation.

It is impossible in a limited space to give more than an outline of some of the desirable features of an ideal franchise. The foregoing is offered for the benefit of those who are interested in new franchises and the trends indicated by the provisions of more recent agreements. The chief points to work for, if franchises are to be modern and comprehensive in their scope, have been given. The writer fully realizes that some of the ideas are controversial, yet believes that most students of such problems will agree and will recognize that modern conditions make modern features necessary. In summary, a franchise should provide for: (1) Indeterminate or terminable tenure; (2) just compensation, in case of termination; (3) a reasonable return on a fair value through service-at-cost agreement; (4) a monopoly of common carrier transportation; (5) relief from unfair and obsolete imposts; (6) city supervision or participation; (7) a fair share only of taxes; (8) the right-of-way for street cars; (9) arbitration of disputes, and (10) flexibility of provisions.

Recognition of the need for co-ordinating all facilities is shown in the plan for the new $40,000,000 Union Terminal in Cincinnati, which will provide facilities for street cars, buses and taxicabs as well as the railroad facilities

Co-ordination of

Community Transportation

a Great Economic Problem

By

C. E. SMITH

Vice-President
New York, New Haven & Hartford Railroad
New Haven, Conn.

Although the importance and fundamental soundness of co-ordination are being recognized more and more by transportation leaders the problem is still receiving too little attention

IN THE present age, when practically all business activities are tending toward consolidated effort and the advantages are so generally recognized that the results are anticipated far in advance of realization, any discussion of community transportation co-ordination may seem superfluous. It is true that local transportation facilities have been co-ordinated in many cities, but there is still much to learn about the problem. It is also quite important that there be a more fundamental grasp of the essential features of the several phases of transportation problems.

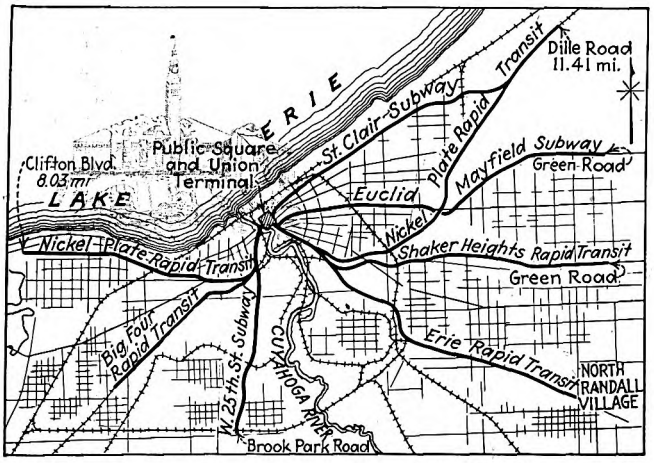
With the possible exception of the application of power to present-day requirements, no other agency of civilization begins to have the importance that transportation has, whether it be considered as a specific means of moving men and material, or in its secondary effects in eliminating distance, and thus making practicable so many of the advantages of the time. It might be thought that the desirability, not to say the necessity, of co-ordinating the various forms of transportation, and the facilities over which the movements must be made, is quite obvious. Yet, surprisingly little attention has been given to the subject, and in some instances where apparently there has been at least a measure of co-ordination it will be found that this appearance is due more to chance than to any carefully developed plan.

There are today comparatively few communities where the proper relations and fields of the various agencies of transport, or the facilities through which they operate, receive any consideration other than that applied to each individually, and then only for the particular problem which at that time has drawn attention to needs or shortcomings.

On the other hand, there is scarcely a railroad system that was built as a single entity; most of them are consolidations of numerous lines that were formerly disjointed and in many cases competitive. The benefits that followed their consolidation, and that still flow to the community, are too real for argument—none would go back to the old conditions. Surely the communities served by the Pennsylvania Railroad would prefer the service of that system as now constituted to the best service that could possibly be rendered by the hundreds of corporations of which it is formed.

The same is true of the local transportation facilities. The street railway systems in practically all large cities were formed by the consolidation of numerous lines that were formerly independent. Surely no one in any large

Digitized by Google



Rapid transit lines proposed in the recent Brinckerhoff report for the Cleveland Railway all radiate from new Union Terminal

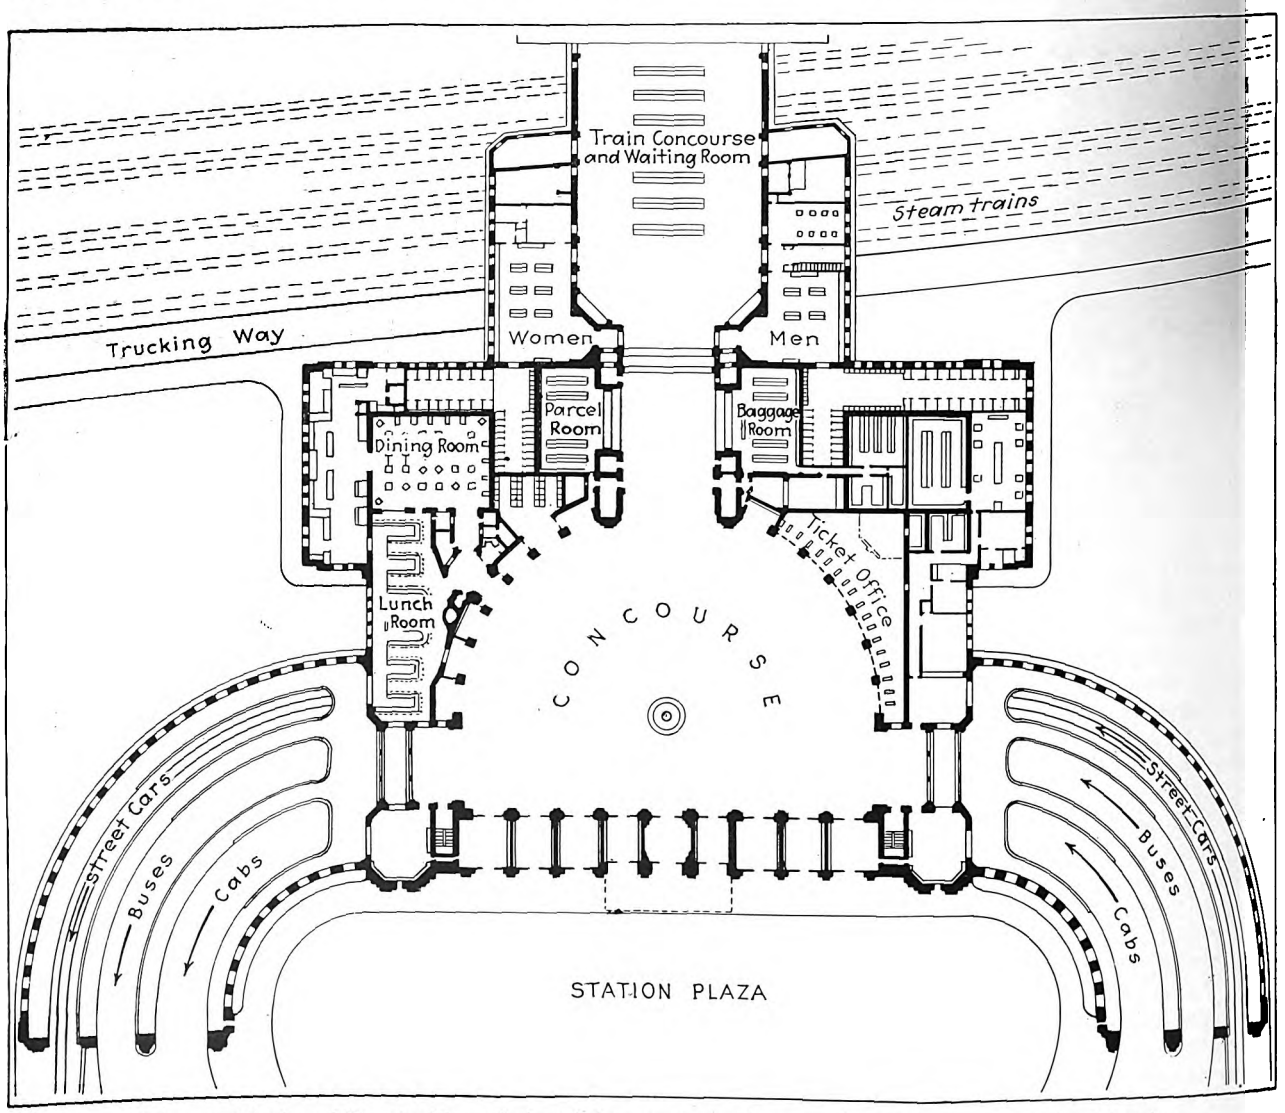
city would prefer the service that could be rendered by the numerous formerly independent street railway lines to the co-ordinated transportation provided by the consolidated systems.

Even in New York City, Washington and San Francisco, where co-ordination of local facilities has been delayed, the problem will not down, but is ever present. The co-ordination of transportation services in those cities has been given continuous attention for many years but has not been accomplished because the problem was not understood properly and because a doubt existed as to how the desired results might be accomplished.

The Chicago Surface Lines constitute one of the best examples of complete co-ordination of surface facilities without actual consolidation of the companies. However, there is further opportunity in that city for consolidating the surface lines with the elevated lines, the motor buses and future rapid transit lines. Boston presents a good example of complete consolidation of all forms of local transportation with the exception of taxicabs, and Philadelphia has gone a step further in including taxicabs in the consolidated system. In both cities, motor buses, surface street cars, elevated and subway lines are operated as one, with results beneficial to all.

In all cities where there has not been complete co-ordination of all agencies of local transportation, the problem has been one of the most important and most engaging in the community. The benefits have been taken for granted; the doubt and delay have related entirely to *modus operandi*. And yet, before the first phase of consolidation has been completed in all cities, there are signs that the fundamentals will be lost sight of merely because other agencies of transportation have become available.

The trend toward consolidation and co-ordination was



The new Cincinnati Terminal is so designed that street cars, buses and taxicabs may enter the right wing, unload and load passengers under the main concourse

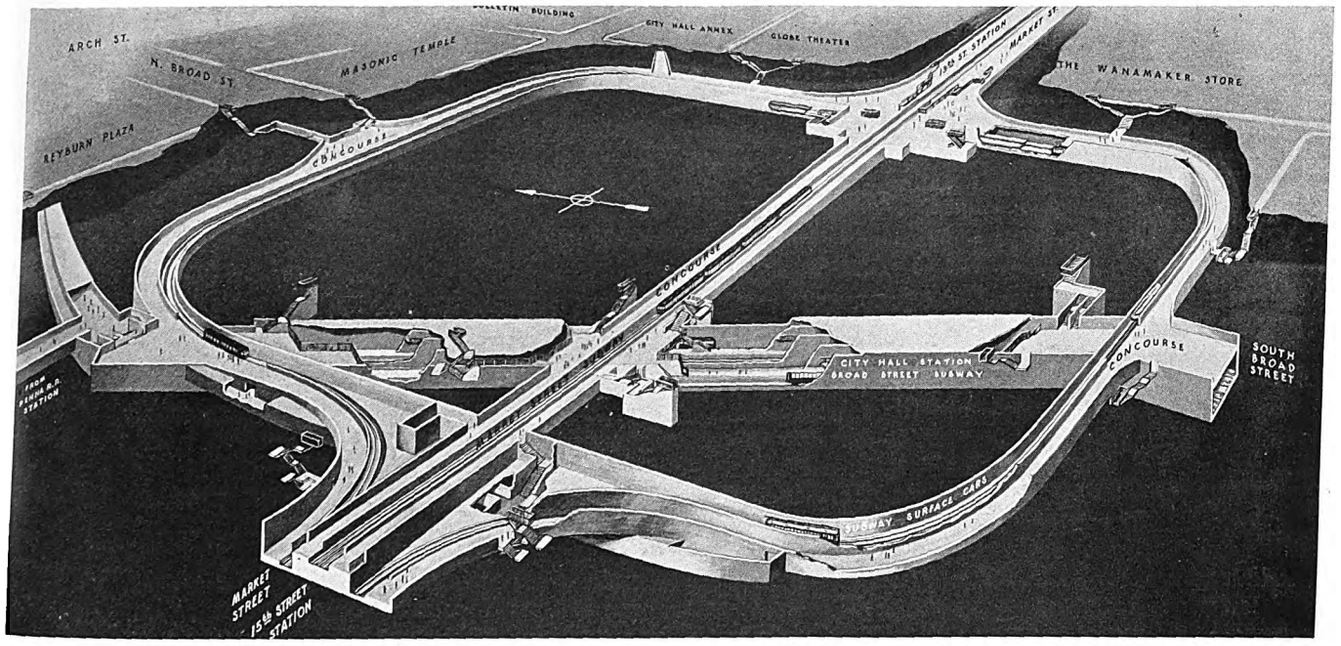
Digitized by Google

not interrupted in the progress from the omnibus through the horse car and cable car periods to electric street cars and the rapid transit lines at Boston and Philadelphia. There is no reason why the trend should change now merely because of the advent of the motor bus, nor because of the need of additional rapid transit in the larger cities.

Fundamentally the problem is the same now as when the other agencies were co-ordinated. Motor bus operation and rapid transit facilities should be tied in with all other agencies. The problem never should be considered as that of street railway *or* motor bus—it is street railway *and* motor bus. The same is true of rapid transit—not rapid transit *or* surface systems, but rapid transit *and* surface systems.

In smaller cities, the minimum and maximum size of transportation agency to a feeder and distributor. If the locations of the latter do not meet these latter requirements there results either heavy outlay in relocation, or if for any reason the desirable changes are not made the service is under a more or less serious disadvantage. It is equally important that surface systems be planned to co-ordinate with future rapid transit lines as that the rapid transit lines be planned as the trunks of the surface collecting and distributing systems. Bus lines, with no fixed property in the street, are readily shifted, but the cost of track changes will be heavy. It is not a case of "off with the old and on with the new," but the new should be added to the old and the two co-ordinated in such a way that the best and cheapest transportation can be rendered.

Rapid transit lines as and of themselves would per-



When the comprehensive Philadelphia City Hall project is completed, passengers arriving by the rapid transit lines or the steam railroads can walk underground to any of the other systems or to points several blocks distant

which may be open to argument, the motor bus is admirably adapted to furnish the entire local transportation. In larger size cities the motor bus is indispensable as an adjunct to the street railway system to serve sparsely settled exteriors, crosstown service and other auxiliary service. But the street railway will remain the backbone of the local transportation system, particularly where heavy peak loads must be handled in and out of business districts, and to and from industrial areas. Motor buses can perform their best service in collecting and distributing traffic for the faster heavy traffic street railway lines and in supplementing street railway service in a number of ways.

In still larger cities, where the traffic of all sorts gets so heavy that surface street cars can no longer perform service satisfactorily within certain areas, rapid transit lines above or below the surface should supplement other agencies and not supersede them. How essential a rapid transit system is to the city lacking such facilities depends upon many local factors, and pending its construction surface lines and buses must function in its stead. Sooner or later, however, the time comes when the economics of the situation demand the higher speed facility, thereby changing what had been the main form but little service in either city; they can perform their best service, as has been demonstrated in Boston, as trunks for the surface systems, deriving their traffic with the aid of the surface feeders and distributors. A similar solution is indicated by the observations of all who have studied the needs and future of transportation at Chicago, Pittsburgh, St. Louis, Cleveland, Detroit, Los Angeles, San Francisco and other large cities. The conclusion is no different for New York City, where all students of transportation believe that co-ordination and unification of all agencies is not only desirable but necessary. In the latter city the desirability of co-ordination was recognized by the New York Legislature and directed by statute in 1921.

The development of separate agencies of transportation leads to unnecessary duplication of investment and service, is wasteful, costly and less satisfactory than when service is rendered by one agency. Separate agencies cannot render as good service to their respective parts of the traffic as the consolidated facilities can render to the whole traffic. Unsatisfactory service and increased costs are inevitable unless there be co-ordination.

The situation as to local transportation is not different

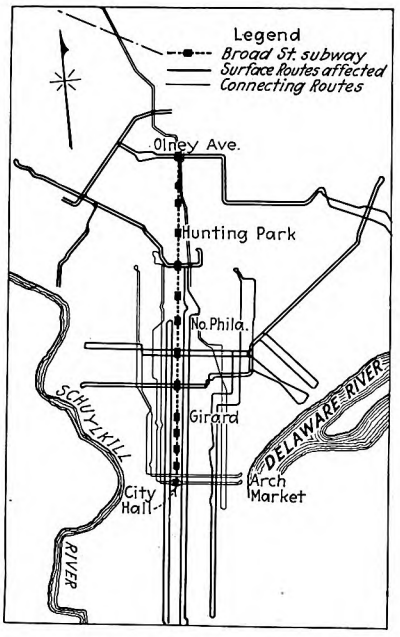
Digitized by Google

fundamentally from that of other community utilities. Who would favor more than one water system, sewer system, electric light and power system or gas system in a city? Are there any who believe better and cheaper service can be given the community by several such systems than by one co-ordinated consolidated system? The only logical answer can be given to the same question as to local transportation — there should be but one.

It is only comparatively recently that even the most advanced states have recognized the interdependence of the various agencies of transportation, and by bringing them under common regulation, have forced a measure of co-ordination by preventing undesirable competition.

Unfortunately there is relatively little recognition of the broad relationship between transportation and city growth, either in city planning or in the development plans of local transportation companies. The city planner has a very definite interest in community transportation co-ordination. One of his major problems is to plan the city so that its inhabitants can get in and out and move from place to place with the least loss of time and at least cost, and in accomplishing this to promote the orderly, symmetrical development of the city.

He can bring about a lopsided city by providing better street and transportation facilities for one section than for another. He can bring about a lopsided city by providing for a faster transit line to one district, or in one direction, than to another. In such cases, the districts favored by wider streets and more direct transit lines will build up and become congested while other districts much closer to the center, being less attractive from a transportation standpoint, will languish. Such developments having been haphazard rather than studied in the past, practically every city affords a good example of unbalanced and lopsided development. New York is probably the outstanding example. Districts far out are congested because they were favored with rapid transit lines, while attractive residential sections much closer in are practically undeveloped because of lack of transit. The same is true in a measure of Philadelphia. Chicago presents a slightly different picture because of its transit lines that radiate from the hub, giving practically all sections of the city equal transportation, although even there congested developments will be found along the suburban railroad lines, while areas between them remain undeveloped because of less satisfactory transportation.



New routing of car lines in Philadelphia to co-ordinate surface facilities with the Broad Street Subway

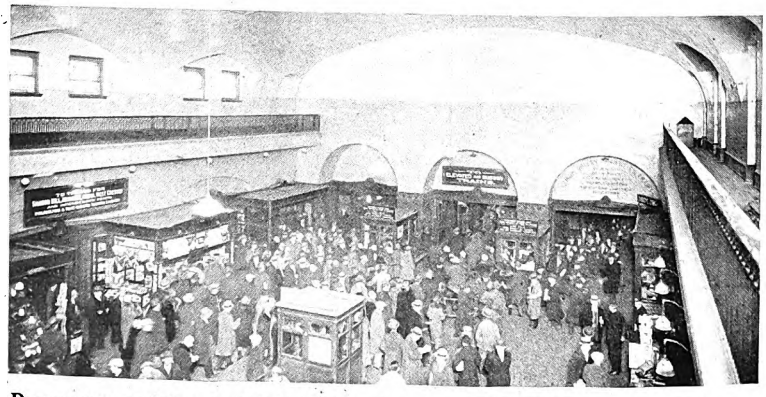
Boston is possibly the best example of systematic planning. There a more orderly development has been brought about by projecting rapid transit lines through congested districts relatively short distances in all directions; street car and motor bus lines radiate like the branches of trees from strategic intermediate points and from the ends of the trunk line rapid transit lines. The result is a fairly uniform growth outward from the hub, no untoward congestion in any direction nor undeveloped sections intervening. The same treatment and results are indicated elsewhere. But such results can only be secured by co-ordinated transportation where heavy traffic trunk lines, whether on the surface or separated, are developed satisfactorily to handle transportation where it is dense and heavy, and other transportation facilities to serve outer and intervening areas throughout the lighter traffic areas. There can be no thought of competition here. Co-ordination is the only answer.

City planners must recognize that private automobiles cannot perform all or any large part of the local transportation, regardless of the extent to which streets may be widened and parking places provided. The space occupied by automobiles that carry an average of less than two passengers each is a sufficient reason. If all those who enter and leave the business district of a large city each day could be transported in automobiles, the entire area of the business district would not suffice to hold them, nor could there be built sufficient streets to handle the number. All cities are learning that large expenditures for street widenings and new streets do not improve transportation in general in proportion to the cost.

On the other hand, few cities can afford separated rapid transit lines, as the cost would be prohibitive and the fare forbidding, except in the larger cities. Nor can the cities depend entirely upon the steam railroads to provide transportation by suburban trains.

Both these extremes being out of reach, the communities must depend upon some other form of mass transportation on the surface; the cities and the transit facilities should be so planned that the people can be transported most quickly, comfortably and cheaply, not in the interest of the transit companies that perform the service, but in the selfish interests of the people that must use and depend on the service.

When streets are widened and cut through to expedite traffic, particular and controlling attention should be given to the transit lines. Spaces



Passengers arriving in Philadelphia by the Philadelphia & West Chester Traction Company, the Lehigh Valley Transit Company or the Philadelphia & Western Railway can transfer at the 69th Street terminal to the Market Street elevated and reach the center of the city in a few minutes

Digitized by Google

should be set aside for them where necessary so they may function properly without interference of and by other traffic. Under present conditions the movement of 50 people in a street car is subordinated to the convenience of two in an automobile. Manifestly the 50 should have 25 times the consideration of the two.

In the very large cities it becomes necessary to look beyond the limited area served by the local transportation agencies, and into the suburban areas that must be served by fast rail lines. As all railroads cannot be consolidated, this service will necessarily have to be performed by or on more than one railroad. The railroads themselves have recognized the advantages of co-ordination in handling passengers by gathering such traffic into one or more union stations, the location of which and the density of travel through which favor further co-ordination of local transit lines.

In every large city transit lines center at union passenger stations to afford quick and frequent transportation locally, although it is thought that much more can be accomplished by definitely planning such co-ordination for the quick and convenient transfer of passengers between them than by the haphazard manner in which it has grown up in the past. The most lasting impression one carries when traveling is the long walk and inconvenience of transferring between railroad trains and local transit facilities, much of which might be avoided by proper planning.

However, some good examples of co-ordination of the local transit facilities with the railroad passenger stations are indicated by the intersection of rapid transit and surface lines at the North and South Stations at Boston, and at the railroad stations at New York City, Philadelphia, Baltimore, Washington, Detroit and Los Angeles. The new Union Terminal in Cleveland, rapidly nearing completion, and the new Union Passenger Terminal of Cincinnati, the plans for which were recently made public, are also striking examples of wise planning to tie in the steam road and local facilities. This principle is further exemplified at the Grand Central and Pennsylvania Stations in New York City, both of which were controlling features in the location of the east and west side trunk subway lines there.

Just how far co-ordination of suburban service can go is a deep question. The railroads that perform that service also perform long distance passenger as well as local and through freight service, which under the spirit and letter of the transportation act must be so conducted as to preserve competition in full vigor. Signs are not lacking that something may be accomplished even here, and there is evidence that railroad men are giving more attention to this subject. At Boston, the Rapid Transit Commission has converted a railroad branch into a rapid transit line co-ordinated with the local transit system. At New York, a suburban transit system to consolidate all the suburban transit lines of the railroads under one company has been proposed, with trackage rights over the several railroad lines, and including trunk line distributing and collecting subways on Manhattan. The mechanics of such a co-ordination are quite readily understood; the question here is primarily one of economics. No doubt, facilities can be devised on which excellent service can be rendered, but can't it be done at a cost that will satisfy the patrons?

In every instance of improvement, extension and co-ordination of transportation facilities and service, property within the influence of such transportation increases in value. The aggregate amount of such increases is enormous and suggests the thought that has been given effect in legislation in certain instances that a portion of such increases should be taxed to pay for such parts of the cost as the patrons should not be expected to support.

There is a close economic relationship between the railroad terminals of a city, its local transit facilities, its street layout, its traffic problems, its property values and the trend of its development. In a comparatively few cases this fact has been recognized and due weight given the several elements in planning and in carrying out the development plans of the railroads, the local transportation companies and the city, but in the majority of instances there is little or no co-ordination, each group concerning itself only with its own particular phase of the matter.

It is, however, absolutely necessary that these interests be brought into line if the community is to have any really satisfactory transportation. Not only should it be possible completely to harmonize all the street traffic, but by virtue of such improvement a number of serious civic problems growing out of present conditions will be materially simplified if not entirely cleared.

Persons not wishing to drive into the center of Philadelphia can leave their automobiles at this large parking area operated by the P.R.T. and take the Market Street Elevated at the adjoining 69th Street terminal

Present Trends and Future Demands Determine

City Development

By

J. ROWLAND BIBBINS

Consulting Engineer, Washington, D. C.

Area Having an Assessed Land Value of $10.00 per Sq.Ft. or More

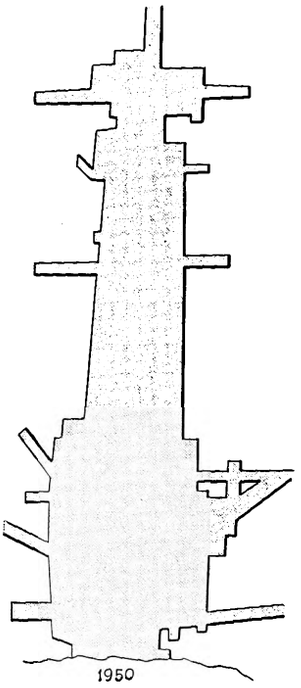
Business district of Detroit in 1926 above, and its probable extent in 1950, at right

CITY building is zooming ahead—logical or illogical, economic or uneconomic. But what about transportation and other utility services—are they keeping pace? This question is a difficult, if not impossible, one to answer, unless a thorough study of the present trends and demands is made. Much of the present difficulty in securing proper city development and adequate transportation facilities to meet the insatiable demand of population growth has been because many city governments and transportation agencies have been too inactive in evaluating these present trends and the clear demands of the future.

In the meantime, long-haul population has taken the steering wheel in hand and developed a means of private transportation, which, in Detroit, for example, appears to have absorbed about one-third of the normal fair weather riding habit, leaving the mass transport agencies to get along on the remaining two-thirds—that is, about the same passenger riding habit as in pre-war days.

But already it has transpired that private transportation has encountered its own fatal limitations through the combined effects of inadequate street capacity, the slow down of improper traffic signaling, the lag of requisite central garaging, delay in instituting equitable traffic regulations, etc. And so the demand is swinging back more and more to rapid transit, regardless of the fact that, without sufficient population density, rapid transit cannot be self-supporting under reasonable fares except by spreading the cost burden more equitably between the present and future by some amortization plan like benefit assessment. In the last analysis, however, the benefit assessment levies only upon the quick turnover of speculative builders or realtors and is relatively no burden in the long run upon stable property holdings. What this quick turnover may mean will be apparent from a study of the potential growth and land values.

Such a study was made in connection with a "Building Construction Forecast" made for the Detroit Edison Company by the writer, under the auspices of the Department of Engineering Research, University of Michigan, Prof. J. H. Cissel and N. B. Hubbard, engineer, Detroit, collaborating. The purpose of the survey was to determine whether the utility services were keeping pace with the city building, and to guide the Detroit Edison Company in planning a rational development program. A year's study of Detroit's population, commercial growth and future "central district" revealed definite laws of growth that were used as a basic approach for an economic forecast of urban building and service facilities.



Area Having an Assessed Land Value of $10.00 per Sq.Ft. or More

Study of population, commercial growth and future central district reveals dependable laws of growth and an unusual basic approach of forecasting what the city of the future and its demands will be

One of the most striking results of the "Survey Forecast" is that there is a basic per capita demand for building cubage (floor space) not only in the central office district, but also outside. This is true also of utility services for those districts. This demand is growing almost mathematically with the population, differing in "index number" according to the district, but always following a law. In the same manner, total transportation demand or "riding habit" is mounting upwards generally around the "Law of the Squares," whether by rail or rubber. This is all-important. And because of this definite trend it appears that the problem of forecast is to determine the demand rather than the means of utility supply.

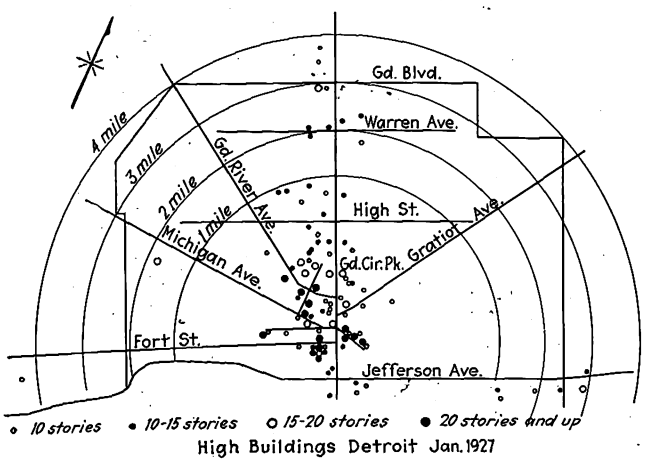
New York City serves to illustrate one difficult phase of forecasting, namely, that of forced development on

Digitized by Google

Detroit's rapid development in its central business district seemed for a while to present a problem. The development of wide surrounding areas, however, is now tending to check concentration at the center

the one hand versus under-development on the other. Scanning the horizon from the top of the Chanin Building, one sees to the south the mass-pyramid of the old financial center, devoted exclusively to offices, and abortive pyramids at 23rd Street and 34th Street. But to the north is the high pressure development of 42nd Street at Times Square and Grand Central, and further north is the rapidly rising cubage at 57th Street. Still further north are the two "mountain ranges" on either side of Central Park.

The significant factor is that in the Grand Central District there has been built more than half as much office building cubage as exists in the old financial district of lower Manhattan, but with this important difference—that the uptown offices are superimposed upon a solid retail district with a tremendous residential cubage in hotels and apartments. Here is food for thought—this new massing of both day and night population. For mid-Manhattan is no more self-contained than before, that is, within walking distance of home and office. Transportation and traffic facilities are still required and superimposed upon those of former days, with obvious results in over-saturation of both subways



Location of all buildings over ten stories in January, 1927 (one-quarter scale outside of 1-mile zone). Of 22,500,000 sq.ft. gross floor area, 12,500,000 sq.ft. is in the 1-mile zone

and suburban services. The resort to individual transportation by taxicabs only aggravates the congestion.

This economic hiatus of a city, unprepared for forced development, reveals itself in street speeds. Recent mid-day speed logs taken in Manhattan show the following results:

Fifth Avenue—8 m.p.h. south of Central Park, 12 m.p.h. north.

Park Avenue—10 m.p.h. south of Grand Central, 14 m.p.h. north.

Traffic crest speeds on the avenues—Running to 25 to 35 m.p.h.

Crosstown—Almost walking speeds, for example, 3 to 4 m.p.h. on Fourteenth Street.

The proof of the pudding is in the eating. This is hardly modern efficiency. New York is building a three-deck city of troglodytes—stores, offices and tenements—only to repeat the old accustomed drift to a new "town pump" without sufficient "watermain" facilities to supply the pump. Skyscraping, like sky-writing, is dangerous business; and for the great mass of building cubage, the economic balance between investment, rental, obsolescense and return is found to operate inflexibly and to expand the "town pump" district rather than contract it by forcing it further skyward.

Surrounding Potential Areas Preventing Over-Development at Center

Detroit's rapid development seemed to present parallel aspects but the survey-forecast has shown a possible solution. The old "town pump" will still function, but the economic vacuum of the wide surrounding potential areas (not geographically restricted as in New York) is already operating to check over-development at the center by the logical process of the law of diminishing returns, except for speculative buildings, monumental in character, which pay their way through their advertising value.

An airplane view over Detroit is striking evidence of this, showing the small central pyramid around the City Hall but also, far to the north, new cubage rising incessantly along Woodward Avenue and parallel streets. Even on Grand Boulevard, 3 miles away, there is an important center, with the largest office building in the world and other high-pressure developments close by. This Boulevard sub-center, however, has been admirably located on two widened boulevards in both directions. Here, then, is in evidence both the old and the new, furnishing one important approach to the forecast, differing entirely from conditions in Manhattan.

The specific problem in Detroit was to estimate by five-year stages, 1925 to 1950, the probable building cubage of the future so-called "business district" in 45 sub-districts or zones of different business characteristics, and in seven different building classifications. This potential central district of the future covered about 550

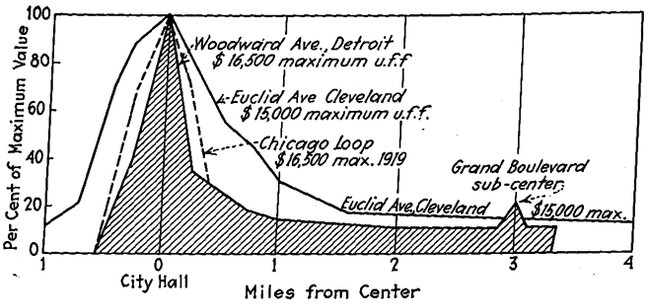
Digitized by Google

city blocks in a rectangular plot 1 mile wide and 3 miles long centering on the main axis, Woodward Avenue, already designated for Detroit's first subway trunk.

For such a dynamic industrial center, a reasonable population forecast required careful examination into the broad economic picture of the city's growth from the old historic city of 1900, proud in its conservatism, to the now revitalized industrial community with its traffic-ways carrying a motor load of nearly 400,000 automobiles, business bursting through its old boundaries, sub-centers springing up here and there, and whole communities, some of them speaking a different language, surrounding the great industrial establishments. Yet in the rapid commercial turnover of a decade it is significant that more than half the commodity value of Detroit's production now rests upon diversified industry other than automobiles and accessories. Here indeed are most evident the opposing centrifugal and centripetal forces of urban development—the "pull" of outside realty against the central realty.

Economic Relation of Land Values

Deeply imbedded in this economic struggle is the problem of taxation and of the high building or skyscraper. Already 10,000,000 sq.ft. of high building floor area exists outside of the present downtown central zone I, as compared with 12,500,000 sq.ft. inside of it (ten floors and above). Detroit's future district population, all things considered, was estimated to be 1,640,000 people in 1930 and 2,750,000 in 1950, which forecast approximates Chicago's vital experience in a corresponding industrial era. This estimate set against similar vital experience of other cities when of Detroit's present size, and taking into account their "personal characteristics," appears rational and probably conservative. It means doubling Detroit's present population between 1925 and 1950.



Comparative profiles of values along the main business axes of Detroit, Cleveland and Chicago, in per cent of maximum values

On this next question available experience and statistics are nil. So the problem was attacked *de novo* from the basis of land value. It was found that in urban experience throughout the country an astonishingly rational relationship exists between growth of land value and population, that is, land value and building cubage increase with population by economic law. Some economists question this, but New York, Philadelphia, Cleveland, Detroit and other smaller cities have followed a parallel trend. The historic trends of some 20 or 30 "key blocks" in Detroit selected for detailed examination were similar also. Thus central land values in Detroit

Michigan Avenue, Chicago, with the tallest of the city's skyscrapers in the background. The Loop District of the city, with a few tall buildings on its edge, shows the tendency toward concentration of business activity

Digitized by Google

are increasing about as the first power of the population, and outside values as the second, third or even fourth power, according to distance.

From this fundamental economic relation future land values throughout the entire survey zone could be predicted, using reasonable judgment and local knowledge of "district" characteristics and making allowance for known land value enhancements due to city planning, major highways and projected rapid transit.

Thus more than $1,100,000,000 in land value alone will be added to this "central district" by 1950, nearly 3½ times the 1926 value. In the process, nearly 16,000,000 sq.ft. of residence land area will be converted to business. This increase in value gives some conception of the propriety of benefit assessment justified in providing transportation facilities to serve this tremendous cubage increment. It is obviously an error to assume that the same result will be produced by city-wide taxation, for if the increased tax revenue is simply "covered into the city treasury" it will inevitably be dissipated in dozens of public projects other than transportation, which is the primary source of the increased value and so vitally needful.

While there are no comparative statistics over a long period on the underlying demand per capita for stores, apartments, etc., the record of office building floor space is very clear and the analysis shows that this also follows the "goose-step" of progress not only in Detroit but elsewhere, as in Chicago and Cleveland. This is known to be true of all other utilities as well as school facilities. The ratio chart clearly indicates this absorption rate.

Determining the Permissible Load Upon the Land

Further technical studies of probable building cubage properly reflecting land value and population growth developed a rational conversion formula for all of these economic factors into building cubage. Here the experience of the Building Owners and Managers Association, architects, engineers and builders proved most effective. Questions of efficiency of design, construction methods and cost ranges, amortization rates, and last but not least the probable effect of zoning height limitations, all were deeply involved in the problem. But they all fall within reasonable economic limitations.

From the preceding it is clear that the survey-forecast is a combined picture of historic trend, economic law, engineering experience, construction practice and local judgment. Mathematics and theory alone would not suffice. The cubage forecast presents "probable building cubage." This is not necessarily "economic cubage," for it is found that some districts will be underbuilt and some overbuilt until the law of diminishing returns inevitably corrects this economic hiatus. The conversion formulas and class allocation indicate that nearly 2,000,000,000 cu.ft. of commercial buildings will be erected by 1950, or a total of more than 3,100,000,000 within this potential central district.

It is interesting that the actual gross building cubage, 1926, by detailed census was found to be as close as 4 to 9 per cent of that produced by the conversion formula, in some of the zones not yet influenced by over-building or under-building.

Economic Skyline a Measure of Peak Loads

That Detroit is attempting to do business on an economic "mountain top" of land values more peaked at the center than Chicago, New York or Cleveland is shown by land value profiles along their business axes. Cleveland has the flattest value profile—a fact worth much study by both zoners and realtors. Land value measures cubage, and cubage produces peak loads of transportation.

The final results in perspective are rather appalling in view of present traffic troubles in the highly concentrated cities. The survey indicates that the population will almost double by 1950, a 1,340,000 increase, that building cubage will almost treble, adding 1,997,000,000 cu.ft., that land value will increase 3½ times, a $1,111,000,000 increase, that the business land area will about double, adding 15,600,000 sq.ft., and that within the 1-mile circle from City Hall, building cubage will more than double.

From the net results of this survey and the 1926 cubage check it appears that forecasting, when carefully carried out with proper perspective and study, may form the finest argument for adequate city planning and zoning, at the very foundation of which lies this economic cubage. And thus the problem of building and rebuilding cities offers an immense opportunity for wise technical replanning of our transportation systems. Without it, strangulation and stagnation of business districts must ensue, possibly with tremendous relative losses in old established values. Even the new sub-centers will not function properly in this picture of vast economic growth if they are not planned ahead.

The interpretation of all this, in terms of transportation, points an unerring finger toward the necessity of looking ahead as well as "looking backwards," and of planning and research even in such apparently unrelated subjects as building and taxation. These lie at the bottom. Traffic and congestion are only present surface indications. If it is possible to visualize double the population and treble the business cubage of today in terms of peak load riding habit, which increases by multiplication rather than by addition with the population, then a true measure of future needs in city transport will be obtained. Clearly the price of neglect and expediency will be inevitable economic shifts of business and industry to other less congested cities.

MUCH OF THE PRESENT DIFFICULTY *in securing proper city development and in expanding and readjusting transportation facilities to meet the insatiable demand of population growth is because many city governments and transportation agencies have been too inactive in evaluating the present trends in the city's growth and the clear demands of the future*

Regulation of Taxicabs

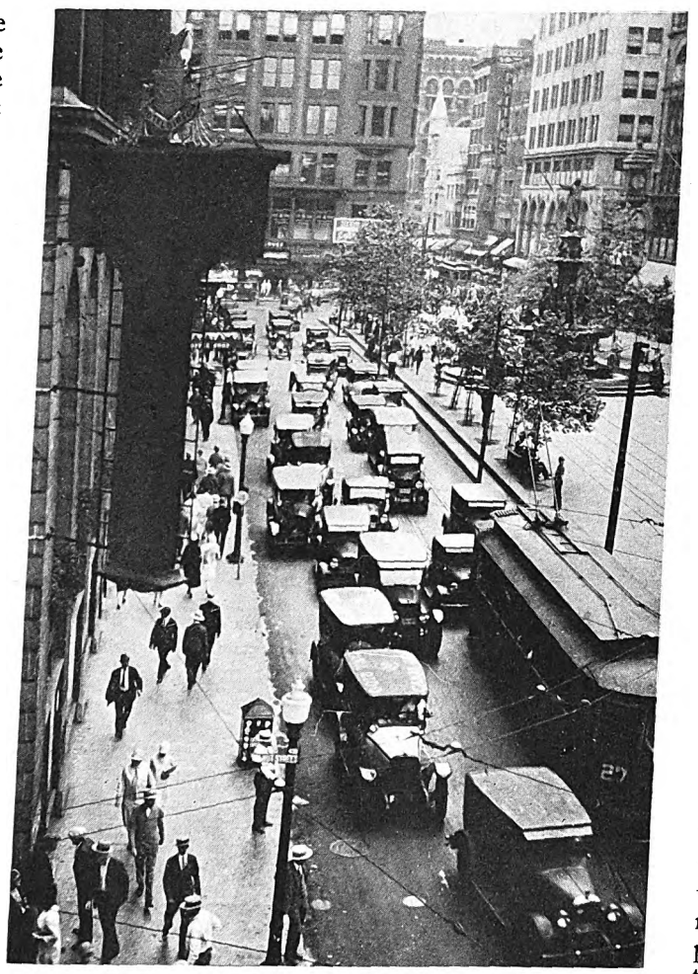
Necessary for Stabilization

WHAT is the place of the taxicab in the field of public transportation? Should taxicabs be regarded legally as common carriers? How would the electric railway industry be affected by the regulation of taxicabs as public utilities, properly classified? These questions have demanded much time and thought in the past few years, not only from the purveyors of transportation, but from the city officials as well. Electric railways naturally are interested in all forms of transportation of persons; municipalities are vitally concerned with satisfying the requirements of citizens within their borders, and existing taxicab companies are forced to consider what their place is or should be in the vast plan of furnishing the transportation required in the municipality.

The electric railways are in a business which, by its very nature, consists in analyzing public needs and producing service to satisfy those needs. Taxicab operation has its sphere of specialized service—it is not thrust upon the public, but is permitted only in response to existing requirements. No company in the transportation business can afford to ignore such an actual demand or fail to study its scope of service, or to be interested in its classification and regulatory provisions.

Primary consideration must be given to public interest in the classification and regulation of all public service vehicles. In this the public and the utility companies could stand on a common ground if they would. The public must recognize that its own interest is ultimately best served by a continuity of safe, reliable transportation, built up on sound business principles, adequately protected from losses that tend to destroy it, and able to attract capital enough to finance needed developments. Cut-rate competition, failure to make allowances for proper replacement and failure to keep adequate records of cost, lead to cycles of excellent service, followed by long periods of disgraceful conditions, operation by unfit personnel, worn-out equipment, and the use of the business as a blind for various kinds of illegal activities. The taxicab situation in American cities has been peculiarly subject to these cycles, chiefly because the welfare of the "public" has been a secondary consideration in regulatory laws. The granting of the privilege of operating taxicabs has been based too much on whether or not an individual needed a job and not enough on what the public requires, either for the best service or for its own protection.

A rather casual study of the organization of taxicab service as a whole in nearly every city shows the necessity, from the standpoint of both the public and the industry, of attacking the problem from a different angle from that by which it has heretofore been approached. In nearly every city there are some well organized companies and small operators, but the business is flooded with a transient class, who are temporarily tiding over a period of non-employment. They have no intention of developing their own business or adding to the soundness of the public interest as a whole. In a few months they get other jobs and pass out of the picture, but there are others of the same type who constantly flow in for short



Three distinct classes of vehicles offering different classes of service use the streets—the private automobile, the taxicab, and the mass transportation vehicles

By

Cincinnati, Ohio

Taxicabs must be recognized as individual service vehicles and transient operators denied permits by strict regulating provisions if the industry is to serve the public properly and adequately

Digitized by Google

periods as some step out. The turnover is too great for sound operation. Such transients give the business a bad name. Their method of computing costs over their short operation is such that no organized company, operating with good equipment and responsible personnel, and hoping and intending to develop and to give the public high-class service, can meet their competition. It cannot be expected that well organized service with proper rates, capable of meeting the variable demands of the public, season by season, and even hour by hour, can be developed as long as this competition is permitted.

The foregoing should not be taken as constituting an objection to competition when the competitors enter the business in good faith with the intention to continue and develop it as a means of permanent livelihood. But in the taxicab business, particularly, such intention is many times entirely absent, and many times it is the "down and out," the man who has failed at everything else, who turns to taxicab driving as a last resort. His aspect toward himself, his business and toward the world is not such as to qualify him properly for a quasi-public position of responsibility. Yet because he is down and out, and claims the need of a job which he cannot obtain any place else, many of our regulatory laws take care of him by permitting him to drive a taxicab, instead of handling his case through a public welfare organization. Competition with the intention to continue in the business as a livelihood has its merits. However, advocates of competitive operation would be surprised, and would be overcome by the apparent hopelessness of their cause, if they could see how many of the so-called competitive operators are merely trying to force a sale rather than to maintain a competitive business for public interest.

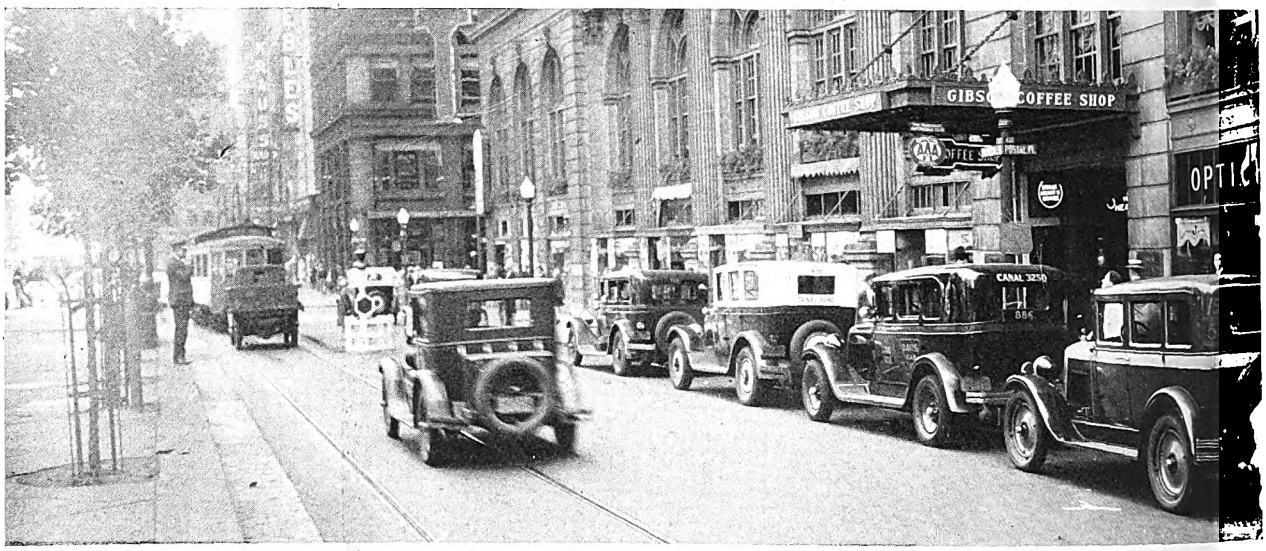
Regulatory Ordinance Passed in Cincinnati

For more than a year the Department of Public Utilities of the city of Cincinnati, under C. O. Sherrill, City Manager, has been carefully considering these matters. The studies led to the drafting of an ordinance which was passed by the City Council and became a law, effective March 9, 1929. The major change from the previous law was the classification of taxicabs and the insertion of a "public convenience and necessity" clause which definitely places the taxicab as a public utility.

Cincinnati is not the first city to have such a law, for the cities of Minneapolis, Minn., and Milwaukee, Wis., passed ordinances containing the "public convenience and necessity" clause, in September, 1928, and February, 1929, respectively. Taxicabs are now classed as common carriers in Maryland, Pennsylvania, the District of Columbia and Connecticut, legislation in the last two having been enacted only recently. Pressure is being brought to bear in nearly all states for regulations which will put this public service on a more systematic and higher basis. Prominent executives of the electric railway interests have urged that there be some organized regulation. To some extent their interest in the matter can be considered biased but to a considerable extent the unregulated operations as jitneys materially affect the rail service and in this the public interest is affected.

Regulation Requires Careful Classifications

Proper regulation of transportation as a whole requires careful definitions and classifications of the different types of service. There has been no definition of a taxicab in Ohio, either by state statute or by court decision. Definitions are frequently found in municipal ordinances, but in most cases such definitions are left open, or are based upon an arbitrary standard of the capacity of the vehicle. This is fundamentally wrong, as the classification should be based upon types of service and not upon the capacity, design or make of the vehicle rendering that type of service.



Observation in Cincinnati showed that for every hotel guest desiring a taxicab there were four or five vehicles available. This is more than is required for the "convenience and necessity" of the person desiring service

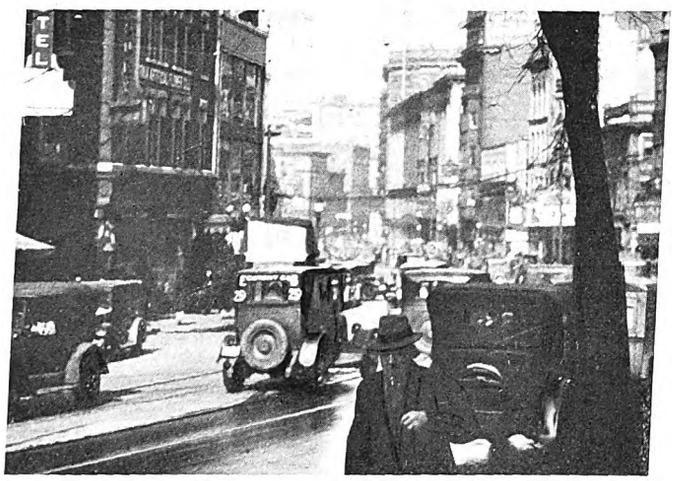
Transportation may be divided into two major classifications—mass transportation and individual transportation. Mass transportation is a service which holds itself open at all times to any number of persons. That is, anyone utilizing such service knows and expects that it is not for his individual use and that other persons who are strangers to him may also come into the vehicle at the same time that he is being transported. Mass transportation must of necessity be adapted to the requirements of the majority of persons as to route and schedule; that is, it travels along a fixed route between fixed termini and upon a fixed time schedule. The person purchasing such service must accommodate his wishes to these fixed factors. Because of these factors, and because the cost of moving the vehicle can be divided

Digitized by Google

among a large number of persons, the rates for mass transportation are relatively low. Both street car and motor bus operations come under this heading.

Contrasted to mass transportation is individual transportation, which holds itself open for hire to any person as a common carrier, but when once hired must devote itself exclusively to the service of the rentor and not hold itself open for hire to any other person until the prior engagement is completed. Individual transportation does not operate on a fixed route or schedule, or between fixed termini, but is free to operate over any route or between any points and within any time that the rentor decides. In other words, during the time that the vehicle is rented it may be regarded as being as completely at the disposal of the rentor as would be his own vehicle.

Classification as an individual transportation vehicle is a fundamental distinction of the taxicab, and has been adopted as the differentiation between taxicabs and other public vehicles in the drafting of the Cincinnati ordinance. The theory discards entirely the capacity of the vehicle as a basis of classification, as it is conceivable that a large vehicle might operate as a taxicab, or that a small vehicle might operate as a public coach. The application of this classification does not mean that a taxicab cannot carry more than one person. It means that the contract for the use of the vehicle must be made by the owner with one person. The owner must not make a separate contract with somebody else for transportation until he has completed the existing contract. For example, a patron can call an individual service vehicle to carry himself and family to a certain destination and there can be no objection to members of his family or of his party utilizing such service; but if he calls a taxicab, and there is other space available, the taxicab owner cannot fill such space by holding it open for hire.



Cut-rate taxicabs, operated by irresponsible, poorly-managed companies, have caused great harm to the public, the electric railways and the legitimate cab companies

Ordinance Restricts Issuance of Licenses

Prior to the passage of the Cincinnati ordinance, the Department of Public Utilities, which is responsible for the issuance of taxicab licenses, was required to approve any license applied for, except on the grounds of character of the applicant or vehicle. There could be no refusal of the license on the ground that there were already too many taxicabs in the city, even if there were clearly more than were needed to serve that part of the public requiring taxicab service, or that the additional taxicabs would hinder the use of public streets and interfere with the existing taxicab service. This situation led to an objectionable condition in the use of public streets. Observation showed that for every person coming out of a hotel and desiring a taxicab, there were four or five vehicles ready to give him service. A check over a ten-hour period on a busy corner in Cincinnati showed 2,300 taxicabs moving in one block, in one direction on a one-way street. Of this number only 400 had passengers and 1,900 were empty. This is unnecessary from the viewpoint of the person desiring service and is an interference with the rights of other citizens in the utilization of the streets. The "public convenience and necessity" clause was, therefore, written into the ordinance, giving the Public Utilities Department the right to deny a license on the grounds that the public interest did not require its issuance.

This is concisely expressed in the order issued upon the first application for a taxicab license under the new ordinance. In this order a general policy was set forth for the government of future applications and orders. There has since been a denial of more than 100 taxicab licenses, none of the orders of denial containing any other statement than that upon investigation it was shown that public convenience and necessity did not require the granting of the licenses applied for. The explanation contained in the first order was as follows:

> This license is denied because data show that it is not required by "public convenience and necessity." This phrase constitutes a standard established by the City Council to govern the issuance of taxicab and auto-for-hire licenses. Unless "public convenience and necessity" require it, the director has no authority to grant a license, and if they do require it and other conditions of the law are met, the director has no authority to refuse to grant a license.
>
> The convenience and necessity which the law requires to support the issuance of a license is that of the public, and not that of an individual or any number of individuals. In order to qualify as a "public" requirement, a fairly general distribution of the benefits of the proposed operation must be shown.
>
> The public affected by taxicab operation in Cincinnati can be divided into two groups: (1) the taxi-riding public, and (2) the non-taxi-riding public. For the convenience and needs of the former, there should be a reasonable number of taxicabs available. Any number beyond that reasonable number will unreasonably infringe upon the rights of the second group, because empty taxicabs cruising on the streets are not rendering service of a "public nature" and are occupying time and space on already crowded streets, that might be utilized for constructive public service. If the taxi-riding public is not unreasonably delayed in securing a taxicab at the depots, hotels, in the congested areas, and by telephone in the outlying areas, then public convenience and necessity for additional cabs has not been shown. The present situation in Cincinnati does not indicate any unreasonable delay on the part of the public in securing taxi service.

Public Interest Should Govern Use of Clause

The use of the convenience and necessity clause must be accompanied by a broad viewpoint of the problem as a whole. Decisions must be made from the viewpoint of the *public* interest only; the benefits to be derived must be general and not individual. This eliminates consideration of evidence as to the necessity for work on the part of the person applying for a license. From a purely philanthropic viewpoint this seems a hardship, but if the taxicab situation is to be handled for the benefit of the public at large, this viewpoint must be adopted. There exists a requirement of the public, in the satisfaction of which certain numbers of persons can make a livelihood. Beyond the point of satisfying this need, not only would the public be interfered with by granting additional licenses, but the livelihood of those already in the business, or even of the new applicant, is seriously jeopar-

Digitized by Google

dized. The experiences in Cincinnati in the past six months have proved this, as several of the operators, in the midst of a flurry of cut-rate methods, have gone into receiverships. Such proceedings are not in the ultimate public interest and they do not lead to continued good service at the most reasonable rates, but lead to cycles of low rates with superfluous service followed by high rates with inadequate service. The aim must be to obtain a standard of continuous good service at rates lower than those which have been charged without proper regulatory power and which will cover a proper cost of operating the taxicabs, plus a reasonable return on the investment in the business.

Transfer of Licenses Restricted

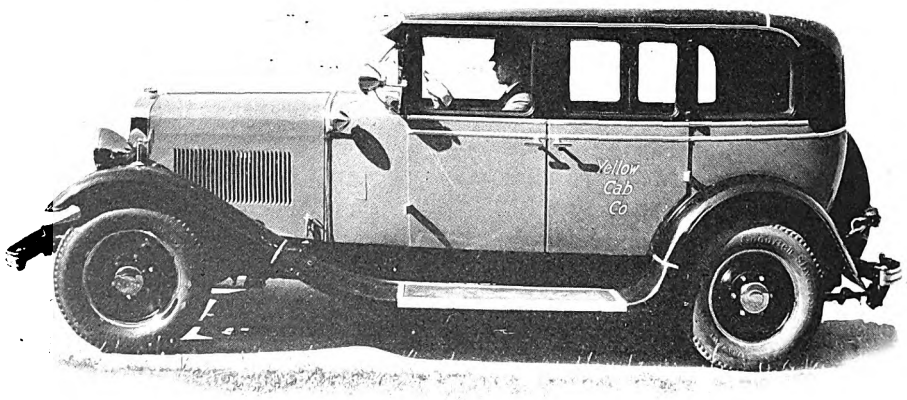
In the drafting of the ordinance considerable thought was given to the regulations governing transfer of licenses. The transfer of licenses from vehicle to vehicle of the same owner was made mandatory upon application, but the transfer from one owner to another was made subject to the convenience and necessity clause. Attempts were made to have the latter mandatory also, but if such transfer from one owner to another were made mandatory, it would create a market value for licenses. Furthermore, the license as issued is a privilege granted to a certain person or organization, and a mandatory transfer would give to that licensee the right of passing the license on to anyone whom he might elect and would deny to the city the right to determine the required qualifications of those holding licenses. Also the application of the convenience and necessity clause may require some means of reducing the number of outstanding licenses. If this became necessary in public interest, it might be provided either that the license issuing authority could withdraw existing licenses on a pro rata basis, or that when an outstanding license ceased to be used by the person to whom it was issued, it would become void. It was felt that the latter method was preferable, although it is slower in its effect.

One of the outstanding features in the city ordinance is the authority given the Director of Public Utilities to suspend or revoke licenses. This authority has been questioned as being a delegation of legislative power. However, if an official is charged with the responsibility of granting or denying a license for cause, he must be given the authority to suspend or revoke a license for causes which would have resulted in its denial in the first instance. Otherwise the entire purpose of protecting the public by licensing is nullified and the routine of licensing becomes so much paper work.

The Cincinnati ordinance provides four methods of computing rates: The taxi-meter rate, the zone rate, the hour rate and the special trip rate. Any vehicle may choose to operate either the taxi-meter rate or the zone rate, but it may not use both. In theory, at least, there should be no distinction in the regulations governing a taxicab on the streets because of its method of computing charges. In hearings on the ordinance it was urged that a taxicab charging by the zone rate should have restrictions placed upon it. This is inconsistent. Whether a cab is metered or charges by zones has to do only with how the charge for service is computed, and not with the type of service to be rendered. At the time of passage of the taxicab ordinance, there existed a general feeling on the part of the public that the zone rate method of computing charges was the cause of low prices. There is no reason why a meter cannot be set to give as low a rate as a zone, but it was felt that it would be a mistake to legislate it out of existence, that it would be better to permit its operation for that length of time necessary to show its favorable and unfavorable effects. Although only six months have passed since the passage of the ordinance, the large companies which started out on a zone rate have already changed over to the meter rate; not because the law required that they do so, but because, from the standpoint of the company, it was found that the zone rate was not workable.

The special trip rate in the Cincinnati ordinance sets aside, for certain purposes, the individual transportaton feature of the taxicab and permits it to pick up any number of persons and to operate between fixed termini. This rate can only be used for particular occasions, after filing application and receiving the approval of the Director of Public Utilities.

In conclusion, it appears that at least two things are of major importance in building up the taxicab industry to a point where it can properly and adequately serve the public at reasonable rates. First, it should be recognized that taxicabs are "individual" service vehicles as heretofore defined and that in this classification they have a scope of service that is distinctly different from that of either street cars or motor buses. The regulatory provisions should recognize the lines of demarcation and should insist on each operation confining itself to the service for which it is designed. Second, the privilege of operating taxicabs should not be granted to transient operators, but should be confined only to those operators who have serious intentions of developing their own interests to a maximum and who plan to continue in the service of the public.



Modern taxicabs, operated by courteous, reliable drivers and so regulated as to prevent unnecessary competition and cut rates, assure the public of proper service

Concerted Effort Needed for

Relief of Tax Burdens

By

HAROLD W. GEISSE

Vice-President and General Manager Wisconsin Valley Electric Company and Chairman A.E.R.A. Committee on Taxation

In Connecticut the electric railways have benefited greatly by the gross revenue tax which has been in effect there for several years

WHEN the Special Joint Committee on Taxation and Retrenchment of the State of New York, reporting in 1922, stated that many of the electric railways of that state "had literally been taxed into bankruptcy," it had good reasons for its conclusion. It had made an investigation of a comprehensive nature and it was so impressed by the variety, burdensomeness and discriminatory nature of the taxes levied upon electric railways that it used these strong words to emphasize the necessity for immediate change. But legislative wheels move slowly and the state of New York has not yet, after seven years, granted any material redress. Indeed, a recent survey made by the A.E.R.A. staff, on behalf of the committee on taxation, brings out the fact that very little progress has been made in any state within the Union, so far as street railway taxation relief is concerned.

In one state in the East—Connecticut—the gross tax has for some years been in operation, much to the benefit of the electric railways there, and in one state in the West—California—the same system of taxation, though at a higher rate, is in vogue. The state of New Jersey also has the gross tax, but uses other forms in conjunction with it. When the California Tax Commission reported to the Governor on March 5, 1929, it made recommendations for the relief of street railways. On the basis of these recommendations, bills have been introduced in the Legislature, and there is good reason for believing now that substantial relief is in sight. In no other state has any real progress been made. It is true that the tax burdens of some properties have been reduced, but this has been due either to a recognition of the depleted value of the property, or to the fact that the very existence of the transportation system depended upon tax relief.

Almost very operator within the industry feels that he is being overtaxed as compared with other groups that are doing business within the same community. Unfor-

Digitized by Google

tunately, it is almost impossible to obtain figures on the comparative tax burdens of various industries, for the private investigator is hampered by his inability to study the books relating to other industries, and states have been reluctant to set up special investigating committees or commissions with the power to delve into this matter sufficiently to get at the truth. But it can be safely said that wherever impartial investigations have been made, the street railways of the country have stood forth as the bearers of the heaviest burdens of taxation.

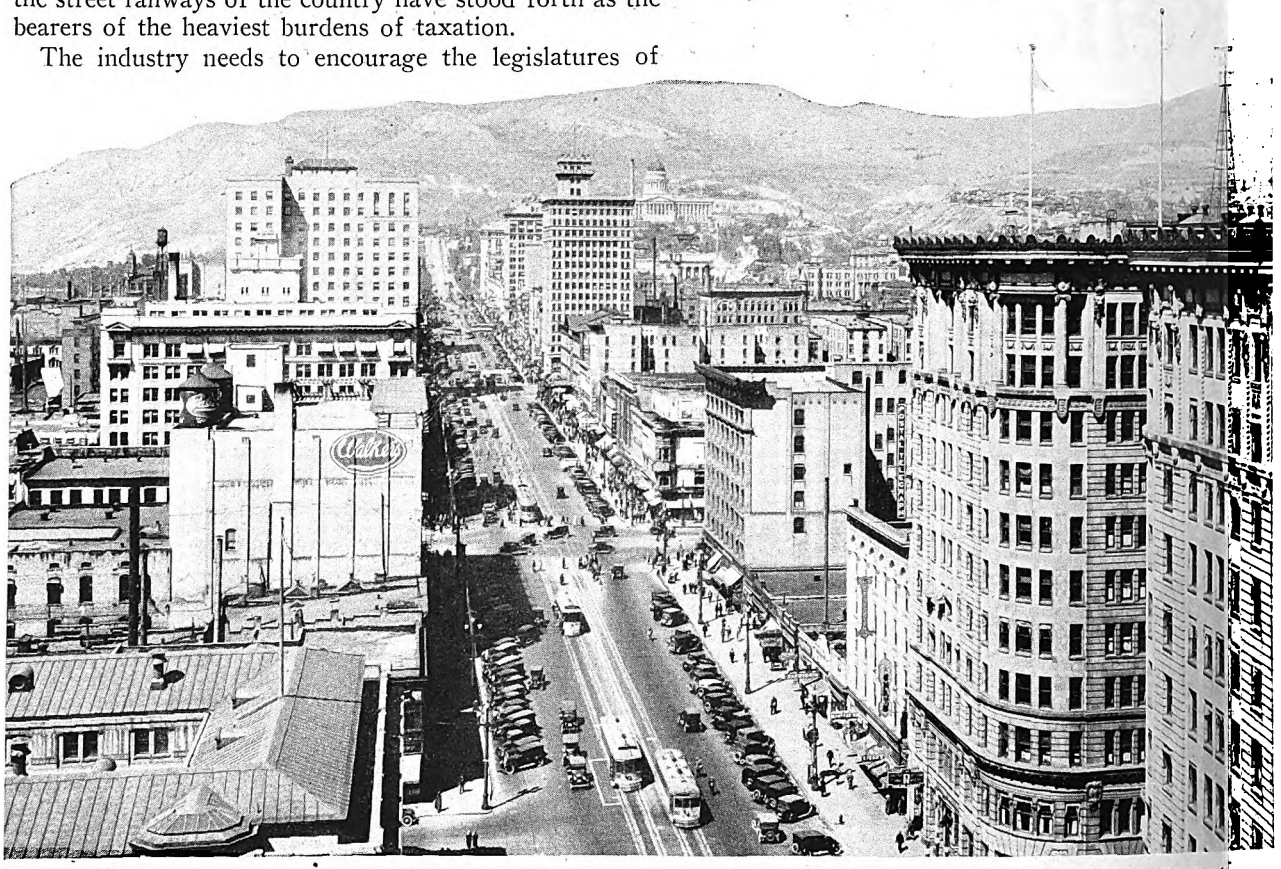
The industry needs to encourage the legislatures of the various states to set up such fact-finding tax commissions as will bring out in an official way what every one in the industry knows to be true, and, relying upon the conclusions of these commissions, frankly and openly approach the legislatures for relief. The procedure followed by the state of New York in 1922 and the state of California in 1928, is to be commended. The personnel of these commissions was such as to leave no doubt that their findings would be accepted, even though legislation was not immediately forthcoming.

Several years ago the state of Wisconsin appointed a commission composed of members of the Legislature. It opened up the subject to such an extent that it is certain its work will be carried on and changes brought about in that state. Utah has taken similar steps, and, while the findings of this commission are not yet available, it is evident that they will throw light on the need for changes in the taxation procedure.

In many individual communities partial investigations have been made, but few of them have had legislative backing and hence their conclusions cannot be given the same weight as those from the states of New York and California. One such study was made in Dayton, Ohio. Philip H. Worman of that city states:

> An investigation of the tax status of 35 mercantile and manufacturing institutions in this community shows that these businesses paid 2.08 per cent of their gross revenues and 18.96 per cent of their net revenue in taxes, whereas the street car industry here pays 11.47 per cent of its gross revenues and 43.05 per cent of its net operating revenue in taxes.

From the hundreds of letters which were received by the association staff in answer to a questionnaire sent out, it is apparent that the electric railways of Dayton, which pay 11.47 per cent of their gross revenue in taxes, represent about an average for the street railways of the country. But there are, unfortunately, many cases where the ratio of taxes to net operating revenue is more than 40 per cent. It is actually unusual to find a company which pays less than 35 per cent of its net in taxes. In a sense, most companies are working for the taxing authorities, since they pay far more in taxes than they do in dividends or to surplus.



Investigations now being made by a legislative commission in Utah promise an early improvement in the taxation situation in that state

What is needed is a new "industry viewpoint" on this matter. The railways do not need to bear these taxes indefinitely, but they will never get rid of them without active and well-organized opposition to them. Long ago the citizens of the colony of Massachusetts "got mad" about their taxes and it ended in the Boston tea party —an expression of their unwillingness to sit by and supinely accept the existing tax situation as inevitable. They adopted a forcible method of calling attention to their wrongs and revolution ensued. But this is a new age, and the only revolution that could be advocated would be one in the minds of those who determine the taxes and who have been left far too much alone to form their own conclusions without adequate knowledge of the oppression from which the industry is suffering.

The best results will not always be obtained by going direct to the legislators. Perhaps the most promising direction for help lies in the cultivation of such public relations as will align the whole group of citizens of the

Digitized by Google

community—the car riders, the property owners and the employers of labor—on the railway's side in a campaign to give such treatment to an essential and public industry as will remove the discriminatory tax burdens from which it suffers, and allow it to prosper and give adequate service.

In most cases the man in the street, the rider on the car, the members of the Rotary and Kiwanis and other clubs, do not have the slightest conception of the difficulties under which the street railways are operating. They are, in the main, business men who are fundamentally honest and fair-minded. If they could be impaneled on a jury there would be no cause for hesitation in submitting the case to them, since it would be certain that the case would be justly treated and that the tax inequalities would be wiped off.

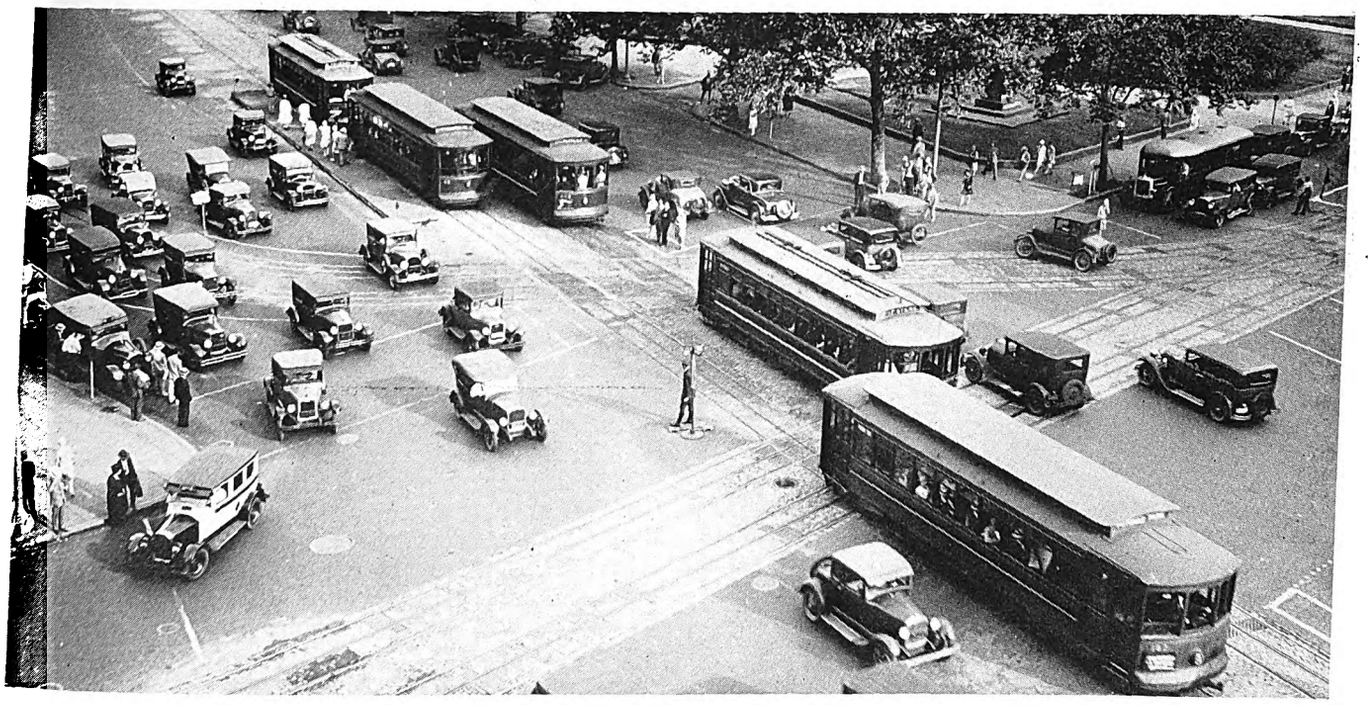
In the matter of relief from the imposts which have burdened this industry since its very inception, there is a still stronger case. But strangely enough, as the taxation committee's survey shows, very few companies have made real headway in relief from paving and similar charges which are as indefensible today as they are burdensome. It is not only unfair to the industry to go on accepting these out-of-date conditions, but it is obviously unfair to the patrons, drawn for the most parts from those classes of society which cannot afford their own private means of conveyance and which have no organized voice to speak for them. They have the right to look to the electric railway to represent them. When a street car rider contributes one-tenth of his fare to pay for paving from which he gets no benefit and the existence of which encourages automobiles and trucks to use the space between the tracks, slowing down the public conveyance, to pay for the sprinkling and cleaning of streets, for snow removal or for crossing policemen, it is time the industry took up the argument on his behalf and demanded that these absurd conditions cease.

It is quite certain that more progress has been made in this matter than has been made in relief from taxation. Many companies report that they have received some form and some degree of impost relief within the last four or five years. In a number of cases, however, where one form of relief has been obtained, another form of impost has been accepted. Apparently a good many companies have felt that their only way out of the difficulty was by a series of tradings. The danger of this procedure is evident.

The greatest progress seems to have been made in the states of Connecticut, Indiana, Iowa, Massachusetts, Montana, New Jersey, New Hamshire and Utah, where the legislatures have enacted legislation, removing all or most of the paving cost burden from street railways. A typical example is the Indiana law, which states in part:

> Whenever the track of any railroad, street railroad or interurban street railroad occupies any portion of any street or alley in any city (first, second, third, fourth and fifth class) of this state, and the Board of Public Works of any such city shall desire to improve such street in any manner provided by law, including the portion occupied by such track, such board. . . . shall, in the resolution for such street improvement, provide for the improvement of the space occupied by such track in the same manner and with the same material as the other portion of the street. . . . . Such railroad company shall enter into a contract . . . ., agreeing to pay such city any additional cost that may be incurred on account of the use of the kind of paving designated . . . . or different method of construction . . . . and shall give bond . . . . for the fulfillment of such contract.

This means that the railway pays only such additional costs as are due to the different kind of paving it may desire around its tracks, while if the same type as is provided for the remainder of the street is accepted, the company bears no cost whatever.



Street car riders pay the salaries of many of the traffic policemen in Washington, D. C.

The eventual passage of this relief act by the Legislature of Indiana was the result of the efforts of a committee, representing civic organizations of Indianapolis, investigating the financial needs of the local street railway. Their efforts were followed by the ruling of the Public Service Commission regarding the Indianapolis Street Railway. The railway had accepted an indeterminate franchise under the terminable permit law passed by the Legislature. The city demanded that the company pay its share of paving and the dispute was carried to the commission, which stated:

Digitized by Google

By accepting the indeterminate permit, the street car company entered into a new and binding contract with the state of Indiana, and no longer could it be held subject to the requirements of any of the obligations created or imposed by reason of the franchises with the city of Indianapolis which it had surrendered.

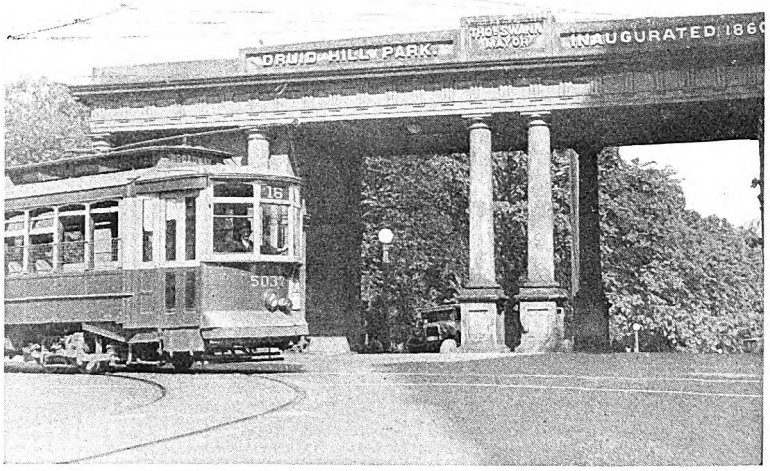
Much of the commission's decision is worthy of attention and quotation. The ruling stated:

We must accept changed conditions and solve the problems of today in the light of those changes. The days of horse and mule cars are past. Street car companies no longer have any use for an improved pathway along the line of their tracks. Passenger traffic has changed, and we are all aware that it has suffered great diminution in recent years by the private automobile, which not only causes a loss in revenues but impedes traffic by using the street car tracks, and wears out the pavement, for which the city is asking the petitioner to pay.

If this burden is to be carried by the street car company it must of course be borne in turn by the car riders through an increase in fares. This, to the commission, seems unfair. This means that the citizen who lives two or three blocks away from the car line must pay for paving his own street and then contribute his part for paving the street on which the car track is located. . . .

It is argued that the abutting property owner should not be required to pay more than it would cost to pave the street if not occupied by street car tracks. The commission finds no fault with this argument. . . .

It is not the province of the commission to say whether the paving between the tracks should be paid for by the abutting property owners, by the owners of vehicles or by the city out of its general fund; but it is certain that the street car riders as a group should not be assessed for such paving and, therefore, that the order should be held to be unreasonable.



Electric railways in Baltimore contribute to the upkeep of the city's parks

The following year the Legislature passed the bill which relieved the street railways throughout the state of Indiana from paying paving charges.

Long Struggle in Iowa for Relief

In the state of Iowa relief did not come easily. Time after time the bill met with defeat in the Legislature, till in the session of the early part of 1929, legislation was enacted in part, as follows:

. . . . shall be assessed for the construction or reconstruction of paving between the rails of their track or tracks and for 1 ft. outside of each rail thereof, in the amount the cost of such pavement per yard area exceeds the cost per yard of the remainder of paving upon such street.

When this matter was presented to previous legislatures, it has always met with defeat, but I think there is a general recognition on the part of the people, at least in Iowa, that if we are going to maintain our present railway systems, some relief must be given the railway companies in the matter of paving assessments.

In the states of Connecticut and New Jersey relief was won by persistance on the part of the operating companies. In the state of New Jersey especially, a complete educational and publicity program was worked out, which succeeded after several reverses.

In the states of Pennsylvania and New York, the electric railway associations have furthered the movement for paving relief, but so far without success.

Real progress is noted among a number of companies whose franchises have come up for reconsideration within the last year or two. The railways in Youngstown and Steubenville, Ohio; Fresno, Stockton and San Diego, Cal.; Cincinnati, Ohio; Charleston, S. C.; Portsmouth and South Norfolk, Va.; Williamsport, Pa.; and Rockford and Aurora, Ill., have all obtained measures of relief which are incorporated in their new franchises.

In most cases where relief of any kind has been obtained, the procedure seems to have been to conduct first a well thought out publicity campaign in the street cars and sometimes in the newspapers and then to lay before the authorities that impose the burden the facts of the case, with an appeal to their sense of justice and fair play for relief. While this has worked in many cases, some companies report that in spite of all they could do, they still found the regulatory bodies wedded to the idea that they were operating under a franchise or a contract the letter of which must be carried out, no matter what the consequences might be.

It is apparent that the industry has only begun the struggle for relief from these antiquated burdens. And it is certain that the fight will not be waged successfully by the street railways themselves, but by their patrons, by their fellow business men, to whose doors they carry customers, and by the property owners who must be made to realize that public transportation systems add value to their property and make it possible for business to be transacted within their city limits. While the initiative must be with the electric railway executives, the responsible and operating heads of these urban and interurban systems of transportation, they must not feel that they are able to achieve success by themselves unless they enlist the sympathy and the active help of all those organizations within the community that use the transportation systems for private or business purposes.

Taxation and paving relief must come to many properties if they are to survive and give that kind and degree of service to which the traveling public is entitled. The operating companies are quite willing to pay whatever taxes are just—and these can best be measured by the net earnings—but they do not see any valid reasons why the people who use their services should be taxed for that privilege. A good taxation system for street railways fundamentally should do justice to the railways as compared with other industries, be simple, be easily collected and, as far as possible, be definite in its amount. It should not involve the necessity of constant valuation and appearances before regulatory bodies.

On the whole, real progress has been made during the past year in the matter of impost relief, and the coming year should be one in which legislatures will seriously approach the problem of taxation, both in the interest of justice and the continuation of an essential service.

A system of fares that takes into consideration the frequency and time of use of the service has been adopted in Houston

Fares *Should Be Put on a More* SCIENTIFIC BASIS

By
MORRIS BUCK
Engineering Editor
ELECTRIC RAILWAY JOURNAL

PAYMENT in proportion to services rendered has become the rule in almost every line of business. The so-called "American Plan" of a flat rate for unmeasured service has practically disappeared, being found only in second-class hotels and American street railway and bus lines. Even the term American Plan has been forgotten except in connection with the hotel business.

Occasionally it has been suggested that at least a part of the difficulty in which electric railways have found themselves in recent years is the result of a system of fares following, with few exceptions, a principle long since discarded by every other major industry. The central station industry originally computed its charges at so much per lamp per month, but this method was given up long ago in favor of a charge for measured service. The phenomenal success of the electric power business is in no small measure due to the ability of its operators to measure the fundamental characteristics, demand and energy, by automatic recording devices and to charge for the service under schedules which recognize differences between customers in the nature and extent of their use of service.

To obtain a satisfactory system, solutions must be found for the problems of measuring the service rendered by electric railways and of differentiating between various classes of users

Measurement of the service rendered by the transportation company and of differentiating between various classes of users is vastly more difficult than the parallel problem of the central station. Perhaps the problem is not only difficult but is impossible of solution. In fact, many railway operators have made this contention. The occasional experiments attempted in fare

Digitized by Google

structures have not been highly successful, although there are Philistines in the industry who have felt that certain of these experiments were foredoomed to failure because of the conviction of those making them that they could not succeed.

The feeling persists, however, that the theory underlying the fare structure should be re-examined and a study made of the controlling factors, with the purpose of seeing if it is possible to determine a correct basis of fares or if the electric railway industry must continue as the sole exponent of the otherwise universally discredited theory of unmeasured service as the basis of charges.

In the past there have been sporadic attempts to determine the sound basis of rates in general terms, but the industry apparently has felt that such investigations were not worth while, probably on the theory that no scheme of rate structure would be applicable generally. However, with conditions varying as much, the electric field has made a determination of the general principles. This has been widely supported, and while the rate schedules of operating companies show wide variation, with minor variations they conform to the principle that no class of users should be served at a loss, but that those with best load characteristics should receive the benefit of their favorable position, and that the possibility of other sources of supply should be considered in fixing rates. No class of service which makes even a small contribution to net is ignored if reduced rates are necessary, in view of competitive conditions. to attach the business.

In a few instances street railways have experimented with the permit, the pass, and in many instances with reduced rate tickets, although these reduced rate tickets have usually been equally favorable to the individual riding five times a day and the one riding five times a year. The wholesale purchase of the tickets and not the wholesale riding with them has been the criterion. A few zone fares have been inaugurated, but these represent the classification of use based on only one characteristic—the length of ride—while very generally the time of day or the day of the week, is more important than the length of the ride in its effect on the cost of serving the patron.

Surveying the Problem

As a preliminary to a study of the fare structure the problem should be surveyed in an effort to discover the extent of the field which would have to be covered and the nature of the phenomena which would have to be isolated and measured. For the purposes of preliminary discussion the problems involved can perhaps be arranged in three major groups:

1. What are the characteristics of the use of railway service which fix the cost to the company of serving the various classes of patrons? This question involves the effect on cost of length, time of day and of year, frequency, speed and certain other characteristics of the ride.

2. What are the characteristics of the service rendered and the rates charged which make the service competitive or otherwise with alternative methods of transportation available to the prospective customers? These characteristics involve comfort and convenience as well as cost.

3. What are the compromises that must be made between the criteria developed under 1 and 2 in order to permit practical adjustment between the preferences of the rider and the necessities of the company? These compromises are limited to varying degrees on different properties by the limitations of personnel and equipment.

First of all, the revenue must be sufficient to cover the entire cost of the service, no matter how the charges are distributed among the various classes of riders. The cost of the service will include not only operating expenses, taxes and interest, but a sufficient additional amount to cover the depreciation and obsolescence of the property, or to set up a fund for the retirement of the capital if it is decided to abandon any part of the plant.

Granted that a certain revenue must be obtained in order to carry the property with efficient management and reasonable costs, that fare structure is best, both from the standpoint of the owners of the property and from that of the users, which will bring the most revenue from the largest number of passengers. It is only in this way that the system will be of greatest benefit to the community.

Many Changes Affect Cost of Service

Considering the two major elements of cost of service —the fixed charges and the direct operating costs—it will be seen that many elements enter into the fixed charges which are not always apparent to the user. The cost of creating the transportation system as it exists today includes not only the original expense for laying tracks, buying cars and supplying power, but many elements which, while they may have disappeared, nevertheless have not been written off.

The geographical and economic characteristics of the community determine in large measure the amount of investment necessary to provide satisfactory service, and the proportion of capital devoted to the various elements of the physical property. Crooked streets, steep hills, rivers, rocky or unsubstantial subsoil, barren districts which must be passed, all add to the cost above the minimum for constructing an adequate transportation system in a compact city.

Most of the present city transportation systems have been built up as the merger of many lines, all or part of which were competing. Often the competition was almost ruinous, and was stopped only when the stronger company bought out the weaker, perhaps at an exhorbitant price. Not infrequently the competing line was established with the avowed intention of selling out at a "nuisance value." As a rule only part of the lines so purchased have been of advantage to the combined system, and it has been advisable from an operating standpoint to abandon large portions of the duplicated facilities. Unfortunately the investment has not been abandoned so easily, but has continued with corresponding charges to the patrons.

One of the elements of cost frequently overlooked is the soundness of the investment. The rate for money is determined very largely by the certainty of the return and the security of the principal. Security of the principal, however, cannot be guaranteed merely by the existence of a good physical plant. Changes in method may make unsuitable large portions of the property which are in first-class condition. It is rather the position which the company has in its community, its ability to earn a sufficient margin over expenses to insure continued payment of charges, and the prospects for continuance of the revenue, which make the securities attractive. A long record of good earnings is one of the most valuable assets a company can have. Another is a

Digitized by Google

record of good public relations, particularly if it extends over a period of years.

Other intangible elements of cost are the losses during the period of development. Few properties have been able to earn the full return on the invested capital from the moment operation began. All properties have had a period of a year or more subsequent to the collection of the principal during which construction was in progress and no opportunity for earning existed. The interest during construction and losses in the early years of operation are often a material addition to the amount on which the present car rider must pay. Then there are expenses in connection with building up a competent operating staff and the training of employees in all departments.

An outstanding example of unscientific fare structure is found in New York City, where a passenger can ride many miles for the flat rate of 5 cents

While direct operating costs vary in considerable degree with the actual service given, there are differences that make it difficult to assign to each ride a proportional amount of the cost. Factors which have a marked influence are the density of travel, the length of the line and the relative loading from one end to the other, the loading in the two opposite directions, the schedule speed, the number of stops, the kind of track and cars in use, the hours in which service must be given and the relations of rush and non-rush loads, the ability to fit runs efficiently into the agreed working hours, the character of riders and many other elements.

In determining a workable fare structure it may not be possible to make each rate exactly in proportion to the cost of service. Still the various elements may be considered and given weight so that the resulting fare is close enough to the theoretical figure to be substantially equitable. The flat fare has been maintained not because it is correct in principle but largely because it is easy to collect and account for. Further, it has the sanction of custom and is thoroughly understood by public and city authorities. On the other hand, the flat rate is discriminatory, as no distinction is made between the passenger who rides a block or two and the one who rides the entire length of the system.

The argument frequently has been advanced, particularly by politicians in favor of the "one city, one fare" principle, that the flat fare has done much to

Digitized by Google

develop the typical American suburban communities. This may be true to a limited extent; but those who are familiar with European cities, particularly in Great Britain where the zone system has been used for generations, know that the density of population is far less than in the American tenement and apartment-house districts in the large cities. That the workman may and frequently does reside nearer to the factory with the zone fare is undeniable. There are districts built up around various industries where the workers live in individual or semi-detached houses under better conditions than many of those who work in American factories and live miles away in tenements. The amount of transportation service needed to supply the British workers may be less than that required under the American system, but the amount paid by the passenger is greater per unit of service rendered. Inherently there is no more reason why there should be a flat rate

Various rates of fare are in effect in the territory served by the Pittsburgh Railways, depending on the locality and class of service furnished

which is charged over an entire political subdivision such as a city than for any arbitrary area to be determined.

A variation in the flat rate that has been a source of difficulty in nearly every principal city has been the free transfer. Originally it was an outgrowth of the combination of many lines into one. The area covered by a single fare is increased largely with the transfer, which in nearly every instance has made it possible to reach any point within the single fare area. It has been argued that the additional ride made possible by the use of the free transfer is seldom taken. The patron usually rides on one or the other car only a short distance, getting the convenience of reaching a point closer to his destination than where he can ride on a single car only for one fare. The chief advantage of the transfer to the company is the stimulation of riding. Since the transfers usually are made at some central point one portion of the through ride is made against the ruling direction of traffic, so that no additional equipment is needed. There is a marked advantage in car routing since each line can be treated as a unit, and there is no necessity to provide unusual or roundabout routes in order that the passenger may ride from any point to any other for a single fare. This results in a saving in car-miles and an elimination of duplicate service. It also makes the use of crosstown lines advantageous, as they can carry a considerable portion of the riders without the necessity of bringing them into the congested district. The free transfer carries with it a number of disadvantages. The one that is most often mentioned is the opportunity for fraud. Another is the reduction in total revenue occasioned by through riding at a single fare. The transfers necessitate a considerable expense for printing, handling and auditing. Still other disadvantages are the greater possibility of injuries and damages, and slower car operation.

In some instances a variation of the free transfer plan has been made by charging a small amount for the transfer. This is a departure from the flat fare scheme which usually has been justified by the increased revenue obtained. It does, however, result in a market reduction in the use of transfers and a much greater reduction in the number issued. On the other hand, the transfer has a cash value and it is more difficult to refuse to accept one which has exceeded the time limit. The disadvantages are the same in character as with the free transfer, except that on account of the reduced volume issued they are lessened somewhat.

Determining the Cost of Individual Rides

If any system of rates other than the flat fare is to be used, it is necessary to determine the cost of the individual ride, or at least to separate the rides into various classes which can be treated as units. The larger the number of riders that can be grouped together the simpler the fare structure can be made. On the other hand, if a fare system is to be equitable every element that enters into the cost and the value of the service must be analyzed in order to arrive at a rational basis for charging. From this point of view it is preferable to make a detailed and searching analysis into all the elements and then to combine as many minor variations in cost as will result in a fare that is not too complicated to collect and to audit.

There is sound logic to the graduated fare system. As was pointed out earlier in this article, the enormous growth of the electric power industry has been in no small measure due to the system of rates by which each consumer pays in proportion to the use he makes of the service. There are several viewpoints which may be taken in analyzing the use of the transportation system. One has to do with the length of the individual ride, another has to do with the number of rides taken in any fixed period, still another considers the time of the day or of the week in which the ride is taken, and a fourth is concerned with the direction of movement as compared with the general trend of traffic.

The distance basis of charging has long been recognized as fundamental by steam railroads and interurban rail and bus lines. It is not possible to state definitely that the straight distance basis for the individual ride is

Digitized by Google

correct, since many elements enter into the cost that are not directly related to distance. For instance, since the value of transportation depends to a large extent on the saving of time, fast transportation can be charged for at a greater rate than slow transportation. This principle has been recognized by the steam railroads in the extra fares charged on limited trains as an inverse function of the time taken for the trip.

Inherently two classes of costs enter into the production of transportation which should be given consideration in determining the rate of fare. These are the costs which are fixed regardless of the use made of the transportation system, and those costs which vary with the amount of service. The complete plant must be available for service at all times, or at least until there is a demand which requires its expansion or a change in method. The amount of track and power supply system, the number and size of the cars and buses, once determined, can be changed only occasionally and at considerable expense. The carrying charges for the system, therefore, are quite definite in amount.

The use which is made of the plant, on the contrary, can be changed quickly from a minimum of zero up to the limit of capacity. The cost of use increases with the use, although not directly in proportion to the amount. Some of the factors vary with the number of car-miles, others with the number of car-hours, while still others vary according to other factors of use.

One form of fare that has been proposed as a result of such an analysis is made up of a flat service charge and a movement charge. If such a fare is computed it is necessary first of all to determine the number of rides over which the two elements of the cost of service are to be distributed. If a property has been operated under a flat fare and a change is made to some form of measured service a trial period may be necessary in which the use of the plant under the new arrangement can be determined. If a zone system is worked out there is always a question of the proper unit, which may involve differences in fare from 1 cent upward, depending on the possibilities of collection and of keeping the various zones segregated. It may be advisable, for instance, to combine service and distance charges to permit of 5-cent zones, in order to prevent a multiplicity of fares. Even with such a rate established, there is a question of distinct or overlapping fare zones that is open to considerable argument.

As to the minimum limit for fare increments, it is questionable if units smaller than 5 cents should be used. This is a unit which is easy for making change and for collection. If it is desired to reduce the fare unit below this figure it can be done by means of tickets or tokens sold in bulk.

The principal use of tickets in the past has been to offer a lower rate for bulk purchase but not for bulk use. The advantages to the company are the reduction in number of cash transactions and the shorter time taken when the passenger boards the car. A minor advantage is the fund of prepaid fares, although a certain amount must be set aside out of this for redemption of unused tickets. The principal disadvantage is in the accounting of the several classes of tickets and the cost of handling them.

Reduction of the charge for bulk use is seen principally in the sale of the so-called weekly pass, which is sold for a flat sum, permitting the holder to ride as often as he likes during the stated period. The charge for the pass usually is based on the single fare, amounting to between twelve and twenty times the single-fare rate. This recognizes that the holder will ride to and from work each day, or twelve times, and that the additional riding will be done at other times than during the peak load. Therefore, for this additional service the charge is much less if the rider uses his ticket a sufficient number of times. The charge must perforce depend on the characteristics of the community and the opportunity for taking additional rides above the assumed minimum. A variation is seen in the Sunday and holiday passes issued by certain railways, and the one-day tickets good all over the system of other roads.

Still another class of ticket which has met with some success is the weekly or monthly permit, sold at a price depending on the readiness-to-serve charge, and which entitles the holder to ride at a fare lower than the cash fare. While the principle is more scientific than that of the straight pass, the difficulties of collection and auditing are increased.

A difficult fare-collection problem has been solved by this post-payment area in the central business district in Youngstown

A few instances are on record where local tickets are used at the ends of long lines, where there is service to spare which otherwise would not be used.

On the principle that the greatest use should be made of the plant all of these special rates are advantageous to the company and to the public.

To a certain extent the same reasoning holds for the use of the transportation plant for doing other classes of business than the handling of passengers. Carriage of mail, parcels and the like will bring in additional revenue. Some roads have gone still further in carrying freight and express matter. Although the primary purpose of the local transportation system is the passenger service, any additional use of the plant that can be made without detriment to the main purpose, and that will earn a profit above the operating expenses and incidental charges, is of benefit to the rider in that it lowers the fare or improves the accommodations.

Relation of

RAPID TRANSIT

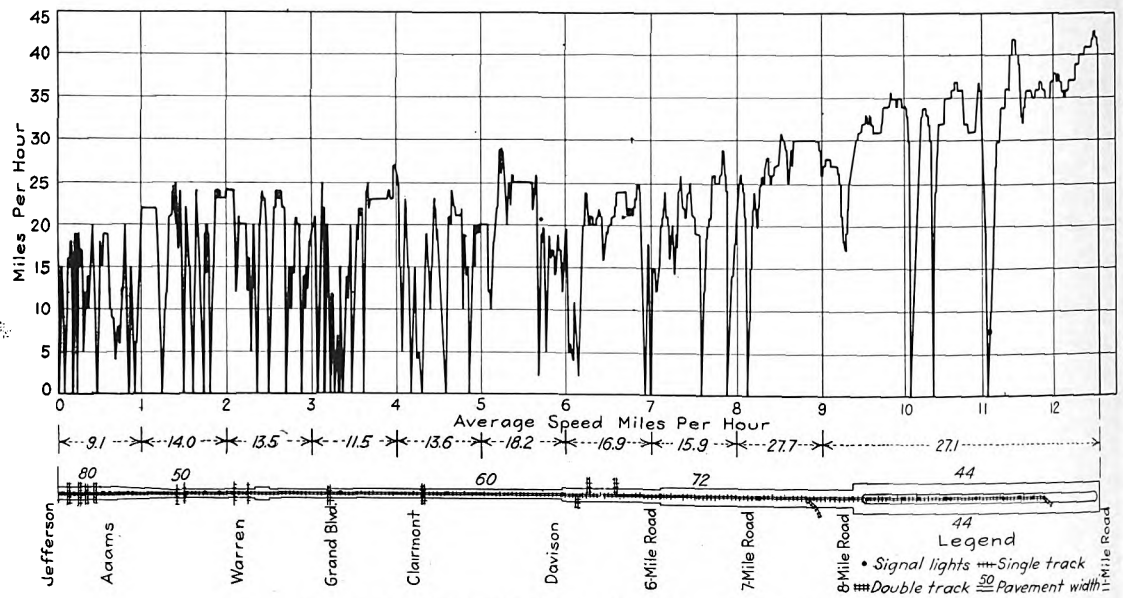
to

Community Development

By

JOHN P. HALLIHAN

Chief Engineer Rapid Transit Commission, Detroit, Mich.



Average speed of vehicular traffic on Woodward Avenue, Detroit, in July, 1929

IN THE past 50 years the United States has been changing from a dominantly agricultural country to a dominantly manufacturing country. This change has caused an increasing shift of population from the farms to the cities. Since 1880 this movement has proceeded at the rate of 5 per cent per decade. The trend of the curve indicates that the census of 1930 will show that about 55 per cent of the population is living in the cities.

Changes in manufacturing methods in the same period have had their effect on the transit requirements of cities. Mass production requires concentration of industrial workers in great numbers in comparatively small areas. Groups of manufacturing units create concentrations in a fraction of the space that would be occupied by the same number of people distributed about the other districts of an important city. A single industrial unit may employ anywhere from 5,000 to 30,000 workers. However, workmen no longer live in the neighborhood of the industries in which they are employed, but are found distributed over the whole city and its suburbs.

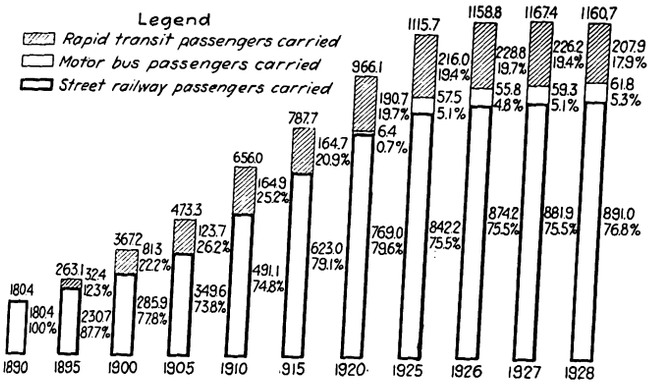
It is not unusual for a city to be called upon to serve and transport a daytime population much in excess of the residential population within its corporate limits. This affects revenue requirements and stimulates annexations motivated by the necessity of increasing the taxable base. The tendency of large cities is either to become larger as a single political unit, or to merge in metropolitan districts where the planning, financing and direction of the basic public services of water supply, sewage disposal and transportation are carried on apart from local political influence.

Economic Effect of the Automobile

The rise of the automobile as a transportation medium has exerted the most profound influence on all phases of community development. In its economic effects this influence in the field of passenger transportation and of road and street space requirement is only beginning to make itself apparent.

Digitized by Google

There are now more than 24,000,000 motor vehicles in use in the United States, of which 21,000,000 are private automobiles, or one to less than six persons of the population. In some localities where public transportation facilities are limited the rate of use is one automobile to less than two persons. In large cities the use is limited only by the character of the street system. In the county of Wayne in Michigan, which includes the City of Detroit, the rate of use is one to 3.8 persons, and the registration in this single county is exceeded by



Passenger traffic in Chicago, 1890 to 1928. The totals, in millions and percentages, are of street railway, motor bus and rapid transit passengers carried

only seventeen states. The curve of use of all motor vehicles drawn in relation to the population curve indicates that by 1950 the national rate of use will have risen to that of one to three persons, which may possibly be somewhere near the point of practical saturation.

According to the figures of the latest industrial census (1927) the automobile industry directly employs 4,000,000 persons and produces $3,162,000,000 in manufactured products of the total of $62,721,000,000 produced in the United States. The production in 1928 was 4,827,849, in addition to 530,899 commercial vehicles.

The Automobile as a Transportation Facility

When we come to compare the investment in this new facility with previously existing forms of transportation, a better idea is obtained of its relative value as a transportation medium. The present investment in improved roads is $7,385,000,000 and the investment in motor vehicles, at depreciated values, is $8,575,000,000, making a total of $15,960,000,000 for road and equipment for automotive transportation. This is more than half the investment in steam railroads and is equal to 2½ times the investment in electric roads. This capital investment is being added to at the rate of more than 10 per cent per annum, about evenly divided between road and equipment.

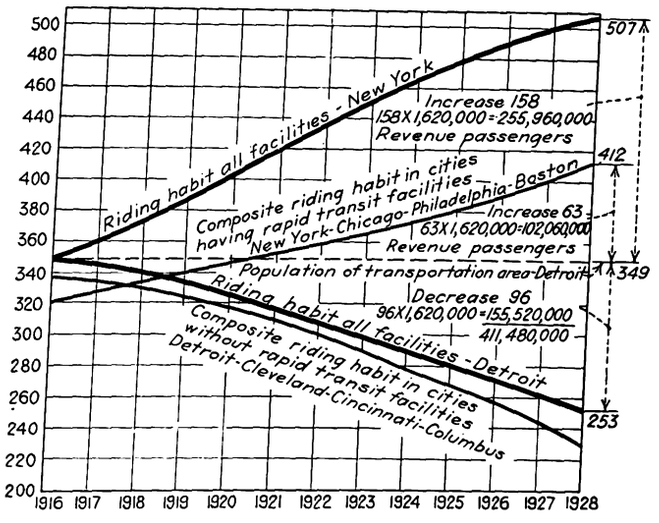
In 1928 the total revenue derived by steam and electric railroads from passenger transport was in round figures about $1,800,000,000, while the amount spent on transportation in private automobiles, estimated on a basis of 6,000 miles per annum for 21,000,000 automobiles, was $8,200,000,000, or more than 4½ times the amount spent for transportation in steam and electric trains.

On the assumption of two persons per car, there is a movement of 252,000,000,000 passenger-miles per annum in private automobiles or individual transportation, plus some 13,000,000,000 passenger-miles in buses or in group transportation. The significance of these figures lies in the fact that it largely represents new business or the development of a new riding habit, in addition to the riding habit in other facilities. During the period of the growth of this facility the use of rail transportation has greatly increased. In 1908 the steam and electric railroads together carried 8,000,000,000 passengers. Although the steam railroads have lost a considerable amount of short-haul business and the volume of electric railroad business is on a declining curve, there were 12,000,000,000 passengers carried in steam and electric trains together in 1928.

Effect of the Automobile on the Development of the Community

The primary effect of the great freedom of movement given by the automobile and the consequent greater freedom of choice in home sites has been enormously to expand the residential area surrounding the larger cities. If we accept 45 minutes from home to work as a reasonable travel time, of which 30 minutes would be actual running time on rail lines, the distance of the home from the work is limited, on present street car system speeds, to from 5 to 6 miles, whereas the same period of time via the automobiles at 20 m.p.h. permits the home to be 15 miles distant from the factory or office. An example indicating the practical utility of the automobile as a transportation unit is found in Detroit, where more than 20 per cent of the 450,000 industrial and commercial workers move to and from work under their own power.

From a sociological viewpoint this is a highly desirable change. It makes for better living conditions,



Comparison of riding habit in cities with and without rapid transit facilities, from 1916 to 1928

for the single family home instead of the tenement and for better recreation possibilities for the youth of the nation. But the community is put in the anomalous position of being obliged to provide street space for the private transportation vehicles of a daytime population of considerable magnitude that is supported by and necessary to the industries of the city, but lives outside the corporate limits and does not contribute to the city's expenditures. Its contribution to increase of road space is paid directly to the state and redistributed to the counties, but in this distribution the cities do not participate. The provision of travelways for automobiles

Digitized by Google

within the city limits must be met from the city's own resources.

The population of cities within the corporate limits is constantly moving outward from the center as residences are absorbed by business expansion. This movement proceeds silently, irresistibly, and does not attract public attention, but it is of great economic importance. It is attended by increase in population density in zones contiguous to public transit facilities and by material change in currents of travel. It can be followed by observation of the annual school census and the location of building permits. It is materially affected by the position and carrying capacity of the rail transit facilities and the amount and arrangement of street space available for the use of automobiles.

Unquestionably the majority of people prefer to live within reach of public transit facilities. The ownership of an automobile by the family does not fully satisfy the daily transport demands of its different members.

The average fare on urban railways is now reported by the A.E.R.A. as approximately 8 cents, and for that price the passenger may ride to any point reached by the city system. According to the National Automobile Chamber of Commerce, the average cost of operating an automobile is less than 7 cents per mile. If we assume an average distance of 5 miles from the rail terminals to the center in a large city for an average trip from the outskirts to a destination in any part of the developed area of the city, then the motorist pays 35 cents in his private automobile for the same ride (except for the factor of exclusiveness) that he can get on the rail facilities for 8 cents, making a differential of 54 cents for the round trip. This can only be justified on the basis of greater speed or by the value of the personal convenience obtained through use of the privately owned car.

It is the assumption of automobile users that much time is saved by the use of the automobile in city travel as compared with travel on the rail facilities. Recent studies of the average movement in the morning and evening rush hours, however, do not support this assumption. On Woodward Avenue in Detroit, from the Six-Mile Road to Jefferson Avenue, the average speed of motor traffic in the rush hours is 13 m.p.h. The corresponding average speed of the street cars between the same points at the same hours is 10 m.p.h.

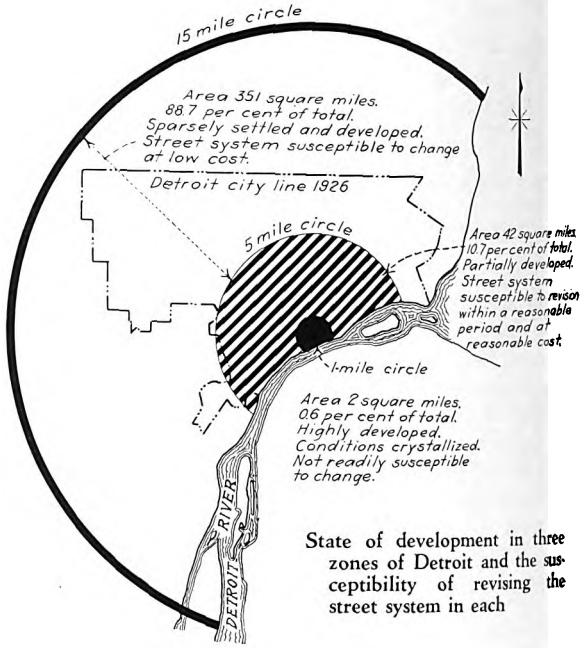
The economic ideal of balanced use of transit facilities would seem to be for the suburbanite to use his car to the terminus of the urban rail facilities, garage it there for the day, and use the urban facilities for movement about the city. The traffic burden would be materially relieved and the motorist would save time, effort and money. For this purpose high-speed motorways would be required in the outer areas, cheap garage facilities at the rail terminal, and a co-ordinated system of rapid transit, surface rail and bus lines giving a diffusive, city-wide service within the sphere of business and industrial activities.

Change in Form of the Transportation Plan

When transit facilities, developed on a plan of lines radiating from a common center, become saturated there are several remedies that may be employed. The most obvious is the addition of other transit lines leading to the same center, but this stimulates building development in the same limited area and hastens the saturation of the relief lines. A second remedy is to expand the center by through routing of arterial lines and by introduction of concentric belt lines operating independently as elements of transfer, collection and distribution for the radial lines. In addition, new through lines are required, designed to serve primarily the new currents of travel set up by the expansion of industry. Such lines bypass the congested center but reach it by transfer to other lines serving it directly.

Whether the system is expanded by one or all of these methods, the result is a definite change in form of the transportation plan as the city grows. The radial, or star-shaped plan, with its primary idea that every passenger must be carried through the business center regardless of his destination, gives way to the gridiron plan offering diffusive service by passenger transfer.

An interesting and instructive example of this evolution is furnished by Chicago, which has a rapid transit system of 72 route-miles which center upon a loop within the central business district. The Surface Lines, in general a gridiron layout system of 1,082 track-miles,



State of development in three zones of Detroit and the susceptibility of revising the street system in each

equivalent to 541 route-miles, have 26 lines which penetrate the loop on more or less radial routes. Bus transportation was introduced in 1917, and in 1925 carried 5.1 per cent of the total business. Since 1925 the relation of the three facilities in per cent of total business has been as follows:

	Per Cent of Total			
	1925	1926	1927	1928
Rapid transit	19.4	19.7	19.4	17.9
Surface lines	75.5	75.5	75.5	76.8
Buses	5.1	4.8	5.1	5.3

A total of 75 per cent of the business of the rapid transit system enters or crosses the boundary of the Loop, while only about 14 per cent of the business of the surface lines moves to and from that district. If motor bus passengers are included, then approximately 28 per cent of the total city transit business enters or leaves the central business district. Approximate figures of commuting business indicate a total of 80,000,000 passengers per annum, all of whom are delivered to the Loop, equivalent to about 6½ per cent of the city transit

Digitized by Google

business. (Figures furnished by E. J. McIlraith, staff engineer Chicago Surface Lines.)

The total passengers carried in 1928 by the city transit facilities were 7,000,000 less than in 1927. The Chicago Surface lines, offering a city-wide service by means of universal transfer privileges on a gridiron system of interconnected lines, gained 7,500,000 passengers. The Elevated Lines, routing in and out of the center, lost 18,000,000 passengers in 1928 over 1927, part of which may have been due to a raise in fare from an average of 8.3 cents to a straight 10-cent fare.

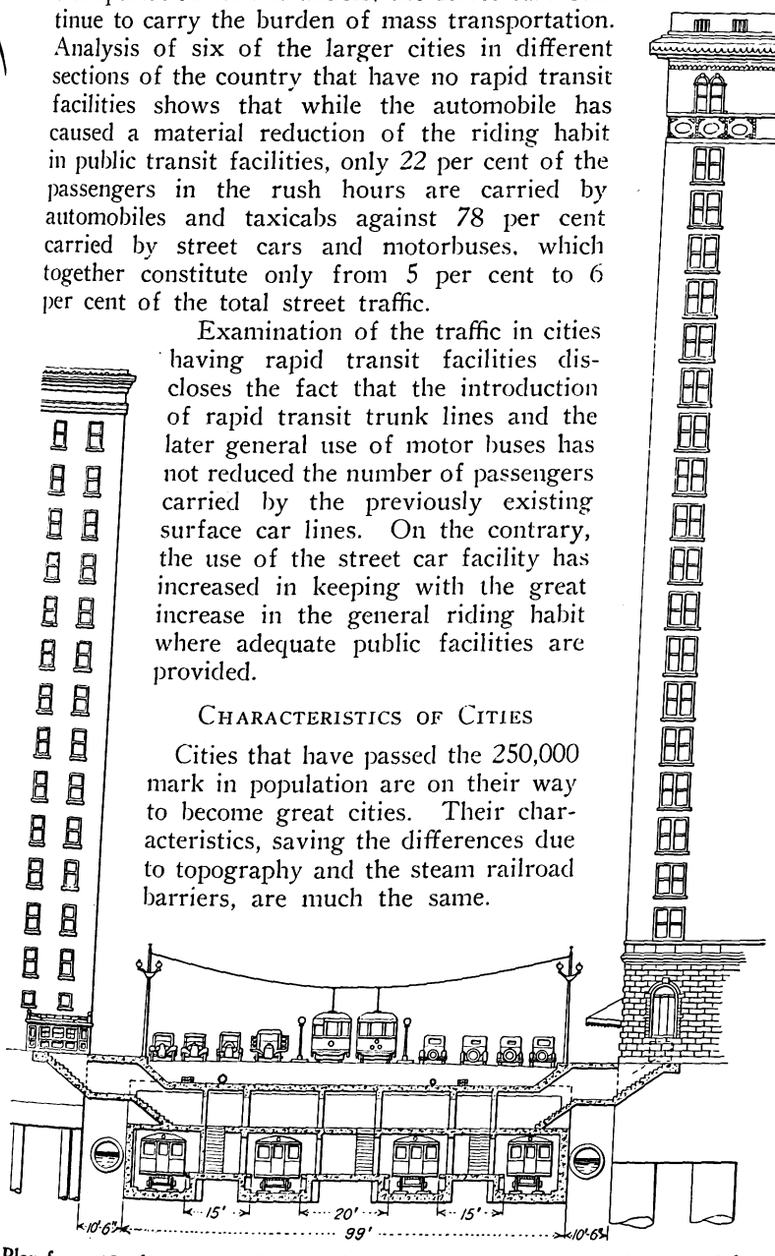
It would appear from these facts that there must be full co-ordination of transit facilities on an equalizing transfer basis in order to obtain the full advantage of the change in form of the transportation plan, and further, that the rapid transit trunk lines should be designed as through lines, with as many crossings of surface lines as will best facilitate such co-ordination in the future as well as in the present.

It is a significant fact that with all the automobile transportation now available, the street cars continue to carry the burden of mass transportation. Analysis of six of the larger cities in different sections of the country that have no rapid transit facilities shows that while the automobile has caused a material reduction of the riding habit in public transit facilities, only 22 per cent of the passengers in the rush hours are carried by automobiles and taxicabs against 78 per cent carried by street cars and motorbuses, which together constitute only from 5 per cent to 6 per cent of the total street traffic.

Examination of the traffic in cities having rapid transit facilities discloses the fact that the introduction of rapid transit trunk lines and the later general use of motor buses has not reduced the number of passengers carried by the previously existing surface car lines. On the contrary, the use of the street car facility has increased in keeping with the great increase in the general riding habit where adequate public facilities are provided.

Characteristics of Cities

Cities that have passed the 250,000 mark in population are on their way to become great cities. Their characteristics, saving the differences due to topography and the steam railroad barriers, are much the same.



Plan for a 120-ft. thoroughfare, 90 ft. between curbs, providing for two 15-ft. sidewalks, eight lanes of motor vehicles, two safety zones and two street car lines on the surface and two express rapid transit tracks, two local rapid transit tracks and two main sewers underground

The relation of the different zones of development to each other and to the total area of the present city and to its probable future area may be visualized by reference to a diagram illustrating the development situation in Detroit which now has a population of 1,500,000 in an area of 139 square miles. By 1950 Detroit expects to have a population of 3,000,000 in an area of approximately 395 square miles. The present highly developed business district in Detroit, within which changes in street space are impracticable, embraces 2.2 square miles and constitutes less than 1 per cent of the area of the city of 1950.

The area of moderate development within which changes are possible at reasonable cost within a reasonable time is approximately 42 square miles and constitutes 11 per cent of the future area, while in the remaining 88 per cent of the area any desired change may now be instituted and carried out at a fairly nominal cost.

The relation found in Detroit between the central district and the outer areas is more or less characteristic of most American cities. Full advantage of the opportunities offered by this relation must be taken when the community is faced with the problem of developing a modern street system.

The imperative necessity for adequate street space for automotive transportation brings with it the opportunity of bettering the position of the surface rail facilities and of providing adequately and economically for future rapid transit requirements. No community can afford to create the space desired for automotive transportation on every street any more than it can afford to put a street car or bus route on every street, nor is it necessary to do so. An entirely different kind of street plan is demanded, in which the skeleton of the plan is designed for heavy traffic needs and the intervening areas are left to their natural development.

Because it is an essential element in the transportation scheme and should be utilized in full measure, automotive transportation (private automobiles, buses and commercial trucks) ought reasonably to have available through streets of capacity for volume traffic at intervals not exceeding a mile in each direction. The thoroughfare created to serve the volume requirements of private automobile traffic must at the same time serve all other city transportation utilities. The economic width to satisfy all these needs must be ascertained.

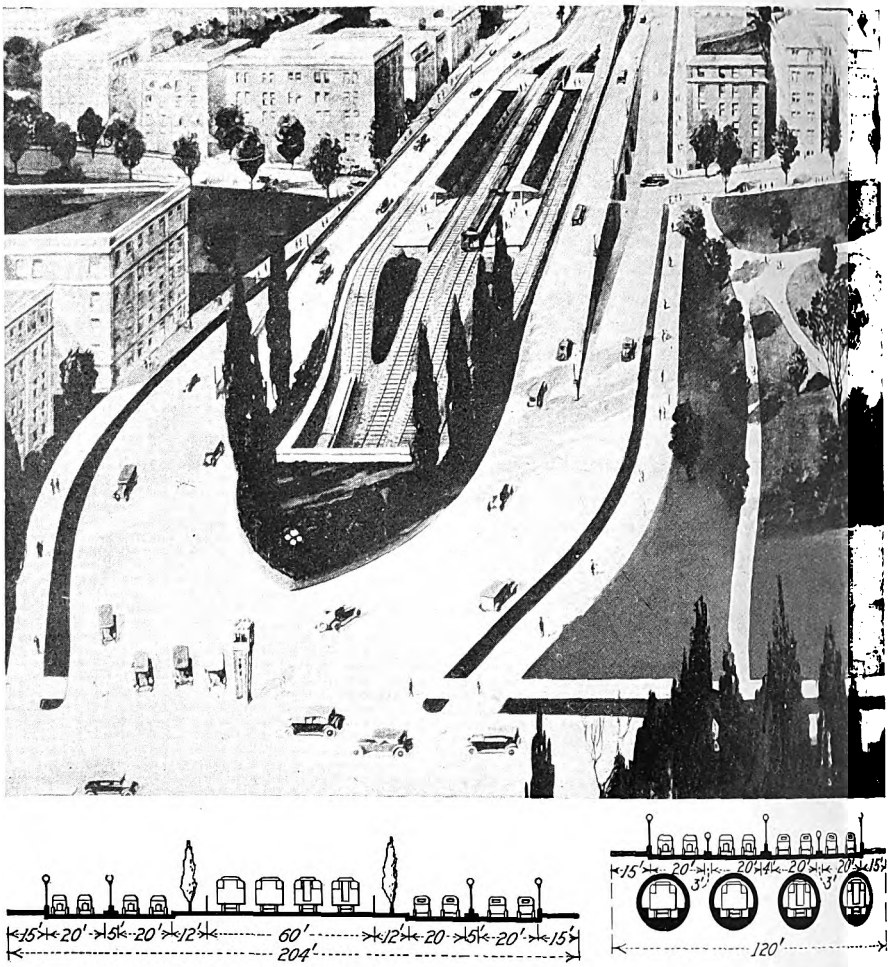
Economic Width of Transportation Avenues

Traffic experts agree that a major thoroughfare should have a loading and discharging lane at the curb, a lane for right turns, a lane for left turns, and at least one through lane. The street car must have a lane. The sum of the one direction requirements, viz., a loading lane, three travel lanes and a street car lane produces 45 ft. for the half roadway or 90 ft. for the full roadway. The addition of a 15 ft. sidewalk on each side for pedestrians produces a street 120 ft. between building

Digitized by Google

lines. This width will satisfy the utility requirements. If used in the future as a two-level street with rapid transit tracks underground, it will afford room for four tracks with adequate station platforms and will effect great savings in underground construction over the cost in a narrower street by reducing the amount of underpinning of adjacent buildings.

In making provision for the free circulation and volume requirements of automotive traffic on the street surface, the community will also better the efficiency of the street railway facility. The movement of equipment on the street surface is regulated by the interference of other traffic but there is a wide difference in degree of interference on a wide street and on a narrow street. An instance of this difference in efficiency between narrow and wide streets is found in Detroit, where the system speed is 10.2 m.p.h. and where three of the principal lines are on streets of 72 ft., 100 ft. and 120 ft. widths respectively. At the time the comparison was made, operating conditions were similar.



Transition from a 120-ft. major thoroughfare with four rapid transit tracks underground to a 204-ft. super-highway with the rapid transit tracks in a private right-of-way on the surface

On the 72-ft. street, a radial meeting the gridiron system at an angle of 60 deg., the line speed for a twelve-hour average between terminals was 10.6 m.p.h. On the 100-ft. street, a 30 deg. radial, the line speed was 12.05 m.p.h. On the 120-ft. street lying at right angles to the main street system, the line speed was 14.4 m.p.h. A 36 per cent betterment in speed between the 72-ft. and the 120-ft. street and a 20 per cent betterment between the 100-ft. street and the 120-ft. street have a very definite money value. A system speed of 14 m.p.h. for surface cars would assist in pushing farther into the future the necessity of underground construction for rapid transit trunk lines.

The cheapest form of rapid transit is that of surface rapid transit, where the trains operate on the surface in an exclusive right-of-way. The width required on the surface for a possible four track line with adequate station platforms is 84 ft. Combination of this requirement with the 120-ft. requirement for motor traffic in the form of a 60-ft. street on each side of the central reservation produces a street 204 ft. wide between building lines.

After the acquisition of right-of-way, the development of such a transportation avenue, or super-highway, would proceed in accordance with the needs of the adjacent territory. It would be first developed by a 20-ft. roadway on each side adjoining a 15-ft. sidewalk, later by expansion toward the center until a 45-ft. roadway was created, having a loading and discharging lane and four traffic lanes. Such a development is already in satisfactory operation in Detroit. As the development progresses the central reservation is used by interurban rails to be gradually pushed outward by extensions of the rapid transit rails occupying the underground section of the two-level 120-ft. thoroughfare in the inner city.

When the rapid transit rails occupy the central reservation, an exclusive right-of-way is developed by half-elevation of the rail station structure at half-mile intervals and corresponding half-depression of the cross-street. At the same time an express motor roadway is developed by lifting the two adjacent lanes of the 45-ft. roadway on each side of the rails to the elevated station level of the rail structure, leaving a two-lane local roadway meeting the cross-street roadway at the underpass grade. Access from the local to the express motorway would be afforded at several points between stations where both are at the same level. Underpasses for pedestrians would be provided at necessary points.

The differential in construction cost between a two-track line on the surface and a similar line in an underground structure amounts to $2,500,000 per mile, and to nearly $5,000,000 for a four-track line.

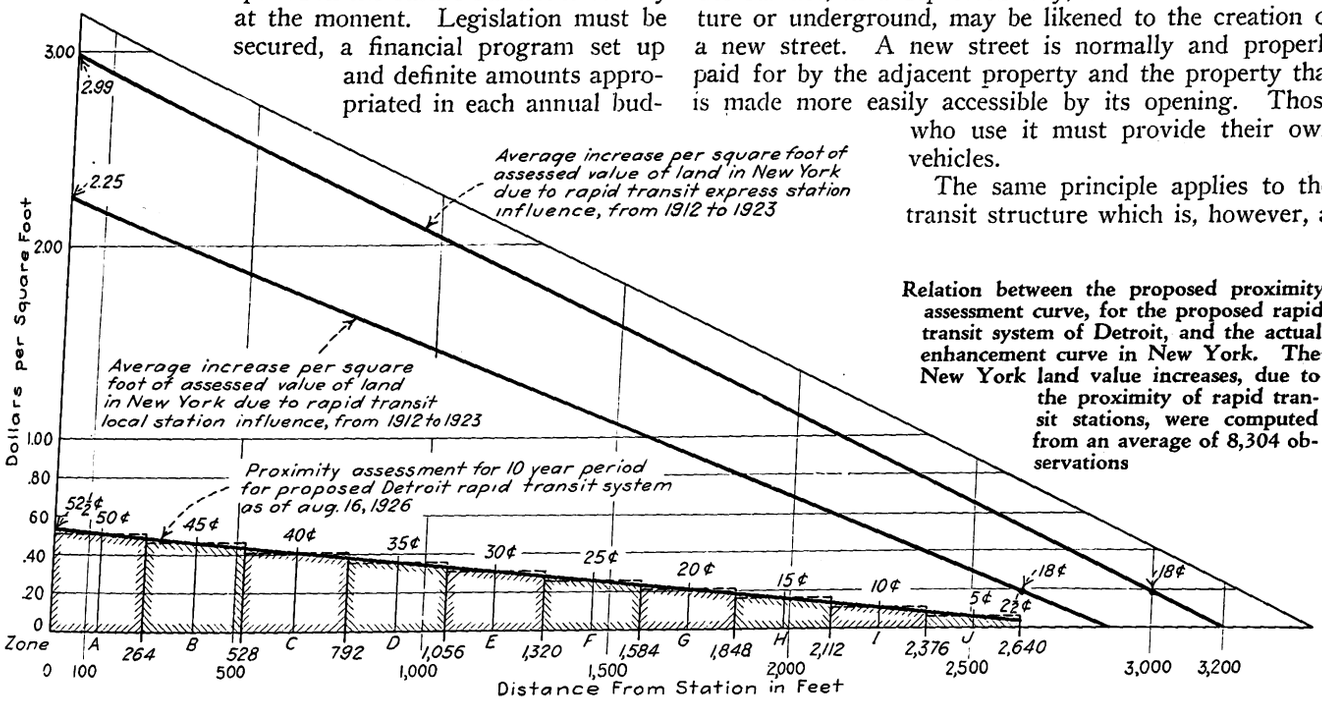
The territory surrounding a large city would be adequately served with main routes 204 ft. wide at 3-mile intervals, offering rapid transit and express highway facilities and with intermediate roads 120 ft. wide at mile intervals, both connecting with a system of 120-ft. thoroughfares at mile intervals or less within the developed section of the city.

The economic by-product effects of acquisition of

Digitized by Google

ample space for transportation streets on predetermined locations in advance of the expansion of the principal community in a populous region are very far reaching. They extend into every form of public improvement, providing through routes for water mains, gas mains, power and communication conduits, and trunk sewers. Residential districts are automatically protected from intrusion of through traffic, and land values are stabilized through the practically permanent definition of the character and use of the streets.

Notwithstanding the immediate and potential economies attendant upon advance preparation for transit needs, any community undertaking the task may expect to encounter many difficulties in carrying it out. The public mind is slow to realize the many advantages attendant upon getting an early start and continuously working toward an objective that is certain to be required in the future but not necessary at the moment. Legislation must be secured, a financial program set up and definite amounts appropriated in each annual budget to carry out the foundation work of revising a street system. The community should be able to see to the end of its general plan before selecting routes for the permanent construction required for rapid transit lines.



Relation between the proposed proximity assessment curve, for the proposed rapid transit system of Detroit, and the actual enhancement curve in New York. The New York land value increases, due to the proximity of rapid transit stations, were computed from an average of 8,304 observations

Financial Plan to Distribute Cost Equitably

When it becomes necessary to initiate the construction of rapid transit trunk lines, public opinion must not only be crystallized on a route plan but as well on a financial plan that will equitably distribute the cost. Heretofore it has been the practice to make the rider carry all the capital charges for construction as well as the charge for maintenance and operation. The inequity of this practice has been long evident, and study of the economies of transit financing has been stimulated by the fact that the cost of construction has so increased that the carrying charges for the whole cost can no longer be met within the limits of a reasonable fare.

It is not difficult to determine how the benefit from a rapid transit system is distributed. There is ample evidence in the assessor's records in New York, Chicago, Philadelphia and Boston to show that the "lion's share" of the benefit from a transit facility is enjoyed by the property along the line and within the service area. It is reflected in the great and continuous rise in land values in the area directly served over and above the rise in land values in other sections of the city.

The amount of this special benefit over a ten-year period has been shown to be from three to five times the entire construction cost. It has, moreover, the peculiar merit of being the only benefit conferred by the transit facility that is immediately realizable and capable of being converted into cash at the will of the land owner, while the benefit to the rider is available only by his use of the facility, and the benefit to the general taxpayer is confined to his share in the increase of the city's assets and to his standing as a potential rider.

Rapid Transit Structure a New Street

In its effect upon property the construction of a transit facility on an exclusive right-of-way, whether it be on the surface, in a depressed way, on an overhead structure or underground, may be likened to the creation of a new street. A new street is normally and properly paid for by the adjacent property and the property that is made more easily accessible by its opening. Those who use it must provide their own vehicles.

The same principle applies to the transit structure which is, however, a street of much greater capacity than an ordinary street. If occupied by a two-track rapid transit line it is capable of delivering 60,000 persons per hour to any parcel of land along its course in excess of the number that can be brought to a similar parcel of land on an ordinary street that is without the facility. This increased accessibility to a greater number of people is the measure of the excess benefit conferred upon the property along the transit line over and above the benefit to other property in the city. The full benefit attaches to the property immediately adjacent to the stations and decreases as the distance from the station increases.

Effect on Land Values

The most illuminating evidence on this subject is given by Avery W. Schermerhorn, real estate agent and appraiser for the Board of Transportation of the city of New York, in a report presented in 1926 on the effect on land values of the construction of the dual subways. The following salient points are from a report which followed the examination of 8,304 parcels of land:

It was found that the average increase in assessed value of land in districts similar in character to those covered by the 8,304 points, but where there had been no rapid transit, averaged only 6 cents a square foot in ten years, whereas the net increase in

Digitized by Google

value at local stations averaged $2.25 a square foot and amounted to 18 cents a square foot a half-mile away from the station.

At express stations the net increase in value amounted to $2.99 per square foot and the influence of the facility extended to a distance of more than 3,000 ft.

Benefits from the older subways in New York have steadily increased for a period of more than 25 years and the greatest centers of present value coincide with those of most intensive rapid transit facilities.

Studies were made to determine what has been the effect on assessed value both for land and buildings in the older portions of the city of New York traversed by the new rapid transit system now under construction on Eighth Avenue.

Although construction of the new system was not more than 25 per cent completed, the effect on even the older developed portions of Manhattan already served in part by rapid transit lines has been astounding.

For example, in a zone extending 800 ft. to the east and west of Eighth Avenue in the Borough of Manhattan, through which a new subway is being built, from 14th Street to 40th Street, a zone which has on its outer boundaries an elevated railroad on Ninth Avenue to the west and a modern subway on Seventh Avenue to the east, between Oct. 1, 1924, and Oct. 1, 1925, land values increased 45 per cent and land and buildings together 57 per cent, while land in the entire Borough of Manhattan increased only 18 per cent.

It is manifest from the New York evidence, which is fully supported by similiar examinations in Philadelphia along the line of the Frankford elevated, and in Boston along the subway lines, that it is totally inequitable to load the cost of the permanent way as well as the cost of equipment, maintenance and operation upon the rider. It is equally inequitable to put all the cost of the permanent way upon the city at large, while the property within the zone directly served receives an enhancement in value many times greater than exactly similar property paying the same proportionate contribution under the general tax.

It would be easily possible to determine the benefit to each parcel in the benefited zone with reasonable accuracy by recording the rise in value during the construction period and deferring collection of assessments until the line goes into operation. Perhaps the most equitable method of assessing the locally benefited property would be to distribute it in equal amounts on the whole district over a ten-year period, and determine the annual amount to be paid by each parcel by the relation of the assessed valuation of the individual parcel to the total valuation of the district. The assessment would then reflect the annual rise in value on each parcel due directly to the facility. The community should, however, define the proportions of cost to be paid by the rider, the city at large and the district locally benefited, before initiating construction.

The benefit shown to attach to property by reason of proximity to a rapid transit line attaches also, but in a lesser degree, to property contiguous to a street car line. The rapid transit committee of the A.E.R.A. has estimated the capacity of a single street car track at 13,500 passengers per hour in one direction, and of a single rapid transit track at 60,000 passengers per hour, or 4½ times the street car capacity. Something like the same relation exists in the value conferred on property. No such value is conferred by a bus route for the reason that, while it may be established over night, it may also be taken away quite as easily.

It would be imprudent and uneconomical for a community to undertake the creation of a system of transportation thoroughfares within its corporate limits without a definite plan for extending the system with the expansion of the community into the surrounding territory, and a definite understanding with the authorities of other communities affected. Except as it affects the public convenience, it is of relatively less importance for a community to get under way with the construction of its rapid transit trunk lines than it is to see that the routes its rapid transit system will occupy in its outer area are defined in advance and the right-of-way secured, so that the greatest possible amount of trunk line mileage may be of the most economical character.

The progress that has been made in the Detroit area in carrying out its regional plan may be of interest. The Master Plan, providing for super-highways at 3-mile intervals, 120-ft. roads at mile intervals and major thoroughfares at approximately ¾-mile intervals within the city, was proposed in 1924. At the end of 1928 more than 600 miles of frontage right-of-way or more than a third of the entire right-of-way required, had been secured, 80 per cent of which was dedicated without cost. The value of the right-of-way already secured is, at present prices, about $25,000,000. Immediate relief has been given to motor traffic by construction of new pavements on the new highways to the value of more than $10,000,000. In the same period 36 miles of major thoroughfares within the city have been widened or condemnation proceedings started to that end.

When it finally becomes necessary to initiate the construction of rapid transit trunk lines, the comprehensive plan of major thoroughfares offers a choice of routes to fit the immediate needs of the city with the certainty that extensions are already provided for and may be made on a scale of decreasing expenditure.

Vital Facts on Community Transportation

Automotive transportation is not necessarily a competitor of rail transportation, but an effective aid and ally.

The automobile, with its instant availability, great mobility and distance-reducing qualities, has met the demand for diffusion of population and has pointed the way to a diffusion of service.

The transportation scheme of the future must be broadly designed to fit each element in its proper field so that each feeds to and profits by the operation of the other.

It is a matter of vital interest to the electric railway industry, which has $6,000,000,000 invested in the use of streets, that in the rearrangement of the street system of cities its opportunity for service is not restricted.

It is the function of the community, its responsibility and its duty to create an adequate street system on which the transit facilities of the future may rest. The electric railway industry, with its great opportunities for educating the public, can do much to promote a clearer understanding of the task and make the way easier for its accomplishment.

An Essential to

Successful Merchandising

Is CONFIDENCE *in the Goods*

By

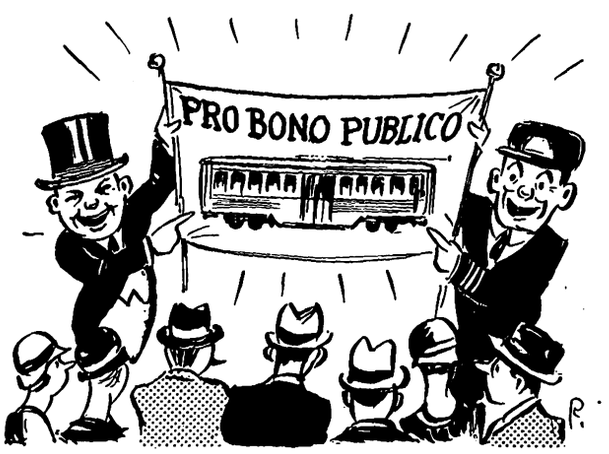
F. A. CUMMINGS

Vice-President in Charge of Transportation
Eastern Massachusetts Street Railway
Boston, Mass.

The public relations department of an electric railway not only must tell the story of the company to the public in an effective way, but must see to it that such a story can be justified by the facts. Confidence of the employees can be obtained best by making all of them real partners in the enterprise

RESPECT of the communities in which they operate can be obtained by the street railways, and it can be earned and deserved as well, if they will muster up enough courage to tell the people they serve just what they are doing, what they intend to do in the future, and what kind of support it is necessary to obtain from the public in order that satisfactory service may be maintained at reasonable rates of fare.

After having been in the thick of things for more than ten years, and seen the rehabilitation of a street railway which in 1919 was carelessly described as a huge junk pile, and by that fearless critic, Peter Witt, as a property "awaiting the arrival of an auctioneer," the writer has an abiding faith in the sense of justice of the great American public. As a result of this experience, I believe that at least 90 per cent of the people in this country are willing to give the street railway a square deal. The difficulty is, that over a long period of years they have been thoroughly saturated by political hokum hostile to this business. In various instances, several of us in the public relations departments have been only voices in the wilderness, making frantic efforts to catch up with and overcome the Legion of Lies.



Tell the people just what you are doing and what you intend to do in the future

As a matter of fact, the propagandists have been at work for many years. Most of the damage had been done before street railway managements woke up and began to realize that if they were to avoid having their properties destroyed through false statements and slander, they must perforce set up within their organizations departments to combat these attacks with the truth. These departments have become generally known under the heading "Public Relations."

The establishment of public relations departments was a step in the right direction, it is true. In all too many instances it was only one staggering, solitary step. What did many of them amount to? I'll tell you—less than nothing! Heresy, you may say. Well, if so, make the most of it!

Let me explain what I mean. The public relations department usually was not allowed to tell the true story publicly. Instead of choosing a good healthy, experienced, courageous newspaper man, fired with an ambition to make good on his own, and thoroughly sold on the justice of his cause, too many street railways turned to hiring relatives or friends of executives or academic persons for their public relations experts. Sometimes, even, radicals have been employed, in order to stop their attacks. Street railways which have built up public relations departments in this way have got just the kind of service they might have expected.

In passing, I might say that one of the greatest liabilities in the attempt to merchandise transportation is a public relations department which is too "high hat" with the public and too much "yes, yes" to the management. If the management hasn't enough confidence in its public relations department to give it a free rein, then it is time either to close up the department or change its personnel. It should be necessary to establish that degree of confidence which will, at least on some occasions, allow

Digitized by Google

it to go ahead and experiment, even if the management is doubtful whether the results will help or hinder.

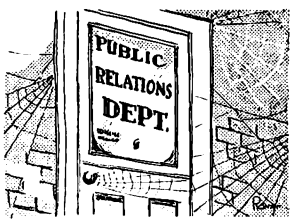
Sell your service instead of the cars

Taking a leaf from the book, on the property with which I am connected we have ventured into so many new and untried fields that they could not be enumerated within the limits of this article. In whichever direction we have turned, the public relations department has been consulted. That its personnel has not changed in nineteen years has been due, I believe, principally to the unswerving and sympathetic support it has received in numerous aggressive campaigns in uncharted fields, where there were no precedents to follow nor warning signals to help. On the other hand, there has always been a crusader's belief in the righteousness of the cause.

Has a street railway a good story to tell the public? If so, where and when should the story be told? In the newspapers, of course. Editors everywhere are willing to give columns of space to street railways, providing the articles submitted have real news value. On the contrary, they soon detect advertising or propaganda which is dressed up in the form of news.

Straight advertising should be paid for at advertising rates, and run as such. It is futile to attempt to pass it on as news matter. When street railways advertise, and they certainly should do so, it should not be spasmodic and should appear not only when the company is in trouble, but regularly all the year around. The major factor should be the daily newspaper in the home town. No other medium can compare with the front page of the daily newspaper.

Circulars, billboards, magazine advertisements, dashboard signs, and a variety of other mediums do considerable good, but they should be considered as supplementary to the regular newspaper advertising.



Many public relations departments amounted to less than nothing

Of course, the company must have something worthwhile to sell. If the sales force does not know how, or refuses to deliver high-grade and properly priced service to the public, no amount of money spent for advertising will bring the desired results. If the management expects to continue running a street railway, it must have smooth rails, up-to-date cars, schedules that are fitted to the volume of business, and platform men who are courteous. One of the worst advertisements for a street railway is a trolley car that needs paint. A regular painting program is just as essential, if not more so, than a systematic overhaul of the equipment. I say this because I believe it is the dress-up of our show windows. To the street car it really is what rouge and lipstick are to femininity, only more so.

If we are running a street railway in a community and the development has grown away from the lines upon which it is running, with the result that the street railway's business was not keeping pace with the industrial and building developments, especially in the hinterlands, we should not hesitate but should become "bus-minded." When this thought strikes us, we should not remain in executive session with ourselves too long, but should act on the inspiration, and perhaps in this direction may lie the solution of the problem which is now testing the best brains in the transportation field. With competition as keen as it is today among transportation agencies, the customer demands doorstep service. The company that cannot carry him in de luxe fashion from the spot where he is to the spot where he wants to be in quick time, and at a price which does not dent his purse too deeply, need not attempt to explain the reason, but should try to furnish the service demanded.

Now as to salesmanship and salesmen of the service. In recent years an impression has been built up that the only salesmen of the transportation companies are the uniformed employees who deal directly with the customers. Nothing could be further from the truth. Every person who draws pay from the company ought to be included in the sales force. The instinct of self-preservation should be enough to teach the employees this. Of course, there are selfish ones, but a simple and easily understood educational campaign can be conducted to convince them.

Use the newspapers to tell the story

On the Eastern Massachusetts Street Railway, in order to show the necessity of enrolling everyone in the sales campaign, on the walls of offices, carhouses and repair shops, this legend, printed in big type, has been posted:

> **Are You For Your Bread and Butter?**
>
> *If so, don't be afraid to defend the street railway from unjust attacks. To hold our jobs we must be one great big family, all for one and one for all. If we all pull together and do our best nobody can ever do us any harm.*
>
> **We Are For You; Are You Also For Us?**

Of course, nobody would dispute that the direct contact men, who meet the customer face to face where the money which keeps us in existence is exchanged for the ride we have to offer, are the most important cogs in the whole machinery. They can make or break the company. The white collar office workers, beginning with the president, know this. All too often, they do very little about it. In their wisdom they compile a voluminous rule book for the trainmen, and, figuratively speaking, fling it at them, saying in substance, "Go out and run the cars or buses and be sure not to break any of these rules, or God knows what will happen to you."

I will admit that this last assertion is going to bring a storm of protest, especially from executives of some street railways which have spent thousands of dollars in salesmanship campaigns among the platform men. I would request that they do not get too excited until I have the opportunity to do a little explaining of what I mean.

What rouge and lipstick are to the flapper paint is to the street car

Instruction in salesmanship, to be effective, must be simple, honest, straightforward and intelligent. It must be conducted by someone whom the men can understand, and in whom they can have confidence. Big words shot from off the heights, no matter how nice they may look in print, nor how well they may sound on the tongue of the speaker, never did and never will

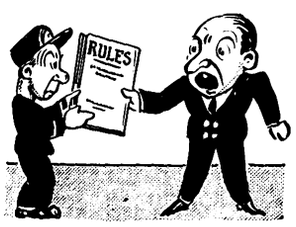
Digitized by Google

accomplish as much as language of the kind used by the men themselves, and delivered to them with as much informality as possible, consistent with dignity, by someone whom they consider one of their own.

Street railway managements which are always trying to explain to public authorities why they cannot do this or that or the other thing, or are making futile efforts to obtain rights to which they are justly entitled, might well turn their attention first to their own misnamed "family group." By this, of course, I mean the employees. Before the attempt is made to convert anyone else, it is necessary to sell these men on the merits of the street railway's case. One of the worst enemies of the street railway is the employee who uses the mouth which the street railway feeds, for the purpose of whining and complaining and misrepresenting the street railway to the public. The next worst enemy is that employee who takes his pay regularly, but listens to others condemning the street railway without ever uttering a whisper in defense of his meal ticket. I believe that no other industry in America could survive such vicious attacks as have been made upon street railways almost everywhere in this country.

A good salesman must have confidence in his goods. No street railway platform man can possible be a good salesman unless he fundamentally believes that his street railway has a soul to save, is entitled to the respect and confidence of the customer, and that, most important of all, the customer is not being overcharged for service rendered.

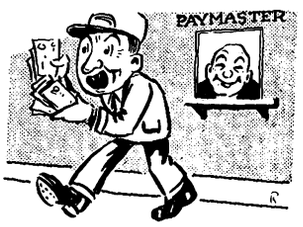
How many of the platform men know much, if any, more than nothing at all about the business which the company is conducting? What proportion of them really believes that carrying a passenger in either a street car or a bus is worth all the company is charging? How many of them know that certain reduced rate tickets are carrying the passengers for less than cost? How many of them really believe half of what they hear about the company's struggle for existence? Every street railway man, of course, has his own answer to this question. By and large, we venture to say that an alarmingly large proportion of the platform men in this country are in woeful need of the right kind of instruction along this line.



Too often they compile a voluminous rule book for the trainmen and "fling it at them"

Policemen and firemen are subject to periodical inspection of their uniforms. So should be the street railway platform men. No car or bus operator can be a good salesman who is untidy in his personal appearance. The smile and "good morning" which he gives the customer, along with other marks of courtesy, are too obvious to need writing about.

Perhaps some companies may find it profitable to award prizes or to adopt similar methods to provide special incentives for salesmanship. There is, however, nothing to compare with "putting it in the pay envelope," an expression that appeals almost universally to the platform men. To obtain the highest degree of skill and salesmanship, they must be convinced that they are obtaining the highest possible wage and working under the best conditions, consistent with giving the owners of the property a chance for their lives in the matter of dividends, or, as our public pleaders would say, "a fair return on the investment."



Nothing compares with "putting it in the pay envelope"

Subject the platform men to periodic inspection of their uniforms

Some people believe that slogans are overdone. They never can be. Dramatization is what the transportation business needs, and in some places it is being obtained in larger measure than ever before. Street railway technical heads who have devoted most of their lives to engineering and financial problems could do worse than to make a study of that most artful and elusive thing, mob psychology. As a matter of fact, haven't street railways suffered from too much technology and too little psychology? Today's slang becomes tomorrow's polite English. Those who frown upon slang merely because it is the orphan child of legitimate language apparently are not aware that the success of some of the world's greatest business enterprises is founded, at least in part, on slangy slogans.

Say it with slogans

To carry this dramatization of the business still further, a street railway executive must break away completely from all orthodox moorings of the past. He must be willing to make experiment after experiment. He must do this with the suddenness and sublility of a department store manager who cuts prices down from $1 to 98 cents. The fact that Uncle Sam does not produce a coin between a nickel and a dime throws most street railways into the ticket field, or else makes the use of metal tokens necessary. This gives all sorts of opportunities for bargain rates and bargain sales of transportation.

As an example of ticket rates, on the Eastern Massachusetts Street Railway lines we have a $1 ticket good all day on the date of issue. It may be used throughout our system, which covers more than 600 miles of rail and 175 miles of bus routes. During the past year, without putting on an additional car or bus to take care of this business, we obtained revenue from it which exceeded $100,000. Our cash fare for any ride, long or short, is 10 cents for a whole division. However, in each of our divisions we have a $1 punch card ticket, the number of rides obtainable in this way varying to conform to the receipts and expenses of the division for which it is issued.

While we are not pretending that this company is living in a bed of roses, it has enjoyed a fair share of the recovery of the street railways from the post-war period of despair. This has been due, in the greatest measure, I believe, to our willingness to try anything once, to deal fairly with the public, to speak openly and unreservedly to public officials and employees, to work unceasingly for the upbuilding of the morale of our organization, to pay a living wage, and finally, but paramount in importance, never failing to meet our problems courageously, and to insist that we be given what belongs to us.

What Executives Think *About the* Fundamental

A symposium of opinion on transportation economics, franchises, co-ordination of facilities, vehicle design, employee relations and other live topics

Further Rehabilitation Is Industry's Great Need

Full recognition by financial interests that a complete change has occurred in public transportation affairs, and that electric railway corporations are now sound institutions from a credit standpoint, which will make available the relatively small amount of new funds required for the further rehabilitation of the transportation plant, seems to me to be the outstanding necessity of our industry.

All executives now know where we are going and how to get there, and only this final push is needed to enable us to arrive.

L. S. Storrs
Executive Chairman
United Railways & Electric Company
Baltimore, Md.

Railway Problem Is Twofold

Generalizations about the merchandising of transportation do not get us very far. We know that much electric railway riding is of the necessity type, since holiday and pleasure riding have greatly decreased. Our problem is to give the best possible service to the necessity riders, who form the backbone of the business, while at the same time catering as far as possible to the non-necessity "prospects."

We must recognize at least two fundamental facts, namely, that people do what they do largely because they want to do it and not because it is the best or most economical thing to do, and that the vehicles operated by the electric railway cannot compete with the automobile in those particular characteristics which make the latter supremely attractive. Is not the chief charm of the automobile a sense of proprietorship and independence, even when it is only partly paid for and when it is at the mercy of general traffic? There is little use in arguing with the private automobile owner about how much it costs per mile to run his car. How, then, can we get some business from this man? It can be done in two ways, I believe. One by what we do for him when we get the chance, and the other by what we say to him.

On these occasions let us prove to him, for example, that the electric car or bus is more comfortable than he thought; that the men and women who serve him with transportation are at least as well-mannered and considerate as store sales people; that in a public service vehicle he can read in comfort. Then, by word of mouth and in print we can convince him that his own best interests are conserved when he uses the local transportation service and his own automobile in such proportions as give him the best over-all service.

Any live commercial concern is on the alert to find special business that it is equipped to handle. Thus, one merchant picks up a stranded stock of goods at a low price for cash, and puts it on the market at an attractive figure. Another develops a new line of goods and cashes in on it before his competitors sense the situation. So in our business there are often large groups of people who need to be moved comfortably and conveniently over a special route. We should get this business. We have the facilities to initiate such business too, by showing organizations of citizens what their railways can do to help them have a good time. In general, we can convince our clientele that we are wide awake.

Edward Dana
General Manager
Boston Elevated Railway

Employee Confidence a Valuable Asset

Because public service is largely personal service, too much attention cannot be given to the personnel of a street railway organization. Throughout the country it will be found that where executives are concentrating attention on their personnel service, complaints are no longer a problem.

The one thing that is certain to make for a better personnel and at the same time better service, is understanding. An instructor teaches the new trainman to understand his equipment and how properly to operate it, but as a rule he hits only the high spots when he undertakes to tell him about the quality or brand of service which the company aims to supply.

The employee must get this fuller understanding of the company's policies and problems from his superior officers. All of his superiors, even up to the president, should indicate to him from time to time that they are interested in the brand of service which he is producing. Rules and regulations are necessary, of course, but heart-to-heart talks with some degree of regularity make these rules and regulations almost secondary. Tell the employee your problems from time to time. Have him see them as you see them. Have him understand these problems as you understand them, and you have the solution of them well under way.

It is needless to add that the spirit of the organization is directly reflected in the service to the public. If employees are to be courteous to the public, there must be a spirit of satisfaction and contentment within the organization. Courtesy can be

ame Problems

of the Industry

forced under some conditions and for a short while, but where it is demanded from early morning until late in the evening and day after day under all sorts of conditions, it must come from a peaceful mind which can be maintained only when the employee is happy in his job.

To keep the employee happy in his job is largely a matter of keeping him informed. Tell him from time to time about the progress of the business to which he is devoting himself. Let him know that there are no secrets about it, but that there are problems to be solved in which he is as vitally concerned as you. There is no satisfaction like confidence.

W. E. WOOD
President
Virginia Electric & Power Company
Richmond, Va.

Improved Performance Is Aim of Car Design

DOUBTLESS every effort should be made by progressive railway properties to improve their schedule speeds on both old and new equipment. This may be accomplished when purchasing new cars by endeavoring to secure lighter equipment, by a careful study of scientific principles involved in the construction of trucks and bodies, and by elimination of all unnecessary equipment which might be regarded as frills helpful in meeting automobile competition.

Higher running speeds are also desirable, together with faster acceleration and braking. I would like to emphasize the desirability of obtaining a low center of gravity. This in itself will permit higher speeds with safety and will encourage passengers to use the service by a greater ease of entrance.

The ultimate objective should be to have the car only one step from the ground, even though this might involve putting the motor apparatus overhead rather than under the body. Such a design would give surface operation one of the advantages of rapid transit operation, by making it possible for passengers to walk directly from the safety zone platform into the car. Another fact deserving of careful consideration is the advantage of large units which have a considerable reservoir of capacity for peak operation.

J. H. ALEXANDER
President
Cleveland Railway

Education of Trainmen Needed

OF ALL THE FACTORS involved in merchandising and providing satisfactory transportation service, none is more important than the courtesy or lack of courtesy of the operator. He is the company's representative to the public, and should be a good salesman as well as a cashier. There is only one way to improve the attitude of the trainman toward his work, and that is by education.

J. H. HANNA
President
Capital Traction Company
Washington, D. C.

Standardization of Car Design

EQUIPMENT MODERNIZATION represents the greatest need in the street railway industry today. The public has become thoroughly automobile-minded, and because of this it expects a comparable service from its mass transportation facilities.

The work done in recent years on experimental cars has demonstrated that a vehicle can be made which will enable the street railway industry to offer effective competition to the automobile. The operating companies, however, are faced with a problem in financing the purchase of such vehicles.

The industry must do its part to bring about the desired results; that is, to co-operate with the manufacturers in the production of a car at a price within the reach of operating companies.

In my opinion, the most constructive step which the industry can take in this direction is to agree on and adopt general specifications as to car design and limit its specifications to desired rates of acceleration and braking, and free running speed as well as to other general factors such as weight and capacity; in other words, the industry should set up only general standards for the manu-

Substituting Invention for Convention

IN DEALING with any problem of the street railway industry, I instinctively find myself confronted with the phrase "invention versus convention." There seem to be many factors which are fixed by habit or convention, and one of the most difficult barriers to overcome is the mental inertia in the minds of the public, the passengers and especially of the employees, We must break down the old ideas of the 5-cent fare, the paving charges of horse-car days, and the idea of being content with such business as comes to us rather than seeking to increase our patronage.

To my notion, invention should be substituted for convention. We must invent ways and means of overcoming obstacles and making our service more attractive than any competitor's service. Better tracks, less noisy cars, more conveniences, more courtesy, and better public relations are all factors which make for progress.

I value those employees most who by their initiative can invent new ideas in these directions. Imagination to invent, and courage to experiment, are valuable assets in any organization. If our franchises, taxes and fares were fixed years ago, the chances are very great that they do not suit modern conditions. Inventing ways to change them makes the work fascinating.

facturer and depend on him to develop a vehicle which will not only meet these standards but be attractive to the riding public. The results of adopting such a policy would permit the mass production of street cars, with a consequent lowering of price to a point where the operating companies would be enabled and stimulated to purchase modernized equipment.

T. FITZGERALD
Vice-President
Pittsburgh Railways

The Small City Is a Difficult Problem

SUPPLYING MASS TRANSPORTATION to cities of 75,000 and under is one thing that has not had the attention its importance warrants. It may seem foolish to think one class of cities has problems any different from any other class, but a moment's reflection will serve to convince you that there are fundamental differences in operation in communities of the small city class which demand a method of treatment different from that of the larger cities.

Because of these fundamental differences, the problems facing the small city property deserve special attention, not only from the operators but from the trade papers and the association. By such a study the best possible practices may be formulated and presented to the small city operator, who often finds himself facing situations without either adequate staff or the necessary finances to combat it.

During the past year the Traffic and Transportation Association had a committee devoting its time and efforts to a study of the small city problem. While much of interest was developed, the committee could not formulate a comprehensive report because of lack of detailed information.

Inasmuch as the situation that is affecting this group of properties is critical, it is to be hoped that all those interested in small city properties will assist the association during the coming year in furnishing comprehensive information which will enable it to help.

This group of properties carries approximately 12½ per cent of the population of the United States and is the largest single group in the industry.

A. C. SPURR
Vice-President and General Manager
Wheeling Traction Company

Co-operation the Secret of Good Employee Relations

PROBABLY the one best answer to the question of how to improve relations between the employee, his management and the public may be found in the very simple, yet magnetic word "co-operation." From the knowledge gained through our own experience, as well as that which history relates, we find that the greatest success in any venture has always been attained by those who had a full understanding of the word "co-operation." We cannot overestimate the value of an efficient welfare division in the establishment of the best relationships between the employer and the employee.

It is our belief that the *esprit de corps* of our employees is greatly strengthened by an active interest from the general welfare standpoint. Through a systematic method of home analysis, intermittent workers are reported to the welfare division by their supervisors and a complete investigation of home conditions is made.

Arrangements are then made to provide the necessary medical care, legal assistance, or any other help that may relieve the employee of difficulties or troubles existing in his home. This creates a sympathetic activity between all the men, and embraces moral and physical tendencies which help to establish a confidential relationship by which our welfare division may obtain the true status of each man's difficulties.

DEL A. SMITH
General Manager
Department of Street Railways
Detroit, Mich.

Revenue Possibilities in Bus

WITH THE PRESENT ERA of industrial prosperity, it would seem advisable at this time to examine our own industry with the thought in mind of placing it upon the same sound financial basis enjoyed by other industries. In making this comparison we are at once confronted with the fact that the electric railways have not kept pace with the general price trend as regards the sale of their product.

The public will pay a fair fare if the service rendered meets with its approval, because in its final analysis the matter of service is first.

The public has accepted the motor bus as a harbinger of a change which is taking place in the transportation industry. The installation of new motor bus routes has provided an opportunity for securing reasonable tariffs. Certainly, operations with this relatively new unit should be conducted at a profit; consequently, the inauguration of such service should carry with it a tariff which will insure the financial success of any such operations.

With adequate and satisfactory service of this new unit it is possible to establish a tariff which will produce satisfactory returns, at the same time meeting with the approval of the traveling public because of the place the bus now has in the mind of that public. Once a fair tariff for bus operation is firmly established, many companies will materially improve their condition as substitutions of bus lines are made for non-paying car lines, and extensions into new territory are made by bus instead of rail.

J. F. JOHNSON
General Manager
Community Traction Company
Toledo, Ohio

Bus Design Will Determine Its Future Use

IMPROVEMENTS DEVELOPED in the design of buses, as in street cars, will determine the extent to which buses will be used in community transportation. Under present conditions the buses serve more satisfactorily and more economically where patronage is relatively light; the street cars when riding is heavy.

The greatest development which could occur to increase the economic usefulness of the bus would be the invention of a storage battery which would give at least a 300-mile radius of operation. This would permit the use of electric motors and central station power, in addition to the present advantages of the bus. The usefulness of the street car could be most improved by the perfection of a braking design by which the rate of braking could be made equivalent to that of the best brakes applied on private automobiles.

Further improvements in noise reduction will also be necessary in order to make street car riding more attractive to the public. The development of these improvements will be a large factor in determining the extent to which buses and street cars will be used in the future.

Industry Advanced by United Effort

NOT SO MANY YEARS ago the association was not united as it is today. But the men at the helm were not discouraged. They did not lie down on the job, but took hold of the affairs of the industry and started it along the course they had charted, a course which leads to success. This has not been the work of any one man, but has been accomplished through the united efforts of all. Perhaps a few have been somewhat more outstanding in their efforts than others, but all are working so wholeheartedly that Herculean tasks have been performed. I am confident that we will carry on in a way that will spell success.

FRANK R. COATES
President
Community Traction Company
Toledo, Ohio

Give People What They Want

EVERY MANAGER should surround his congested mass transportation area with a circle and denominate it "Metropolitan Area." Outside that area he should draw another circle, and that outside area should be denominated the "Outer Metropolitan Area." Beyond that, if necessary, a third area should be inclosed, called the "Interurban Area." The two outside areas should be served with buses, which accomplishes the following:

First, it relieves the metropolitan area of a large number of cars, allowing greater speed in the inner circle; second, it brings into the inner circle, through the medium of express service from its circumference, patrons in the outer circle with greater speed, more comfort, and with a tremendous saving in time; third, it allows for greater flexibility in service.

If there should be instances in the inner circle where there is not sufficient traffic density, then buses should be substituted. Transfer from bus to trolley is in most cases ridiculous. The auto brings luxury, comfort and speed.

That is what the people want. That is what we are giving them here by means of the bus on the plan as defined above. Wherever these three results can be attained the substitution should be made. The truth of the statement and the success of the undertaking have been proved here, and in each case where the plan has been started the gross has increased materially. The place of the bus is hardly a debatable question today.

A. R. WILLIAMS
First Vice-President and General Manager
United Electric Railways
Providence, R. I.

Co-ordination of Taxicabs Advantageous

IF THE TAXICAB is classed as a public utility and properly regulated one or more competitive lines of taxicabs should be taken over by the street railway company and co-ordinated with other transportation facilities.

By the street railway taking over its strongest competitor, competition would be eliminated to a large extent and a number of operators forced off the streets. The matter of transporting the residents of a community is a business in itself, regardless of the means by which this service is conducted.

A company which has had the experience of conducting a street railway business for a number of years can handle any other means of transportation which can be co-ordinated with its central business. Much more efficient service can be provided under this plan than is possible by an independent with only one isolated means of transportation.

The public would be more efficiently served, and at a lower rate of fare, by co-ordinating under one management these transportation agencies which logically fit into each other.

W. H. BOYCE
Commercial Manager
Pittsburgh Railways
President Transportation and Traffic Association

Franchises the Foundation of the Industry

UNREASONABLE franchise conditions are among the principal causes for unsatisfactory conditions in the industry. The franchise is the foundation upon which the whole structure of a railway utility is built, since it usually stipulates the taxation, the fare structure and service requirements.

Companies which desire to continue operations must set their franchise house in proper order. The only way to do this is to inform the public frankly of the changes which have taken place during the past ten years and what is necessary for any company to operate a high-class satisfactory utility which the public can now demand.

There is no reason why a franchise must terminate, as the public is well protected at the present time by public service commissions. The fare stipulation need not be included in franchise requirements because, under modern conditions, the rate of fare cannot be raised beyond a certain limit without losing more traffic and revenue than is compensated for by the increase in fare.

The franchise should give the utility the monopoly of providing transportation in the community, including rail, bus, taxi service, and even local water service by ferry if such exists. If the public realizes that the money invested and spent in providing and maintaining pavement is really taxation on the utility and consequently the car riders, there is hope of relief from such an unjust burden.

H. E. WEYMAN
Vice-President and General Manager
Levis Tramways
Levis, P. Q., Canada

Traffic Congestion a Serious Civic Problem

REGULATION of street traffic presents one of the foremost problems to all large American cities, and consequently is one of the chief problems facing electric railways. Transportation companies are often the only organizations in the community which combine expert knowledge and an intense interest in the proper solution of the problem. These factors combine to place an obligation upon the transportation company to assume leadership in solving the problem.

The fundamental cause of all traffic congestion is the inherent selfishness of all human beings. This human impulse can be brought under control only when the sentiment of the entire public is aroused to the point where sensible regulation of all traffic and parking is demanded and enforced.

Street railways will be criticized, but they should not be swayed from their purpose of building up the proper public sentiment. We can and should exert a strong influence. First, we should see that our own operations, our track layout, our route and schedules, are such as will permit the most efficient service with the least possible interference with the movement of other traffic. Then we can co-operate with other transportation agencies, public organizations, civic authorities, newspapers and others in-

Digitized by Google

terested in working toward adoption of a sensible plan.

Co-operation of other agencies should be sought actively and obtained. If it cannot be obtained, street railways should work single-handed in the interests of the industry and in the interests of the communities served.

F. L. BUTLER
Vice-President in Charge of Operations
Georgia Power Company
Atlanta, Ga.

Bus as a Street Car Supplement

AS A SUPPLEMENT to street railway service the bus is fast finding a place in the public transportation field. High depreciation and high operating expenses are problems that still must be solved, however. The future will probably bring out a further expansion of the bus. In cities not large enough to support rapid transit facilities, buses very likely will be used to give fast express service to outlying communities, which in my opinion is the logical manner in which they should be co-ordinated with street railway service.

J. L. ALEXANDER
General Manager
Houston Electric Company

Lighter-weight Cars Needed

ONE of the most important factors in merchandising electric railway transportation is modern, up-to-date equipment. The railway's problem is to secure an up-to-date, light-weight, double-truck trolley car that is within the price range of the large capacity bus—"a six within the price range of the four," so to speak.

I believe that if the car builders are to hold their own against the replacement of street cars by buses, they must develop a light-weight, double-truck trolley car seating 40 people, and with a total weight of not more than 18,000 lb. This car must be built for a price, and not necessarily to last for more than ten years.

Examination of our miscellaneous property accounts shows that 74 per cent of them are affected by the weights of rolling stock, and more than 40 per cent of the operating accounts are directly involved.

Times are changing, and the industry is now suffering from cars that were built too heavy and last too long.

A. J. BOARDMAN
Vice-President in Charge of Operations
Eastern Massachusetts Street Railway
Boston, Mass.

Freight Revenue Can Be Increased

FREIGHT REVENUE on most interurban electric railways can be materially increased. But to do so capital expenditures must be made in order to increase their scope of operations, and make improvements in their service. In most instances these expenditures should be for commercial switches; steam and electric railroad connections; reduction of curves, particularly in cities; and purchase of more equipment, including more powerful motors or locomotives.

Keen competition of steam railways and motor trucks, together with urgent demand of manufacturers and wholesalers and retail merchants who carry all stock, makes it absolutely imperative that electric railways schedule fast trains, make immediate delivery, and provide dependable service. Adequate facilities must be available to get this service.

There is plenty of freight business to be had, of both carload and less-than-carload type. If well-located electric lines will improve their facilities and service as mentioned above, and supplement it with consistent advertising and personal solicitation, they can increase their freight business considerably.

H. A. NICHOLL
General Manager
Union Traction Company of Indiana

New Bus Designs Increase Usefulness

DEVELOPMENTS in the design of the urban bus with increased motor power and greater carrying capacity have increased the field of its usefulness. It never has and never will be used for wholesale substitution of street car service, as it can return a profit only when used on comparatively short lines. In many American cities a great many street railway lines can profitably be replaced with buses.

New sections of cities where transportation facilities are needed can be tested out best with tentative service of bus lines.

The bus is an alternative vehicle in city transportation and should be operated under the same conditions and at the same rate of fare as the street cars. It should be an essential part of the proper transportation system.

The development of street cars with high motive power in proportion to their weight, and which permit quick acceleration and utilization of this acceleration through automatic control, removes the chief disadvantages of street cars in modern traffic. Street cars and buses can now be made similar in appearance, in seating arrangement and in operation, so that complete co-ordination between the two types of vehicles is possible.

R. N. GRAHAM
Manager of Railways
Penn-Ohio System
Youngstown, Ohio

The Bus Not a Substitute for the Street Car

THE FUTURE of the bus in the field of community transportation is wrapped up in the development of the bus itself. There has been much improvement in the motor bus in the past few years and quite apart from what was supposed to be its chief appeal—that is, an opportunity to "ride on rubber"—it has taken its place in the scheme of efficient and economical transportation by its increasing dependability and its reduced cost of operation.

With the reduction in the cost per passenger the field of the motor bus is widely increased. In many cities, and Cincinnati is one of them, the public has been slow to accept the substitution of buses for street cars. This has been found to be largely because of a desire to secure the ride for the cheaper fare charged on street cars, although the feeling of permanency of a rail line as against a bus line may have had something to do with it. This has probably been due to special conditions, such as quicker time, avoidance of congested parts of routes or type of sections served.

The reduction of operating costs per passenger on the bus, with the possibility of a smaller fare differential, will tend to widen the field of the bus in cities where its progress has been slow. Its place in the city service will be twofold: As a feeder in this territory in regular service alongside rail lines; or in de luxe service alongside normal rail lines but at a much higher rate of fare. There will, however, in my opinion, continue to be only a few of our smaller cities in their entirety and a few places in our larger cities where there can be a real substitution of motor coach for surface rail line unless the motor coach is developed much beyond its present limitations.

WALTER A. DRAPER
President
Cincinnati Street Railway

The new Pittsburgh car is the product of the Osgood-Bradley Car Company. Particular features are the extremely low body weight of 14,000 lb. obtained by the extensive use of aluminum, the high acceleration and braking rates and the pedal control. Individual bucket type seats accommodate 38 out of 42 seated passengers.

New OBJECTIVES *Govern* Vehicle Design

By

CLIFFORD A. FAUST

Assistant Editor

ELECTRIC RAILWAY JOURNAL

GROWING realization of the necessity to meet the present-day standards of public transportation service has been apparent through the past year. Obviously, it is responsible for the interest that is being taken in the improvement of electric railway cars and buses. Putting the situation briefly, the industry is making an endeavor to obtain vehicles of a character such that they may be used so to improve the service that the patronage of the public will not only be retained but will be increased materially. At the same time that it is endeavoring to develop equipment which will enable it to offer the most attractive possible transportation service, the industry is planning to furnish it at a minimum cost to the consumer.

These objectives are apparent. To state them is merely to reiterate what has been said in the industry over and over again during the past several years. Nevertheless, they merit analysis—analysis with the object of defining more closely, as experience increases, the fundamentals of transportation with which the industry is dealing, the objectives toward which the developments are leading, and the methods by means of which it will be possible to reach these objectives.

It seems a fair statement of the present-day transportation situation to say that the American public is now automobile-minded. Not any more is this a smooth-sounding generality. Today it literally is true. With the automobile in nearly every family—and many families have more than one car—ownership and use of the automobile have become so universal all over the country that public transportation service is compared, automatically and unconsciously, to that possible with the private automobile. This is true both from the standpoint of performance and from that of attractiveness. In fact, the term "automobile performance" is being used quite frequently in describing just what it is the electric railway man is after in a program of improvement for his street cars.

Considering the problem from the point of view of the investor who is planning to place his funds in electric railway securities, the objective in vehicle design is the development of types of equipment which will give reasonable promise of justifying the investment of new money for the purpose of replacing old cars or buses. If the industry is to avoid moving backward, such an investment is justified and will be made if through in-

The aluminum sectional construction, letterboard elimination, continuous roof line, single-pane windows and magnetic rail brakes feature this car, built for the United Traction Company of Albany by the Cincinnati Car Corporation

where they want to go. Schedules must be designed to take advantage of the possibilities due to improved operating characteristics of the new equipment. Schedules must be held to by the operating force so that the service is regular. The company must obtain the confidence of the community and the friendship of the public which it serves. The deportment of the operating forces toward their patrons must be courteous and helpful. Without these essentials, development of equipment alone will be futile.

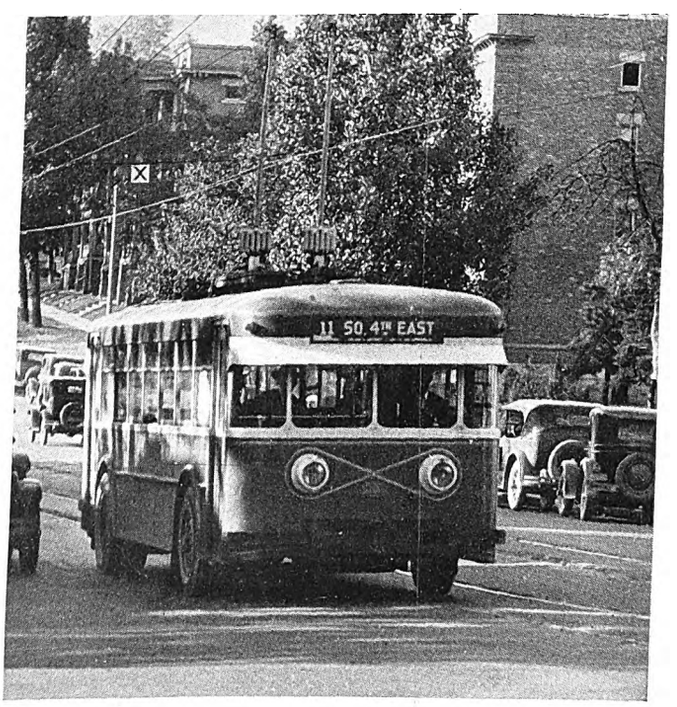
How the Objectives Are Being Met by Car Designers

So much for the objectives. Consider first the progress being made in development of electric railway cars. During the past several years, and most particularly during the last year, considerable experimentation has been under way. This has led to much progress in the effort to work out specific improvements in design to meet these objectives. Sample cars have been built embodying the fundamental principles outlined above, and these cars have attracted favorable comment from operators.

More attention than ever before has been given to improve the general appearance of the street car. The purpose of the designers has been to create a vehicle which not only will be in keeping with its surroundings in the modern city street, but which will be an outstanding and desirable element. They have come to realize that the mere appearance of the vehicle creates definite psychological reactions in the minds of the public, the prospective patrons of the service. So attention has been directed to the balance in the general proportions, to lines and colors, to the curves of the roof, to the proportions of windows, to the shape of the front and rear ends, and in fact to innumerable details that a number of years ago were given scant attention, if considered at all.

So, likewise, attention has been given to the riding qualities of the vehicle and to noise reduction and smoothness of operation. These factors have been found to influence not only the design of the vehicle and the running gear, but also the motors, the control and the braking system. An analysis has been made to break down more specifically the significance of the term "automobile performance" in an effort to increase the attractiveness of the street car ride.

There has been an insistent and growing demand for high rates of acceleration and braking. It is now conceded that the street car must have a get-away that will beat the automobile. With this object attained the car will no longer be classed as an obstruction in the street and an obsolete form of transportation. The slow acceleration of many street cars has resulted in more adverse comment than any other feature by those who are of the opinion that the street car is doomed to go. As experimentation has progressed and experience has increased, it has been recognized that smoothness of acceleration and braking is a most important factor in achieving high rates of starting and stopping. This is to some extent psychological and to some extent physiological. The passenger is not aware of the rapid



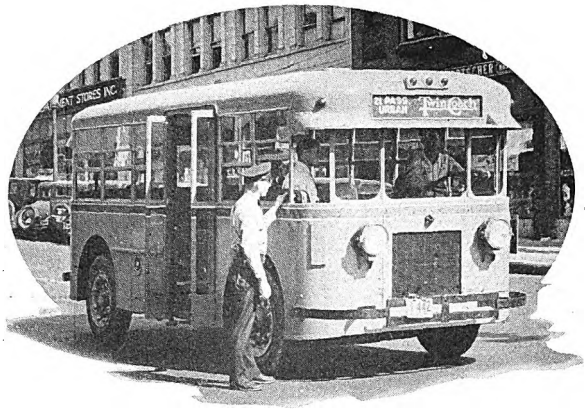
The most extensive recent installation of trackless trolleys is in Salt Lake City. It is being watched with interest by transportation men the country over.

At left—Versare electric coach of the Cincinnati Car Corporation in service on the Salt Lake City system. It is of duralumin construction and weighs 16,000 lb. It seats 43 passengers.

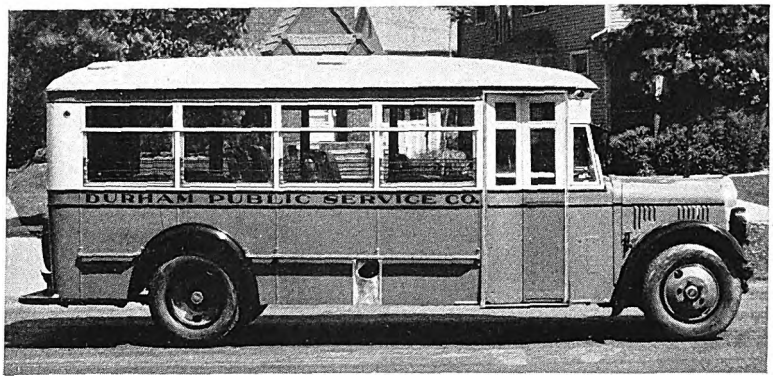
At right—The Twin Coach trolley buses, also used in Salt Lake City, resemble the standard 40-passenger buses produced by the same manufacturer.

Digitized by Google

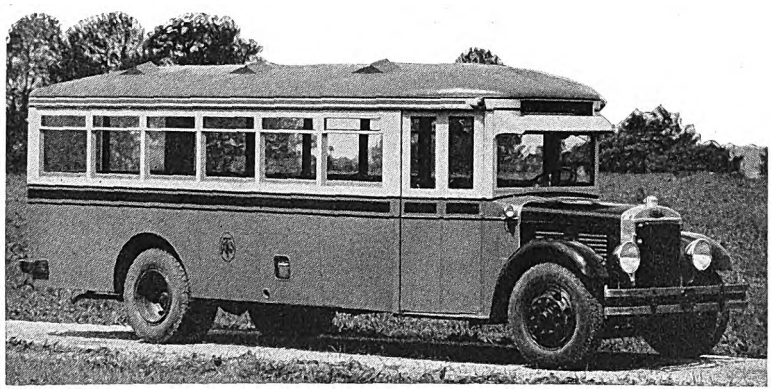
Four Recent Developments in Small Capacity Buses



The 21-passenger "Baby Twin Coach" has been designed to meet the need for a small unit which will give higher schedule speeds than standard buses and at lower operating cost.



Another example of the trend toward the 21-passenger size for light service is this White bus with Bender body built for the Durham Public Service Company.



This 21-passenger Mack for the Montreal Tramways was brought out during the year.

The Dodge Brothers parlor coach is a small capacity bus which has featured the current year's development by this manufacturer.

acceleration or braking if it is accomplished without roughness or jerking. As a means to this end, high-speed motors have been developed, along with gear ratios between the armature shaft and the driving wheels much larger than have been possible with older designs. Control equipment has been improved correspondingly, and the number of contact points has been increased greatly above what has been standard for a great many years. There has been reawakened interest in the development of regenerative braking, in track brake systems, and in the adaptation of automotive-type air brakes to the electric rail vehicles.

As there has been an increased interest in mechanical improvements and in exterior appearance, so has there been greater attention to interior design and appointments. In many instances seats have been made almost luxurious. This development has been carried to such an extent that there seems to be an adequate basis for questioning whether the practical limit in this direction has not been exceeded. As was to be expected, the tendency toward the use of circus colors and expensive and obviously impractical trimmings has been considerably modified in the direction of good taste and practical utility. At the same time designers have not lost sight of those worth-while features that would tend to make the street car a more desirable vehicle in which to ride.

Weight Reduction Considered Essential

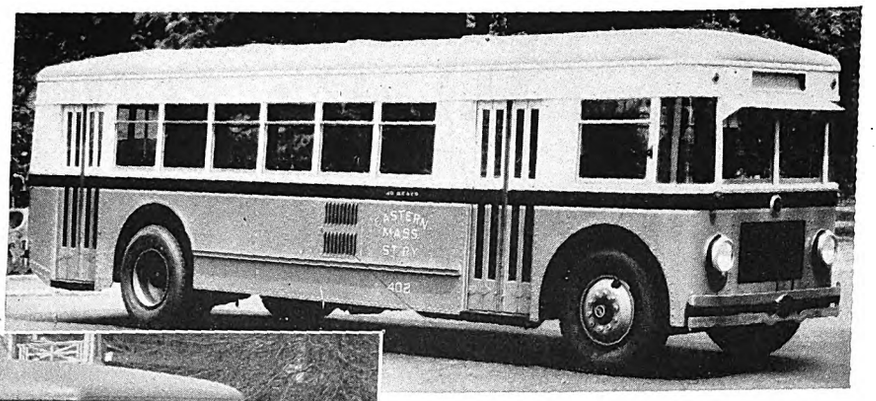
Reduction of weight as a means of effecting operating economies is still receiving consideration. It is not felt that the ultimate has been reached by any means. There has been an increase rather than a reduction in the amount of attention given to possibilities for the use of aluminum and its alloys, both in the car structure itself and in equipment and fittings. Based on the results of a number of experimental units, some of which now have been in service for several years, it appears to be probable that aluminum will be used widely in car construction.

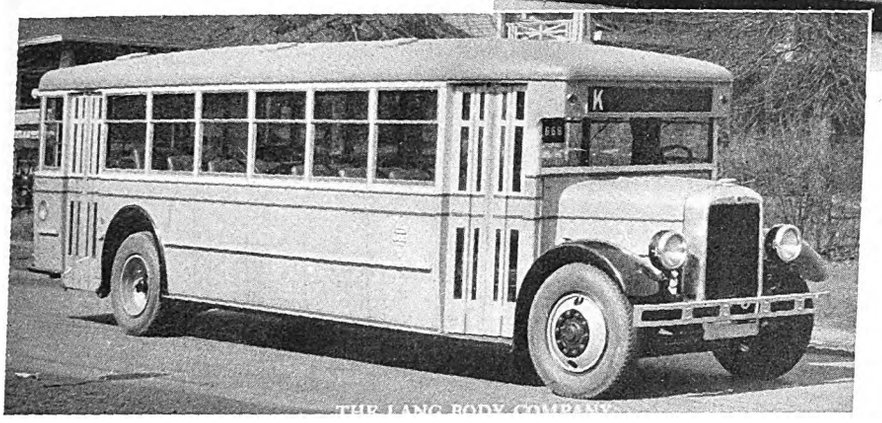
First Cost of Cars Too High

Possibly one of the most significant trends during the past year has been the attention given to first cost. The conviction seems to be growing throughout the industry that the first cost of cars must be reduced radically, and that designers must make every possible effort in this direction. A corollary of this idea is the suggestion that cars be built for a service life approximating ten years, rather than the twenty or more years that has been standard for a long time. Accordingly, the cost of new units must be considered from this point of view. Many operators have pointed out that obsolescence of transportation vehicles may be expected to become a matter of increasing importance and that designers must take it into account seriously.

Digitized by Google

Thus, as might be expected, the industry approaches the 1929 convention of the American Electric Railway Association with the question of car development even more aggressively in the foreground than it has been during the past several years. Several new and radical developments are promised for the car exhibit at Atlantic City. One change in trend from the last Cleveland convention is to be regretted. The efforts at the development of a city-type four-wheel car, which aroused a great deal of discussion at the 1928 Cleveland show, will be less prominent this year. However, at least one design of this type has been promised. The other manufacturers seem to have concentrated on a medium size, double-truck car.





Two developments in the line of large-capacity buses during the past year

At top—One of the 40-passenger buses built for the Eastern Massachusetts Street Railway by the American Car & Foundry Motors Company.

At left—A 39-passenger Yellow Coach with Lang body built for the Cleveland Railway.

Many Improvements In Buses

Buses are undergoing a transformation almost as radical as that taking place in the design of cars. There appears to be a definite trend toward the use of a large capacity bus, with about 40 seats, for heavy city service. Several manufacturers have brought out designs of this type during the year. The opposite trend, also quite marked, is toward a much smaller bus, of about 21-passenger capacity. This design is favored for de luxe service and on light lines where the cost of operating larger units is prohibitive. In contrast, there is correspondingly less demand for the 29-passenger bus, which in past years has been favored. It now appears that this size, which was adopted when bus design was less advanced, is too small for mass transportation and too large for economy where loads are light and normal high speeds are demanded.

In the detail of buses many improvements have been made. These are principally in the nature of refinements for the comfort and convenience of the passenger. Ventilation has been given increased attention, particularly to obtain proper temperature control without the danger of contaminating the air with fumes from the exhaust. Window-opening mechanisms have been improved and simplified. By placing the steering column farther forward it has been found possible to increase the seating capacity of certain types of buses with no greater length.

As to appearance, there has been a general lowering of the center of gravity. Combined with a short, high radiator, this has resulted in a more pleasing design, and has brought the latest vehicles more in line with the current models of passenger automobiles. Braking apparatus has been improved, a feature that is of immense value from the standpoint of safety, particularly when the bus is used in congested traffic.

The reawakened interest in the trackless trolley, which has been one of the outstanding features of the equipment situation during the past year, should not be overlooked. The present trackless trolley is a far cry from its predecessor of a decade ago. Many transportation men are watching with interest the performance and financial results that are being achieved in those cities that are experimenting with the trackless trolley.

Thus it is apparent that experimentation and development to produce better transportation vehicles are still going forward. Many progressive operators, however, do not feel that the improvements, particularly in the design of electric rail cars, have reached the stage where the industry has available modern equipment that has stood the test of actual operating experience.

The thinking public, as well as the transportation industry itself, is just as much convinced as it ever was that a modern and efficient transportation system is of vital importance to the continued development of the American community. In the last analysis, therefore, the major objectives in the design of vehicles are those which will permit the street car and the bus to perform their functions in the mass transportation agency in such a manner as to meet those standards of speed, attractiveness, style and convenience which have become adopted by the automotive-minded American public.

Among the developments of the year is this Studebaker 25-passenger bus

Buses an Essential

in Regional

By

CHARLES B. COOKE, JR.

Senior Engineer Ford, Bacon & Davis, Inc.
New York, N. Y.

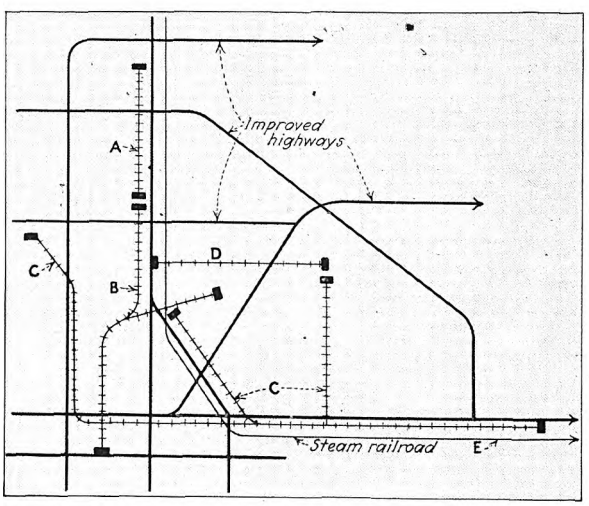
NEW travel lanes offered by networks of public highways superposed on districts served in the past solely by rail lines have brought about many sweeping changes in the local transportation situation. Shifting centers of population and new types of vehicles have changed the character of transportation from that to which the people have been educated over a period of many years. The district plan of electric railway and related bus services must be made right in its physical and corporate line-up, before individual links can win any lasting success. The motor bus, straddling the boundaries of rail territories, will precipitate the entry of electric railways into comprehensive regional systems. Only by far-seeing joint action toward this end can individual lines or systems expect to block dangerous invasions, arrest traffic losses due to bad co-ordination and increase business through offer of more salable service.

THE PERSPECTIVE

To place the bus in fair perspective with the future of the industry it is necessary to get down to first principles, starting with a view of two root causes of electric railway troubles and considering the effect on these causes of the position which is being gradually taken up by the bus in local transport work. It is true enough that well-planned properties are not even approaching obsolescence from purely physical viewpoints. This is, however, only true to the extent that their physical capacities for efficient, salable service are not being undermined by internal factors which obstruct co-ordination of the physical, corporate and financial elements of the railway business structure. Competition of the private automobile has come to be the standard explanation for unsatisfactory traction showings but as there is no profit in explanations it is better to look within the body of the industry itself for the means of correction.

In recognition of the fact that the industry must resort in some measure to new tools to live in an automotive age, it is generally admitted that the bus is here to stay and because of this fact its effect will be increasingly to force major adjustments in the physical layouts of the older systems. Abilities of the primary agents—the railways—to foresee the character of adjustments needed and apply corrections on a scale commensurate with the size of the problem, will determine whether their security ratings will advance, be stationary or decline.

Regardless of the strong points favoring railways as carriers in cities of 100,000 and over, the fact remains that many of the companies can only make inferior offerings to investors. The business cannot compete successfully with other classes of enterprise in public favor and cannot even be expected to "come back" until its mechanical position in the transport structure is brought in line with conditions which have to be met in "selling the service." The survival test which has been evolving during the last fifteen years, while furnishing a fine proof of worthiness of the railway as a basic facility, has also been elementally a contest between fixed and flexible methods of meeting the need for transportation.



District formerly served solely by four electric railways, A, B, C, D, still separately controlled, and steam railroad, E. Territory now is overlaid with improved highways. Each railway has its own bus company. This kind of situation calls for unified control of lines and the consolidation of bus operations

The inability of well-managed properties, as a class, to do more than maintain a "status quo" can be traced mostly to the fixed or inflexible set-ups of their physical services and capital structures. These organic faults prevent companies from coping with inherent conditions of their business and are thus in fact the seat of practically all their difficulties. The automobile and the bus should be regarded as new factors to be met by a change in the conditions which can be controlled, rather than frowned on as more or less uncontrollable causes of the trouble itself.

With the above in mind, it is intended here to outline the physical place won by the bus in the transit structure and its potentialities for bringing about changes in control and operating plan of systems where present faults in their line-up cause failure to meet public convenience or result in overall costs of service higher than the economic fare.

Essentially, electric railways have fixed and distinct physical limits which were set in days long past to meet service requirements since vanished or modified. The corporate and financial mechanisms through which the

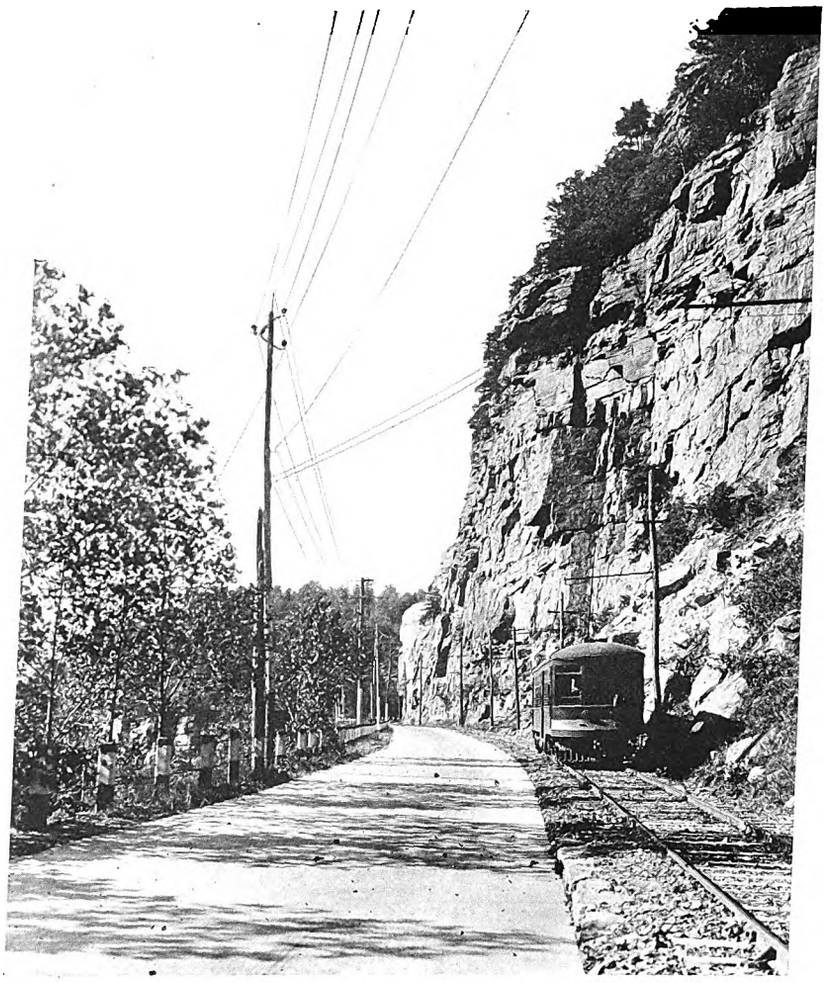
ssen Factor

in Co-ordination

Under the pressure of new conditions affecting their business, electric railways must use buses properly to protect territory and capture new service areas, making major adjustments in their physical layouts to secure needed co-ordination



Hard-surfaced highways paralleling many rail lines which formerly enjoyed a monopoly, have caused sweeping changes in the transportation situation

industry was built up sectionally and systematized physically are well understood and need no comment here.

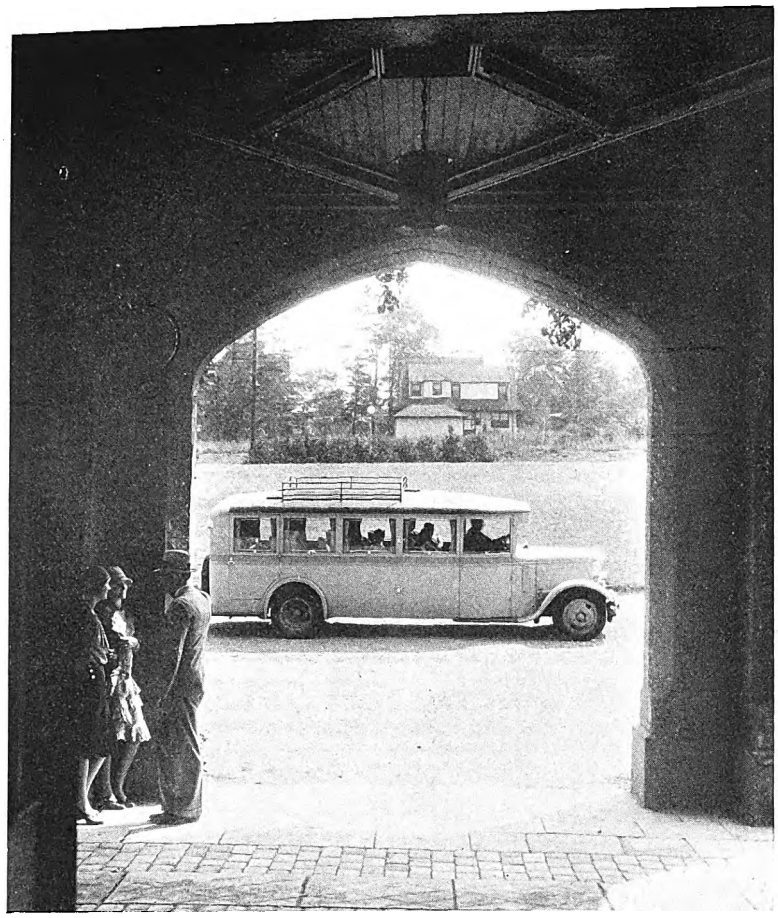
Systems put together in the consolidation era probably represent the best and most that could have been accomplished under the conditions then. While the process of unification was sound in principle, as present hindsight views the situation, poor lines were put or forced into certain systems that should have been left out and lines were left out that should have been included. Urban systems often acquired lines penetrating far into foreign or outlying territory. Again the picture is further complicated by the lines which should never have been built at all or those in the twilight zone just managing to live, lacking only a right hook-up with neighboring properties to show economic justification. Past mistakes in the assembly of systems or distortions thereof born of circumstance are, to be sure, water over the dam. However, the industry must find ways to live under its own basic conditions. The bus furnishes at once the tool and the opportunity for getting around the defects anchored into the set-up of railway systems or bringing them to a head for cure by reorganization.

Many of the difficulties in the present transportation situation are the result of the division of ownership and control among too many corporate groups. This multiplicity of private interest is frequently found in territorial situations which economically call for unit control of all transport facilities engaged in the same general classes of local service. Examples of good properties, showing a decline in earning power traceable more or less to collisions between the interests of non-affiliated transportation agencies, can be seen in many places. Such areas form "transportation districts" from which maximum traffic revenue can best be cultivated at lowest cost through single control of all facilities in it, lined up to meet changes in the direction and flow of the demands for service.

The demand of people today is for prompt, uninterrupted movement. Transportation agencies operating under multiple control in a unit district usually do not offer "through" and co-ordinated services having the quality of directness most needed to attract patronage. They can, therefore, absorb only a small part of traffic flows set up by shifting centers of population. The balance goes to the automobile unless it is possible to have recourse to the use of the bus where this can be properly applied to meet the demand for "point to point" service. While the mechanical position of many of the railway systems is not organically adapted to supply special qualities of service to which people have been educated by the automobile, they can well form the backbone of a co-ordinated system which will fill all the legitimate needs of the community they serve. Looking at the principles involved it is also clear that correction of this mechanical position will require, first, the working out of unified controls covering all local transportation lines serving a given traffic area so as to increase the quality of directness via rail routes, and, second, broad-gage use of the bus to satisfy needs which cannot be met by fixed rail routes. In short, there must be regional planning for public transportation as well as for other civic features of the modern community.

As the financial and physical stabilities of the public services are founded on the principle of a protected right to do business, it is important to bear in mind the basic difference in the principle of railway and bus franchises. The railway franchise is fundamentally a right granted to install and maintain private property in the public do-

Digitized by Google



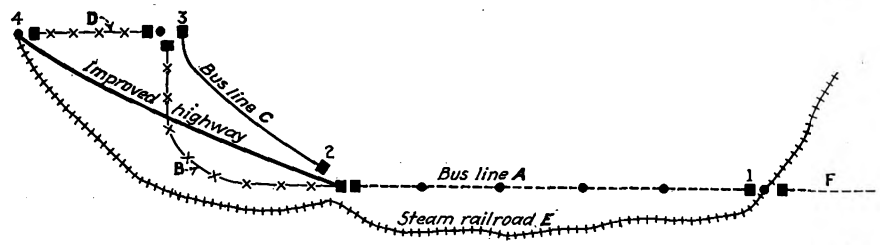
New business can be developed by extending bus lines into suburban districts to feed the rail lines

main, while the bus franchise is merely a right to use the highway with no question of vested interests involved. Franchises originally granted to electric railways were, in type, usually fixed term or perpetual; in some cases where neither of these proved satisfactory indeterminate forms were developed. Due to past experience with trolley franchises and in the face of rapid expansions of motor highway systems, with no regulations of their use by interstate carriers, the state authorities have granted only short term rights to bus operators, with renewals usually assured to legitimate interests giving fair service. Intrastate bus franchises are therefore substantially indeterminate, which is as nearly correct in principle as can be worked out at this stage, bearing in mind the complex public viewpoints which state commissions have to consider in keeping their regulations balanced with practical considerations.

The safeguards which state commissions have thrown about the rail carriers to hold down direct competition have been nothing more than a makeshift—a gesture, if you please, and a warning to the railway people to get busy with buses on their own account. Where applications for road rights are denied on the pleas of railroad lines, these denials, in the long view, are only a sop to precedents which are gradually being dimmed by newer conditions and weakened by pressure of fresh public demands. Where bus rights are granted subject to restrictions against lifting traffic in certain zones to protect established carriers, the same rule holds sway. Transportation people and the commissions themselves know very well that restrictions do not work and are not satisfactory from the viewpoint of either public or carrier interests, as permanent regulatory measures. They are merely being suffered by patrons and bus operators (rail or independent) until conditions force a new line-up through affiliation and adjustment of interests that will remove artificial barriers to the natural flow of traffic. The American public will be served in the way it wants and will not be herded to this or that form of travel, under the pressure of learned argument and regulatory rules. Neither is the public much persuaded from the line of its desire by sentimental appeal based on the conceded values of rail service rendered in the past. All of these things have little weight in comparison with the personal wishes, comfort or convenience of those who ride.

The absence of interstate regulation, broadly viewed, has not been an unmixed evil because it has forced rail interests to widen their horizons, and depart from conceptions of service or profit strapped down to their roadbeds. By the same token the service capacities of the bus (which the railways need to cope with the private automobile) would not have progressed as fast as they have if their development had been repressed and guided under the domination of rail interests, of necessity more concerned with guarding the old than advancing the new. The result of all this has been to bring major rail transportation interests into the bus field and so begin the release of both classes of service from deadlocks which for a long time have retarded the start of co-ordinated transport.

The confined local applications of the buses up until about three years ago were not such as to excite much interest among the steam railroaders. With, however, the rapid assembly of bus lines into regional and semi-national groups and their apparent ability to attract long-haul traffic, many of the leading roads have gone aggressively into the bus business and are fortifying their position through purchase of stock interests in going companies. It is to be expected that they will continue steadily to expand their bus interests in this way. They are doubtless finding out that bus territorial positions can be won at comparatively low costs per mile of route and per dollar of gross, and are beginning to reap some of the benefits derivable from "co-ordination."



Multiple Control of Facilities Has Left This District Open to Invasion by Competing Buses

A is an independent bus line; *B*, an electric railway; *C*, a bus line controlled by *B*; *D*, an electric railway independent of *B*; *E*, a steam railroad, and *F*, a bus line controlled by *E*. Traffic on electric railway and bus lines is stationary or declining due to physical transferring required at terminals and lack of unified control. Bus line *A* is a logical adjunct to electric railway *B* to secure long hauls through 1, 3 and 4.

Digitized by Google

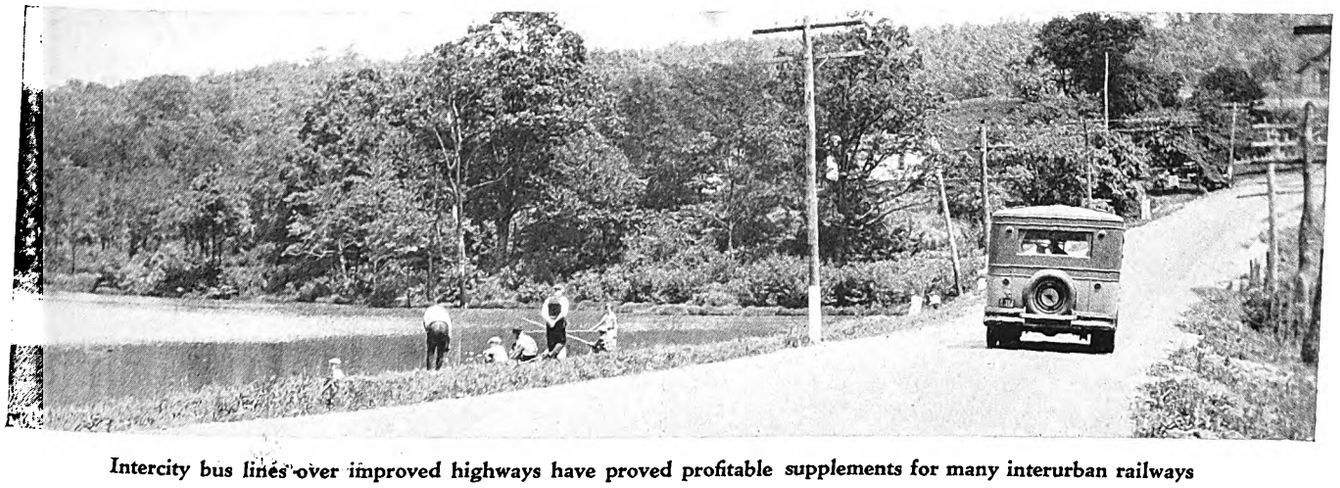
The bus lends itself to service on routes without rail service

Under the oblique pressures of all these new factors bearing in on the business, the traction company not armed with buses properly applied to protect territory and capture new service areas, is practically helpless. There are not, of course, many companies wholly in such a position today but many are near the danger line mainly because they have applied the bus with conceptions of its use confined to their immediate rail territory. From the standpoint of the self-interest of any particular property this is wrong in principle and will not work in practice as a defensive measure. Due to flexibility of bus operations and multiplicity of opposing but legitimate interests controlling them, a given rail territory can never be permanently protected by intensive application within limits defined by rail-heads of the particular system. A railway can usually work out lasting protection and improvements of position only by capturing the full transportation territory in which it is located. This often extends far beyond the present rail-heads and depends upon relative location of motor highways, other public carriers, out and in-lying population centers and the flows of traffic.

It is not so much a question of "buses or bust" as it is a question of "co-ordination or bust"—by co-ordination meaning not only the right use of each method of transport but also the right unification of independent trolley lines where these cover territory needed for protected development of a well-rounded system.

It happens too often that companies approach their co-ordination problems in piecemeal fashion, basing conclusions on technical and frequently incomplete comparisons of costs of trolley and bus services, which are after all only one factor in the problem and not always the most important one at that. Rail executives who understand these problems and are able to execute should be the first to see that their main chance for operation at a profit can only come out of a broad-gage survey and treatment of their situation *as a whole*. This may or may not involve study and working out of property and territorial consolidations with other interests, but if this is required to provide correct mechanical positions for electric railways in the regional plan, therein lies the hope and the opportunity for every property that can contribute to a co-ordinated set-up that is physically right.

This, then, is what all electric railways can do as the first phase of a real life insurance policy—survey and study their territorial situations *as a whole* with horizons raised above the terminal rail-heads, plan for them *as a whole,* and act on them as far as possible *as a whole* in conjunction with other trolley and bus lines concerned with stabilizing and bettering themselves in the only way possible under modern conditions of the business.



Intercity bus lines over improved highways have proved profitable supplements for many interurban railways

Attracting New

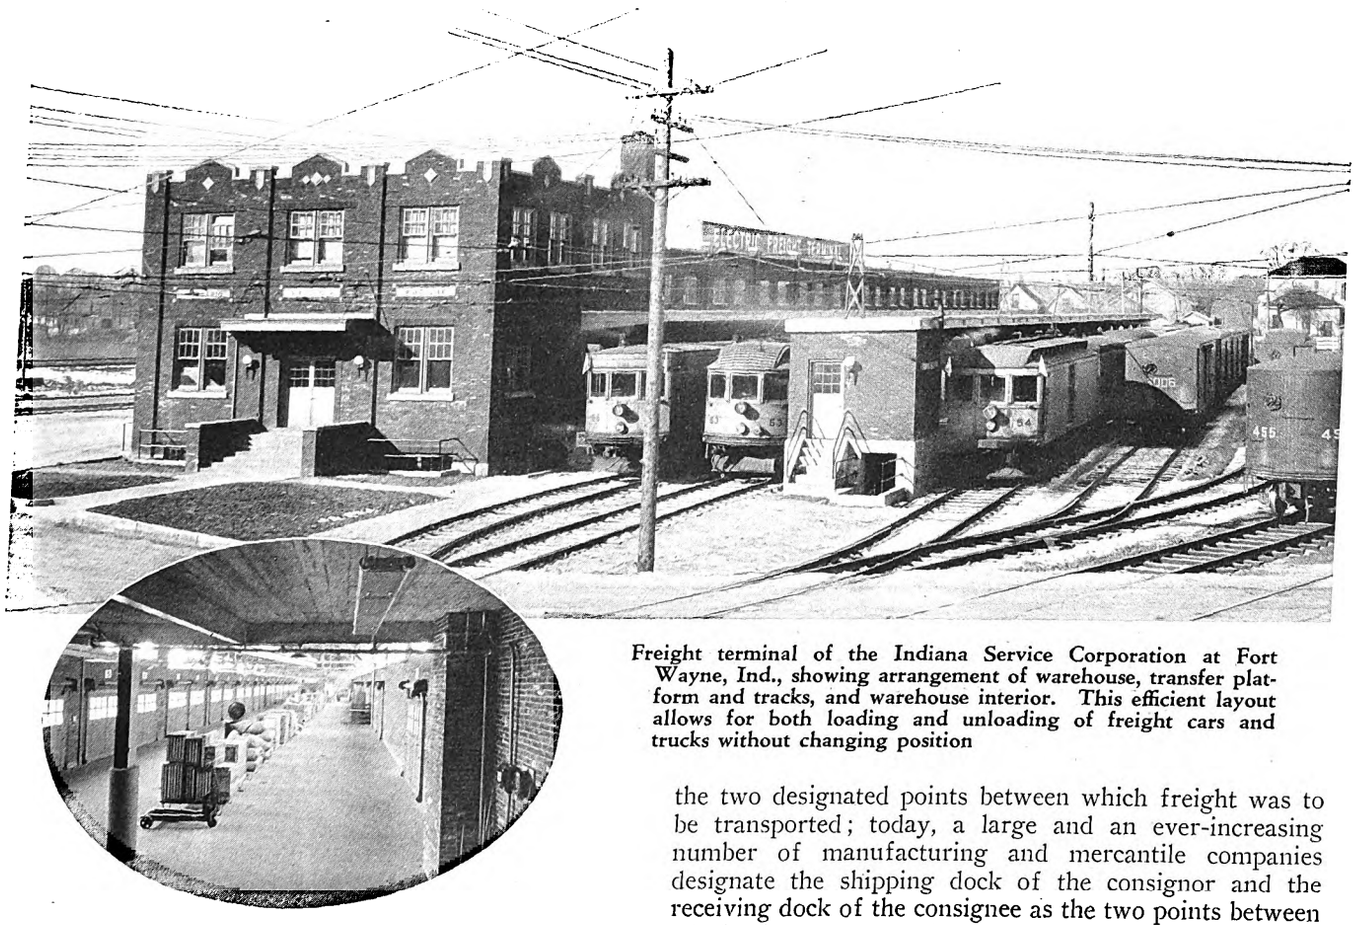
Freight Business

Fundamental Problem of Interurbans

By

DAVID R. THOMAS

President Electric Railways Freight Company
Cleveland, Ohio



Freight terminal of the Indiana Service Corporation at Fort Wayne, Ind., showing arrangement of warehouse, transfer platform and tracks, and warehouse interior. This efficient layout allows for both loading and unloading of freight cars and trucks without changing position

ATTRACTING a sufficient amount of new and profitable freight business to offset the gradual but constant decline in passenger revenue is the fundamental problem of the majority of interurban electric railways, not including those that may be classified as electrified steam roads. The fundamental problem of the freight business itself is that of profitably transporting merchandise between two designated points in such a manner as to render the service of the electric railways more attractive to the shipping public than that of any other transportation medium.

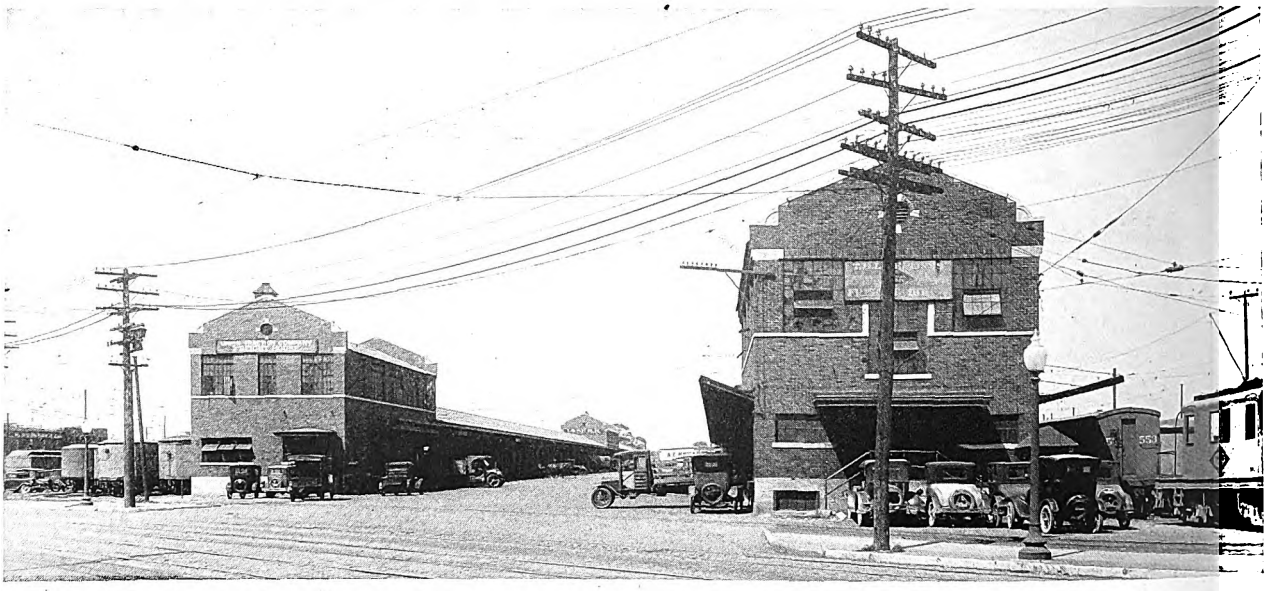
Twelve years ago the freight terminals of the railways were, except where side track facilities were provided, the two designated points between which freight was to be transported; today, a large and an ever-increasing number of manufacturing and mercantile companies designate the shipping dock of the consignor and the receiving dock of the consignee as the two points between which the transportation companies shall function in handling such freight as is included within the higher rate classification of freight tariffs. The dock-to-dock, door-to-door or pick-up and delivery service now demanded by the shipper and receiver of freight is the direct result of the extensive construction of hard surfaced roads and the development of the motor truck and its complement—the highway trailer.

When the interurban railways first entered the freight business the motor truck was scarcely thought of as a common carrier of freight. It was, therefore, possible to designate the electric railway freight terminals as the points at which freight would be received and delivered. The shipper and receiver of freight arranged and paid

Digitized by Google

for cartage to and from the terminals, as a matter of course. Other conditions were also then favorable to the rapid development of a substantial freight business by the electric railways. For years prior to the time under discussion the steam roads had been financially unable to provide the freight equipment and facilities necessary to meet the normal increase in demand. The abnormal conditions existing during and immediately following the war made matters so much worse that the shipping public eagerly sought new carriers of freight.

It was then a comparatively simple matter to develop freight business. The only traffic and soliciting organization required was one capable of filing tariffs and of giving information relative to the service; accounting procedure was simple, the passenger business was then flourishing and the freight revenue was such a comparatively small part of the total that a detailed freight accounting system was unnecessary. The freight business, too, was largely local to the line originating it—



Freight terminals of the Union Traction Company of Indiana, the Terre Haute, Indianapolis & Eastern Traction Company and the Indianapolis & Southeastern Railroad at Indianapolis, all laid out for efficiency

there consequently was but little interline accounting and but little detail involved in adjusting claims. Capital expenditures for freight facilities were confined to modest warehouses, usually located upon leased grounds; rolling stock consisted of old interurban passenger cars rebuilt into freight motor cars. Later trail cars were purchased. Inasmuch as freight was usually transported late in the evening and early in the morning no additional trackage was required with the exception of terminal tracks and switches. Even with delays incident to inadequate warehouse organizations, insufficient equipment, and hit-and-miss freight schedules, the service of the electric railways was so much faster than that of steam roads that an ever-increasing amount of freight naturally gravitated to the interurban lines.

Today the problem confronting the electric railways materially differs from that of twelve years ago. The fundamentals of the problem have not changed, but the solution is more difficult. The speed with which freight moved via interurban lines between the door of the shipper and that of the consignee has been matched by that of the intercity trucks. Steam roads have improved their facilities and move freight more rapidly and efficiently. The "pick-up and delivery" system of motor freight companies and the "container" system of the steam roads are additional facilities made available to the shipping public at no increase in freight rates. Today, too, increased freight earnings are required by the electric railways to offset the decline in passenger earnings. Twelve years ago freight business was incidental to passenger business—today freight business is, in many instances, the more important of the two.

Many methods of increasing freight earnings are being discussed and considered by those directing the affairs of interurban lines. It undoubtedly would prove of interest were it possible to describe each method in detail. Space, however, does not permit of more than pointing out the salient features of each method suggested. This is done in the accompanying summary of suggestions and recommendations made from time to time by men interested in constructively developing the interurban electric railway freight business. Many of the methods briefly described are now being followed by some of the interurban companies, but not all of them are applicable to every company.

An analysis of this summary discloses the encouraging fact that many of the recommendations relative to methods of reducing operating expenses will automatically produce an increase in revenue. The recommendations that are attracting the immediate consideration of the managements of interurban lines are those pertaining to the things that electric lines will be required to do in order to meet the new requirements of the shipping public—requirements that are the result of the development of the motor truck as a carrier of freight.

Three Classes of Motor Freight Carriers

Motor freight organizations may be grouped into the three following classes:

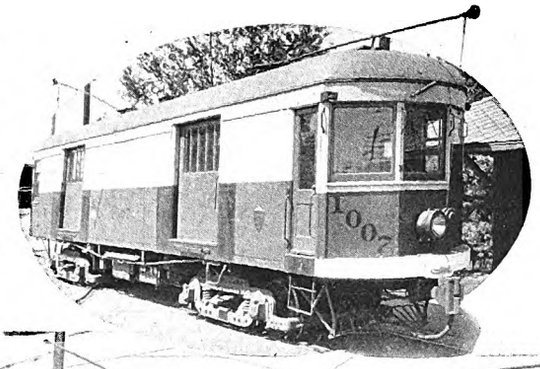
1. Companies or individuals doing an intrastate business. These operators are required, in many states, first to obtain a certificate of public convenience and necessity; their schedules, tariffs, etc., are subject to supervision of the respective state utilities commissions.

2. Companies or individuals doing an interstate business. Interstate operators are not subject to the supervision of the Interstate Commerce Commission. Where state commissions have jurisdiction it is nominal only. In some states it is necessary to obtain a certificate of public convenience from the state commissions

Digitized by Google

and to designate routes to be traveled over, equipment to be used, etc. However, it is not legally possible for the commissions to refuse to grant such certificate, although the truck companies are required to pay the equipment tax provided by the state laws and are governed by the rules regulating the use of the highway.

3. Companies or individuals engaged in "contract hauling." A "contract hauler" transports merchandise between the shipper and destination under a specific contract with the shipper or with the consignee. The state laws of a number of states provide for this type of operator by granting, on proper showing, an "irregular" certificate of public convenience and necessity. A "contract hauler" is not usually required to file a tariff, inasmuch as his rates are based upon contracts with the individual shipper.



Freight cars like these, with rounded ends and painted to resemble passenger cars, create a more favorable opinion when passing over city streets. In the oval, car of the Penn-Ohio System; below, Eastern Michigan Railways train

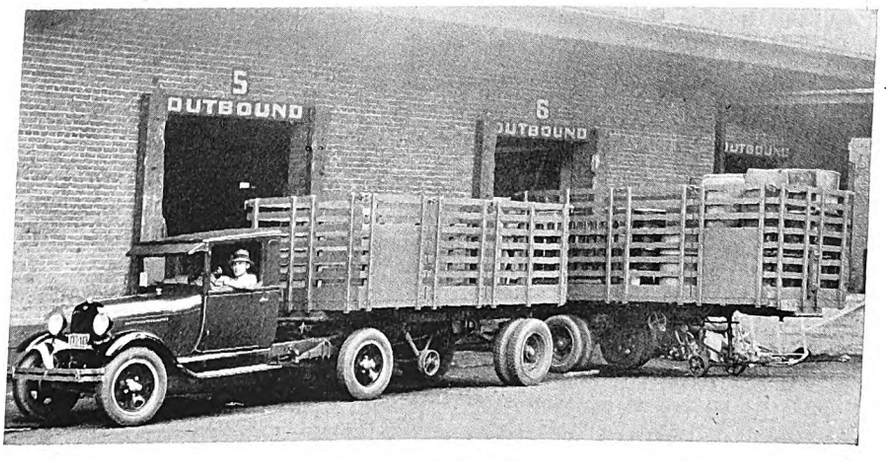
The motor freight companies transport merchandise from the door of the consignor to the door of the consignee at rates that do not exceed, and are often less than, rail rates—there is no additional charge for that portion of their service that corresponds to the city cartage company's function of hauling merchandise to and from the terminals. Where the individual shipments are sufficiently large it costs the motor freight companies no more to operate from door to door than it does from terminal to terminal.

Truck tariffs provide that a charge shall be added to the published freight rate to cover the cost of picking up and delivering shipments weighing less than a specified amount. This minimum weight varies from 1,000 to 2,000 lb., and the charge from 3 cents to 7 cents per 100 lb. Motor freight companies naturally desire to confine their operations to handling the tonnage of large shippers of high-class freight. The business of the smaller shippers is not solicited and therefore usually moves over the lines of the carrier.

Practically all companies operating under intrastate certificates also have "irregular" certificates. Many also are interstate operators. In view of the fact that rates applicable to "interstate" and "irregular" operations are not subject to the jurisdiction of any state commission or of the Interstate Commerce Commission, it will be appreciated that the freight rates of motor freight companies are susceptible of being "equal to almost any occasion" and limited only by the cost of handling the particular shipments involved. It is being discovered, however, that these costs are not as low as at first estimated, particularly where no "return load" is immediately available.

To afford facilities now made available to the shipping public by the motor freight operators it will be necessary for the electric railways to provide: (a) Pick-up and delivery service, (b) container service, (c) terminals open 24 hours each week day, and (d) increased soliciting efforts. Certain of the facilities named have been made available by one or more railways and a greater number of companies are experimenting with, or studying, methods of doing so.

As stated, the motor freight companies give door-to-door service at rail rates or less. Railway trap car tariffs provide that all switching charges are to be absorbed by the railways, provided the shipments conform to specified minimum weights. It is therefore apparent that, if the electric railways are to obtain any appreciable amount of new business by performing a pick-up and delivery service, the additional cost involved cannot be added to the present rail rate, but must be absorbed by the carrier.



Tractor with light semi-trailer for pick-up and delivery service

Digitized by Google

Summary of Methods Recommended to Increase Freight Revenues and to Reduce Operating Expenses of Interurban Electric Railways

TO INCREASE REVENUES

1. Provide Pick-Up and Delivery Service—Absorb pick-up and delivery costs on shipments conforming to classifications and minimum weights provided in trap car tariffs; charge a reasonable rate for cartage of shipments weighing less than provided in trap car tariffs. In smaller communities furnish the agent with truck equipment and virtually put the freight terminal on wheels.

2. Render Container Service—Container service is attractive to shippers, as it eliminates the necessity of crating or wrapping merchandise for shipments, reduces loss and damage claims and eliminates rehandling merchandise at warehouse. It is possible to interchange containers between steam and electric roads. A rate covering movement of container direct from shipper to consignee will prove profitable and popular.

3. Own a Cartage Company—City cartage companies control routing of an appreciable amount of freight which can be diverted to electric railways; cartage companies are in themselves profitable.

4. Provide Express Service — Express service with city pick-up and delivery is an essential branch of electric railway merchandise service. C.O.D. feature is an important requirement of the shipping public.

5. Offer Station-to-Station Package Service—Have passenger agents or passenger conductors accept packages for delivery to passenger agents at destination stations.

6. Encourage Car Loading and Distributing Companies to Use Electric Railway Facilities—These companies collect freight and reconsign shipments to all points of the United States. This is a class of business that it is difficult for electric railways to reach. A car loading and forwarding company that operates exclusively on electric lines will add to the revenue of the latter.

7. Allow Joint Tariffs with Connecting Electric Lines—Practically all connecting interurban lines operate under joint tariffs.

8. Arrange Joint Tariffs with Steam Roads and Water Navigation Lines—The electric railways are natural feeders to steam roads and boat lines.

9. Improve Warehouse Facilities—Inadequate terminal facilities that cause delay to trucks of consignor or consignee in delivery or picking up shipments will drive business away; congested terminal conditions increase loss and damage claims and cause dissatisfaction with service. Insufficient warehouse and house track space delays loading and unloading of cars and slows up service.

10. Improve Handling of Shipments—Lost shipments and failure of "bills" to accompany shipments cause dissatisfaction with service. Greater care should be given to this feature of operation, particularly where more than one carrier is involved.

11. Increase Hours During Which Freight Will be Received—Motor freight companies receive or pick up and deliver freight 24 hours a day. The electric railways will increase revenues by giving similar service where required.

12. Establish Sub-Freight Stations—In larger cities additional revenue will be derived by establishing sub-freight stations in strategic locations, where these stations are not on the electric lines, and hauling the freight to the principal station in trucks and trailers.

13. Arrange Side Tracks in Manufacturing Plants—Many opportunities exist to arrange side-track facilities with industrial plants along interurban lines and also in cities, the latter in conjunction with city railways.

14. Utilize Available Sections of Interurban Lines for Handling Tonnage Requiring Steam Road Equipment and Arrange Switching Connections with Steam Lines—Steam road equipment cannot be moved over city streets, but many interurban lines have sections of road upon which such equipment can be handled with profit.

15. Operate Trains on Definite Schedules—Irregular arrival of trains at destination will result in loss of business. The reverse is true of trains regularly maintaining schedules. Fix schedules to conform with requirements of shippers.

16. Increase Schedule Speed of Trains—Early morning delivery at destination will get business that cannot be obtained if trains arive at noon.

17. Improve Track and Roadway, and Equipment — Eliminate curves, reduce grades, build cutoffs around cities, utilize facilities of belt lines to avoid city streets, increase power of motor cars and maintain high standard of rolling stock. Increased speed will increase revenue.

18. Operate Truck Line Feeders—The scope of the territory served may be profitably increased by joint tariffs with, or by operation of, feeder truck lines.

19. Establish Parallel Truck Lines—Freight requiring quick delivery is often tendered after regular trains have departed. Truck facilities that will permit handling such shipments will increase revenue and will make similar service of competing truck lines unnecessary to the shipper.

20. Increase and Improve Solicitation—The solicitors of the motor freight companies, the personal contacts of the "contract hauler," together with the personal contact of truck drivers with the routing clerks of each shipper, have greatly increased the demands of the soliciting department of the electric railways.

21. Insist on Courtesy to Customers—Courteous treatment of truck drivers delivering or calling for shipments at terminals will produce profitable results.

22. Pay Claims Promptly and Courteously—Freight service is in part measured by the promptness with which claims are paid.

23. Create Favorable Public Opinion (General)—Advertising, courtesy, consideration of pedestrians and automobile drivers by train crews, well-maintained equipment, well-painted equipment and reduced passenger fares all contribute to bettering public relations.

24. Create Favorable Public Opinion (City Operation)—It is essential that companies should eliminate as far as possible all causes for objection to use of streets: cars should be well-maintained and all danger of faulty equipment delaying traffic or causing accidents eliminated.

25. Consolidate Companies—Where two or more non-competing lines can be consolidated better service can be given to the shipping public and increased revenues will result. Increased purchasing power of larger companies also is a factor.

26. Combine Facilities—In the event the corporate entities of two or more non-competing lines cannot be combined, facilities may be beneficially combined such as terminals, solicitation organizations and freight motor equipment.

27. Consolidate Freight Departments—Where the corporate structure is such that the companies themselves cannot be combined beneficial results may be obtained, in part, by consolidation of the freight departments of connecting, but non-competitive, roads.

TO REDUCE OPERATING EXPENSES

1. Better the Freight Terminal Layouts—Freight terminals should be so designed that cars may be loaded and unloaded without shifting them from the inbound to the outbound station. Sufficient track, dock, warehouse and driveway space are essential to efficient operation. Provide transfer space or dock.

2. Add More Warehouse Floor Space and Use Labor-Saving Equipment—Floor space at a majority of interurban terminals is insufficient. Congestion results involving delays to cartage trucks, loss of time locating freight and rehandling. Lack of space also makes impossible the use of industrial tractors and other labor-saving equipment.

3. Provide Additional Track Room at Freight Terminals—At terminals in larger cities track room is insufficient for efficient loading of freight. Adequate track room enables spotting required number of cars and reduces cost of "flooring" and rehandling freight.

4. Have Sufficient Team Track Capacity—Sufficient team track capacity not only encourages carload business but also provides space for direct loading of large shipments, thus reducing handling costs.

5. Equip Terminals for Handling Heavy Shipments—Only a very few terminals are equipped with the necessary crane or hoist equipment to handle heavy shipments. The possible saving in labor costs is self-evident.

6. Use More Powerful Motor Cars—It is naturally true that it is cheaper to operate one train consisting of one motor car and five trailers than two trains each consisting of one motor car and two trailers.

7. Better the Maintenance of Equipment—A crippled car either means delayed arrival of freight at destination or transfer of freight to another car. Either is unprofitable.

8. Load Cars to Capacity—An unnecessary number of cars reduces the effective track capacity of terminals and increases transportation and switching costs.

9. Reduce Loss and Damage Claims—Loss and damage claims of interurban lines are in many cases excessive; the amount of claims can be substantially reduced.

10. Use Container Equipment—One of the two greatest items of expense is that of handling freight through the warehouse. Containers loaded at the shipper's warehouse and containing freight consigned to one city or to one consignee will reduce or eliminate handling costs, except that of transferring the container from the truck to the railway car or vice versa.

11. Have an Efficient Accounting Department—Information necessary to economical operation must be furnished by the accounting department. Freight accounting is very much in detail and an adequate personnel is necessary. Mechanical tabulating and office equipment is necessary to supply other departments with essential information efficiently.

12. Improve Track and Roadway—Cut-offs around cities and elimination of curves and grades will reduce operating costs.

13. Interchange Motor Cars—Interchanging motor cars with connecting electric lines will permit loading them with through freight and will eliminate necessity of operating them when only partially loaded.

14. Consolidate Companies—Where non-competitive interurban companies with connecting lines are combined reduction in overhead, solicitation, traffic and accounting expenses will follow.

15. Consolidate Freight Departments—Where the corporate structure of non-competitive interurban companies, with connecting lines, does not permit of consolidation, economies may be obtained by consolidating the freight departments of such roads.

16. Consolidate Facilities—In cities where two or more non-competitive companies maintain separate terminals and soliciting organizations economies may be obtained through joint solicitation and joint terminals.

The cost of picking up and delivering merchandise does not necessarily represent an amount that will, in its entirety, be added to present freight operating expenses. There will be certain changes in methods and conditions that will tend to reduce expenses; the use of containers will reduce terminal labor costs and "loss and damage claims," and a larger volume of business will permit of heavier car loading with a consequent reduction in transportation expenses. The difference in rate between the comparatively low-class freight now carried and the higher class freight that pick-up and delivery service will recapture for the electric railways will, in some instances partially and in other instances entirely, absorb the entire additional cost of such service.

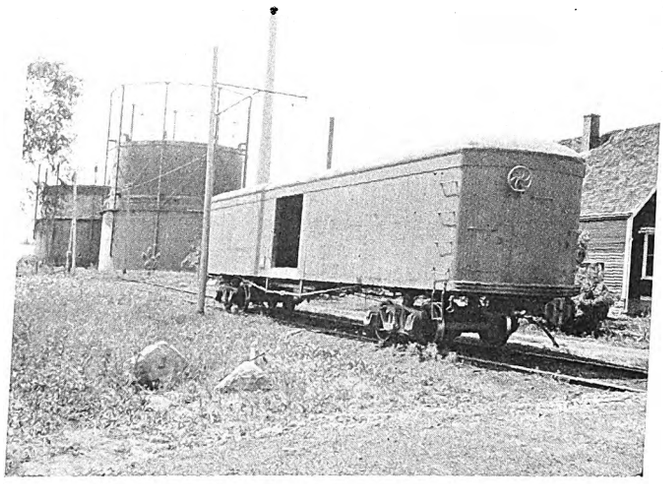
Inasmuch as the type of truck equipment now used in pick-up and delivery work is the same as that used by the city drayage companies, merchandise must be loaded or unloaded at the railway terminal. Were this rehandling cost eliminated a portion of the additional cost of pick-up and delivery service would be recovered by the railways. Interesting examples of efforts to solve this problem are the "container-trailer" system of the Chicago, North Shore & Milwaukee Railroad, the "container" equipment of the Eastern Michigan Railways and the Bonner Railwagon with which the Electric Railways Freight Company is experimenting at Cleveland. It will be noted by referring to accompanying illustrations that the containers of the Chicago, North Shore & Milwaukee Railroad and of the Electric Railways Freight Company are highway trailers, and when unloaded at a rail head can be drawn any distance required by trucks or truck-tractors now in commercial use. The container with which the Eastern Michigan Railways is experimenting is mounted on rollers and is readily transferable from the railway car to the platform of a motor truck or trailer and consequently is also adapted for highway use.

The Bonner Railwagon System, developed by Col. Joseph C. Bonner, contemplates the transfer of highway trailer containers from the highway to railway flat cars and vice versa, without the use of any special loading equipment other than that of a ramp 6 in. high placed on the outside of each rail. The railwagons are placed upon, or removed from, the ramps by any truck or tractor drawing them over the highway. Loading the railwagon upon the railway flat car is accomplished by running the railway car underneath, and between the wheels of the railwagons when the latter are in position on the ramp. When in proper relative positions the railwagons are locked in position on the railway car. As the latter moves forward on the rails the railwagons coincidently move forward on the ramp, and as the railwagons descend the inclines at the end of the ramp they gradually settle down and come to rest upon the platform of the railway flat car. In this position the railwagons are carried to destination. When unloading the railwagons from the car the reverse takes place.

No labor other than that of the train crew and truck driver is required for the loading or unloading of the containers. The ramp does not interfere with the use of the track for other purposes. Ramps are inexpensive and may be designed to hold any number of railwagons. The journals of the railway flat car are placed inside of the wheels instead of outside, and the space ordinarily taken up by outside journals is utilized for the wheels of the railwagons.

The use of containers will reduce operating expenses where shipments are made from one consignor to one consignee, or from one consignee to one terminal or vice versa, and also where one continuous movement, requiring transportation over both highway and rail, is involved. In addition to reducing operating expenses the use of containers will also increase revenue by supplying the demand of certain manufacturers for facilities that will permit them to ship their merchandise unwrapped or uncrated; this demand is not met now by any service of the electric railways which involves rehandling at terminals, but is filled by motor freight companies.

As yet there is no general agreement between the electric railways whereby each carrier participating in the transportation of any shipment bears a proportional share of the pick-up and delivery cost. Before the pick-up and delivery service can be made generally effective it will be necessary for the intermediate carriers and both terminal carriers of an interline shipment to share this additional cost; this will probably be worked out in the near future on the basis of allocating the pick-up and delivery cost of any shipment in the same proportion as interline freight revenue of that particular shipment is apportioned.



Industrial siding of the Toledo & Indiana Railroad at Bryan, Ohio. Sidings are necessary to secure the business of many large companies

Pick-Up and Delivery Tariffs

That the electric railways are preparing to adopt pick-up and delivery service is indicated by the fact that pick-up and delivery tariffs have been recently put into effect by a number of interurban companies. The established minimum weight of shipments that will be handled free of extra charge is usually the same as the minimum provided in trap car tariffs, which vary from 2,500 lb. for shipments carrying 2½ times first-class rate, or higher, to 10,000 lb. on shipments carrying the fourth, fifth or sixth class rates, or lower. These minimum weights cover quantities received from one consignor or to be delivered to one consignee. Some tariffs provide for absorbing a portion of the total drayage charges on straight shipments weighing less than the minimums stated above. These drayage absorptions vary from 5 cents per hundredweight on commodities carrying the third class or higher rate, to 2½ cents per hundredweight on commodities carrying the sixth class or lower rate.

An efficient modification of the pick-up and delivery tariff described is the container tariff of the Chicago, North Shore & Milwaukee Railroad which provides for handling freight of all kinds from one consignor to one consignee between Chicago and Milwaukee at the rate of

Digitized by Google

20 cents per hundredweight on the basis of a minimum of 20,000 lb. per highway trailer unit. This 20-cent rate includes cartage in both Chicago and Milwaukee and rail transportation between these two points. A slightly higher, but similar, rate is available for 10,000-lb. shipments.

Arrangements for providing cartage service have not been standardized by the interurban lines. In some instances the railways pay the specified pick-up and delivery allowances to any cartage company or individual that will deliver to, or take away from, their terminals the minimum amounts specified in the tariffs. In other cases the railways specificially contract with one or more cartage companies to perform this service. In a few cases the railways themselves own and operate the cartage equipment. One interurban line is experimenting with the plan of doing a general cartage business in addition to merely handling the merchandise tendered for transportation over its lines, charging a slightly lower rate for merchandise going to or from its lines than is charged for merchandise going elsewhere.

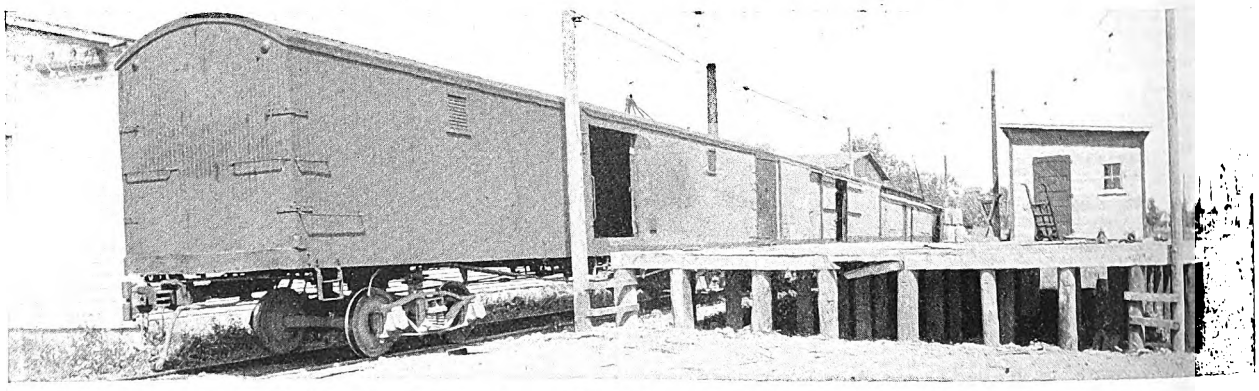
Another change in the old order of things brought about by the advent of motor freight companies is that affecting the hours during which freight terminals remain open to receive and deliver freight. Formerly freight terminals were closed at 4:30 or 5 o'clock in the afternoon but now, in order to meet the present requirements of the shipper, terminals remain open much later. This demand for a later closing hour on the part of the shipper is the result of manufacturers carrying lower inventories and of the desire of the shipper to put in transit everything manufactured during the day in order that such merchandise may be translated into "accounts receivable" and not carried as "material in the process of manufacture."

During and immediately after the World War it was the custom of industrial concerns to carry inventories sufficiently large to fill manufacturing requirements for a period of two or three weeks and sometimes longer. A glaring example of this new condition is that of two manufacturers located 300 miles apart; freight is tendered for transit by the consignor at 6 o'clock in the evening, and if not delivered to the consignee by 12 o'clock the following noon a department employing 300 men will be closed down for the balance of the day.

Accompanying the necessity of maintaining later terminal closing hours is that of operating trains more frequently, as it is manifestly impossible to hold at the receiving terminal until the following day the shipment tendered at 9 or 10 p.m. These shipments must go forward, and until received in quantities to be efficiently handled in railway cars should go forward by truck. This is an illustration of the value of interurban lines operating a truck route that parallels the rail line.

More Intensive Solicitation Needed

A further necessity created by the development of the motor truck is that of increasing the solicitation efforts. Every city of any importance is served by one or more motor freight companies of considerable size. There are also other companies controlled by individuals and operating one or more trucks; in addition thereto there are numerous "contract haulers." Each large motor freight company is represented by a soliciting organization; the solicitation work of the smaller companies is usually done by the owner and occasionally an assistant, and every "contract hauler" is a solicitor. Another feature in the situation is the fact that in the majority of the motor freight organizations a large percentage of truck drivers own the trucks and receive for their services from 65 to 70 per cent of the revenue derived from the tonnage carried by them. These truck drivers are, therefore, vitally interested in obtaining full loads for both their outbound and inbound trips, and naturally use every influence at their command with the shipping clerks of the consignor to obtain a maximum load on each trip. To meet this situation it is not only necessary for the railways to increase the personnel of their soliciting departments, but also to develop the initiative and promotional ingenuity of their solicitors and station agents and also to see that they have full knowledge of all details pertaining to the territory served by the company employing them.



Transfer platform for the interchange of freight between the electric railway and a feeder truck line

As between the motor truck and electric railway operations the economics of the situation favor the latter. It costs less per ton of available carrying capacity to construct a mile of track than it does to build a mile of paved highway. The unit transportation cost of the interurban lines is less than that of the truck. The unit cost, maintenance and depreciation of rail equipment is much less than that of truck equipment. The speed with which it is possible to transport freight, from door to door over the electric railway lines, is greater than that possible over the truck lines, and also than over the lines of other rail carriers. Consequently, in territories where the density of traffic is sufficient to justify interurban rail operations, and provided the companies will equip themselves to handle the business, there is every reason to believe that the development of the interurban railway freight business will prove profitable.

More Financial Reports Summarized

REPORTS for several electric railway companies, principally in foreign countries, have become available for publication since the analysis which appeared in ELECTRIC RAILWAY JOURNAL for June. In general, these indicate continued stability in the industry.

Of particular interest is the report of the Paris system, which operates the tramways, rapid transit lines, buses and boats in the French capital. The operating deficit, it is explained, results from a retroactive wage agreement through which the increase in wages over a period of two years brings the total labor expense up to 70.54 per cent of the gross receipts.

The monthly reports which are available indicate that gross revenues are holding up well during the summer, and that the reduction in operating expenses which has been evident for some time is continuing. The Eastern Massachusetts Street Railway shows a large gain in revenue for July as compared with last year, while the expenses have been reduced sharply. As a result the gross corporate income increased $14,500 for the month.

Substantial gains in gross revenue also are shown on the United Railways & Electric Company of Baltimore, the Interborough Rapid Transit Company, and the New York, Westchester & Boston Railway.

NEWS *of the Industry*

$1,500,000 Car Order in Brooklyn

Surface Lines Award Contracts to Osgood Bradley and Brill for 100 Vehicles

THE Brooklyn & Queens Transit Corporation has placed orders with the Osgood Bradley Car Company, Worcester, Mass., and the J. G. Brill Company, Philadelphia, Pa., for the construction of 100 single-end trolley cars, delivery of which is to be completed in about six months. The cars will cost approximately $15,000 each, completely equipped.

The new cars are to be front entrance, center exit cars, and equipped with prepayment fare turnstiles adapted for use on individual cars. With such turnstiles they will be especially adapted for one-man operation.

Each will have seats for 54 passengers. Eighty of the cars will be equipped with leather covered, spring cushion seats, the supports and backs of which will be made of aluminum. Thirty-two of the seats will be arranged in pairs—ten pairs on one side of the car and six pairs on the other—and the remaining 22 seats are to be single seats running lengthwise along the sides and around the rear end. This arrangement of the seats is designed to provide a maximum of aisle space. The remaining twenty cars are to be equipped with wooden seats, the two types of seat—leather covered and wooden—being used for comparative purposes to determine which type is more practicable.

Rapid Acceleration Provided

Each car will have four 35-hp. motors, and the control equipment is to be of the automatic acceleration type similar to that now used on subway cars. This feature will enable the cars to keep abreast of, if not outdistance, automobile traffic using the same streets as the surface cars, since it will be possible to pick up speed rapidly and automatically.

The specifications require that the control equipment must provide acceleration at the rate of 3 m.p.h.p.s. and retardation or braking at the rate of 2½ m.p.h.p.s. The control equipment is to be provided by the Westinghouse Electric & Manufacturing Company.

At the center exit, two doors will fold inward, controlled by treadle plates in the floor and on the steps just inside the exit doors. The door control and airbrake equipment will be so interlocked that the doors cannot be opened unless the brakes are applied and the car is stationary.

The new cars are to be 45½ ft. long overall and 8 ft. 7 in. wide. Their height from rail to roof will be 10 ft. 2¾ in. and the distance from floor to headlining 7¾ ft. The estimated weight per car without passengers is 37,000 lb., this relatively low weight being obtained by the use of aluminum for interior panels and headlining, with the car body itself constructed of steel.

The roof of the car is to be of the arch type with twelve ventilators in each car. Porcelain hand-rails suspended from the ceilings at a height of 6 ft. from the floor take the place of handstraps. The floors are to be of the same composition as the floors of subway cars, a half-inch layer of this composition being laid over half-inch thick steel sheets.

No Figures Yet Under St. Louis Plan

Complete statistics showing the effect of the new fare schedule at St. Louis, Mo., on street car travel are not yet available. During the first two weeks of operation of the St. Louis Public Service Company's experimental fare of twelve rides for 90 cents and extra rides at 5 cents each in any one week and a cash fare of 10 cents for adults compared with the old 8-cent fare for adults, traffic by the People's Motorbus Company, which charges a straight 10-cent fare for adults and children occupying seats, has decreased during the rush hours when the twelve-ride tickets are generally used, but has picked up at periods when casual riders are abroad. This gain in business, however, is moderate.

St. Louis Public Service has established seven downtown stations for redemption of unused portions of twelve-ride tickets. Four department stores and three banks are redeeming the tickets. In addition authorized agents at the main offices of the company and all carhouses also redeem the unused parts of the tickets. If nine or more rides are used no refund is made.

Men Reject Tentative Strike Settlement

Hope for Adjustment at New Orleans Not Entirely Lost—President Mahon Sorely Disappointed at Outcome

CONDUCTORS and motormen of the New Orleans Public Service, Inc., New Orleans, La., by a vote of 1,009 to 87 on the night of Sept. 11, rejected the tentative agreement looking toward a settlement of the strike which had been drafted by William Green, president of the American Federation of Labor, and A. B. Paterson, vice-president of the New Orleans Public Service, at a conference in New York. The agreement also was approved by W. D. Mahon, president of the Amalgamated Association of Street and Electric Railway Employees.

At Indianapolis, Mr. Green said that the rejection of agreement was due to a "misunderstanding," and from Seattle came word that Mr. Mahon, in that city at the convention of the Amalgamated Association, regarded the negative vote of the car men as a "serious mistake" and that he would seek to have the vote reconsidered.

Local union officials at New Orleans asserted that neither Mr. Green nor Mr. Mahon had the true facts of the situation, which was aggravated by the refusal of Public Service officials to reassure the union that the strikers would be taken back to work. The clause in the agreement, the union officials said, did not bind the company to re-employ the men, and they had reason to believe that about 400 of the former employees never would be reinstated, under the terms.

In a telegram sent to Mr. Mahon in response to a telegraphic query, A. B. Paterson of the New Orleans Public Service, Inc., said:

"Subject to prompt acceptance of the agreement by your association, a large number of men can be returned to work immediately. The others as fast as conditions will permit."

At Seattle Mr. Mahon is reported to have said that he was disposed to order the New Orleans Association to accept the compromise strike settlement agreement offered by the American Federation of Labor, provided the agreement still holds good, but would take no action until Mr. Green gives him a definite reply as to whether the compromise agreement had been withdrawn. Mr. Mahon said he believed the action of the New Orleans strikers in refusing the settlement had been unwise.

The tentative agreement to settle the strike was brought about by the efforts of Father John O'Grady, of the Catholic University of America, Washington, D. C. In New Orleans during the early stages of the strike Father O'Grady had an opportunity to confer with Acting Mayor Walmsley and members of the Commission Council and Father Wynhoven, head of Catholic Charities in New Orleans.

When Father O'Grady returned to Washington, he sought out William Green, president of the American Federation of Labor, on his own initiative, and finally secured from Mr. Green an agreement to meet A. B. Paterson, vice-president of Public Service, if a conference could be arranged.

In the meantime Father O'Grady obtained Mr. Paterson's acceptance to meet Mr. Green in New York. In this way the conference was arranged. In addition to Mr. Paterson and Mr. Green, those who took part in the conference included Henry C. Abel, representing the Electric Bond & Share Company; Rudolf S. Hecht, chairman, board of directors, Public Service; W. D. Mahon, president of the Amalgamated Association; Edwin Peyroux, president of Local 194, and Edward Rightor, attorney for that union.

The agreement to settle the difficulties was signed by Mr. Paterson and Mr. Green. Mr. Mahon approved it also.

Two features of the agreement are those which give Public Service the benefit of the open shop plan and the provision for an impartial tribunal upon which both

New Jersey Agreement Renewed

The wage dispute between Public Service Co-ordinated Transport, Newark, N. J., and its employees was settled on Sept. 6 by the signing of a new contract for three years, starting Oct. 1. The new contract is a renewal of the present one, with a few minor changes. Union men had asked wage increases of approximately 25 per cent and the company had countered with a suggestion that wages be reduced. The company offered to arbitrate the dispute, but the men voted in favor of a renewal of the present contract rather than resort to arbitration.

Golf at the A.E.R.A. Convention

As chairman of the golf committee in connection with the convention at Atlantic City, Harold B. Gardner has arranged with the Country Club of Atlantic City, Northfield, N. J., to hold the golf tournament there on Sunday, Sept. 29.

The matter of prizes has also been arranged. The first 18 holes are to count toward winning prizes in four events, namely:

Class "A"—Handicap scratch to 14 inclusive.

Class "B"—Handicap 15 to 24 inclusive.

Class "C"—Handicap 25 to 35 inclusive.

Kickers—Numbers to be chosen between 75 and 85.

The tournament will be on the basis of medal play. All members of the A.E.R.A. should advise Mr. Gardner, Westinghouse Air Brake Company, 150 Broadway, New York, of their intention to play, giving their regular club handicap and name of club. If there is no handicap, the applicant should state his three best scores when filing his application. In case of a tie the lowest handicap will win. No player is eligible to more than one prize.

Theatrical District in New York Asks Modification of Traffic Ban

The Broadway Association in New York has announced that it was preparing to ask Police Commissioner Whalen to meet Dr. John A. Harriss, president of the association and a traffic expert, to discuss possible changes in future procedure in the regulation of traffic in the theatrical section of the city that would benefit the district. The problems that face theater owners, restaurateurs and shopkeepers in the zone where parking is prohibited during certain evening hours were described by Dr. Harriss, who said the Broadway Association "believes that a better solution of the entire traffic problem can be found, and it hopes and believes the commissioner will see it that way." It will be recalled that Commissioner Whalen modified the original rules in the interest of owners of businesses conducted in the district.

Another Grade Protection Conference in Ohio

Definite steps have been taken by the Ohio Public Utilities Commission to insure the installation of flasher signal lights or other protective devices at more than 600 unprotected railroad crossings in Ohio. Copies of an order, issued by the commission, have been sent to representatives of each interurban and steam railroad affected. The representatives of the roads are to meet again with the commission on Sept. 17 to discuss the matter. The commission favors the automatic flasher light system, but the entire subject will be gone over thoroughly with each railroad.

$300,000,000 Chicago Expenditure Forecast

"Deadlock Committee" Gets Tentative Financial Program Proposal Under Pending Co-ordination Scheme

IN THE long-awaited financial plan for the proposed Chicago consolidated system which was submitted on Sept. 5 to the "deadlock committee," Chicago transportation companies forecasted the expenditure of $300,000,000 in the extension and improvement of that city's transit lines. Of this sum, $200,000,000 would be spent by the surface and elevated lines for extensions and improvements during the next ten years, and the city would be expected to spend $100,000,000 in the construction of subways during the next three years. The plan provides that there shall be no change in the present fare of 7 cents for the surface cars and 10 cents for the elevated, but calls for a 3-cent charge for transfers from surface to elevated lines.

Public hearings are to be held soon by the City Council's committee.

According to the plan, the new corporation would start with a capital value of $262,137,980, divided thus:

Rapid Transit lines	$97,558,695
North and West Side surface lines	94,898,302
South Side surface lines	69,680,983

Of the sum which the companies would devote to improvements, it is estimated that about $67,000,000 would go to extensions and betterments of the surface lines, and the remainder for the improvement and extension of the elevated system. The companies contend that it will be necessary to crowd fifteen to twenty years of delayed construction and extensions into the next ten years, in addition to the normal number of extensions and betterments required to meet the current needs of a community of 4,000,000 or 5,000,000 people.

The capital of the elevated and surface lines is at present represented by 28 different security issues. The two-fold financial plan devised by the companies suggests that these securities be refunded or exchanged for not more than five or six kinds of securities. To finance the $200,000,000 of new money it is proposed that the company issue first and refunding mortgage bonds, the initial issue to bear interest at 5½ to 6 per cent. It could also issue other securities as might be advantageous at different times.

In a table attached to the report the companies estimated the city's compensation at 3 per cent of the gross earnings. No definite rate of return for the companies is given in the report, but in their tabulations the companies estimate that the revenues would give a return of from 6.52 per cent in the first year to 5.94 per cent in the last of the ten-year period.

The group working for more than three months on subway plans has been delayed by disagreements between engineers for the surface and the elevated companies as to what type of subway is needed. The deliberations of the committee have been secret, but it is understood that one of their proposed plans called for the expenditure of $217,000,000 for the underground tubes, more than double the sum estimated in the companies' plan submitted to the "deadlock committee."

Railway Service Withdrawn in Enid

The French Bus Lines and a number of jitneys are attempting to meet the transportation problem created in Enid, Okla., by the sudden suspension of street car service. The city cancelled the franchise of the Enid City Railway and ordered cars stopped following a controversy with the company over maintenance of the properties and paving between the tracks. The city immediately issued a permit for one year to the French Bus Lines to operate buses in Enid. The buses have started operation with a 5-cent fare. The French Bus Lines at first were able to secure only two buses to use on the city streets, but two more have been ordered. In order to meet the emergency created by a circus crowd in town on Sept. 4, a number of jitneys were authorized to operate. Local newspapers have carried interviews with many citizens which show that sentiment is divided as to whether this city can meet its transportation needs without street cars. Three former mayors of the city are quoted in the Enid *Morning News* as opposing the change.

Final Briefs in Louisville Case

The case carried to the federal court some weeks ago in which the Louisville Railway, Louisville, Ky., is seeking to enjoin the city from interfering with it in collection of a 10-cent fare with a special ticket rate, intended to produce an 8 per cent return on the investment, argued before Judge Dawson some weeks ago, has progressed by the filing of briefs by the Louisville Railway and the city. The city now contends that the company for years paid dividends under a 5-cent fare, but did not set aside funds adequate to care for depreciation. The question now raised is whether or not refusal of an increase to more than 7 cents in fare is confiscation of property, as asserted by the company. It is a matter of speculation just how soon Federal Judge Charles I. Dawson will render his decision.

Working Control at St. Louis With Holding Company

More than 38 per cent of the voting stock of the St. Louis Public Service Company, which operates the co-ordinated railway and bus system in St. Louis, has passed to the City Utilities Company, a Delaware holding corporation, in turn controlled by the Newman interests and the North American Company.

In June the Public Service Commission, over the protest of minority stockholders of the railway and officers of the city, authorized the City Utilities to acquire more than 10 per cent of the stock. An appeal by the city to the Circuit Court of Cole County is now pending.

The North American Company formerly owned all of the common stock of the United Railways, which was succeeded after foreclosure and sale by the St. Louis Public Service Company.

City Utilities was formed by J. K. Newman at the time he reorganized the railways in St. Louis and Kansas City. Its authorized capitalization is 50,000 shares of $100 par value preferred and 300,000 shares of no par value common stock. The company is understood to be the holder of a substantial amount of stock of the Kansas City Public Service Company.

Hearing on Indiana Sale Set for Oct. 29

Final hearing on the temporary injunction restraining the bondholders' committees of the Union Traction Company of Indiana from selling bonds held under deposit agreement to the Midland Utilities Investment Company, Chicago, was postponed from Sept. 7 to Oct. 29. The injunction suits were filed by Gavin L. Payne and S. E. Test, Indianapolis, acting for minority bondholders. They say negotiations for the sale of the bonds to the Midland Company were in violation of the deposit agreement, which, it is contended, provided that the bonds were to be used to protect the interests of bondholders during receivership and reorganization but were not to be sold. The Midland Company has offered 20 cents on the dollar for the bonds.

Flat Rate Cab Company Goes Broke

The Ring Cab, Inc., operating in Worcester, Mass., has liabilities of $16,308 and assets $8,605, according to its bankruptcy schedule filed in the federal court at Boston. The corporation has secured claims of $7,000, the only secured creditor being the Devonshire Financial Service Company, Worcester, whose claim is secured by a lease on automobiles. The corporation has unsecured claims of $9,308. Assets consist mainly of vehicles valued at $6,000. Debts due on open accounts amount to $1,755, which the corporation says is "due from drivers." The Ring Company was the original 35-cent flat rate taxi to enter the field in Worcester. This it did on Oct. 1, 1928. At that time there were 224 taxicabs and 423 licensed drivers in the city. Last March there were 335 cabs and 1,146 drivers. Since then conditions among the taxi operators have become chaotic, best instanced by the Ring bankruptcy.

Fare Hearing in Portland, Ore., on Nov. 12

Discovery that under the law a 10-cent fare could automatically become a fact in Portland, Ore., if the Portland Electric Power Company cared to put it into effect, unless the state took some action before Nov. 24, led the Public Service Commission on Sept. 7 to set a hearing on the request of the company, for Nov. 12.

While Franklin T. Griffith, president of the company, declared he had no intention of attempting to raise the fare without a full hearing before the commission, it was found that the company would have the right to do so unless the state denied the request within six months after the application was filed.

To determine the attitude of the city on the fare case, Mayor Baker called a special meeting of the City Council on Sept. 9.

Mr. Griffith announced that he would not put the 10-cent fare into effect until after 30 days' notice following the expiration of the six-month period.

Fare Experiment in Boston

The Boston Elevated Railway, Boston, Mass., will experiment with a new method of collecting local fares on street cars operating from Sullivan Square to Scollay Square via Main and Bunker Hill Streets, Charlestown. Single metal tokens will be sold for 7 cents; four tokens for 25 cents. The intent of the single token is to enable persons who do not want to buy four local rides but wish only a single ride to do so for 7 cents instead of 10 cents on these lines.

Persons wishing to buy four local rides may do so at the regular rate of 6¼ cents, but instead of paper tickets tokens will be used on these lines. Tokens presented for local fare will be acceptable on other lines of the system. No transfers will be issued on the token fare.

Cars running on these two lines have been equipped with a new type fare box which will take only the metal tokens and dimes, and will show a separate registration of the two coins.

$95,500,000 Chicago "L" Value

The properties of the Chicago Rapid Transit Company, which operates the elevated lines in that city, have been valued at $95,500,000 by an especially appointed committee composed of Col. A. A. Sprague, Joshua d'Esposito, consulting engineer, and George Woodruff, vice-chairman of the National Bank of the Republic. Their report was delivered on Sept. 7 to Alderman McDonough, chairman of the Council local transportation committee.

The committee recommended that the sum be considered both as the price at which the company should merge with the other lines and as the basis of rate making. Although this figure submitted by the committee is approximately $2,000,000 lower than the valuation given in the financial plan submitted by all of the local transportation companies, it appears probable that it will be accepted.

In evaluating the properties, the committee began with the appraisal set by the Illinois Public Utilities Commission in 1918. From this valuation, which was $86,250,000, the committee deducted $1,000,000 as an allowance for working capital. It then added $8,300,000 for additions and betterments made since 1919. This was $986,073 lower than the costs as shown on the companies' books. For real estate owned by the company and unused at present for railway purposes, the committee allows $2,300,000, bringing the valuation to a total of $95,500,000.

New Cars in Prospect for Columbus

The Columbus Railway, Power & Light Company, Columbus, Ohio, may purchase faster and lighter cars as a step toward relieving congestion in that city. To this end officials of the company will study the exhibits at Atlantic City, and it is believed that at least one experimental car will be delivered for use in Columbus shortly after the close of the convention.

In daily peak loads the company operates 239 cars. Nearly all of them traverse High Street or cross it in the congested area. The company favors rerouting some of the lines, but each proposal has met with opposition from car riders and downtown business men. So far the only lines which have been taken off High Street in recent years are the West Broad Street and the Cemeteries lines.

Railway officials also favor the prohibiting of parking in High Street in the downtown area. To the end that conditions may be improved the company has volunteered to co-operate with the police, the Columbus Auto Club, the Columbus *Citizen* and any other group or organization that is working to eliminate traffic accidents and to relieve traffic congestion. The skip-stop system was recently put into effect as one step in this direction. A study of traffic conditions is being made by engineers to determine further possible plans.

Men Reject Settlement

(*Continued from page 942*)

workers and company are to be represented. The full text of the tentative agreement, condensed only to avoid repetition of proper names, follows:

"It is agreed that the strike of the employees of the Public Service will be terminated upon the acceptance of the following stipulations:

"That all persons in the employ of the company when the strike occurred on July 2 shall return to work in the order of their seniority; all to be re-employed as rapidly as conditions will permit, and no other employees to be hired until after all old employees have been given full opportunity to return to work.

"It is agreed that the details of an agreement between the management and Local 194 shall be negotiated at the earliest date which may be mutually convenient, the agreement which has been in effect for the past nine years to be the basis upon which this contract shall be negotiated.

"It is understood that the president of the Amalgamated Association and the president of the American Federation of Labor shall participate in the negotiations of this agreement, and that said new agreement shall be built upon the basis of co-operation, mutual good will and common understanding.

"It is agreed further that the new terms to be negotiated shall create an impartial tribunal upon which the workers and the company shall be represented. This tribunal shall endeavor to develop and foster a co-operative relationship between employees and employer to secure the maximum of efficiency on the part of the management and employees in the operation of the railway.

"The duties and functions of this tribunal shall be agreed upon and defined by those who participate in the conference when the new agreement is finally negotiated.

"All persons who are eligible to membership may exercise the right to join Local 194, and no man who may become a member of the local union shall be discriminated against because of his membership in the said union, or for any part he may take in the legitimate administration of the affairs of the local union.

"It is further understood that the agreement which shall finally be reached shall be between New Orleans Public Service, Inc., and Local 194.

"It is understood that any employee, if he elects, may plead his own case and present his own grievances, but in the event that he desires representatives or committees to represent him, said representatives or committees must be the duly and properly appointed or elected committees by authority of Local 194. No others will be recognized."

Following the announcement of these terms, members of the city government, civic leaders and industrial executives expressed their pleasure at the tentative settlement, but officers of the local union declined to comment in any way except by public notice that the strike was not officially over.

Maryland Men at Ocean City

Discussion at association meeting centers around the improvement of equipment and its maintenance

DISCUSSION of means for improving transportation equipment and its maintenance featured the meeting of the Transportation Section of the Maryland Utilities Association on Aug. 30 at Ocean City, Md.

Progress in transportation vehicles was outlined by Adrian Hughes, Jr., superintendent of bus transportation, United Railways & Electric Company, Baltimore. It is not a question of the car against the bus, but of providing transportation to give the service demanded by the public. Improvements have been made in both classes of equipment. Mr. Hughes feels that maximum speeds of equipment have been featured on account of the advertising campaigns in the sale of automobiles. The real criterion, however, is the time that it takes to get the vehicle over the route. Here success demands high acceleration and braking rates, combined with moderate free running speeds. As buses are being built larger and larger, he feels that sight must not be lost of the economic necessity of continuing with one-man operation. Greater comfort is needed, he thinks, both for the passenger and for the operator. Proper destination signs both inside and outside the vehicle are important in making it easy for the passenger to use the service. According to Mr. Hughes a change in the appearance of the street car would make that vehicle appear as though it is going somewhere. He believes an agreement could be made so that the production of street cars could be on a quantity basis, and thinks that it should be possible to standardize on a single-truck car, a double-truck car, and possibly an articulated car for rush hour or heavy service.

Maintenance of street cars was discussed by W. H. McCarty, president of the Electric Railway Equipment Men's Association of the Middle Atlantic States, while bus maintenance was discussed by R. D. Voshell, of the Washington Railway & Electric Company. Both speakers stressed the point that maintenance should be preventive. In connection with bus maintenance it was held that lubrication is one of the most important elements. It was also proposed that safety tests, such as tests of brakes, should be made a matter of record. It would then be possible to prove conclusively whether or not the vehicle was in proper condition as regards safety if an accident should occur.

F. J. Moore, bus manager and superintendent of bus maintenance, Blue Ridge Transportation Company, outlined some of the problems of long distance bus transportation. He believes that the private automobile is the most serious competitor to the electric railway or the bus. To meet this competition he has made a party rate of one and one-tenth times the one-way fare for five or more persons. The fares on the Blue Ridge lines were fixed at about 4 cents a mile originally. Interstate competition ensued, the rates on the competitors being about 2½ cents a mile. Accordingly, his company figured out a new basis of charges on a sliding scale, so that the longer the ride, the cheaper the rate.

The morning meeting was presided over by J. H. Stephens, superintendent of railways, Washington Railway & Electric Company. The members engaged in various sports in the afternoon.

In the evening there was a banquet by the association in honor of Light's Golden Jubilee. Talking movies were shown, featuring Thomas A. Edison, who told some of the incidents in connection with the develoment of the incandescent lamp.

Boise Valley Operation Approved

The Boise & Western Railroad has been authorized to operate in Ada County, Idaho, from Boise to Star, 16 miles, and from Boise to Onweiler Junction, 9 miles. These lines form segments of the loop operated in the Boise River valley for more than twenty years by the Boise Valley Traction Company and its predecessors. Operation of the loop line was suspended in May, 1928. The Boise & Western was incorporated in July, 1929, and has acquired the segments of the old line which it proposes to operate. The Interstate Commerce Commission holds that the experiment properly may be permitted if a conservative financing plan is adopted.

Washington Fare Case Closed

The hearings on the petition of the Capitol Traction Company, Washington, D. C., for an increase in fare came to an end on Sept. 11 and the case was postponed to Oct. 7 by the Public Utilities Commission. At this time the question of savings to the companies, possible through joint use of tracks and other facilities, will be discussed. All parties were given until Sept. 30 to file briefs on that portion of the case affecting the rate of fare to be charged, and until Oct. 15 for the filing of briefs in reply. No oral arguments will be heard on the case.

Late News Briefs

New York, N. Y.—Michel Kirtland, receiver of the Eighth & Ninth Avenue Railway, started suit in the Supreme Court on Sept. 10 for a review of the refusal of the Transit Commission to grant his company the right to charge a 7-cent fare. Justice Crain has directed the Transit Commission to file all proceedings relating to the fare application in court within twenty days. The review of the commission's decision is asked on the ground that the company is deprived of its property without due process of law, and that the rejection of its evidence as to its loss at a 5-cent rate was unlawful.

Atlanta, Ga. — The Georgia Power Company has asked the United States Supreme Court to review its controversy with the city of Decatur, Ga., arising out of the city's petition, granted by a lower court, that the company be perpetually compelled to operate its North Decatur Street car line at a 5-cent fare. Under the franchise granted in 1903 the company agreed "to never charge more than 5 cents for one fare." The company agrees that this provision fixed the rate of fare while the line was operating, but contends that "such provisions did not undertake to compel perpetual and never-ending operation."

Staten Island, N. Y.—On Sept. 3 a fire attributed to a short circuit destroyed the platforms of the Tottenville station of the Staten Island Rapid Transit Railroad and burned six coaches on a nearby siding.

Boston, Mass.—In July, the first month of the trustees' fiscal year, the cost of service on the Boston Elevated Railway exceeded its revenue by $285,903 compared with excess cost of service in July last year of $331,329.

Cleveland, Ohio—The Cleveland & Southwestern Railway may discontinue its branch line from Seville to Wooster, since the village of Creston ordered the removal of the tracks within its limits when city and railway officials failed to get together on a renewal of the franchise.

Atlanta, Ga.—The City Council has adopted a resolution in which it requests the Georgia Power Company to reduce school children's fares on buses from 10 cents to 5 cents, the same school rate now applying on street cars, and to issue transfers from buses to street cars and vice versa. The buses are run by the Atlanta Coach Company, a subsidiary of the Georgia Power Company.

Youngstown, Ohio—The Youngstown & Southern Railway is working on a program to extend its line from Columbiana to Signal. Recently the Village Council of Columbiana granted the company a new franchise within its corporate limits and the new road has been surveyed from Columbiana to Signal. Completion of the line to Signal will also give the Rogers district in Middletown township service to Columbiana and into Youngstown.

Baltimore, Md.—The Washington, Baltimore & Annapolis Electric Railroad is adding the new steel trailers, ordered a few months ago, to its North Shore branch, operating between Baltimore and Annapolis.

Chicago, Ill.—A drive for still greater courtesy among the trainmen has been launched by C. H. Evenson, superintendent of transportation of the Chicago Surface Lines. In a recent statement to the trainmen Mr. Evenson said: "The trainman is the salesman of the only commodity the railway has for sale—service. If he is disagreeable in his contacts with passengers he is a failure as a salesman."

Richmond, Va.—An amendment to the bus ordinance authorizing the Virginia Electric & Power Company to substitute bus service on Hermitage Road, and Laburnum and Chamberlayne Avenues in place of the present railway service, will come before the Aldermen at their September meeting. The paper has passed Council.

New York, N. Y.—An order directing Police Commissioner Whalen to show cause why he should not grant the application of the White Horse Taxi Service for a permit to operate taxicabs in the city was issued on Sept. 9 by Justice Valente, of the Supreme Court. In a recent similar action, Commissioner Whalen refused to grant the permit on the grounds that he was attempting to lessen traffic congestion and that he would have to be entirely satisfied with the financial responsibility of a concern before he would issue a license.

Cleveland, Ohio—The Statler Hotel has been selected as the place for the next meeting of the Central Electric Railway Association, to be held on Jan. 23 and 24, 1930.

Digitized by Google

Providence, R. I.—Two years ago the United Electric Railways scrapped approximately 300 obsolete cars of various types and this year it is scrapping another 160 cars which, because of type, age and condition, are no longer serviceable. The list this year includes 113 closed passenger, 16 open passenger, 16 express and 15 miscellaneous service cars. The average age of these cars is about 26 years. The car bodies are burned after all serviceable material has first been salvaged.

El Paso, Tex.—A brief now in process of preparation is to be presented to the committee of judges setting forth the safety record of the El Paso Electric Company for 1928 in competition for the Anthony N. Brady Silver Memorial Medal to be awarded under the joint auspices of the American Museum of Safety and the American Electric Railway Association. The El Paso Electric Company won this medal for 1926, and again in 1927 received a certificate of award and honorable mention in this contest. Its accident record for 1928 is even better than that established during 1927, which in turn was an improvement over the record for the year before.

Birmingham, Ala.—The next meeting of the Electric Railway Association of Equipment Men, Southern Properties, will be held here on Jan. 27, 28 and 29.

Staten Island, N. Y.—The strike of the drivers of the Tompkins Bus Corporation, which began on Sept. 6, ended at 9 o'clock on Sept. 12 in a victory for the company. J. P. Ryan, president of the Central Trade and Labor Council of the American Federation of Labor, said: "After careful consideration of the labor situation in Staten Island, I feel that the men were ill-advised in calling a strike at this time and instructed Thomas J. Lyons, president of Local 807 of the Teamsters' Union, to call it off." Throughout the strike full schedules of the company's eleven lines were operated without interruption, the island's 35,000 commuters by bus being carried to and from their destinations each day without accident or delay. M. T. Gordon, Jr., acting president of the company, reiterated his intention not to take back the 22 men whose discharge precipitated the walkout, adding: "The Tompkins Bus Corporation will, in the future as in the past, employ any and all men measuring up to its standards."

St. Louis, Mo.—R. J. Kelker, Jr., consulting engineer of the St. Louis Transportation Survey Commission, says that the city should consider the advisability of a rapid single deck bus service which would make stops only at points like Union, Kingshighway and Grand Boulevard, in coming down town.

Shreveport, La.—It is expected that the presentation of testimony will soon be completed in the case in which E. Wayles Browne is acting as special master for the court in its consideration of the plea of the Shreveport Railways for the right to run one-man cars. The company is seeking to show that the system is not making a fair return on its investment and that unless economies such as one-man cars are put into effect, it will mean confiscation of property. Depositions were taken recently in New York among men in the industry qualified to testify for the company as experts on the results attained in other cities with the one-man car.

Boston, Mass.—The Eastern Massachusetts Street Railway has declared a dividend of 37½ cents a share on the common stock, payable Oct. 15 to stock of record Oct. 1. A like declaration was made three months ago. On April 1 an initial dividend of 37½ cents a share was paid on the stock. The usual quarterly dividend of $1.25 a share on the adjustment stock was also declared, payable Oct. 1 to stock of record Sept. 16.

Boston, Mass.—The legislative committee of the Boston Central Labor Union, appointed several months ago to investigate the Boston Elevated Railway situation with regard to ownership and management, has reopened the entire question of public ownership or continuance of public control.

Portland, Ore.—Beginning Sept. 13, every one of the 3,150 employees of the Portland Electric Power Company will launch a "safety drive" which will involve not only street car and bus operation but every activity in the organization. During July street cars and buses of the company ran an average of 49,135 miles for each reported accident.

New York, N. Y.—At the meeting of the International Congress on Accounting held on Sept. 10, L. R. Nash, of Stone & Webster, criticized accounting system prescribed for public utilities that fall under the control of the Interstate Commerce Commission. He said that the interstate system is objected to on the ground that its cost is burdensome, and that it permits inaccuracies because it is based on an assumption as to useful life which the outstanding executive and technical talent in the industry believes to be untenable.

Duluth, Minn.—Directors of the Duluth Superior Traction have taken no action on either common or preferred dividends for quarter ended Sept. 30, due at this time.

Boston, Mass.—The Atlantic Avenue route of the Boston Elevated Railway probably will be utilized in an interstation mail transfer plan expected to speed up delivery of letter mail deposited locally and intended for local distribution. The system has merely been discussed tentatively.

Minneapolis, Minn.—Mayor Kunze has requested the Minneapolis Street Railway to grant school children a 5-cent fare. He sent the communication to the City Council, and it will be referred to the street railway committee. T. Julian McGill, vice-president of the railway, said he understood the 5-cent rate was in effect in Duluth as an experiment on the assumption that it would increase the Duluth company's operating receipts.

Richmond, Va.—The Virginia Electric & Power Company announces a new car-to-bus transfer system as the result of the mis-use of the transfer under the universal transfer plan. Under the new plan, passengers desiring a car-to-bus transfer will request a "bus transfer" instead of a "transfer" as under the old plan. Special bus transfers have been prepared and will be different in design from the old universal transfer, thus avoiding the use of the bus transfer by persons riding at reduced rates, many of whom have obtained a bus-car ride for almost half the regular rate. The old 7-cent car fare, 8-cent bus fare and 1-cent for car-to-bus with transfer will obtain as usual.

Chicago, Ill.—A new edition of "Seeing Greater Chicago" is just off the press and ready for distribution. It contains the routing of all street cars of the Chicago Surface Lines and a brief description of points of interest with directions for reaching them. The guide will be distributed through agencies handling street car tokens and at information desks in railroad stations, hotels and elsewhere.

Alliance, Ohio—Approximately $25,000 is being spent by the Stark Electric Railroad to rebuild half a mile of track on Liberty Avenue. Early this year, the company replaced its 65-lb. rails with 100-lb. rail on this street. When the city, a short time later, made plans to re-pave the street, the Stark Electric awarded the contract for half of the street excavation. By the time the city contractor was ready to begin work, the Stark Electric had most of its portion of the street project completed. With half the street excavated, the tracks were thrown onto a temporary roadbed without interruption of service.

South Bend, Ind.—The hearing on the petition of the Chicago, South Shore & South Bend Railway to remove tracks from Chicago Avenue in East Chicago, Ind., was on Aug. 29 continued until early October by the Public Service Commission. The railway wishes to build a new right-of-way along the Calumet River in East Chicago.

Havana, Cuba—Plans are under way to establish a transportation commission to organize rail, motor and street car transportation and the fixing of routes to avoid ruinous competition. All fares will be changed, taking into consideration the interests of the public.

Detroit, Mich.—Notice that interurban passenger service on the Detroit, Jackson & Chicago Railway between Jackson and Detroit would be discontinued has been issued by J. F. Collins, receiver for the road, under the authority of a court order signed by Federal Judge Charles S. Simons. The dismantling of the Detroit-Jackson line ends passenger service that has existed for 30 years between the two cities. Passenger service on the Michigan Electric Railway from Jackson has been suspended for several months.

Greensboro, N. C.—The City Council has received a petition signed by residents and property owners of North Elm Street asking that the present trolley cars of the North Carolina Public Service Company now running over that street be supplanted by buses.

Montreal, Que.—City engineers have been instructed to proceed immediately with such additional city work as may be necessary and the Montreal Tramways Company was requested to begin laying rail for the extension to the summit of Mount Royal. The line will join Mount Royal Avenue with Shakespeare Road, thus opening transportation between the north and east ends with the west end by a direct route to the rear of Mount Royal, affording great relief to lines between mountain and river which now have to carry practically all crosstown traffic.

New Ideas

and New Tools to Execute Them

READINESS to accept new ideas—a spirit indispensable to progress—was evident in greater degree than ever before at the 48th annual convention of the American Electric Railway Association just closed. New ideas in car and bus design; new ideas in track and overhead line construction; new ideas in operating methods which a few years ago would have been looked upon as being extremely radical, are today receiving unquestioned acceptance.

The industry now passed beyond the old controversy of cars *or* buses. The sentiment of the present is for both cars *and* buses. On the one hand it has been learned that the bus is an indispensable asset in rounding out our transportation systems. On the other hand, the conviction is firmer than ever that the electric railway is and must remain the backbone of at least the larger transportation systems.

WITH the argument about the place of the car and the place of the bus practically settled, the field is clear for action. Cars that will win against the automobile are the most pressing need. Public favor cannot be won by an academic discussion of car design, nor can it be won by a single specimen vehicle displayed as an exhibit. It must be won by service. A broad gage program is required to convince the public that the development of electric rail transportation is keeping pace with the times. The public demands comfort and speed. New rolling stock developments of the past several years have emphasized passenger comfort. This year comfort has by no means been neglected —but special emphasis has been given to speed. Notable improvements have been made in car design. More rapid acceleration and braking were features of the equipment exhibited this year.

Radical innovations have been made in many of the individual items of equipment and apparatus. The electric railway industry has learned from the automotive industry the lesson of re-design. No longer are the railways content with trifling modifications. The demand is for entirely new designs to replace those no longer suitable to our needs.

AS THE chief stumbling block in the way of the much needed improvement in rolling stock stands the high price of new cars. Inherently there is no reason why a street car should cost more than a bus. On the contrary, it should cost less. Just so long as street cars are built to measure, however, they will remain more expensive than a ready-made article. Some degree of standardization is needed—not a single type, which must necessarily be unsuitable for many conditions, but rather enough standard types to meet all ordinary conditions. Details of design are comparatively unimportant, but the industry has reached a point where wide-spread acceptance of certain fundamental principles and definite action to put them into effect are required. The time has come to act, rather than merely to talk. The final word has not yet been said on the subject of vehicle design. But the final word will never be said. It is a military maxim that in a crisis it is better to do any intelligent thing rather than to strive hesitatingly after the ideal.

Already many improved designs are available. The willingness shown at the convention to accept new ideas is most encouraging. It remains now to translate these new ideas into action—to test their value in actual service. In no other way can the industry verify the soundness of its thinking and regain the experience necessary for future progress.

A Strong Pull

NO MATTER how many conventions are held where the executives of the industry tell each other what their needs are, it avails little. When they tell outsiders of the needs of the industry, that is a step in advance. But when leading men come to the association and tell its members that they understand and appreciate the problem, that is real progress.

Summing up the sessions of the American Association, it becomes evident that the problems of the industry are becoming more widely understood. Speakers of national reputation demonstrated at this year's convention an intimate knowledge of the industry's affairs that a few years ago would have been almost impossible. Such men as Secretary Lamont, Colonel Barber and Mr. Stevens presented searching analyses of several phases of the transportation business that show thorough investigation and deep thought.

As for the course of events within the industry itself the program that has been advanced for improvement—better vehicles, better handling of traffic, better operation and financing—must be pushed forward. While it is indeed gratifying to transportation executives to feel that the constructive work that has been carried on by the American Electric Railway Association during the past several years has been so fruitful, when men of note outside of the business show such recognition of the vital importance of public transportation evidence is given of real progress in its relations with the outside world. But we must not rest on our oars. We must pull unremittingly against the current of unthinking opinion. Every stroke makes the battle easier. And with the showing that was made at Atlantic City the industry can feel that it is definitely moving in the right direction.

From the Scrap Heap to the Front Rank

FOR its remarkable achievement in moving, within the short period of four years, from the scrap heap to the front rank among electric railways of America, the Chicago, South Shore & South Bend Railroad was awarded the Charles A. Coffin prize for 1929. Despite the competition of several steam railroads and the private automobile, this company increased its operating revenue 34 per cent over the preceding year and 257 per cent over its 1924 figure. The number of revenue passengers was increased 8½ per cent last year and 24 per cent during the four-year period. Freight business has been increased enormously despite the competition of motor trucks on the many well-paved highways traversing the South Shore territory. Equipment has been improved and schedules speeded up. Effective work has been done in accident prevention. To accomplish these many improvments an investment of $13,000,000 was required. That this expenditure was amply justified, is shown by the substantial profits which have replaced the former heavy losses. The record of the South Shore Line is another bright page in the history of electric railways which have been rehabilitated and made prosperous by the adoption of courageous and far-sighted policies.

Notable though the achievements of the South Shore Line have been, the contest was remarkably close. All of the briefs submitted by the seven contestants this year were excellent and several were outstanding in many respects. It has been the experience of the committee of judges that the presentations have been of higher quality each year, and have shown an increasing record of accomplishment. The reports this year were even more impressive than those of previous years. The average increase in operating revenue reported was slightly more than 9 per cent. This was accomplished partly by economies in operation and maintenance and partly by higher rates of fare. It is particularly noteworthy, however, that the group of contestants this year showed an average increase in passenger traffic of 4 per cent over 1927 and 7 per cent over 1924. Details of the achievements of the various properties are given in an article appearing elsewhere in this issue. No evidence more impressive than this could be found to show the progress which is being made by the local transportation industry.

Fundamental Transportation Problems Studied

VITAL to the welfare of the industry are the five subjects, all broad in scope, investigated during the year by the committees of the Transportation and Traffic Association. They were studied in great detail, with the result that extremely informative reports were presented.

One endeavor was to develop means of using the existing street facilities more effectively. The movement of the vehicle committee considered four distinct questions, the control of parking, traffic regulation, stop location and equipment design. President W. H. Boyce emphasized the importance of this investigation when he said:

"One of the greatest problems of thickly populated communities today is that of traffic movement, and so difficult has this problem become that managements of transportation companies realize that their ability to attract revenue is dependent on their success in moving their vehicles with regularity and adequate speed."

Two outstanding contributions also were made by the committee on the equipment. One of these was the development of a practical method of determining a few sizes and types of uniform vehicles which will permit their manufacture on a production basis. The second was the outlining of a method of accounting or cost keeping to provide needed data regarding results of operation of individual lines and to furnish a guide for efficient transportation management. Recognition also was apparent that more attention must be given to the actual needs and desires of the traveling public and a more definite knowledge secured of the real attitude of passengers toward the service. To that end the committee on the passenger outlined in detail the methods of making market analyses—definite investigations into the views of the riding public. The fundamental problem of the industry today is to obtain more car riders. They can be secured chiefly through the contact of the employees with the customer. In giving the human force that same serious consideration which has long been expended upon the mechanical side of our industry, the employee committee has made a great forward step.

The small city committee succeeded in collecting much valuable information during the year. This is a big subject. No systems are more harassed than properties operating in such communities. It was quite proper that this subject was referred back for additional study. It is not one that is easily exhausted. The continuance of the study of the small city problem should be productive of other helpful ideas to supplement those already advanced.

In getting down to the fundamentals of the industry and reaching out for the answer to the many problems

Digitized by Google

with which it is confronted the T. & T. Association is more than doing its part. Commendable spirit and effort were shown in these deliberations. The work done presages a continuation of the vigilance so necessary to keep the industry headed in the right direction.

Making the Platform Man a Partner

WHILE comparatively few men from the ranks were able to attend the recent convention at Atlantic City it is a matter of satisfaction that their status in the industry was the subject of much consideration and interest. In papers and discussions the importance to the industry of developing a strong and intelligent personnel was a prominent theme. The claim agent insists that the best hope for decreasing accidents lies in impressing the platform man with the importance of safe practices. The power engineer is well aware that the possibility of effecting a saving in energy consumption rests with the motorman. The master mechanic will admit that his maintenance costs depend to a large degree upon the skill with which the equipment is handled while on the road, while the new-business department realizes that the best way to retain the present traffic and build up receipts is through the organization of an intelligent sales force from among the men on the cars. More and more, the idea is gaining ground that great possibilities lie in the development of a superior operating personnel.

Perhaps the platform man himself may not gain much immediate benefit from this active interest in his intellectual welfare. But in the long run he is bound to benefit. After all, it is his company and his job. To the extent that his company's operations are improved, his chances for material reward increase. If his company prospers, corresponding prosperity cannot long be withheld from him. Thus it is in his own interest that he is urged to start the program at a point where it is the consensus of opinion that it must start, in the development of a finer spirit and a more intelligent co-ordination of effort among the men in the ranks.

Arrangement of Programs Presents a Problem

MANY changes have occurred in the form of programs for the several associations since the last convention held in Atlantic City in 1925. A glance at the program in that year shows that the major portion of the time was taken up with presentation of committee reports and discussion based on them. Only a few addresses were made, either before the American Association or any of the affiliated associations. This year the committee reports of the American Association were not presented on the floor of the convention. The only reference made to them was in the address of President Barnes, who in a few words summed up the committee work of the year. No opportunity was afforded for discussion, either of committee reports or the addresses.

On the other hand, the affiliated associations devoted a large part of their time to committee reports. In the Engineering Association eight sessions were taken up almost exclusively by them. Unfortunately, no one person could attend all these sessions, four being held on each of two days. Presumably the members attended those sessions with which they had the most concern, and other matters of secondary importance had to be left out of their consideration. Specialization in this association's proceedings has indeed been carried a long way.

The real work of the American Association was carried out at the series of nineteen luncheon conferences. In this again there was a large element of specialization, since five luncheons were held at the same time. The topics were well chosen, and at most of them the discussion was excellent. As at any meeting of the sort, the value depended to a considerable extent on the ability of the chairman to draw out those men who were able to make real contributions. In general this was done, and those who attended the luncheons left with the feeling that they had been well worth while.

As to the value of general sessions consisting exclusively of set speeches, with no opportunity for discussion, there may be some difference of opinion. It is a subject that itself merits discussion. Three sessions of this sort take a great deal of the delegates' time, and when they are followed by luncheons lasting well into the afternoon, there is little opportunity remaining for other activities. Before the next convention serious consideration should be given to these features of the program.

Depreciation Accounting Demands Attention

REALIZATION of the seriousness of the present depreciation accounting situation is increasing slowly. For many months the members of the American Association sub-committee on depreciation have been engaged in an intensive study of this subject. Briefly stated, the situation is this—the Interstate Commerce Commission has promulgated a plan of depreciation accounting for the steam railroads the effect of which is to fix definitely the amounts which the carriers must set aside for depreciation each year and to specify in considerable detail how these charges shall be made. Moreover the plan contemplates the transfer of a large amount of what has heretofore been regarded as maintenance expense into the depreciation account. Under the new system such property as ties, rails, paving, etc., which in the past has been renewed mainly through maintenance would be replaced through charges to depreciation. In other words, maintenance expense would be substantially reduced and in its place would appear a much larger depreciation allowance. It is clear that this large reduction in the maintenance account might seriously interfere with the ability of an operating company to adjust its expenses to meet changes in revenue. Heretofore it has been customary to curtail maintenance programs in lean years and expand them when conditions improved. Under the plan proposed by the I.C.C. such adjustments would be impossible.

Although the proposal applies only to steam railroads at this time the plan contemplates the ultimate inclusion of such electric railways as are under I.C.C. jurisdiction. Even this would not be so bad were it not that many of the state regulatory bodies are bound to follow the lead of the I.C.C. in this matter. The proposal is therefore of immediate concern to every electric railway. Strenuous efforts are needed to arouse the industry to a realization of the situation. A paper on this subject presented by Dr. Thomas Conway, Jr., before the Accountants' Association at Atlantic City is abstracted elsewhere in this issue. The interest aroused by his able presentation is an encouraging sign that railway men are awakening to the vital importance of the depreciation situation.

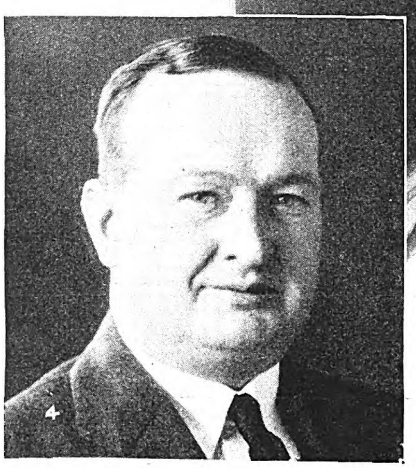
Newly-Elected Presidents

of the

American and Affiliated Associations



1. **PAUL SHOUP,** newly-elected president of the American Association, is president of the Southern Pacific Railroad. He is a former chief officer of the Pacific Electric Railway and other electric subsidiaries of the Southern Pacific, and as such has been for many years in direct contact with problems in this industry, since the lines that go to make up the Southern Pacific embrace city, suburban and interurban railroading as well as electric operation over main line divisions. Mr. Shoup is a native Californian. He stands not only as one of the outstanding business executives of the territory west of the Rockies, but of the entire nation as well.

2. **W. W. WYSOR,** new president of the Engineering Association, is a graduate engineer. He has been in his present post, chief engineer of the United Railways & Electric Company, Baltimore, since 1917, having previously served that company as assistant chief engineer, after wide experience on city, suburban and interurban properties. His connection with the system in Baltimore dates from February, 1916, when he was appointed assistant chief engineer.

3. **SAMUEL RIDDLE,** elected president of the Transportation and Traffic Association, is vice-president of the Louisville Railway, Louisville, Ky. He has served as an officer of the Connecticut Railway & Lighting Company, the Rhode Island Company, the Chicago, South Shore & South Bend Railroad and the Philadelphia Rapid Transit Company. He was formerly superintendent of transportation at Louisville. He has long been active in sectional association affairs in the Central West.

4. **WILLIAM E. FOLEY,** the new president of the Claims Association, since 1924 has been general claim agent of the Third Avenue Railway System, New York. In July, 1907, he began work with the Metropolitan Street Railway and was assigned to the Third Avenue division. He was advanced from clerk in the accounting department to payroll clerk, and in 1912 was assigned to the claim department, being transferred to the trial department in 1914. He was made chief examiner in 1917 and claim agent in 1924. Mr. Foley is a native of New York who completed his schooling at night after he had entered business. He is only 39 years old.

E. H. REED, who heads the Accountants' Association, is an accounting officer of high standing and long experience, one of the group of men who assisted in rehabilitating the Brooklyn City Railroad after the lease was abrogated under which that system was long operated by the Brooklyn Rapid Transit.

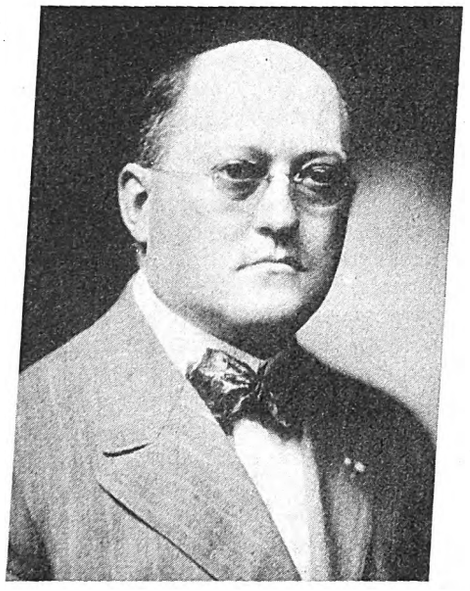
We Are Forever at a Turning Point

By James P. Barnes
President American Electric Railway Association
President Louisville Railway

In his presidential address before the American Association, Mr. Barnes calls attention to the ever-changing needs of the public for transportation and to the new methods we must develop continually to supply them

NO LESS than eleven times in the last twenty years has this association met in Atlantic City. Our sense of homecoming is natural and it is intensified by enlarged facilities which this city, in a sense our home-town, places for the first time at our disposal. The courage and vision of Atlantic City in embarking on the vast enterprise represented in its new auditorium exemplify the qualities which have kept our industry progressing during the years of its greatest trials.

The program of this 48th annual convention is stripped of all extraneous material. The exhibit committee has admirably acquitted itself under the extraordinary difficulties of staging an exhibit so large and comprehensive that every foot of available space in the auditorium is filled.



J. P. Barnes

Our committee organization is our working machine and is drawn from the best of our personnel. To it and to the headquarters staff we are indebted for sincere effort and positive accomplishment. I cannot better review this year's work of the association than by a brief synopsis of a few high points of committee activities.

The committee on street traffic economics endeavors, first, to formulate the fundamental principles of automatic signal control of traffic and of parking control. Secondly, it presents a concrete suggestion for minimizing interference and delay at street intersections. Thirdly, it urges application of the uniform vehicle code and model city ordinance developed by the Hoover Conference on Street and Highway Safety for the practical betterment of an extremely important phase of community activity.

The committee on publicity has functioned with a smoothness and efficiency which have come to be traditional. Our association has stood for honest and open dealing in all publicity matters. There is as great need for clean publicity as there ever was. Association headquarters stands ready to assist member companies with advertising copy, with posters and with motion pictures.

The committee on taxation deals with a topic which, like the poor, is always with us. Each year the electric railways of the country collect and pay to various branches of government some $62,000,000. The committee's figures show that, when indirect taxes and special imposts are included, nearly 10 per cent of the rider's fare is a tax for the privilege of using this essential mode of common transport. Several of the states have recognized the injustice of indirect taxes and special imposts, particularly the outworn requirement of paving maintenance, and have relieved companies in their jurisdictions from this presently unjustifiable burden. Is it too much to hope that governments may some day exercise practical compassion toward that unorganized host of citizens, the car riders, of whose burdensome special tax we are the reluctant collectors?

The committee on depreciation has devoted its attention to the newly promulgated depreciation rules of the Interstate Commerce Commission for steam railroads. Practically all companies would be affected if the terms were in substance adopted, as I.C.C. accounting rules usually have been, by the commissions of the various states. It is, therefore, of the highest importance that executives and accountants of all properties uphold the committee's hands with analyses and comments that may be useful in pesuading the adoption of thoroughly sound principles in this vital matter.

The committee on industrial relations has done much in formulating principles and in pointing out proper policies in matters of wages, working conditions, continued employment and individual and group relations with employees. The American Federation of Labor recently declared its intention to investigate the labor policies of the street railway industry. This industry has no secret policy. We adhere to the principle of fair dealing. The committee on insurance, with co-operation

Digitized by Google

of stock fire insurance companies, has this year succeeded in bringing about a revision of our rating schedules based on analyses of the industry's fire loss record. Our industry has done well during the past five years in prevention of fires through better construction, improved protection, modernized equipment and methods, and the committee has been equally effective in vitalizing these things into constructive results.

The committees of affiliated associations serve not only to advance the professional work of their associations but afford excellent opportunities for personal discussion of professional problems. Members are amply justified in expending time and energy in committee work of the American or affiliated associations. Our printed proceedings embody a living record of the growth and progress of our industry. Carefully considered rules and standards which are continually undergoing modernization spell not the stagnation but the progress of those who use them.

All of the association's activities are summarized and co-ordinated in the deliberations of the Advisory Council which is now completing its fifth year. It is not my purpose to anticipate its report but rather to comment upon the inspiration and cohesion which the existence and functioning of the Advisory Council and its managing director have brought into the industry. The quiet influence of Lucius S. Storrs has permeated the industry as we have followed without stumbling the clear light of his leadership. No appraisal of our present situation can fail to note the upthrust of the last five years, due so largely to the working-out of Past-President Shannahan's constructive vision. We are fortunate that Mr. Shannahan has consented to assume the chairmanship of the Advisory Council after B. C. Cobb had so generously borne the burden of its first four years.

Something like consternation followed the resignation of the managing director whom we had learned to trust and follow. The wisdom of Mr. Shannahan and his associates in filling that vacancy will be abundantly demonstrated. They have selected a man of education and energy who can think, write and speak. The industry will cordially accept as its prophet Charles Gordon.

In pursuance of a program initiated at the beginning of the year committees on research, public transportation, co-ordination and fare structure were appointed.

The research committee has made a survey and has received pertinent suggestions as to research which might be undertaken under the auspices of the association. Without research, which includes interpretative findings, we are a ship without a compass. We must not drift.

The committee on public transportation co-ordination has entered upon a program based upon the conception that we must render a whole and not a partial transportation service. We cannot scoff at buses; we must not sneer at taxicabs; we may not ignore the other quasi-public forms of transportation service. We are squarely challenged to adapt our means and our methods to the most useful general scheme of public transportation and we must meet the challenge.

The committee on fare structure undertakes the further exploration of an equally important field. Other public utilities have discovered and applied means for adjusting charges to the different services in fair proportion to their usefulness. It is our business to know our market; to appraise its fluctuations and vagaries. We must produce what people will buy; we cannot compel them to buy what we produce. In the truest sense, scientific fare structure is sensible merchandising.

In the near future the mind of the industry must turn more generally than in the past to rapid transit problems and in more than the largest cities only. Geographical extension has been accompanied by such increased speed of communication that the modern community has been in effect greatly compressed. Many cities which cannot presently bear the expense of subway or elevated construction can and will develop arterial highways with few, if any, grade crossings, upon which vehicles may operate at high speed. Since these transportation arteries will be paid for by the public, they should provide for operation of public as well as private vehicles. We must therefore do our share of the thinking and planning that will bring about their development.

In every direction our thought is going deeper and straighter on these and similar questions. This is as it should be. It is our task today to provide the bones of transportation facilities and clothe them with the flesh of service. We are private agencies acting in the interest of the fare payer and committed to the proposition that he, our customer, shall get value received.

For years past your presiding officers, one after another, have stated that the industry was at a turning point in its history. It is a peculiarity of our business that we are forever at a turning point. We must continue turning to face always in the direction of progress. Our communities are changing in shape, in size and in habits. To continue to serve their needs we must continually turn to new developments and methods and this continual turning must be accomplished without vertigo. We must reach deep below the surface and grasp the fundamentals in order that our development may be actual and not a mere change of raiment. The past year has been unusual in devotion to this ideal. We have entered upon a sincere search for the elements which will support our future growth. We cannot rear a structure without a solid foundation nor can we fit our business into the life of the communities we serve unless we base it on fundamentals. The industry must snap out of its complacency, think straight and act boldly.

"Value Received" for Riders

ELECTRIC railways must do their share of the thinking and planning that will bring about the development of rapid transit facilities, grade crossings, arterial highways, and subway and elevated construction. In every direction our thought is going deeper and straighter on these and similar questions. This is as it should be. It is our task today to provide transportation. We are private agencies acting in the interest of the fare payer, and committed to the proposition that he shall get value received.

American Association Gets Down to Fundamentals

Excellent papers covered the general problem of transit, the regulation of traffic, and progress of the industry. New officers were elected and installed

PRESIDENT JAMES P. BARNES formally opened the 48th annual convention of the American Electric Railway Association on Monday, Sept. 30. He introduced Hon. Anthony M. Ruffu, Jr., Mayor of Atlantic City, who welcomed the association back to Atlantic City for the first time in three years. He called particular attention to the new setting given by the erection of the magnificent convention hall, which has given the world a new idea in the provision of accommodations for such gatherings as this one.

In his annual address, President Barnes laid particular stress on the work done by the committees of the association in solving the many vexing problems of the industry. Not only the American Association committees, but those of the affiliated bodies, have been of the greatest assistance in determining the proper procedure on many matters.

Lucius S. Storrs, until Sept. 1 managing director of the association, spoke feelingly of his connection with it during the past four years. One of his greatest sources of satisfaction has been in the many friendships he has made while with the association. He expressed the wish that his successor will have the same co-operation and the same devotion from his associates.

In lieu of the usual report by the managing director, Charles Gordon said that he has been in office such a short time that it would not be possible to prepare an annual report. Accordingly, he presented an address giving his own views on the problems confronting the industry and the association at the present time, and indicating some of the means that can be used to further the interests of the local transportation industry. Mr. Gordon also expressed his appreciation to those who have assisted him in conducting the affairs of the association since he has taken office, in particular Mr. Storrs.

W. H. Sawyer, chairman of the committee on revision of the constitution and by-laws, made a brief report. The proposed revisions, which deal principally with the method of nomination and election of officers and the apportionment of dues, were adopted.

Two formal addresses were presented. The first, "At the Public's Service," was by W. L. Willkie, general counsel of the Northern Ohio Power & Light Company. He pointed out what the business of furnishing service to the public involves.

W. E. Wood, chairman of the board Virginia Electric & Power Company, spoke on the subject, "Men and Machinery." He stressed particularly the necessity for dealing with the human element if a property is to be a success. While machinery is absolutely necessary to the conduct of the business, he said, it is of no value without the full co-operation and assistance of the men who run it. Abstracts of the two addresses will be found elsewhere in this issue.

At Tuesday's session the report of the committee on nominations was received. W. H. Sawyer, in making his report, explained that it had been necessary to revise the published list of nominations on account of the withdrawal of several of the candidates. He presented a new ticket, which was unanimously elected.

Three addresses occupied the remainder of the session. The first, by Elmer Stevens, chairman of the transportation section Chicago Association of Commerce, dealt with means of increasing street capacity. Traffic congestion is a necessary evil if a city is to transact a large volume of business, he said. A city that does not have a traffic problem is either doing little or is suffering from dry rot. The problem to a great extent is whether we need more, bigger and better streets or more, bigger and better use of the streets. He cited the experience in Chicago to indicate that the capacity of existing streets can be increased materially and the speed of vehicles increased at the same time.

Mr. Stevens pointed out a number of things that have helped to improve the situation materially in Chicago. The restriction of parking, while it was not popular at first with the merchants, has been accepted as a logical development, which has benefited the Loop district and has not harmed the merchants. Outside districts are now demanding similar treatment, which goes to show the soundness of the plan. Night use of all facilities, he said, will greatly increase the street capacity at little cost. Staggered hours of business is another means that will assist in making it easier to handle the passenger business in Chicago. Besides, staggered hours aid the worker and the merchant by giving people the opportunity to purchase goods outside of working time.

Price alone, concluded Mr. Stevens, will sell very little. He gave several illustrations of articles which have been able to win on a quality basis. Even the mail order houses and the 5 and 10 cent stores do not make their appeal on price alone. The same principle should hold in the transportation business.

Col. A. B. Barber, manager Transportation and Communication Department, Chamber of Commerce of the United States, gave his views on current traffic problems, with a summary of the observations gleaned from a trip to Europe last summer. Even with the immense number of automobiles in this country as compared with European countries, he found that the fatalities are proportionately much less here than in European cities. He called attention to the benefits that have accrued from

Digitized by Google

Henry W. Blake

IT IS with deep regret that the executive committee learned of the death of Henry W. Blake. There can be no mistake about the service that Mr. Blake rendered to this industry over a period of more than 35 years. He was the scholarly editor who directed the recording of events in this industry over the period that saw the decline of the horse car, the supersession of the cable and the coming of electricity for use on city, suburban and interurban service and for main line electrification work. And he recorded the progress of the art adequately in all its manifestations. He was not only a classical scholar but he was an engineer with an uncanny sense of what was essential in technical description. That by his writing he contributed greatly to the spread of the use of electricity for propulsion is well established. Moreover, he aided not only in the spread of technical information but also of the economics of the business, particularly accounting, playing an important part in the development of the standard classification of accounts. Modesty was the manner of the man. He was not much heard from vocally and it was only through the medium of his published writing that he faithfully served the industry. It was a source of satisfaction to him that he was attached to the staff of such an outstanding publication as the ELECTRIC RAILWAY JOURNAL, and the pages of the JOURNAL for years reflected not only in their general contents, but particularly in their editorials, the well-poised judgment of the technician tempered with the moderation of touch of the scholar and the gentleman. We join with his many friends and admirers in expressing our grief at his untimely end and in offering sympathy to his family and his business associates.

the laws for licensing drivers that have been adopted in a large number of states. While less than 5 per cent of the accidents in some states can be laid directly to mechanical defects of automobiles, there may be many more in which such defects are a contributing cause. No matter how many private vehicles there may be, Colonel Barber is of the opinion that adequate mass transportation must be provided. The volume of travel in the modern city is so great that it precludes the use of individual vehicles.

"We may not all be good organizers, but we all can be co-operators," said E. F. Wickwire in one of his characteristic addresses. Mr. Wickwire said that he had desired to sit in the audience and listen, but that he had been prevailed upon to tell his views. He chose as his topic "A Restful Ride for Ragged Nerves," and with the aid of witty examples carried the message of the necessity for co-operation of all persons involved in the supply of transportation to the American public.

At the opening of the Thursday session, the cup awarded in the *Electric Traction* speed contest was presented to the Chicago, South Shore & South Bend Railroad by Vice-President G. A. Richardson. The cup was received by Charles H. Jones, general manager of the railway, who made a few brief remarks on the progress that his company has made.

Upon presentation of the report of the committee on resolutions by Mr. Richardson, resolutions were passed covering those who have assisted in making the convention a success. Resolutions also were adopted on the deaths of B. A. Hegeman, Jr., Henry W. Blake, T. E. Mitten and Walter White, which have occurred during the year. The one on Mr. Blake appears opposite.

Three addresses of vital interest were given during the session. The first one was by Myles B. Lambert, on "Better Cars and Buses." In the second address, Dr. Thomas Conway, Jr., discussed the "Outlook for Interurbans."

The closing address on "Benefits of Unified Transportation Systems," was by Thomas N. McCarter. Before beginning his address Mr. McCarter stated that he recently had made addresses in the same room before the American Gas Association and the National Electric Light Association. In both instances the hall was filled. At the sessions of the American Electric Railway Association, on the contrary, there was a noticeably smaller number of persons in the number of persons in the audience. He raised the question as to whether the men making up the industry really were doing all they could to get the benefit of conventions such as this one.

In his address Mr. McCarter traced the development of the Public Service Co-ordinated Transport system from its inception during the 25 years of its existence, and the arrangements by which it has become possible to furnish street railway, bus, taxicab and rapid transit service. The co-ordination of all facilities he held to be essential to the proper development of the community and its continued existence.

Abstracts of the addresses will be found elsewhere.

Following the addresses, the new officers were installed. Paul Shoup, the new president, spoke briefly on the plans of the association for the coming year.

Following is the list of officers and members of the American Association elected Oct. 1:

President, Paul Shoup, president Southern Pacific Railway, San Francisco, Cal.

First vice-president, J. H. Hanna, president Capital Traction Company, Washington, D. C.

Second vice-president, G. A. Richardson, vice-president Chicago Surface Lines, Chicago, Ill.

Third vice-president, J. H. Alexander, president Cleveland Railway, Cleveland, Ohio.

Fourth vice-president, W. A. Draper, president Cincinnati Street Railway, Cincinnati, Ohio.

Members of executive committee:

Operating Companies, three year term:

Frank R. Phillips, vice-president Philadelphia Company, Pittsburgh, Pa.

Edward Dana, general manager Boston Elevated Railway, Boston, Mass.

To fill unexpired term, two years:

F. W. Doolittle, vice-president North American Company, New York, N. Y.

To fill unexpired term, one year:

W. E. Wood, chairman of the board Virginia Electric & Power Company, Richmond, Va.

Thomas Conway, Jr., president Cincinnati, Hamilton & Dayton Railway, Philadelphia, Pa.

Manufacturer Companies, three-year term:

C. E. Morgan, president Cincinnati Car Corporation, Cincinnati, Ohio.

C. C. Castle, vice-president A.C.F. Motors Company, New York, N. Y.

Safford K. Colby, manager sales promotion and development, Aluminum Company of America, Pittsburgh, Pa.

Co-operative Planning and Action Are Needed

By Charles Gordon
Managing Director
American Electric Railway Association

Charles Gordon

FOR a number of years I have been very much interested in the analysis of the electric railway situation in this country. I have become convinced that the industry plays a vital part in the life of the nation and that it holds large opportunities for development and expansion. Obviously, however, this must be predicated upon its ability to achieve a sound financial basis so that it may compete successfully with other industries for capital. From the investor's point of view there is $6,000,000,000 at stake. But from the broader point of view of the public interest the stake is even greater and more important. It involves hundreds of millions of dollars in property values; it affects the basic trend of modern business, and it is interwoven with our whole civic and social structure.

Certainly, then, we have a great responsibility, and any suggestion of failure in our efforts to go forward is simply unthinkable. To be sure, our path is beset with many difficulties and perplexities. As in industry we have come through a combination of economic and political strangulation that makes us marvel at our own survival. As individuals we faced discouragement that only strong men could withstand. Is it all worth while? I believe that it is. I believe that the very difficulties and complexities of our business put a premium on the qualities of courage, vision and foresight. I believe that this in turn gives those who are devoting their money, their energy and their lives to this business even greater opportunity for earning that satisfaction which is the reward of constructive human enterprise than exists in other industries where the road may seem easier.

The business is characterized by high capital investment in proportion to the earnings. Furthermore, most of this capital is put into fixed structures and equipment. Depreciation becomes a very important and bothersome question. The necessity for long-term financing magnifies the importance of fiscal policy in the success or failure of the enterprise.

The operations of a transportation company are carried on in the public streets. They affect property values and business. They have a direct influence upon the very development of the community itself and in turn the tracks and service are affected when many public improvements, including street improvements, are undertaken. The ability to win public confidence and to enlist public co-operation is, therefore, a major phase of management.

Even the former advantage of monopoly is today largely eliminated by the rapid development and widespread use of the automobile. As a consequence we have found it necessary to undertake the study of questions of merchandising, advertising and the fixing of competitive prices.

It seems quite evident from all of this that the business in which we are engaged is a highly complicated, technical and difficult one. Nevertheless, the man on the street senses little of this. I feel, however, that if the general public really understood the complexity of this business there would indeed be scant attention given to the suggestion that we would be any nearer a solution of the community transportation problem through the substitution of public—which means political—management for that of private enterprise.

How, then, may local transit facilities keep pace with growing community requirements both with respect to quality and quantity? It is obvious that relatively little progress can be made until these companies are put upon a sound financial basis and there is assurance that present and future investors who put money into them will be permitted to earn, and will be able to earn, a reasonable return consistent with that in other forms of enterprise.

As a matter of fact we face here a question not only of being permitted to earn a fair return on an investment but of ability to earn under present competition. Unless management is permitted sufficient freedom of action to work out measures necessary to cope with this competition it is seriously handicapped in its efforts. That is the situation faced by many properties which were saddled with obsolete rigid franchises that specifically fixed the rate of fare. Relatively few public officials have had the political courage to face the facts presented by changed conditions.

It is hard for the public to understand that the attempt to collect under these franchises "its pound of flesh" from those whom it had formerly considered as "traction barons," drained the lifeblood from many a transportation company and struck at the public interest itself through crippling this essential community service. In

Digitized by Google

many instances the intervention of the courts came only in the nick of time—but not until the properties had been drained into a condition from which they have survived only with the greatest effort.

Perhaps the best plan of providing necessary flexibility in the regulation of local transportation rates under the conditions of competition to which they are subjected, is that of fixing only the maximum fare, granting the right to charge any fare up to that maximum. If the maximum is made high enough it permits the development of a rate structure using the maximum as a base, and designed to improve the load factor on the property so that it may be made of greatest public usefulness. We have recognized the need for flexibility in regulation of new transportation services like buses. In fact, this factor has been so strongly in the minds of those interested in promotion of the use of buses, that it has held up the adoption of legislation needed to curtail destructive competition and to protect the public interest. If flexibility in regulation is important for buses which require relatively low fixed investment, then certainly it is even more important for rail service with much higher investments and subject to changing conditions.

From whatever angle we approach our problem, therefore, it is all-important that we enlist greater public interest and public understanding of the local transportation situation. In pursuance of this objective, I believe that we are totally ineffective when we ask the public for help merely on the plea that our investments were made in good faith. The answer is likely to be that it is our hard luck that we did not foresee changing conditions. The great strength of our case is that measures for the improvement of local transportation are fundamentally in the public interest. We do not ask relief from unfair burdens and restrictive franchises in the interests of our investors alone, but so that we may proceed with rehabilitation and service improvements.

In dealing with broad questions of community planning it is important that we point out the distinction between measures which are in the interests of the public as a whole and those which are primarily for the benefit of certain articulate and powerful minority groups. When a general traffic and transportation plan is formulated by disinterested agencies it must withstand the attacks of many groups clamoring for the expenditure of general public funds for measures that will benefit their special interests.

There is great need for disinterested co-operation among leading groups in modern communities to the end that special interests will be made secondary to the general welfare. Our industry stands for the principle that "the greatest good for the greatest number" should guide public action with respect to the approach to the modern community traffic and transportation problem. Certainly that principle is founded upon the bedrock of our democratic institutions, and we have every right and reason to fight militantly and aggressively to support it.

I believe that we are entirely sound in basing our claim for public consideration on the fact that we render a vital and necessary public service. It is becoming clearer each day that the only permanent solution of street congestion is the improvement of public transportation to a point that will permit necessary regulation of the use of the individual car in congested sections of crowded cities. We must make street improvements needed to expedite the movement of automobiles. People demand better facilities and attractiveness in the cars which they purchase. No longer are they content with mere convenience. But no construction program within the bounds of reason would permit everyone to ride in automobiles for all transportation needs. The sooner we realize that, the more intelligently will we be able to apply our community resources toward the relief of congestion.

We all have much to learn regarding the fundamentals of local transportation. We know, for example, that efficient transportation service creates property values. We know that buiness grows along these transit arteries and that it concentrates at the focal points of transit traffic. But under our present system directly benefited property contributes relatively nothing toward the cost of the facilities which create huge values. The car rider pays the entire bill. Nevertheless, business men and property owners do not consider it presumptuous to dictate the location of lines, with little regard for the riders' convenience. As a matter of fact, in many cities there is a fallacious impression that the paving obligation of the street railway companies is a contribution by the stockholders to the general public. It is not that at all. It is a contribution by the car rider to the property abutting on the streets over which he rides.

In this discussion of some of our fundamental problems I have been voicing merely my personal views. Obviously, the policies upon which our industry as a whole may unite must be carefully determined after the most thorough study by the best minds we can muster. As I have already indicated, the development of local transportation is so interwoven with that of the community itself that many of our problems are likewise public problems. If we are to unite upon the advocacy of measures based upon the application of certain general principles, these principles must be sound from the standpoint of the public interest, not in one community alone but in cities of various sizes and varying characteristics throughout the nation. We know that the actions of one community frequently affect many others. We have had ample evidence of this in matters of franchises, fares and taxation. We also know that each operating property is dependent for its development on the state of the technical art in the industry as a whole. This is illustrated by our present efforts to develop more satisfactory types of car and bus equipment. With all this in mind, therefore, the importance of co-operative planning and co-operative action cannot be over-emphasized.

OUR industry stands for the principle that "the greatest good for the greatest number" should guide public action with respect to the . . . . transportation and traffic problem. Certainly that principle is founded upon the bedrock of our democratic institutions and we have every right and reason to fight militantly and aggressively to support it.—CHARLES GORDON.

Good Service
Is Produced by Men and Machinery

By W. E. Wood
President Virginia Electric & Power Company
Richmond, Va.

The author, speaking before the American Association, points out that while both men and machinery are important, if the men understand their jobs and are in sympathy with the ideals of the company good machinery will follow as a matter of course.

GOOD service for our industry is manufactured out of a combination of men and machinery. A greater interest in the utilization of man power might seem to minimize the importance of the proper kind of machinery, so I want to say that good service is impossible without good machinery, which, of course, includes equipment and plant.

W. E. Wood

Service is manufactured with men and machinery. Good machinery, plant and equipment are as necessary as men in the making of attractive service. We shall deal mostly with men because if an organization is of the right sort it follows as night follows day that it will never rest contented until it obtains proper machinery by which to manufacture satisfactory service.

When we speak of men we must mean the entire personnel of the organization from president to day laborer. Unfortunately, an organization is like a chain. It is only as strong as its weakest link. Our personnel must be perfected.

There are certain important factors essential to a successful transportation service that we should like to emphasize. In the first place, it is inconceivable that a transportation system can be successful unless it is generally deemed a good citizen of the community it serves. This in turn means that its policies as a corporation should be the same as the policies of any important good citizen. The company as such should contribute towards constructive civic work in the same proportion that any other good citizen of its size could reasonably be expected to contribute. Besides, it should train all its personnel individually to be good citizens. If we have developed our company and the individual men who compose it into aggressive, broadminded, good citizens, we have laid a fine basis for a successful transportation system.

Next, we must find ways and means whereby we can teach to every employee two things. First, a comprehensive understanding of the aims, methods and policies of the company. To do this we must be able to convince him wholeheartedly that these policies are proper and constructive. Next, we must find ways and means of teaching him how best to perform his individual work within the company. The man in the office does not have to understand the methods of the mechanic in the shop, nor does the mechanic have to understand the technique of the car operator, but each should be brought as near as possible to perfection in his education. The method varies but some effective method must be found.

There is one more thing that has to be accomplished. The entire personnel should be brought sincerely to respect the organization and to develop a spirit of cooperation for the purpose of rendering the best service at the lowest cost and carrying out the policies of the company. If these conditions can be obtained, it will be surprising what a good character of service will be furnished and how understanding the public will seem to be. If a company would accomplish these things, the surest way is to deal with both the public and the employee with perfect frankness. One of the things that has most impressed itself upon my mind through my experience has been that in good public utility operations there are practically no secrets of any sort that cannot be told to both the employees and to the public. Many officials would be surprised to find how often a discussion of their perplexing problems with the members further down in their organization would bring out sidelights and ideas that would prove most helpful in successfully solving these problems.

The officials of a company spend a great deal of time in producing a proper public understanding. If the entire personnel of the company understands the company's point of view on difficult questions, is in sympathy with it and believes it to be justifiable and logical, it is surprising the amount of work it will do among the public unwittingly in bringing about a better understanding. It is very difficult for a public to suspect the motives of a company if in its contact with the company it finds that its employees are well trained, loyal and understanding. This very attitude on the part of the employees will disarm the doubting citizen.

The transportation business today is a difficult one but for that reason it is also an interesting one and if we will all set about to cultivate, instruct and win over our personnel, we will find our problems infinitely easier to solve.

As civilization progresses, styles change. Our basic principles remain unchanged but fortunately methods have to keep pace with the changing styles. The handling of our employees, of course, must be kept sufficiently up to date to retain their interest. With an up-to-date organization possessing the characteristics we have tried to describe above, the best service will be worked out and this of course will include the modernizing and perfecting of our machinery, plant and equipment.

As we said in the beginning, we have discussed more particularly the morale and education of the personnel but before closing we want to emphasize again that we can never lose sight of the fact that even the finest organization cannot give good service without the proper tools with which to work.

Do not make the mistake of ever letting the impression get out that our business is not an interesting one. It has a useful future and if we will but look at it from the right point of view, we can develop a happy and interested personnel that will render efficient public service at the most reasonable cost.

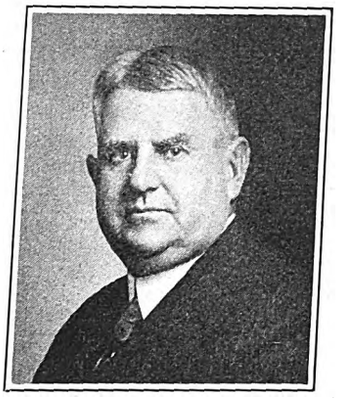
Unified Transportation
Is Necessary

By THOMAS N. MCCARTER
President Public Service Co-ordinated Transport, Newark, N. J.

The author made a strong plea for a transportation system including all forms demanded by the public. This abstract of his address before the American Association gives his views after a quarter-century of experience in the business



Thomas N. McCarter

REALIZING that the task was not easy, that there were stupendous obstacles to overcome and that we faced a popular prejudice and lack of understanding which would make our labors of long duration, with my associates I undertook to improve a chaotic condition that existed prior to 1903 in the affairs of the electric railway companies serving New Jersey. Nevertheless, with the courage and the vigor and the hope of youth we undertook it and today after 26 years we are still at it with our goal, enveloped in the mist of uncertainty, still ahead of us.

Part of our objective has, indeed, been attained. It is not too much to claim that the growth and progress which those sections of New Jersey served have experienced and the prosperity with which they are blessed, are in measure due to the system that has provided for them comprehensive and dependable urban, suburban and interurban transportation. But the return to those whose money and whose initiative made that enterprise possible has been meager and entirely incommensurate with the risk involved, the energy expended and the investment made.

I believe that the situation existing in New Jersey is repeated generally throughout the country and that in practically every community where local transportation systems function an enormous benefit has been conferred upon the public, for which inadequate return has been, and is being, made to those responsible therefor. That situation has existed as long as I have been connected with the industry and this association and it still exists. It is wrong economically, it is wrong practically, and until it is corrected the local transportation systems of this country will never operate to their full public usefulness.

Before the Great War our troubles were in the main concerned with matters of law and regulation—of restriction of return, character of franchises, public requirements as to service and rates—problems of extreme importance and difficulty, yet matters which were capable of solution through the action of state and municipal legislatures. There has since been added a new set of difficulties based on economic changes that have, among other things, more than doubled our wage scales and that are infinitely harder of settlement and it is these that are constituting the major obstacles in the path of our progress to better conditions.

The development of automotive transport has entirely changed the face of local transportation conditions. Whatever natural elements of monopoly the industry once enjoyed have disappeared. No matter what temporary artificial restrictions may be imposed by regulatory bodies, so long as a comparatively few thousand dollars will put a bus line on the street alongside of a railway system in which, perhaps, millions have been invested, the threat, if not the actuality, of competition affects your operation. So long as the passenger motor car is available at decreasing cost and with increasing comfort you can count on passengers only by offering them something that approaches its service in convenience. With the constantly growing congestion on streets and highways we face higher costs and increased physical difficulty of operation.

Yet local transportation is today as vital to the welfare of communities as it has ever been. There has been a change in the character of the service which people want but there has been no abatement in the total demand. A count of street car passengers no longer provides a correct index of riding habit. To the total of persons using the street railway must be added the number using other and newer forms of transportation if a figure that will reflect public requirements is desired. And a combined total of this kind indicates clearly that the business is there for transportation companies to get if they will take the right methods to get it.

Increase in the population of our larger cities has created demand for rapid transit; the spreading areas of so-called metropolitan districts have added to demand for intercommunication; the trend toward suburban living has increased demand for suburban line extension; the decreasing working hours and increased leisure of our working people have brought about a demand for pleasure riding; while the very street congestion of which we

Digitized by Google

complain is reaching further to increase the use of public carriers.

Under these circumstances, it is evident that in spite of the widely prevalent and growing use of the automobile the American public continues to be dependent on the essential service which public carriers provide. That being true, such communities have an interest in the conservation and promotion of their transportation systems which is only in degree less than that of their owners and at the same time this industry has a reason for optimism and a sound basis upon which to undertake the task of fitting itself to new conditions. For if its service be essential and the continuing demand for that service be assured, then a way will be found to put it upon a solid financial foundation.

We have the right and the duty to seek from government and the people assistance in the task of placing the industry upon a sound economic basis. Neither on behalf of the properties with which I am connected nor of the industry do I ask that local transportation shall be subsidized by government or that government shall loan to the companies providing transportation either its funds or its credit, unless it be for the construction of subways or other expensive structures. But I do ask that the public and public authorities shall in their dealings with us be governed by the consideration that we are engaged in performing a public service productive of prosperity for communities, increased value for property owners, better labor markets for manufacturers, more trade for merchants, better living conditions, added comfort and greater convenience for every citizen.

I do ask that our operations be regulated by the states and the municipalities in the light of, and with knowledge of, the fundamental economic facts controlling them. I submit that our use of public streets and highways, long considered as an excuse for the imposition of taxes and other burdens, is a use first of all for the benefit and in the interest of the public; that upon us devolves the duty and obligation of performing for the public essential services and that unreasonable imposts increase cost to the user, while burdensome regulation reacts to prevent good service. I submit that if we are properly to perform our functions we should be assured a return that will maintain our credit and so safeguard our ability to improve and extend service and that if we are to be regulated as a monopoly, taxed as a monopoly and generally treated as a monopoly, we should not be subjected to competition, difficult to meet when our hands are tied by legislative and regulatory restrictions.

I do ask, specifically and concretely, that those transportation companies which have borne the burden of providing service during that long period in which, while benefits continued to accrue to public and riders, owners went without return or bore continuing losses, shall within reasonable limits be protected in the right to provide the extended and diversified service that local transportation now properly includes.

I am not the less insistent because it may be that the granting of this protection will lead to the cry of monopoly. Monopoly, regulated and controlled in the public interest, is in my opinion necessary to provide public requirements for local transportation service. If the history of transportation in this country proves anything at all, it proves that indiscriminate competition among common carriers inevitably leads in the end to poor service and high rates. Today when there are more available transportation agencies than ever before this conclusion applies with increased force.

Subways, elevated structures, street cars and motor buses in city, suburban, interurban and special service, and taxicabs, have all become necessary rapid transit facilities. If they are pitted against each other in competitive warfare, the result is waste that destroys the ability of each of them to perform its full possibility of service, and increased costs of operation that must in the end be borne by the user of the service. If they are co-ordinated under a single management, each can be used to its full advantage, providing a service that meets public requirements, and each can be operated economically and efficiently so that all together can give such comprehensive service as is called for by community requirements rather than by the profit making exigencies of a host of individual owners.

In co-ordination—in the grouping under one responsible management of the various agencies of local transportation—lies, in my opinion, not only the future of this industry but the hope of our communities to secure adequate service.

In New Jersey we are working to that end. Public Service Co-ordinated Transport is, as its name implies, an organization employing several transportation facilities. Operation of street cars and ferries was begun in 1903; of motor buses on an extended scale in 1923; of taxicabs in 1927; and within a comparatively short time the operation of cars in an open cut subway will be undertaken. The company owns 2,390 street cars for operation over 524 miles of route, which includes 872 miles of track; 2,406 motor buses over 2,570 miles of route; nine ferry boats at two separate crossings and 67 taxicabs. This year it will carry 670,000,000 passengers, of whom 350,000,000 will be transported in buses.

Many kinds of transportation service are rendered: mass transportation both by cars and buses; feeder service by buses for cars and other buses; interurban and suburban service by cars and buses; interstate service by buses; super-service by buses providing superior accommodations at a higher fare; charter bus service, both local and long distance, and excursion bus service to various points of interest and on special occasions.

We may, I think, properly claim to be merchants of transportation because we are attempting to find out what the public wants and are doing our best to give it to them.

It is the development of the motor bus that has given us this opportunity. I recognize, as every transportation man must, that transportation on rails will indefinitely continue to be essential to mass transportation and I recognize its importance in the scheme of good service, yet I am forced to the belief that, in the expansion and diversification of that service, it is the bus that will play the most important part.

In 1910 before the advent of the motor bus we were operating some 450 miles of route, as distinct from miles of track; in 1923 when we began the operation of motor buses we were operating 534 miles, a gain of 84 miles in thirteen years. Since 1923 we have added some 2,700 miles of route, all in miles of bus route with the exception of a minor extension of track, for which we have, of course, incurred no expense for either track construction or right of way. Necessary investment in track and equipment would, even under the most prosperous conditions, have made any such extensive expansion of street railway facilities impossible, yet the rapid decline in riding habit on practically all street railways during the period indicates that if additional passengers are to be obtained it is essential that the companies extend their facilities in order to get them.

Digitized by Google

In 1910 we carried on our cars 341,398,688 passengers. The figures for 1923 are not available for comparison by reason of a suspension of service caused by a strike but in 1922 we carried 410,212,814, a gain of some 68,000,000 in the twelve years. Then in 1923 we began to operate buses and in 1928 we carried on cars and buses 643,134,181, a gain of some 230,000,000 passengers in five years as the result of our taking over other agencies and extending our service. These figures of increase are somewhat affected by changes in the method of counting passengers but the legitimate increase is very substantial.

This is an age in which people demand speed in everything that affects their living habits, convenience and comfort. In my opinion the motor bus affords an opportunity to transportation companies to create and at the same time meet new demands in the transportation field. The bus is the best answer to the urge for the private motor car. In speed it nearly approaches it; in comfort the better type of bus equals it; in convenience, when the difficulties in finding parking space are considered, it excels it; while it is far and away the more economical. The bus permits, also, a near approach to that "house to destination" service to which the use of the private automobile has accustomed Americans.

In New Jersey we have found it the best way to meet public demand for additional transportation facilities. The financing of track extensions sufficient to provide any appreciable part of the service that we now give would have been impossible, as I have said, yet if we had not undertaken to meet this demand we would have been confronted by irresponsible competition that would eventually have ruined such railway properties as we did operate.

We cannot as yet boast of satisfactory financial returns as the result of our efforts at co-ordinating service but we can say that our situation is today immeasurably more favorable and secure than it would have been had we attempted to meet the new conditions by any other method than through such co-ordination.

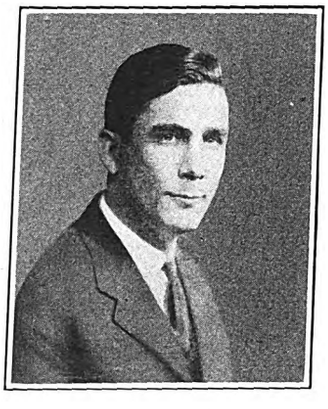
We are not yet out of the woods; our problems are not as yet all solved; we have not yet attained a state of self-sufficiency, and we are still in need of that public co-operation and assistance of which I have spoken. Neither this system nor any other system can function effectively if it is compelled to bear the burden of unjust taxation; nor can it do so unless it receives protection from irresponsible competition and co-operation from the public authorities in the very essential business of maintaining schedules in the face of growing street and highway congestion; while it is a *sine qua non* that it must be permitted to earn for itself a return which will justify its efforts and the investments made in it. If what we have learned in the process of creating probably the largest co-ordinated system of transportation in the country can be of assistance to other units of the industry, our experience is at your command.

The future of the industry represented here today rests upon its ability to adapt itself to the new conditions which confront it. It continues to have a great public service to perform. Its functions have been broadened as new agencies for their performance have come into being and with this widening of opportunity has come increased essentiality and a closer relationship to public weal. Upon these developments is based my firm belief that the industry will emerge from the cloud of troubles that now surrounds it and take its deserved place among the nation's prosperous utilities.

The Public Is Fair if Properly Informed

By W. L. WILLKIE
General Counsel
Northern Ohio Power & Light Company, Akron, Ohio

Legislative action must coincide with public opinion if the result is to be favorable to the utility. This point was made clear in a paper included in the American Association program.



W. L. Willkie

IN THEORY, councilmanic and legislative acts follow public opinion. The loss or gain of our business comes when the two do not coincide in time and place. Every lawyer knows that the course of court decisions follows public opinion. The recognized political thought of today is the court interpretation of tomorrow. As a matter of fact all of our law in this country is based upon the English common law. Consequently it seems to me that in the management of the railway property dependent for its existence upon the course of legislative action, court decision and public reaction, two things must be done: (1) A constant effort must be made to keep a direct relationship as to time between public opinion and governmental action. (2) Public opinion must be educated to correct beliefs as to street railway problems.

Whether we like it or not the life of our business is as intimately and directly dependent on these two factors as is the political life of him who occupies public office. Any variance as to time between public opinion and legislative action usually leads to unhappy results. The obtaining of a franchise grant eminently fair and favorable to the public which is contrary to the then prevailing public opinion is in most instances useless. Nothing is so destructive of the future public relationship as a franchise thus obtained.

The public, rightly or wrongly, has a conviction that public utilities sometimes take advantage of public officials, and when the concessions obtained are not in accord with the public opinion of the community involved, many citizens conclude that the public utility has obtained an unfair advantage. This becomes a settled conviction with them and has an exclusive control over their future attitude toward utility problems. But the great mass of American citizens is both conservative and fair and surprisingly intelligent in the grasping of such public utility problems if the facts are presented to them.

It is not sufficient to convince the representatives of government of the merit of your cause, and it is not sufficient to convince the public. The all important thing is to convince both as nearly simultaneously as possible. The rule of eternal vigilance is the only one by which such a result can be accomplished.

"A Restful Ride for Ragged Nerves"

By E. F. WICKWIRE
Vice-President Ohio Brass Company, Mansfield, Ohio

In one of his characteristic addresses before the American Association, Mr. Wickwire mixed philosophy with homely example that appealed to all.

E. F. Wickwire

IT MIGHT not be a bad idea for each and every one of us connected with the industry to ask ourselves if we are doing as good a job as we know how to do. Because if we're not, as individuals, doing the best job we know how to do to help advance our industry, it follows that the industry as a whole is not going to make the progress that it should. Particularly is this true at the present time, when we are confronted with problems the solution of which demands the best individual and co-operative effort on the part of everybody connected with the industry.

Perhaps one of the worst phases of our situation today is the fact that so many people look upon a trolley car as being neither a necessity nor a luxury. In fact, some of them seem to feel that if the trolleys were only removed from the streets it would relieve traffic congestion. We might suggest to these people that a simpler and surer way to solve the traffic problem would be not to permit anybody to drive an automobile until it was paid for. I'll grant you that it takes a lot of backbone to put forth one's best effort when confronted with a situation like this, but cheer yourself with the thought that things are never so bad but what they might be worse.

There is no denying the fact that in recent years our industry has made marked improvements in our car designs. But that's just the trouble. Some of the leaders of our industry have the feeling that we have stuck too long and too closely to our old, established precedents in this matter of car design. A number of them hold the idea that we might go on forever making improvements in our old designs and not strike the public's fancy. In other words, it doesn't seem sufficient to keep on improving the old design—we must design the new.

Recently I talked with an operating executive whose company placed a number of cars of the so-called modern type in operation some time ago. "Yes," he said, "we placed in service some cars of the most modern type obtainable, but we felt at the time that these cars only represented a small step in the right direction. We tried to embody all the best ideas that we had and could obtain in designing these cars, but we felt that far greater changes and improvements in car design would rapidly follow. In other words," he said "you might say that we followed somewhat the same method that they seem to use in Washington in designing a new tariff. They get all the facts they can, get the best expert opinions they can and then guess as close as they can."

We all know that the average man likes to brag about his home town and its industries, and we want him to include his electric railway system when he starts to brag. But can we hope to get him enthused about his street cars if they look to him in style and general appearance just about the same today as they did ten years ago, whereas everything that he owns, from his alarm clock to his automobile, shows signs of radical changes and improvement over that period?

We're all agreed that the biggest single factor with which we have to contend is the privately owned automobile. It's the thing that has confronted us with the problem of selling transportation to people who, in most cases, now have their own means of transportation. Fortunately for us, it hasn't shortened the distance between parking places.

We can't help wondering how the automotive industry induces the public to pay "so cheerfully" for the millions of automobiles that are produced, whereas this same public, generally speaking, seems to begrudge our industry a few cents increase in carfare.

It does seem strange that many public officials find it so easy to convince the public that a 3-cent increase in carfare is "highway robbery," but that a 3-cent gas tax is simply a "highway necessity."

This is especially significant in the face of the fact that we see many indications that nowadays people don't really want cheap "cotton-stocking" transportation. They seem to want better transportation and, apparently, do not object to paying a fair price for it, when the kind of transportation offered appeals to their "spending instinct." And that seems to strike the keynote of our problem. How can we make a stronger appeal to the public's spending instinct; in other words, get a fair share of their patronage and a fair rate of fare?

It doesn't seem possible to accomplish the desired results with old style equipment. We can't induce the public to give us better rates of fares so long as a good percentage of the people persist in looking upon our industry as the "town drudge" and feel rather "sheepish" about being seen riding in some of our cars. And can we hope to overcome this feeling unless we present our product to the public in an entirely new "dress" and appeal to their "spending instinct" by still further improvements in our merchandising methods?

It is a well-recognized fact nowadays that advertising is a very important factor in the success of every business, and this is especially true in dealing with the public at large. It has been demonstrated many times that where sales have been built up by good advertising, they soon drop off if the advertising effort is reduced. Many properties in our industry have a strong feeling that our business is no exception to this rule and they are doing some excellent work along this line. But it seems as though we ought to be able to improve our opportunities in this direction, not only individually but collectively. It strikes me that if our industry should adopt a yearly "Get-together and pull-together" program it might well include some advertising ideas which could be featured to advantage.

As Old Bill Wise says:

"When traffic drags and twists and bumps,
Don't drive to work with nervous jumps;
You'll find the trolley always serves
A restful ride for ragged nerves."

Courage, Faith and Vision Will Advance Interurbans

By Dr. Thomas Conway, Jr.
President Cincinnati, Hamilton & Dayton Railway

This straightforward talk before the American Association points out that the greatest chance of development is in the freight business

Dr. Thomas Conway, Jr.

BEFORE endeavoring to read the future, let us pause to analyze the present position of the interurban industry and the tendencies in the recent past. The name "interurban" is a general term, loosely applied to a considerable group of properties whose physical and economic characteristics are widely dissimilar, varying from the roadside trolley, built in pre-automobile days as a connecting link between city lines in neighboring urban communities, to what the census bureau some years ago termed the "fast, long interurban" constructed on private right-of-way, usually in accordance with the physical standards of the steam railroads. A large proportion of these properties have always handled considerable freight, and their freight business in most cases has substantially increased in recent years. Such properties are the real interurbans.

According to its published statistics, the number of electric railways reporting to the Interstate Commerce Commission (made up almost entirely of interurban companies) decreased from 312 in 1921 to 235 in 1927. The railway operating revenues of the reporting companies were $235,656,072 in 1921 and $180,886,164 in 1927, a decrease of 23 per cent. Railway operating expenses in this period declined from $189,450,749 in 1921 to $151,847,259 in 1927, a decrease of almost 20 per cent. Passenger revenues were $193,166,389 in 1921 and $126,342,522 in 1927, the decline being 34 per cent. Revenue passengers carried in this period decreased from 2,099,721,398 to 1,180,867,000 or 43 per cent. The only bright spot in the picture is the growth in the freight revenues of these properties which were $28,585,712 in 1921 and $40,410,824 in 1927, an increase of 41 per cent. The reported investment in road and equipment declined from $1,529,065,210 in 1921 to $1,272,943,916 in 1927, or approximately 16 per cent. The total miles of road operated were 14,438 in 1921 and 12,277 in 1927, a decrease of 15 per cent.

These are the high spots in the dismal picture. With the exception of the gratifying increase in freight traffic and revenues, the tendencies of the last decade have been uniformly unfavorable.

We all know the reasons for these disastrous conditions. To some extent they are due to the operation of competitive bus routes under separate ownership, but the real explanation is to be found in the revolutionary changes in public habits and methods of travel which have followed the general introduction and use of the private automobile. In 1921 the total registration of private automobiles in the United states was 9,346,195 as compared with 21,379,125 in 1928, an increase of 129 per cent. The total hard road mileage in the United States was 521,915 in 1925 and 625,000 in 1928, a growth of almost 20 per cent in three years. The total registration of motor trucks in the United States was 1,118,520 in 1921 as compared with 3,113,999 in 1928, an increase of 178 per cent. And the end is not yet.

No one knows to what extent the further expansion of the automobile business in this country will go. Personally I do not believe that we have, by any means, reached the point of saturation as regards the ownership and use of the private automobile. I base this belief upon the following considerations, among others:

(a) On the whole, manufacturers are turning out better cars each year and selling them at lower prices. I believe that the cars which will be offered for sale five years hence will be greatly superior to the models of today.

(b) I look for substantial further improvement in automobile acceleration and braking, safe speeds, roadability, comfort and cost of operation.

(c) I believe that a large part of the future expansion in the ownership and use of the private automobile will come about as a result of the ownership by an ever-increasing proportion of our population of more than one car per family. This tendency is most pronounced.

(d) We are, apparently, on the verge of an era of much cheaper automobiles than any heretofore sold.

(e) I look for a further large expansion in the hard road mileage in the United States.

(f) The parking problem is becoming increasingly serious, but I look for a large increase in the construction of transient garages and outdoor parking facilities.

If my diagnosis of the future tendencies in the evolu-

Digitized by Google

tion and use of the automobile is substantially correct, it seems clear that if we are to induce those owning automobiles—which includes practically the entire population—to use our service, we must transport them more quickly and comfortably than they can travel in their motor cars. If the automobile of the future will be capable of comfortable and safe operation at higher speeds than the car of today and if super-highways will be built, then it seems obvious that the interurban must greatly quicken its operating speeds. Many interurban companies are radically reducing the number of country stops in order to shorten the running time between terminal cities. I believe that the tendency of the future will be toward equipment capable of much higher speeds than heretofore generally attained.

It may interest you to know that my company recently has placed orders for twenty new de luxe interurban cars which will weigh approximately 46,500 pounds and will be capable of free running speeds, where track conditions make such speeds practicable, in excess of 75 m.p.h. We are working on the theory that what the American public desires is speed with comfort and safety. If we are to induce the driver of the private automobile to travel with us, we must get him to his destination more quickly than he feels he can safely make the journey by automobile. I do not believe that an interurban line can survive if automobiles on abutting hard-surfaced roads constantly pass its cars.

We have made very careful observation of long distance bus traffic by interviewing passengers to ascertain why they patronize these buses. The answer, with few exceptions, was that while the service was uncomfortable and the fatigue almost unbearable, the much cheaper fare on the bus not only attracted business which would otherwise use the steam trains, but begot a large amount of traffic which otherwise would not move. We believe that the greater part of this business can be won over to our de luxe high speed interurban service.

While it is too early as yet to reach a definite conclusion, our experiments seem to indicate that in many instances a larger net revenue will result from lower rates of fare. I believe that the electric railways of the country, and especially the interurban properties, can well afford to experiment with special tickets and different rates to determine the combinations which will produce the maximum return. It by no means follows that the highest rate of fare will always produce the largest revenue.

In a large proportion of cases there are few new sources of passenger business. If the passenger business declines it seems obvious that decreased earnings per car-mile must be offset by corresponding greatly decreased costs per car-mile. In my opinion, the desired end must be achieved by a vast improvement in the interurban passenger car which will lower its cost, permitting us to write it off in say ten years, and which will greatly reduce its car-mile cost of operation. The car body itself represents a relatively small proporton of the total weight, and further large reductions in weight and cost must come about through improvements in the design and fabrication of motors, trucks and miscellaneous equipment. The weight of the modern city type motor is approximately 15.9 lb. per hp. As compared therewith, the weight of the power plant of the average automobile is about 8 lb. per hp., and of the modern aeroplane 1.75 lb. per hp. A study of these figures, to my mind, indicates clearly a tremendous margin for improvement. I believe there is room for considerable improvement in car trucks both as regards weight and noise. The weight, original cost, cost of maintenance of air brake and electrical control apparatus must all be greatly reduced. These are but illustrations of the things which must be done if this entire industry is to survive.

What I have just said with respect to the necessity for far-reaching technical improvements in cars applies with equal force both to urban and interurban properties. This industry must do what the automobile industry and in fact every other successful industry have done. We must think less of increasing our fares and more of reducing our operating costs, and the latter can be achieved only by the application of the same methods which have enabled the automobile manufacturer to sell us a car made up of some 4,000 parts for approximately $600. The greatest handicap of our industry is the arrested development of its technique which is at least fifteen years behind the times and which prevents us from balancing our operating budgets.

Freight Business Offers a Hope of Salvation

It seems very clear that the further development of the freight business is the main hope of salvation for a substantial part of the interurban industry. On my own property freight revenues have been increased 91 per cent in the last three years. One of the distinguishing characteristics of recent years has been the development of hand-to-mouth buying, making possible a marked reduction in merchandise stocks of both wholesalers and retailers. Hand-to-mouth buying is dependent upon the rapid and reliable shipment of merchandise between the manufacturer, wholesaler and retailer.

The lion's share of the freight traffic of the interurban lines consists of less-than-carload business. The motor truck has been a very serious competitor of the average interurban railroad because the distances over which it transports freight are within the effective range of the truck. Some two years ago a survey showed that 84½ per cent of the freight tonnage moving less than 20 miles was shipped by motor truck; 54.7 per cent of that between 20 and 39 miles; 32 per cent of that between 40 and 59 miles; 24.2 per cent between 60 and 99 miles, while only 2.3 per cent of the total tonnage moving a distance of 100 miles or over was shipped by truck.

The handling of less-than-carload freight requiries a high order of managerial skill if it is to be done profitably. The steam carriers have never been able to make any money out of the l.c.l. freight business; most of them are handling it at a loss. Unfortunately the interurban railroads have copied in most respects the equipment, practices and operating methods of the steam carriers. There is no doubt in my mind that there is a most fruitful field for improvements in the technique of the interurban carriers in successfully and profitably handling less-than-carload freight. Very few electric railway carriers have experimented with mechanical devices, such as conveyor belts, etc., to reduce labor costs at terminal stations. I believe there is a wide field of usefulness for the so-called container car in the interurban railway freight service.

Improvements in Technique Will Increase Profits

As we improve our technique we shall increase our profits from the freight business. It is now possible to make money out of freight. Our operating ratio in the freight business is reasonably comparable with

Digitized by Google

the operating ratios now prevailing on the steam railroads and we are handling the freight business at a profit. As we improve the technique of handling less-carload freight we obviously increase the profits derived therefrom, extend the field which can be profitably exploited and increase the attractiveness of the service to our shippers.

Another fruitful field of opportunity for the interurbans is the development of an express business or the handling of packages from station to station. Other things which the interurbans must do are to improve warehouse facilities; to establish modern and efficient warehouses on their lines; to establish off-rail freight stations, absorbing the cartage charges therefrom to rail head stations; to install side tracks into manufacturing and wholesale establishments, thus putting the interurban on an equal footing with the steam carriers; to provide adequate team track capacity at all points; to install cranes and other mechanical devices necessary to handle heavy shipments; to achieve the economies which can be effected through the use of tabulating devices and other mechanical equipment in freight accounting; to improve and extend the work of freight solicitation and to support it by effective publicity designed always to keep before shippers the advantages and possibilities of interurban railroad freight service; to build up average car loadings; to operate trains on fixed fast schedules, and in many other ways to improve efficiencies, to achieve economies and to increase the attractiveness of the service to shippers.

The new interurban cars purchased during the last twelve years represent only 18 per cent of the passenger cars owned by the interurbans at the end of 1928. At the rate at which new cars were purchased during these years, it would require over 55 years to replace all the interurban equipment now owned. According to the data compiled by ELECTRIC RAILWAY JOURNAL, during the ten years from 1919 to 1928, both inclusive, the annual rate of reconstruction of interurban trackage was 0.904 per cent per annum. At this rate it will require over 110 years to reconstruct all the interurban mileage reported in the last federal census. It is obvious the industry as a whole is not even keeping up with normal physical replacements, much less with the progress of the art.

Since the freight business is indispensable to the economic existence of most properties in Indiana and Ohio and constitutes the main reliance for the future, the assurance of such freight traffic is a matter of the greatest importance. In most cases the further development of the freight traffic is dependent upon the continued co-operation of connecting interurban carriers. Many of these interurban lines are unable to finance the purchase of new freight equipment, to purchase additional motive power for the movement of freight trains or to construct sidings, freight stations or other property additions necessary. Of course, consolidations, without strong economic justification therefor, will not help the industry, but the consolidation of such lines under a conservative and sound financial plan will greatly stimulate and strengthen the credit of such properties and their ability to provide first class service to the public, and will make possible very substantial operating economies. The larger consolidated property can bring to its problems men of wider experience and greater technical ability than the average small property can afford.

As I have heretofore said, we must have the will to win if we are to succeed; not hurrah-boy speeches and enthusiasm without a solid foundation, but courage, faith and clear-sighted vision of what is required and the inflexible determination to succeed by hard, intelligent work and a vast and continuing dissatisfaction with half-way measures, inadequate facilities and obsolete equipment. In no other way can the future of this industry be assured.

Motor Vehicle Regulation Demands Attention

BY ALVIN B. BARBER

Manager, Transportation and Communication Department, Chamber of Commerce of the United States

Public transportation men have a vital interest in laws governing motor vehicles and in regulation of the use of streets, the speaker told the American Association.

Col. A. B. Barber

BASIC principles of motor vehicle regulation can conveniently be discussed under four headings: (1) Licensing of vehicles and operators, (2) vehicle equipment and maintenance, (3) rules of the road and (4) utilization of street space.

These subjects have been canvassed by various committees of the National Conference on Street and Highway Safety. Today the uniform state and municipal codes, which were completed in 1926 and 1927, have already been adopted in a good number of states and cities, and substantial progress has also been made with other parts of the conference program.

As compared with our ratio of less than one traffic death for every 1,000 motor vehicles in this country the rate per motor vehicle abroad is three to five times as great as our own. Their rates exceed what ours were at the time when we had corresponding density of motor vehicle ownership. We have every reason to be convinced of the soundness of the measures which have brought down the ratios of accidents to automobile registration here.

The licensing of the vehicle is well established in every state, but registration and anti-theft measures should be on a more uniform basis throughout the country. Perhaps the most important single measure of motor vehicle legislation calling for attention in many states today is the drivers' license law. Such laws have been in effect for a number of years in the North Atlantic states and in California. Their effectiveness in promoting better and safer driving seems to be incontestably established.

Digitized by Google

It is an accepted principle of regulation that every vehicle should conform to certain standards as to size, weight and equipment—brakes, lights, horns, etc.—to assure that it may be operated without imperiling other users of the highway and without undue injury to the highway itself. In the uniform act regulating the operation of vehicles on highways care was taken to lay down in the law only those requirements which need to be fixed by legislation and which will remain reasonably constant over a period of years. The act leaves to be prescribed by the administrative authorities of the several states a great amount of detail covering such matters as headlight specifications, braking requirements, etc.

In regard to vehicle maintenance there has been less progress than in safety of design and construction. While most analyses of accident reports attribute less than 5 per cent of fatalities as primarily due to mechanical defects, studies show that the percentage of accidents in which defective maintenance of brakes, steering gear, horns, lights, etc., is an important contributing factor reaching much higher figures. An extensive study of 45 fatal accidents in Massachusetts indicated bad brakes as the principal or contributing cause in 24.5 per cent of the cases. Other estimates are even higher.

From the point of view of public safety uniform rules of the road have an importance hardly less than that of the drivers' license. Of all the conference proposals those which have made greatest legislative progress are the rules of the road. A total of 21 states have adopted this act and have already thus demonstrated their genuine interest in uniform rules of the road.

Considerable progress has also been made in adoption of the model municipal traffic ordinance. It is only in the last few years that pedestrian crosswalks at intersections have been recognized. The status of street car loading zones and the rights of persons passing between them and the sidewalks are still not standardized. There is also still a diversity of opinion in some quarters as to whether an unoccupied safety zone may be driven through or not, although the uniform vehicle code and the model municipal traffic ordinance definitely prescribe that it may not. Another development of recent years has been in the more formal recognition of the superior rights of traffic on main highways and the establishment of through traffic arteries.

There has of late been relatively less progress in taking care of the problem of grade crossings of steam and electric interurban railways. This whole subject is now under study by a committee of the National Conference on Street and Highway Safety.

In any consideration of the right-of-way rule at intersections it is important that the special conditions relating to street cars should be taken into account. The uniform act proposed by the national conference lays upon motor traffic the responsibility of yielding the right-of-way to street cars at intersections. A difficult question is that of giving proper priority to the movement of street cars at intersections controlled by automatic signals while avoiding abuse of that priority. Some mechanical device for this purpose should have careful attention.

As to speed limits, there is still a great diversity of opinion. The national conference went on record in favor of prima facie speed limits, that is limits beyond which the burden of responsibility is placed upon the motorist to show that he was driving safely.

In the European cities parking is much more effectively limited and controlled than in most of our cities. The unloading of merchandise in congested streets is closely regulated. Where buildings are under construction materials are required to be placed on the private property with only the minimum necessary time allowed vehicles to stand in front of the property to permit unloading, which is sometimes permitted only at night or at specified hours during the day. Street obstructions and the tearing up of pavements are similarly controlled.

The National Conference on Street and Highway Safety has from the beginning given attention to the problem of congestion. Recently it has been felt that there has been sufficient experience as to the most promising measures for the relief of traffic congestion to warrant a study and report on the subject and Secretary Lamont has just appointed a new national conference committee for the purpose, under the chairmanship of E. J. Mehren.

It seems fundamental that those who are engaged in the industry of urban transportation must be vitally concerned in every move designed to free our streets of congestion, whether by widenings, creation of new streets, removal of obstructions to traffic flow or otherwise. If streets are congested electric cars and buses will be unable to supply speedy and attractive service. Congested traffic slows up mass transportation even more than it affects individual transportation.

There are certain basic principles governing the utilization of street space on which agreement is general, but as to other principles and as to many details there is far from agreement. For example, it is quite generally agreed that existing street space should as far as necessary be available for the use of moving traffic. In practice, this principle is constantly violated by more extensive curb parking than conditions justify. Compromise on this issue seems almost inevitable, for as long as there is available curb space which can be used for parking without interfering with moving traffic it is too much to expect the motoring public complacently to renounce its use.

Again it is accepted that, along with the abolition or severe restriction of curb parking, there must come development of off street parking facilities. In general, parking facilities provided by public authority are in parks or other vacant property, while those established by private enterprise are of two kinds, in garages and in the open air, usually in vacant lots. The latter type can hardly be more than a temporary or partial means of meeting the need, while the well organized parking garage seems to have a definite field of usefulness.

I am entirely sympathetic with the zoning movement in general, and particularly with the set back requirements that are designed to insure light and air to the lower stories of tall structures. I do believe, however, that a concentrated business district consisting of skyscrapers with large employment of vertical transportation by elevators offers great advantage for doing business. Of course, if the advantages of sky scrapers are to be preserved, there must be sufficient street width for pedestrian and local traffic and adequate transportation must be provided, either on the surface or underground.

I have endeavored to indicate the inter-relationship of the different phases and to point out the interest of street transportation executives in traffic problems. I believe that the future welfare of the mass transportation industry depends on the solution of these problems.

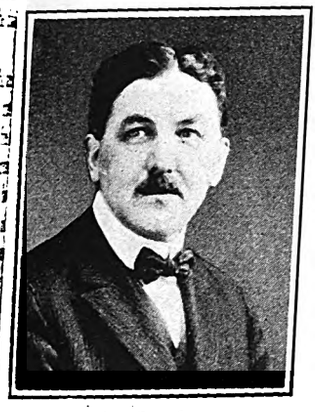
Better Cars and Buses Needed

By Myles B. Lambert

Transportation Sales Manager
Westinghouse Electric & Manufacturing Company

The necessity of developing without delay vehicles better suited to meet present-day competition was pointed out in this address before the American Association.



Myles Lambert

BEYOND doubt the car and the bus are the basic instruments of transportation. While the track, the power supply, public relations and all other things are necessary adjuncts, the car and the bus ride is the service you have to sell the public. That there exists a real need for better cars and buses is perhaps the reason why all the state and regional associations throughout the country, as well as Europe, have had this same or similar subjects on their program this year.

What do we really mean by better cars and buses? We already enjoy every known advance in the art, better body design, better seats, better ventilation, better looking cars, better motors and control, than we ever had in our history, but the cry is still for better cars and buses. Not because this is a normal attitude of a progressive industry, but because modern traffic and other economic conditions have imposed such abnormal requirements that operating engineers realize that they must not only have all these advances, but must have them with much higher schedule speeds, with greater comfort and greater economy in operation. Cars are needed that will get away and move faster than other traffic, attract patronage, and yet be sufficiently economical to operate at a profit.

What Kind of Vehicles Are Needed?

The problem before us may again be stated simply as one of evolving cars and buses that will lead traffic movement safely, reduce traffic congestion, attract patronage, and operate at a profit. What kind of cars or buses are these ideal vehicles? There's the principal nub of our problem. I submit that few, if any, of us know. We do know that on many properties where modernized cars have been placed in service, they are reported to show a satisfactory return on the investment. But the industry in general has not accepted these modern cars as adequately solving the general problem. The best evidence of this is the relatively few that have been purchased.

This question is not brought up in jest, but in all seriousness. First, because there is a wide difference of opinion about it, and second, because I believe it is the crux of our problem. A large number seem to feel that the carbuilders and manufacturers have lacked the necessary enterprise and visualization to produce the kind of car the industry sorely needs, and that if they had, large numbers of cars would be bought.

About a year ago it was stated at the master mechanics' convention that they would not measure up to their degree of "masters" of mechanics unless they addressed their talents to this very problem and visualized for the industry the kind of car modern conditions required; that they were obviously in a better position to do this than any other group in our industry; that they had for decades largely determined by their specifications the kind of cars their companies bought.

The street car of today is an "assembled car" and the joint product of many manufacturers, the purchaser largely determining the character of the assembly. The equipment manufacturer may visualize this or that advance in his art, only to find difficulties. As a rule it results in a compromise to adapt it to other existing or advanced design in trucks, car weights, axle arrangement, etc., and similarly in more or less degree are the truck builders or car builders confronted with similar problems. This being a condition rather emphasizes the need, of some better set-up in the industry to co-ordinate better, with facts about the needs, so that all manufacturers might have before them a common objective in car design to attain.

Interurban Cars Also a Problem

The interurbans have a similar problem as regards cars. Here also much has been done in modernization, lighter weights and higher speeds, but again there is a lack of definite conclusions on what kind of cars are really needed to restore the interurbans to their once general satisfactory operations. We have a number of examples of successful rehabilitation of high speed heavy service interurban lines; still others that have been re-equipped with very light weight cars, and steps have been taken recently to provide a modernized service on a network of consolidated lines in the Middle West with moderately light weight cars and especially high speed service, so that the coming year will without a doubt bring to the surface many fundamentals about interurban service that have been lying more or less dormant for several years.

The only purpose of rails is to provide a way to run on at higher speeds with greater safety than any other way. If buses weighing 20,000 lb. can run with safety and comfort on smooth pavement at 35 to 50 m.p.h. then a properly designed interurban car should run with equal safety and comfort on good track at very much higher speeds.

With the availability of modern street car equipment which makes it possible to accelerate a light weight car as fast or perhaps faster than most other passenger vehicles on the street,—the street car of tomorrow should be a big factor in speeding up traffic. Whether or not the bus will keep in step is a question. Mr. Green, vice-president of the General Motors Truck Company, delivered a very instructive paper last year on the bus in general. The bus manufacturers have rendered a real service to our industry. Of course, their market or customers are not all nailed down on railroad ties. They have a much wider market to thrive on, and the electric railway industry has profited by that wider market. New styles, new models and numerous advances in the art, as a general rule, come about largely by improving the product each year, nourished by the sales of the previous year.

Timely Topics Discussed at Luncheon Conferences

LUNCHEON meetings are growing in popularity. This was evident from the attendance and interest taken in those held during this year's convention. With the subjects carefully selected and skillful sponsors chosen to guide the discussion, those who attended and participated came away feeling well repaid for the time spent.

Spirited discussion on the proper fare structure took place at a luncheon on that subject. W. H. Sawyer replaced G. H. Clifford as sponsor, as the latter was unable to be present. John A. Beeler pointed that while the per capita earnings in the larger cities are higher today than they were ten years ago, they are less in the smaller cities. The problem, he held, is to arrive at a fare that will bring the maximum return for the service rendered, rather than to obtain the maximum possible rate of fare. A number of combined ticket, token, permit and pass systems were described. W. W. Holden explained the plan used in San Antonio. There was considerable difference of opinion as to whether a 10-cent base rate is suitable. D. L. Fennell and Henry C. Page held that this rate is suited to their conditions. M. R. Boylan held that a 10-cent flat fare drives business away when there is competition. Most of the speakers held the same view. Several speakers emphasized the point that it is desirable to render the greatest possible service to the community. J. L. Alexander believes that we should get the lowest rate from the patron who rides the most; Walter Jackson stressed the need for getting off-peak riding; R. N. Graham told of the good results in this direction obtained through the use of the weekly pass, while C. W. Chase held that if the companies do not get riding in proportion to the growth in population the railway is not doing its duty. J. P. Barnes said that if it is possible to get a certain return from a small number of patrons on a high fare or double the number on a low fare, it manifestly is desirable to do the latter. He also stressed the need of giving real service as it is not possible to divorce fares and service.

Interurbans Should Seek Greater Speed

That speed is the principal requirement of the interurbans, and that in addition it is necessary to provide adequate terminal facilities, modern cars, accurate schedules and courteous trainmen to build up riding, was the opinion expressed by those who attended the interurbans luncheon. Instilling in the employees the desire to sell the service, and using buses in connection with the rail lines were topics which also were discussed.

That the relation of the employee to the customer is the paramount issue in connection with securing new business is the view taken by O. C. Gettinger. "We must instill in the employees individual responsibility for selling the service and building up traffic," he said, "if we are to be successful in any merchandising campaign." Mr. Gettinger cited a number of instances where employees on his system had established closer contacts with prospective customers and had secured them as permanent patrons.

F. W. Coen and Truman Curtis, both representing railways in the Ohio territory, told of the experience of their properties with competing bus lines. It was Mr. Curtis' experience that with sufficient speed and modern equipment the interurbans could more than hold their own in competition with buses.

Charles H. Jones, sponser of the luncheon, in closing the meeting expressed the opinion that lack of terminal facilities in the large cities was one of the reasons for the falling off in interurban traffic in the face of competition from privately owned autos. He also stressed the need of selling the service through the contacts of employees and by judicious advertising.

Employee training is the foundation upon which every intelligent industrial relations program rests, according to Edward Dana, sponsor of the industrial relations luncheon. This sentiment was echoed and emphasized by other executives who followed him.

It was the consensus of opinion that employee education, in spite of its importance in the scheme of things, was in its infancy in so far as general recognition was concerned, and that the subject was one which should be given the earnest attention of every executive. The opinion was expressed that at least one member of the association staff should give his entire attention to the matter of industrial relations and to the assembling of material which could be incorporated into a handbook upon the subject.

General agreement was evident at the luncheon meeting held on public relations, with L. S. Storrs as sponsor, that service is the foundation of public relations. This point was specially stressed by G. B. Anderson. The public is fair minded, according to J. N. Shannahan, and any transportation company can count upon being successful if it is able to make the public understand its problems. Dr. Thomas Conway pointed out that the customer is the one who must decide what constitutes satisfactory service. A satisfactory franchise is not a panacea for all the ills of a street railway, according to C. S. MacCalla. E. D. Kilburn pointed out that the manufacturers can help by institutional advertising. Every one, in the opinion of R. S. Tompkins, must work on public relations and not leave the job entirely to the company's public relations man.

The general trend of the discussions held during the luncheon conference on new cars, of which Thomas Fitzgerald was the sponsor, indicated that the present-day automobile strongly impresses its mark on modern street car design. W. T. Rossell said that heretofore the mechanical department influenced too much the decision of the management of the railway when new equipment should be acquired. Frank R. Fageol felt that the demand for street cars would be increasing for the first five to ten years, but held the opinion that after 25 years the demand for buses would greatly surpass the demand

for street cars. Looking at this problem from the point of a manufacturer, Myles B. Lambert of the Westinghouse Electric & Manufacturing Company admitted that the development and modernization of street railway equipment did not go as fast as it should, but stated that improvements are incorporated slowly but surely.

Methods of securing relief from excessive tax burdens, especially the paving tax, is one of the biggest problems confronting the industry today, according to the general opinion of more than twenty-five executives who attended the luncheon on taxation. William A. Jackson presided in the absence of Harold L. Geisse, the original sponsor.

H. B. Weatherwax, vice-president of the United Traction Company, Albany, N. Y., stated that the electric railways of his state were paying about 70 per cent of their net income for taxes, and that all efforts made in recent years to bring about a reduction of taxes had been unsuccessful.

"Take the merchants and the public into your confidence and get them to help solve your excess tax problems," advised John L. Swope, vice-president of the United Railways & Electric Company, Baltimore.

Acknowledgment of the fact that traffic regulation must be based on the greatest good for all classes of users of the street was the dominant note at the traffic luncheon, with D. L. Fennell as sponsor. J. H. Hanna said that railway men must begin with a process of self-education in this matter.

Progress made in the solution of the traffic problem in Baltimore was outlined by Dean Locke. According to J. Rowland Bibbins, it is desirable that traffic should be controlled by a master signal system covering a large area rather than by a series of independent systems.

J. B. Stewart, Jr., expressed the opinion that it is difficult to secure effective action through citizens' traffic committees. Whatever the value of such committees may be, the fact must be recognized, according to J. A. Miller, Jr., that these committees exist, and it is of great importance that the members be fully informed on the subject of public transportation needs. Col. A. B. Barber spoke of the traffic problem being of outstanding importance and praised the active part taken by the electric railways in working for its solution.

Analysis not only of every small city property but also of all phases of operation on every line is necessary to get at the root of the serious problem facing the systems in cities of 75,000 population and less. This opinion was advanced by those who attended the small city luncheon. A. C. Spurr, Wheeling Traction Company, was sponsor.

Mr. Spurr presented extracts from the report prepared during the past year by the small city committee to bring out certain phases of the problem and to note progress made in analyzing small properties.

Many valuable ideas on merchandising the electric railway business were advanced at the "Merchandising" luncheon, held under the sponsorship of G. A. Richardson, vice-president and general manager Chicago Surface Lines. It was the general opinion of those who attended that a salable product in the form of real transportation service must first be obtained and that this must then be sold intensively by every possible means. Among the merchandising methods discussed were a self-analysis of the company's activities, providing the trainmen with neat uniforms, holding frequent meetings to discuss service, giving away weekly passes to persons whose names were advertised in department store newspaper advertisements and canvassing from house to house.

Hudson Biery of Cincinnati told of the efforts of his company in public relations work in "being a good citizen." He stated that his company had for a long period advertised everything but the service, and that at present the test for any advertising is that the end sought must be for the benefit of the city as well as the company. "Start from the top and go down," was his advice for developing a sound public relations policy.

S. B. Way gave the same counsel. "Imbue the public with the thought that the management wishes to maintain good will and you will have taken the greatest step in merchandising," he said. R. S. Tompkins also contributed some valuable thoughts on merchandising in relating the intensive selling of a new de luxe bus service into an exclusive territory in Baltimore, in distributing time-tables and in assisting in the promotion of the city's 200th anniversary celebration.

Digitized by Google

Much animated discussion marked this round-table luncheon on the motor bus for city operation, which was led by D. E. Blair, general superintendent, Montreal Tramways. The opinions generally fell into two camps, one led by A. R. Williams, of the United Electric Railways, Providence, and the other by R. N. Graham, Pennsylvania-Ohio Public Service Corporation, Youngstown, Ohio.

Mr. Williams favored a greater use of the bus, stating that in Providence they had found it popular and profitable to carry people from the distant residential districts to the dense areas. Mr. Graham, supported by several others, held that there is no inherent advantage in the motor vehicle that the electric car does not possess, and that equal comfort may be secured on well-designed street cars.

At the luncheon conference on motor bus maintenance methods, Adrian Hughes, Jr., pointed out the necessity for the bus operator knowing the problems encountered by the other men, thus aiding him in improving his own methods. Various speakers discussed the maintenance methods used on their own properties.

Renewed Confidence in the Industry Needed

Dr. Thomas Conway, Jr., sponsor of the financing luncheon, summed up the various opinions of those present when he said:

"The trouble with our industry is that for years we have been selling the public the idea that we are destitute, always on the verge of bankruptcy. No wonder the public's confidence is shaken in us. We have no one to blame but ourselves. Now we have to unsell this idea, and the sooner we do it the better. Why, even most of us are afraid to invest our own money in the industry. Then how can we expect to attract outside capital? What we need to do is follow the example of the steam roads who had troubles like our own after the World War. They didn't preach hard times. They advertised their prosperity. They sold the public on the idea that they were a prosperous industry. We must do the same thing."

Opinion generally favored offering frequent and high-class service on long-distance bus lines as the most effective means of securing the volume of patronage necessary for profitable operation of interurban buses, in the luncheon conference on "Motor Bus, Interurban and Long Distance Operation." C. S. MacCalla, presided over the meeting.

On the question of how far an interurban railway should extend its bus operations, M. R. Boylan said that question could only be answered by knowing local conditions. R. N. Graham thought that electric railways have been over-conservative in the operation of buses, with an unprofitable result.

"We must discover what the people want, and then provide the service," Adrian Hughes said. "They will be willing to pay for it."

"The most important element in the utility business today is what the public thinks of you, and the best way to obtain a favorable public attitude is through the platform men," according to one of the speakers at the luncheon devoted to education and training. The meeting was presided over by J. S. Hyatt. H. H. Norris reviewed briefly the history of the association's educational activities and told of some of the more recent phases of the work in Boston. "No educational program can be a complete success without the intelligent and whole-hearted support of the management," he said, a sentiment which was echoed by all present.

R. C. Forman explained his experience in public speaking instruction, and introduced W. E. Adams, a trainman from the Beaumont, Tex., property and one of his protégés, who had been sent by his company to the convention in recognition of his services in the interest of better personal relations.

That humorous appeal in public utility advertising is a desirable appeal was the theme of John Marsh at the advertising and publicity luncheon. Humorous appeal, however, is the most difficult to write, and should be used sparingly. The speaker outlined the program of advertising which his property had conducted during the past year, using humorous appeal copy, and told of the widespread attention which it had attracted in the community. Robert Dougan of the Capital Traction Company, Washington, D. C., told of the advertising used by his company in developing de luxe bus service, but expressed the belief that if the service is made sufficiently attractive it will advertise iteslf. The success of the Chicago Surface Lines in bringing about parking relief was described by J. B. O'Connell, who stated that his property had found that the best approach to the problem was through showing the merchants that their interests would be best served by the proposals which the street car company was advancing. The company must show that it has no selfish motove, but is working for the general good. A well-organized speakers' bureau had been very effective in winning public good will.

House-to-House Canvass Promotes Good Will

C. B. Short, manager Roanoke Railway & Electric Company, Roanoke, Va., told of the success attending his company's house-to-house canvass in the promotion of traffic. A six weeks' campaign was carried out early in the year and is to be repeated this fall. While it was difficult to measure the actual increase in business resulting from the canvass, the company is satifised that public relations were distinctly improved as the result of the house-to-house calls.

"See that the newspapers get the news," said Hudson Biery, Cincinnati Street Railway Company; "they are just as anxious to get real news as we are to get passengers. Editors, too, are always glad to get editorial material." Other speakers included Raymond S. Tompkins, United Railways of Baltimore; David Evans, North Shore Line, and Labert St. Clair, director of advertising for the A.E.R.A. The meeting was presided over by E. B. Atchley, Northern Ohio Power & Light Company.

Two subjects, both very live ones for those interesetd in the promotion of safety, were discussed at the safety luncheon on Thursday, the classification of accidents as chargeable or non-chargeable and the bonus method of reducing accidents. The luncheon was sponsored by R. N. Graham. C. H. Evenson contributed some valuable thoughts on the first subject in outlining in some detail the method of charging accidents in Chicago.

Types of buses most desirable for city service, suburban service and intercity service on trips under 100 miles were discussed by A. T. Warner at the luncheon on motor bus design, with C. W. Stocks as sponsor. In his opinion the treadle door is not suitable for use where the zone fare system is in effect. Buses used in city service should have ample headroom for the comfort of standees, because during rush hours they constitute a large part of the number of passengers carried. A shorter headway with smaller buses is to be preferred to longer headway with larger buses, because frequency of service resembles more the transportation service obtained with

Digitized by Google

he private automobile. Convenient placing of the fare egisters for observation by the operator as well as by he passenger was stressed by Alexander Shapiro.

Trends in design of auxiliary elements for better lriver efficiency and increased schedule speeds were dis- ussed by W. H. McAloney, who pointed out that easy ntrance not only facilitates passengers entering but also hus increases schedule speed. Braking facilities was he subject of the discussion by P. V. C. See, who tressed the point that it was of the utmost importance hat a bus be provided with two braking systems working ndependently of each other.

Both carload and l.c.l. handling of freight were ana- yzed at the freight luncheon, held on Thursday under he sponsorship of Julian M. Bamberger. Charles H. ones spoke on co-operating with steam railroads in the eveloping of territory and interchanging business. He old of developing new industries both as the means of ecuring new business and of securing better co- peration with the steam railroads. Mr. Jones em- hasized the need for giving freight service comparable o that offered to passengers. By offering store-door lelivery service, the Lehigh Valley Transit Company has ncreased its freight business 50 per cent in the past two ears, according to F. A. Burkhardt.

Interurbans Must Foster Freight Business

"The salvation of the interurbans is in their freight usiness," commented S. B. Way. He emphasized the mportance of speed in shipping and gaining the recog- nition of the steam roads as a carrier. "Meeting the com- petition of trucks is the principal problem of the electric ailways in the central territory," stated Arthur W. Brady, "and to compete successfully with them you must ffer better service." David R. Thomas told of the ad- antages of co-ordinating the freight activities of inter- onnected systems, also the method of distributing ick-up and delivery charges among the roads carrying single shipment.

Mr. Thomas also commented upon truck competition n his territory, and described the Bonner Rail Wagon vith which his company is experimenting. The con- luding remarks were made by Julian Bamberger, who liscussed the need for better terminal facilities and for egislation which would enable the electric railways to ompete with trucks.

H. B. Potter presided at the luncheon on management, The discussion centered largely on pension and retire- nent plans. There was considerable difference of opinion s to how a fund should be set up for the purpose. Alonzo R. Williams told of methods he has used in umanizing the service in Providence. He believes that ersonal contact between men and management is essen- ial to success.

Big Turnout of Canadians

A MEETING of the Canadian Electric Railway Asso- ciation was marked by the attendance of a large umber of our northern neighbors. C. H. Dahl, presi- ent of the association, presided. Greetings of the American Electric Railway Association were extended by eslie Vickers. In addition to a small amount of routine usiness there was lively discussion concerning the loca- ion of the next convention of the Canadian Association. A resolution was passed expressing the appreciation of he Canadians for the courtesies extended by A.E.R.A.

Registration at 48th Annual A.E.R.A. Convention

Foremen's Training Conference Well Attended

SPONSORED by the committee on education and arranged under the direction of J. S. Hyatt, engineering assistant to the vice-president Chicago Rapid Transit Company, Dr. H. W. Rowland, educational director Milwaukee Electric Railway & Light Company, and Prof. H. H. Norris, educational adviser Boston Elevated Railway, the foremen's training conference course held daily sessions during the five days of the convention. Some 22 men—supervisors, instructors and educational directors of representative electric railways—took the course, which was directed by W. C. Durgin, director of public relations, Commonwealth Edison Company, Chicago. He was assisted by David W. Gordon, director of service improvement Chicago Rapid Transit Company, Jay Barton, of the Peoples Gas, Light & Coke Company, Ernest G. Cox, of the Chicago, North Shore & Milwaukee Railroad, and P. W. Melton of the Commonwealth Edison Company.

In the course of the program these in attendance were addressed by Mr. Durgin on such general subjects as "Personal Service Development," "The Fundamentals of Conference Technique," "Service Sampling," "Building Conference Courses," and "Characteristics of a Conference Leader." Mr. Melton took as his subjects "Who Leads and Who Attends Conferences?" "The Mechanics of the Conference," "Devices, Schemes and Other Aids," "Lessons, Plans and Manuals," and "Motivation." Messrs. Cox, Barton, Gordon and volunteer leaders took turns in leading demonstration conferences, and the entire group participated in the general criticism and discussions.

It had been the original intention to conduct the meetings in two general groups, one to be composed of the advanced students, including those who had taken the course last year, while the other would be made up of those attending the meetings for the first time. After the first meeting, however, it was decided to continue as one group, and the program was carried forward on this basis. In this manner the more experienced men were able to aid the others by precept and example.

During the course of the conferences a number of executives attending the convention took advantage of the opportunity to drop in on the meetings and watch proceedings from the side lines. At the final meeting of the Transportation & Traffic Association a group conference demonstration was staged, with D. W. Gordon as leader and a number of trainmen from the Atlantic City & Shore Railway participating.

World-Wide Transportation Problems Discussed

On Advisory Council Night was given a symposium of transportation problems in various countries through talking movies. South Shore Line awarded Coffin Prize

J. N. Shannahan

TRANSPORTATION in many lands was told about in the evening session held under the auspices of the Advisory Council. An outstanding feature was the presentation of the Charles A. Coffin award to the Chicago, South Shore & South Bend Railroad, which won out of a field of contestants all of which had excellent presentations. In accepting the award the general manager, Charles H. Jones, said that he regretted only that all the employees of the road who had made it possible to win could not be present.

Mr. Shannahan Speaks for Progress

Speaking for the Advisory Council, Chairman Shannahan told of some of the problems of the industry. Mr. Shannahan said in part:

There is no mystery regarding the cause of the change in the public's conception of what it is willing to consider satisfactory transportation service. The rapid and remarkable development of the automobile created new standards of speed, convenience and even luxury in transportation. At the same time, rapidly rising costs of materials and labor made the most rigid economy imperative and prohibited sweeping replacements of physical property.

Because the people as a whole agreed to assume the cost of adequate roads and highways, they have made possible the development of the automobile as we know it today. When the public understands that obsolete methods of dealing with its local transportation problems constitute the primary causes of many of the difficulties faced by cities of various size throughout the country, the road will have been opened to that rapid development and improvement of community transportation facilities which is so badly needed today.

During the past four years there has been relatively rapid progress toward modernization of thought within this industry. We do not ask the public to give intelligent consideration to its local problems simply to help these companies or even those thousands of men and women who have invested their savings in our securities. We ask it in order that we may be enabled to give that volume and character of service which the public has a right to expect. We ask it in order that the transportation companies may be enabled to keep pace with growing community requirements; in order that an intelligent policy and consistent program with respect to transportation development may be worked out in the interests of the public itself—of those millions of people who are inconvenienced and endangered by inadequate transportation facilities and consequent congestion.

On our part we have been proceeding rapidly with the job of putting our own house in order. We have been developing equipment that approaches in speed, comfort, attractiveness and performance the standards set by an automobile-minded public, and which in safety exceeds them. Only a casual examination of the wonderful exhibit at this convention is sufficient to establish that fact.

The time has passed long ago when any single company can afford to hold aloof from the effort to overcome general difficulties which affect the entire industry of which it is a part. I feel that the best report for the council consists not of anything which I may say, but of the revived spirit and the definite evidence of progress in the industry during the period since it came into being. Much of the council's work has necessarily been intangible. But it has been of far-reaching importance nevertheless.

The talking movies were used to introduce several noted speakers, including Secretary R. P. Lamont, the Right Honorable Lord Ashfield, chairman of the board Underground Electric Railways Company of London; Herr Ernst Reuter, chairman of the board Berlin Transportation Company, and A. W. Robertson, chairman of the board Westinghouse Electric & Manufacturing Company. Abstracts of these addresses follow.

Transportation Affects All Business

By ROBERT P. LAMONT
Secretary of Commerce of the United States

R. P. Lamont

OBVIOUSLY, the business of providing local transportation to American communities is a basic utility service which is of vital importance not only in our economic life but in our social and political structure as well. The rapid concentration of people into great industrial and commercial centers is one of the outstanding phenomena of the age in which we live. Our continued progress and well-being under these conditions is dependent upon an adequate and efficient circulatory system for these great communities; that is to say, upon adequate facilities for the easy and rapid movement of people and commodities. Unless this is assured it is apparent that one of the most important factors responsible for the growth of business centers—increased convenience for the conduct of business—would be eliminated.

From the standpoint of the general social welfare it seems important likewise that convenient, speedy and safe communication be available between outlying residential zones, and between these zones and business and industrial districts. Otherwise the living conditions of the workers in great cities would become quite impossible. Public health, morals and general well being would be bound to suffer. It is to you gentlemen who are experts in the business of providing transportation service that the nation must look for guidance in the determination of sound policies for the development of new facilities to meet growing requirements.

In many respects the difficulties of traffic congestion and the resulting inconvenience, hazard and economic loss involved seem closely related to the business in which you are engaged. I presume that in your deliberations you are giving attention to these questions.

I feel, therefore, that you gentlemen are engaged in a business that affects our economic and social life in many ways. For that reason I feel that your efforts to rehabilitate your properties physically and financially should receive the sympathetic attention and interest of your communities. I am sure that you may expect the necessary co-operation provided that through your association activity and otherwise you bring about that degree of self-regulation which will enable you from within the industry to take into your hands the condemnation of unsound practices.

It is my understanding that you are engaged in furnishing local public transportation service not only with street cars, rapid transit lines and electrified trains, but that you are also heavily interested in the operation of buses and in some instances taxicabs to supplement your other services. In this I feel that you are moving wisely and in the public interest. It seems quite clear that under proper public regulation, co-ordination of transportation facilities is in the direction of efficiency and waste reduction.

I am considerably impressed with the importance to all business of the reduction of congestion and the adjustment of deficiencies in available local transportation. These factors have a most important bearing upon the accessibility of existing business centers and business property. In some cities there seem to be marked trends toward the shifting of business centers which must have an important bearing upon existing investments and property values. Many lines of business show a marked trend toward the establishment of branches more accessible to residential districts and relatively free of down-town congestion.

The thought occurs that this may be having a marked effect upon distribution costs and upon the overhead cost of conducting business. Certainly it is a subject that merits the attention of thinking business executives.

Solving Berlin's Traffic Problems

By ERNST REUTER
Chairman of the Board Berlin Transportation Company
Berlin, Germany

Following a five-week trip visiting American cities, including Boston, New York, Cleveland, Chicago, San Francisco, Los Angeles, Philadelphia and Baltimore, Herr Reuter is convinced that co-ordinated transportation, with the surface car as the chief vehicle, is the best means of servicing the population of Berlin. —EDITOR.

I HAVE just completed one of the most interesting experiences of my life. In company with my colleagues, I have spent the last five weeks visiting outstanding city properties in the United States. I came here to study your problems because I believe they forecast our problems of the future. Our problems are multiplying daily. Berlin is growing rapidly. It now has 4,300,000 inhabitants and the population is increasing at an average of 80,000 persons per year. Our traffic problems also are increasing on account of the automobile. Ten years ago there were probably not more than 10,000 motor cars in Berlin. Today there are 100,000. The day is not far distant when there will be a million.

At present we are utilizing subways, surface cars and buses. Our local transportation is co-ordinated under a single management. After visiting your great cities, I am convinced that co-ordination of these vehicles, under a single management, is the solution of local transportation problems. You are following along this line in the United States and it is this line that we are going to follow not only in Berlin but the rest of Europe.

I am convinced that the electric car will remain the chief vehicle in the movement of mass transportation. I have been especially impressed by the progress that your electric car manufacturers have made in improving their product. My outstanding recommendation upon returning to Berlin will be wider use of electric cars in mass transportation. I am going to recommend that both cars and streets be improved. Our cars must be made larger. Our streets must be straightened so that more direct routes can be provided.

Digitized by Google

We have been using the bus and will continue to use it, but in a supplemental manner. Berlin now is utilizing the bus in outlying districts and on boulevards. We shall continue to use buses in these sections. We have no intention of substituting buses for electric cars in our congested centers. We believe that electric cars will do this work better.

Traffic congestion problems in the United States have been of great interest but fortunately we shall be spared some of them in Berlin. Doubtless many of your problems here arise from the presence of the skyscrapers in downtown sections. Berlin has no skyscrapers. Its highest building has less than ten stories. Furthermore, there never will be skyscrapers in Berlin nor will any kind of building be permitted which will cause such congestion of population as you have in your leading American cities. The German people believe in spreading out their population. They believe in having parks and resting places in the downtown sections. The city of Berlin owns about half of the ground space that the city occupies and it is going to use this space for beautifying the city with something besides buildings.

I feel that local transportation is a world problem. Even before the excellent plan of co-ordinated transportation was thought of all countries had a common interest in providing public rides. But now that the wisdom of co-ordinated transportation has been demonstrated both in this country and abroad our problems are more in common than ever. We still are in an experimental period. We can be of great help to each other As you have been of great help to us, I hope that in the near future you will permit us to be of some assistance to you.

London's Transportation Difficult

By THE RT. HON. LORD ASHFIELD

Chairman of the Board
Underground Electric Railways of London, Ltd.

Lord Ashfield

WHEN my friends in America wrote me that those attending the convention wished to have a five-minute film showing me in action in London it would have added enormously to your entertainment this evening if, instead of talking about London transport, it had been suggested that this "command performance" should take place on a golf course where I could have given an exhibition of golf which, if viewed from the varieties of style or from that of a picturesque—and even startling—vocabulary, would, as I have already said, provide not only for your entertainment this evening but add to your knowledge of that fascinating game. But I must obey my definite instructions.

Five minutes is too short a time in which to make any useful observations upon the problem of London traffic for the problem is about as big as the London area itself. This covers approximately 1,820 square miles, has a population of about 8,700,000 who are served by 118 route miles of underground railways, 346 route miles of tramways and about 5,500 omnibuses. It is also served by a very extensive system of suburban railways. In 1928, these several forms of transport carried roundly 4,000,000,000 passengers, which is equal to about 510 journeys per head of the population. Private automobiles also play an increasingly important part in transport and there is at present about one car for every 45 inhabitants, a record far short of that of any section of America.

All the railways, both surface and underground, practically all the omnibuses and a part of the tramways are company-owned, but the larger part of the tramways is owned by the municipalities. The total capital invested is roundly $540,000,000, of which 85 per cent is company and 15 per cent municipal.

In recent years the only passenger transport which has been self-supporting is the omnibuses; they alone have the proud distinction of having not only earned profits but of having given substantial financial aid to the underground railways and to a part of the company-owned tramways.

With a view to restricting competition with other existing forms of transport, especially trams, and reducing congestion upon the streets, further omnibuses are prohibited but it is recognized that to limit one form of transport in favor of another will not provide a satisfactory solution to the problem. On the other hand, it is generally agreed that free and unrestricted competition between one form of transport and another is not in the public interest. Underground railways, trams and buses are not of the same economic value. Each plays an essential part in a complete and effective system of transport but the London situation is further complicated by the fact that the ownership and operation of the several undertakings is vested partly with companies and partly, through public money, with the municipalities concerned. The problem, therefore, is to devise a plan which without disturbing the existing ownerships will provide for the operation of all of the different undertakings under a single management so that each form of transport—underground railways, trams and buses—may be used to the very best possible advantage in providing a unified system of transport and, through a common financial interest, secure to each undertaking its fair and equitable share out of the aggregate net earnings of the combined undertakings.

It is not easy to find a solution to this problem since we must venture into the realm of politics when dealing with it, but I am glad to say that some progress has been made these last few years and I live in the hope that an enlightened government will bring its powerful influence to bear in finding a solution to the problem.

From what I have said in these few remarks, you will, perhaps, say that "Ashfield has nothing on you" and that your problems are in some aspects not unlike ours; I can only venture the wish that you will be as successful in solving your problems as I hope to be in solving mine.

Coffin Award

Won by

South Shore Line

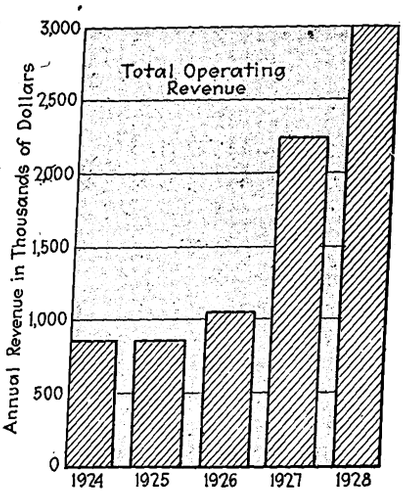
Rehabilitation of 90-mile interurban road considered "a distinguished contribution" to the progress of the industry. Increased traffic and revenue shown by all competitors in contest. Substantial economies made in operation. Improved public relations and effective safety work reported. Presentations summarized in this article

WITHIN four years, the Chicago, South Shore and South Bend Railroad, usually called the South Shore Line, has moved figuratively from the scrap heap to the front rank among electric railways of America. In recognition of this achievement the company was awarded the Charles A. Coffin Prize for 1929. This is the seventh annual award to "that electric railway company which, during the year, has made a distinguished contribution to the development of electric railway transportation for the convenience of the public and the benefit of the industry." Previous winners were: Chicago, North Shore & Milwaukee Railroad in 1923; Northern Texas Traction Company, Fort Worth, in 1924; Pittsburgh Railways in 1925; Pennsylvania-Ohio Electric Company, Youngstown, Ohio, in 1926; Grand Rapids Railway in 1927; and Virginia Electric & Power Company, Richmond, Va., in 1928.

As in past years six principal factors were considered in making the award: More riders and more revenue; a friendly public; lower costs and increased reliability of service; increased safety for riders, employees and the public; co-operation between management and employees; and financial accomplishments. This year seven electric railways submitted briefs. They were: Community Traction Company, Toledo; Chicago, South Shore & South Bend Railroad; Detroit Department of Street Railways; El Paso Electric Company; Houston Electric Company; Northern Texas Traction Company, Fort Worth; and Youngstown Municipal Railway.

Losses Converted to Profits on South Shore Line

Taking over a badly depreciated and insolvent property in 1925, the present management of the Chicago, South Shore and South Bend Railroad thoroughly rehabilitated the line within four years, and completely justified the investment of $13,000,000 of new capital by the conversion of large losses into substantial profits. The South Shore Line is a 90-mile interurban electric railroad, giving a high-speed service with the most modern equipment directly into the heart of Chicago, in the face of keen competition of nine Class A steam railroads, and heavy private automobile traffic over the many good roads which are to be found in the same territory.



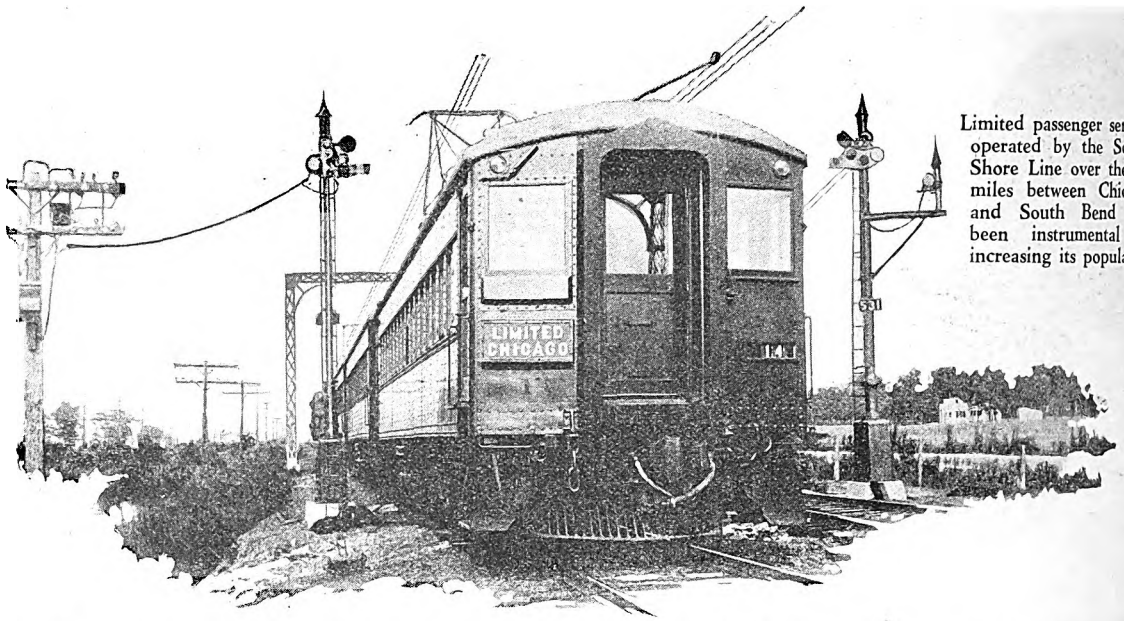
In 1928 the South Shore Line showed a gain in operating revenue of 257 per cent over 1924

The revenue passengers numbered 2,787,190 last year, representing an increase of 8½ per cent over 1927, or 24 per cent over 1924. An increase of more than 150 per cent in freight car-miles was effected from 1927 to 1928, there being 2,992,162 freight car-miles operated last year. The operating revenue was $3,060,540 in 1928, an increase of 34 per cent over 1927 and 257 per cent over 1924.

In addition to operating daily 78 trains now, whereas the old management operated only eighteen trains per day, the schedule speed has also been greatly increased. The 90 miles between Chicago and South Bend was covered in two hours and 55 minutes in 1924; two hours, 30 minutes early in 1928; two hours, fifteen minutes in May of last year; two hours, five minutes in October of last year; with one train making the trip in one hour, 59 minutes at the end of 1928. Trains were operated 93.68 per cent on time in 1928, as compared with 93.09 per cent in 1927, and 75 per cent in 1924.

A large carload freight business has been developed by the use of modern equipment operated on fast schedules, with interchange tracks with thirteen steam railroads. The less-than-carload freight service with over-night delivery between Chicago and cities on the line, properly

Digitized by Google



Limited passenger service operated by the South Shore Line over the 90 miles between Chicago and South Bend has been instrumental in increasing its popularity

advertised, has proved popular with the many industries located along its lines. This l.c.l. freight service gives third morning deliveries to cities of the Mid-West and Northwest. Seven receiving stations are maintained in Chicago, the freight being handled on tractor-trailers from the receiving station to the downtown terminal.

The South Shore Line has carried on a progressive program, in co-operation with Chambers of Commerce of the cities along its line, to stimulate industrial activity and passenger traffic. It has investigated and analyzed the nearby natural resources, and constant encouragement given industries has resulted in the location of fifteen new factories along its line, all of which are served by its side tracks. Progressive merchandising methods applied to its passenger service resulted in 250 special train movements being arranged, which carried 15,000 passengers during the year 1928. Monthly and bi-monthly posters artistically depicting the natural beauties along its right-of-way have been used widely.

A definite effort has been made to meet public favor in operating changes. For instance, freight operation in the streets of South Bend has been eliminated by the laying of a private right-of-way; 2 miles of track has been rebuilt in Michigan City; and plans have been made for relocation of East Chicago tracks.

The completion of the installation of automatic color-light block signals over the entire open right-of-way, 12 miles of which was installed in 1928, was largely responsible for a remarkable safety record for such high-speed service. In 1928 there were no fatal passenger accidents in the operation of 3,822,232 car-miles of high speed passenger service.

A high degree of co-ordination has been effected by through ticketing arrangements between the South Shore Line and the Chicago, North Shore and Milwaukee Railroad, and the Monon steam road. Co-ordination of rail and motor coach service, giving patrons the optional privilege of riding on the South Shore Line or on coaches between Michigan City and Chicago, has decreased the duplication of service by these two carriers.

The fact that 90 per cent of employees bought stock in the last stock issue testifies to the friendly feeling between the management and its employees. Company group insurance, a bowling team, a men's chorus and an arrangement with the engineering extension department of Purdue University, by which the management paid one-half of the tuition of all employees who took night school courses, are among the projects sponsored by the company for its employees. A better business campaign resulted in 757 suggestions from employees, which brought in an estimated total of $7,700 in new business last year.

Budgetary control of construction and operation accounts, employment of an engineering accountant to place final distribution of accounts, and many operating economies were responsible for reduction in operating expenses from 37.1 cents per car-mile in 1927 to 34.2 cents per car-mile in 1928. This compares favorably with an operating expense of 36.3 cents per car-mile in 1924 when lighter equipment was used, and much slower operating speeds were in effect.

Before the present management took over the road, it was impossible to secure outside capital. Since the Midland Utilities Company loaned the money necessary for the rehabilitation program and furnished it expert engineering and purchasing facilities, it has been possible to sell 15,000 shares of 6½ per cent cumulative preferred stock and $3,500,000 of cumulative Class B preferred 6½ per cent stock, 415,000 shares of no-par common stock, and first and refunding mortgage 6 per cent bonds.

Detroit Extends and Improves Transportation Service

IN THE face of severe traffic congestion and jitney competition which first robbed the railway of many passengers and then suddenly ceased and dumped all its traffic upon the street cars, the Department of Street Railways, Detroit, reports in its Coffin prize presentation an increase in the number of passengers carried, an improvement in speed, and a remarkable decrease in accident tolls in 1928.

The most interesting achievement of the year was the inauguration and operation of what is claimed to be the fastest urban surface line in the world, the Jefferson Avenue express. During the year this line maintained an average speed of 18.5 m.p.h. over its 4.3 miles of route. Local stops are made in the downtown area, beyond which express stations are at spaced intervals

Digitized by Google

of 0.9 mile. In the district served by the express stops, local transfer buses operate giving free transfers to express cars upon payment of the 6-cent fare. This remarkable speed was maintained by the use of good equipment, careful schedule-making, efficient performance by the platform men, and most of all, probably, by gaining control of automatic traffic signal lights on Jefferson Avenue through an arrangement with the Police Department. Signal control equipment similar to that used in Louisville, Ky. and described in this paper on page 835 of the September issue, is used on the Jefferson Avenue signal system. By means of contactors on the trolley wire, the street car automatically throws the light in its favor when it approaches the intersection. When the car passes, another contactor returns the light to its original control which in this case is by a master timer regulating all the other signals on Jefferson Avenue. Because the headway is so short that the street cars could easily keep the green lights continuously lit, one of the relays has an adjustable element which can be set from one second to 30 minutes as the longest period of continuous movement on this street.

The fact that 11,466 additional passengers travel over Jefferson Avenue cars daily attests to the popularity of this line. The traffic director of the Detroit Police Department believes that its express features speeded up traffic on Jefferson Avenue from 40 to 60 per cent.

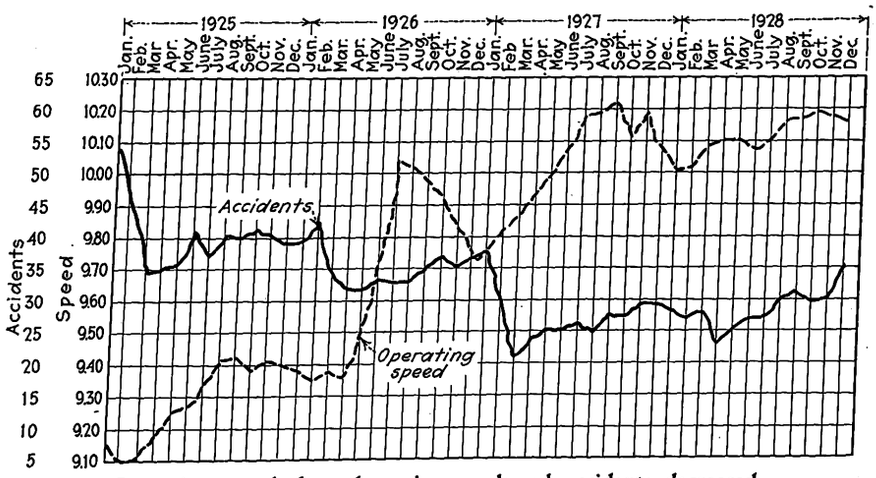
In May of last year the movement of cars and coaches through the downtown area was greatly facilitated at the busiest rush-hour point in the system by an improved loading scheme applied to Capitol Park, the downtown terminus of the Grand River, Fourteenth and Myrtle lines. The plan divorced street cars from vehicular traffic, and provided a safety zone of the steel post type, with ropes strung between the posts permitting three aisles of entrance and egress during the 4 to 6 p.m. period. It is estimated that movement of the 200 cars which pass through the loop during this two-hour period has been accelerated 50 per cent.

Jitney operation, much of which was by "wild-cat" operators, and which had been conducted for six years under the protection of a series of injunctions, was terminated on Oct. 24 when the Michigan Supreme Court upheld the city ordinance banning jitneys. At that time 1,000 jitneys were being operated daily; they constituted genuine and ever-increasing competition. On the morning of Oct. 26 some 40,000 former jitney customers used the street cars. With the coming of November, and the Christmas shopping crowds, the downtown merchants began to wonder if their customers would be transported as well as in the era of jitneys. They called a meeting and asked the department about it. Every bit of available rolling stock was already in service, including 75 new Peter Witt cars purchased in 1928 and 22 cars and trailers rented from Cleveland after the defeat of the jitneys.

But it was feared that the railway system would be swamped with the Christmas rush, so on Nov. 16 the department announced that it had ordered 160 de luxe parlor coaches. Beginning three days later seven new coaches were delivered and placed in service daily until Dec. 24, the climax of the Christmas rush, when the entire fleet of 160 was rolling over Detroit's streets, calling forth much praise, and causing the people to forget entirely the departed jitney.

Along with the safety activities of the railway which reduced the number of accidents 41 per cent in six years to 28.3 per 100,000 car-miles operated, a new method of handling claims was inaugurated. This reduced claims payments to only 2 per cent of the gross passenger revenue during the year 1928.

A new operating center built on Coolidge Highway in the northwest section of the city is expected to result in a $500,000 annual saving in the elimination of waste car-mileage.



Operating speeds have been increased and accidents decreased on the Detroit Street Railway

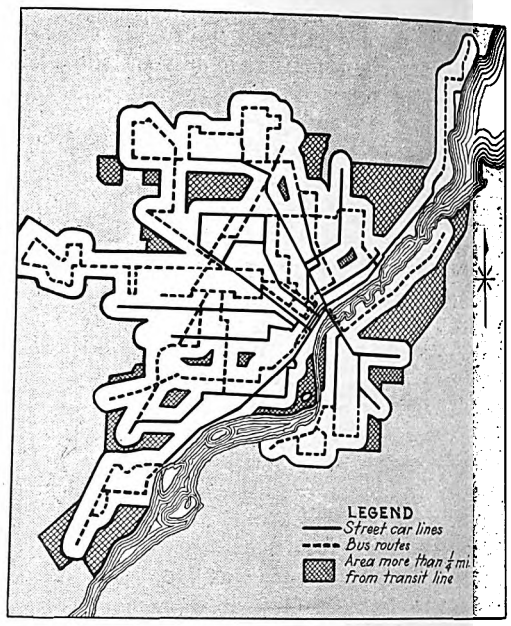
Transportation Service Reorganized in Toledo

EFFECTING a complete change from the public antagonism which in 1919 was responsible for the removal of street cars from Toledo's streets to a spirit of mutual understanding between the city, its citizens and the railway, the Community Traction Company secured a favorable service-at-cost franchise and a steady increase in traffic.

The problem which faced the management of the Community Traction Company and the city officials of Toledo was one of extreme complexity. Constant wrangling had characterized their relations since the original Milner franchise was passed in 1920. Apparently, the franchise had been written with correct principles in mind, but was unsatisfactory because of its vague stipulations. From the railway standpoint, the matter of bus competition was particularly irritating. The city maintained, on its part, that the company was not doing its fair share in a comprehensive street rebuilding program, and had presented to the railway bills for $267,769 representing paving claims dating from Feb. 1, 1921.

Although there had been many earnest efforts made to solve the transportation problem, no results had been obtained. During the first half of 1928 constructive steps were taken in the form of conferences between the city and the company officials. As a result, a new agreement was negotiated, which the City Council approved and the Mayor signed on June 5, 1928.

Substantially a five-year modification of the original Milner ordinance, the new franchise gives the railway almost a monopoly of Toledo transportation service by prohibiting any competition within ¼ mile of a Community Traction Company car or bus line. A disputed power bill amounting to $150,000 was credited to the company, and represented a 1¼ cent per kilowatt-hour reduction. In exchange for these terms, the company agreed: To pay old paving charges to the sum of $185,241 with 6 per cent interest; to pay for a $25,000 traffic survey; to set up a five-year reconstruction program amounting to $560,000; and to make certain concessions in connection with the depreciation fund. The railway agreed to reroute existing lines, to abandon nonessential lines, and to expand its service into new areas.



Revised routings of the Community Traction Company provide convenient car or bus service to every section of the city of Toledo

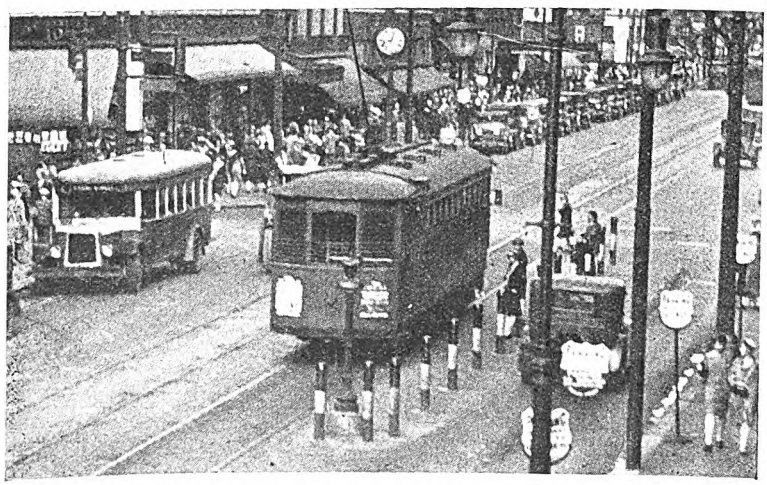
In 1928 there was an increase of 7 per cent in revenue passengers over 1927, and an increase of 7½ per cent in operating revenue. This was accompanied by a substantial expansion of service as indicated by the rail and bus route mileage, which increased from 61.43 miles in 1926 to 124.79 miles in 1929. Systematic co-ordination of car and bus service provides buses to replace weak trolley car lines, to serve as feeders for the street cars and to develop new routes.

Under the terms of the ordinance the independent bus lines were forced to sell out to the railway company. The six lines operating on June 30, 1928, were purchased from the independents on a property valuation basis under the terms of the ordinance. Although a few of the 40 buses bought were serviceable, the company bought a total of 88 new buses during 1928.

By adding two extra 35-hp. motors to the 68 Peter Witt cars already equipped with two motors of that size, the company was able to speed up its service on several lines. An improved scheduling system eliminates needless stops, and varies headways, layover times and speeds during the day to meet traffic demands.

A sharp reduction in operating ratios has resulted from operating economies accompanied by increased revenue. An increase in one-man operation of both cars and buses from 45 per cent to 70 per cent since 1927 was an important factor in the reduction of railway operating expenses from 36.7 cents per mile in 1927 to 34.6 cents in 1928. The railway operating ratio was decreased from 85.3 per cent in 1927 to 79.5 per cent in 1928, while the bus operating ratio was decreased from 105.4 per cent to 93.6 per cent in the same period. Increased efficiency possible in a new modern garage for 150 buses, which was built on an old carhouse site at a cost of $135,000, helped considerably in reducing bus operating expenses.

With improved public relations, the company now pays claims without legal process only when it is clearly at fault, feeling reasonably sure of a fair deal by going into court when not at fault. The total cost of the claims



Bus and street car services have been scientifically co-ordinated in Toledo to render the best service to the greatest possible number of people

Digitized by Google

department was reduced from 4.3 per cent of the gross revenue in 1927 to 2.97 per cent in 1928. In spite of the limitations of a service-at-cost agreement on one side and a strong union organization on the other, good relations exist between employees and management.

Although these achievements cover a relatively short period of time, the Community Traction Company believes that there is every indication that success will be permanent. A comprehensive article telling in detail of the accomplishments of the company was published in the July issue of ELECTRIC RAILWAY JOURNAL, page 701.

Scientific Fare Schedule Instituted at Houston

BY MEANS of a scientific fare schedule which automatically varies the rate charged, making it commensurate with the frequency of use and time of demand, the Houston Electric Company, Houston, Texas, another property competing for the Coffin prize, offers each class of patrons the minimum fare to which it is entitled. This fare system offers a steadily decreasing rate as the use of the service increases. The regular rider, using the service several times a day both on and off peak periods, buys a 25-cent weekly ticket which entitles him to ride as often as he wishes on payment of a 5-cent fare. The occasional rider buys four tokens for 30 cents.

A fine example of community co-operation existent in Houston is evidenced by the elimination of jitney competition by popular vote, and by the adoption of the new fare schedule which appreciably increased the gross income of the company at a time when people were generally opposed to an increase of rates in another utility.

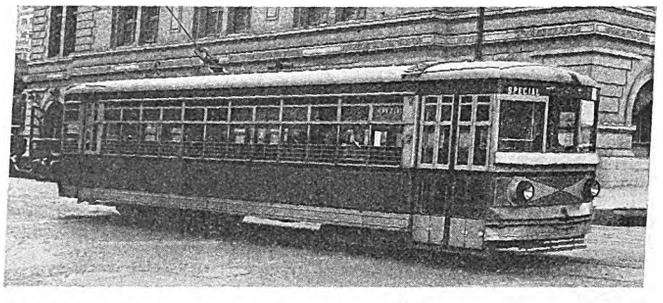
Transportation needs are quickly recognized and analyzed in the communities served by this railway. By scientifically supplementing street railway service with bus service, using the bus to test out the potential traffic of new sections of this rapidly growing city, and eliminating unprofitable car service, the company has increased its operating ratio 9 per cent over that of 1927, or 32 per cent over 1924. Every request for transportation service is carefully studied and the service is furnished if it can be given profitably; where profitable service is impossible a full explanation of the absence of service is given to the citizens interested.

Employees of the Houston Electric Company have been schooled to understand the company's business and to express such knowledge freely to the company's patrons. The company has followed the far-sighted policy of frankly advertising full information on its financial problems through the newspapers and its employees. The results of a carefully planned campaign of employee contacts and newspaper advertising were the ousting of all competing jitneys and the granting of a virtual monopoly of transportation business to the railway by the winning of a popular election on the question.

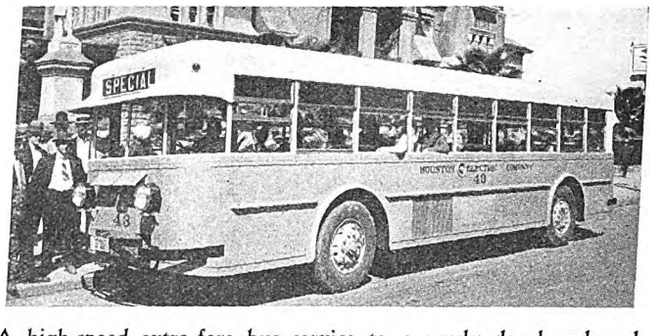
The claim presented by this company in its brief includes an increase of 1 per cent in 1928, or 14 per cent over 1924, in the total number of passengers carried. In 1928 the operating revenue increased 9 per cent over that of 1927, or 32 per cent over 1924; while the total investment is steadily increasing, the investment per dollar of gross revenue is constantly decreasing. The net revenue shows a steady increase with the operating ratio decreasing from 68.3 per cent in 1924, to 64.2 per cent in 1927, and 61.6 per cent in 1928.

In addition to placing twenty new one-man, single end, treadle exit cars in service last year, the company has accomplished a complete modernization of its old railway cars. The modernization program included conversion of old cars for one-man operation, the installation of treadle exit doors, and the use of original and attractive car colors.

A high-speed extra-fare bus service to a newly developed and distant suburb of Houston is popular among the passengers. Their willingness to pay the extra fare evidences the popular understanding of the street railway problem. Off-peak slumps have been partially alleviated by increased special business which was developed by a consistent and regular advertising program, using 30 in. of display space once a week in each of the three daily Houston papers; and also billboards, motion pictures, programs, year books and pamphlets.



The Houston Electric Company placed twenty new one-man, single-end, treadle exit cars in service last year, in addition to modernizing all its old equipment



A high-speed extra-fare bus service to a newly developed and distant suburb of Houston has proved popular

An extensive safety program which was organized in 1927 resulted in a safety record for 1928 which was the best in twelve years, the number of accidents being reduced 27 per cent from those of 1927. The number of accidents per 10,000 miles was reduced 29 per cent in the same period, with the accident cost per mile reduced 6 per cent. As a supplement to classroom study of accidents and accident prevention, a safety contest awarding a gold star to operators with a clear accident record for one year, and $5 bonuses to operators with 60-day accident records clear, has been effective in stimulating operators to their best efforts in accident prevention.

Particular attention has been given street traffic conditions. Complete co-operation of the Police Department has been secured in handling traffic, and allowing street inspectors to act as traffic police has facilitated street car movement. A scientific study of traffic has been instrumental in perfecting schedules and increasing speed.

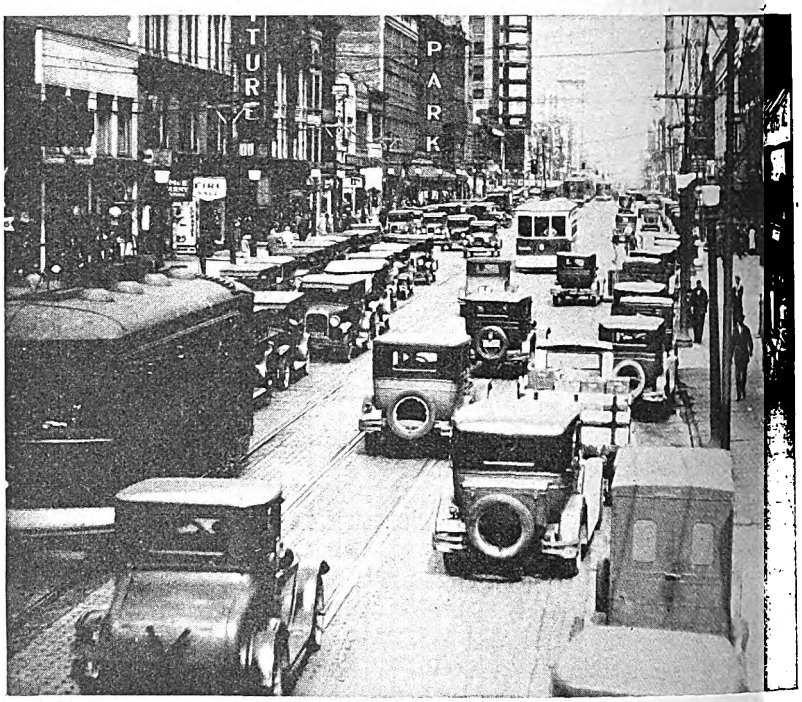
New Franchise an Outstanding Achievement at Youngstown

EMBODYING principles long recognized as sound, but which are often neglected in the preparing of city-railway agreements, the franchise consummated between the city of Youngstown, Ohio, and the Youngstown Municipal Railway marked a great stride in the history of franchises. The new arrangement provides a flexible rate of fare, relief from many tax burdens, protection from all new competition, and genuine co-operation between the city and the company.

While the franchise was actually passed in January of this year the work of preparing it was done in 1928 and the public understanding which made possible the passage of a measure so favorable to the railway had been built up in years preceding. The company has worked on the assumption that if good public relations are to continue, it must take advantage of all the developments in the art. The franchise was drawn up entirely without haggling.

It was recognized from the start that close co-operation was needed between the city, the company, and the public when the City Council appointed in May, 1928, a committee of Youngstown citizens who were leaders in their fields of business, finance and manufacturing to draw up a franchise. This committee met conscientiously during 1928, at each meeting thrashing out the questions with tireless efforts; every meeting was attended by the president and general manager of the Youngstown Municipal Railway. The co-operative franchise as drafted was finally submitted to the City Council of Youngstown which heard it read during three successive meetings, passing it on May 22. It was signed by the Mayor three days later.



Local transportation service in Youngstown has been put on a sound basis by the enactment of a new franchise

The provision in the franchise that all the expenses of the street railway commissioner's office be borne by the city is an interesting indication of Youngstown's acceptance of the principle that the transportation of a city's citizens is a civic problem. Another provision which constitutes an advance in the relationship between a municipality and a railway is that which permits the company to lay tracks over any bridges and viaducts of the city by paying only the expense occasioned by the tracks. Another relieves the company of its contracts in the franchise should the City Council allow any new competition to appear in Youngstown.

Recognition of the dual fields of the street car and the bus and of the value of properly co-ordinating the two carriers, is responsible for the complete service given all parts of the city. Bus lines have been extended from time to time in order that every part of the city might be served by mass transportation facilities. This property has also been progressive in the matter of modernization, ruthlessly scrapping old equipment and maintaining the highest standards of cleanliness and paint. The average age of the company's cars is ten years. There is not a single obsolete car on the property.

A number of experimental bus lines have been operated in Youngstown. The fact that the experimental line was to be operated was thoroughly advertised to the people of the locality interested. When it was found necessary to give up such service because of failure to produce proper revenue, a complete explanation was given the people.

A complete safety program, developed consistently since 1919, resulted in the company's being awarded the Anthony N. Brady gold medal in 1927 for the best accomplishment in accident prevention. The safety program which was responsible for a 22 per cent accident reduction in 1927 and an even greater record in 1928 included: central, intermediate, and group safety committees, representing all departments; a general safety supervisor, who gives all his time to the promotion of safety work; a department of instruction which makes sure that all employees are instructed in safe practices; safety contests whose details are changed occasionally to preserve interest in the results; and a bonus system which has aroused the co-operation of all employees. Bonus awards were made to 96 per cent of car and bus operators in 1928.

By pursuing a policy of holding down as low as possible the number of extra men, while at the same time giving them enough work to make a living, and by efficient scheduling and assignment of runs, the company has been able to increase its number of miles run per operator from 16,255 in 1924 to 21,475 in 1928. Similar economies have been made in its mechanical departments and in the number of platform men with the result that the total amount paid employees decreased 20 per cent from 1924 to 1928, while the gross revenue per employee increased 33.7 per cent. The payroll was reduced not by cutting wages, but often in spite of increasing them. Operators' wages, for instance, were increased 12½ per cent in the five-year period.

Digitized by Google

El Paso Railway Active in Popularizing Service

INCREASED net revenues on railway and bus lines and a substantial increase in traffic are reported by the El Paso Electric Company, El Paso, Texas, in its presentations for the Coffin prize. This was possible largely because of the high degree of co-operation which existed between the management and its employees. Every effort was made to individualize the work of the employees and to stimulate them to their best work. A detachable metal plate with the operator's name on it was placed on the fare box of each operator, increasing public good will and assisting him in transportation salesmanship. Employees aided in popularizing the service, acting as speakers before civic bodies.

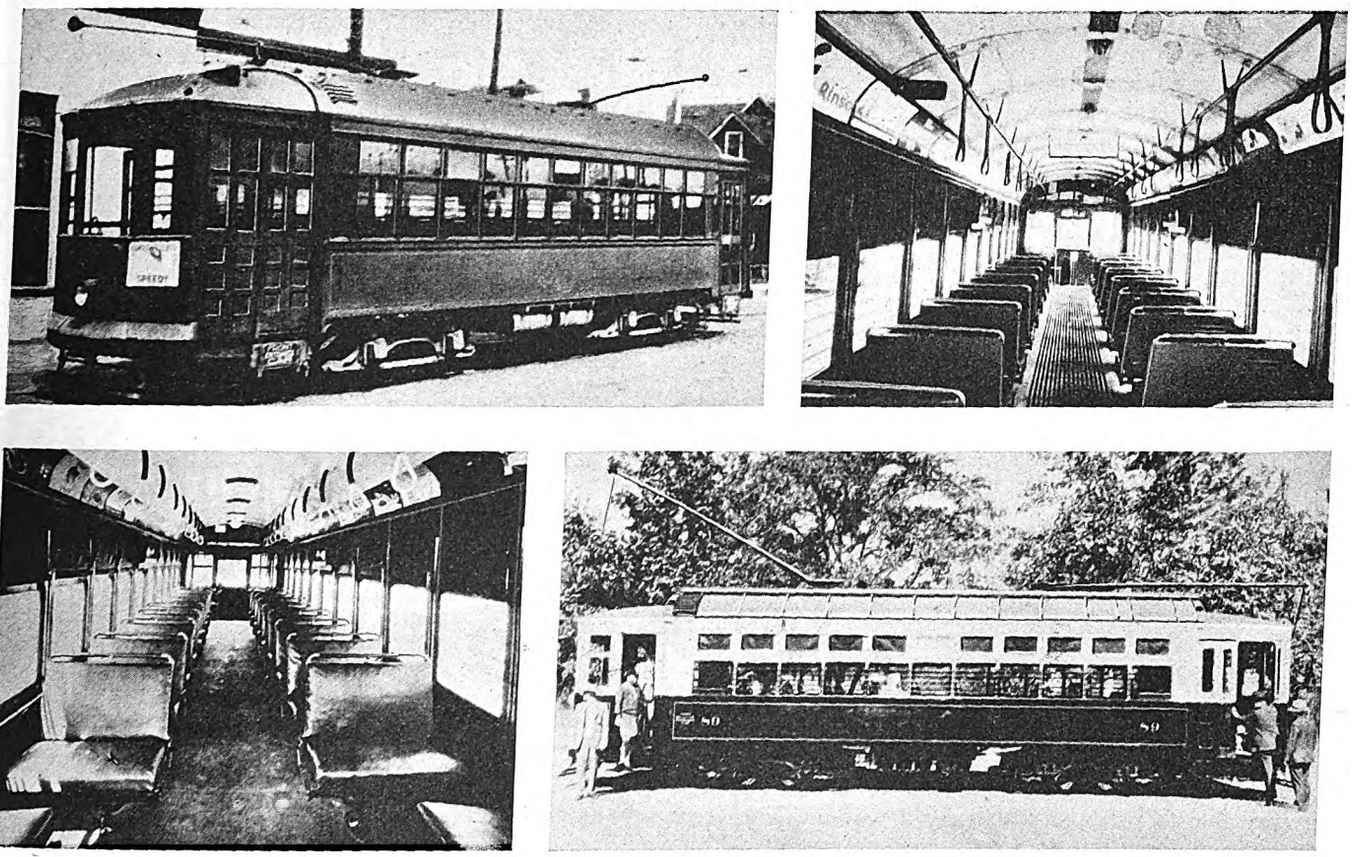
The 2 per cent increase in railway revenue passengers last year over 1927 and the 1½ per cent increase in operating revenue were due also to an organized advertising campaign carried on in dashboard posters, inside car-cards, hotel publications, Chamber of Commerce pamphlets, distinctive newspaper layouts, and in "Personal Transportation." The latter is a booklet with street maps, street car and bus routings, and information on local points of interest, which proved to be a good advertising medium.

A 75 per cent reduction in the number of street car accidents within eight years in the face of a 41 per cent population increase and a 73 per cent increase in the number of El Paso automobiles is the accident reduction record of the El Paso Electric Company. The number of accidents per 100,000 passengers was reduced from 3.16 in 1924 to 2.42 in 1927 and 2.35 in 1928. Safety slogans, safety contests, "zero day" contests, honor rolls and a gold star system have enabled the company to better its accident record during 1928 after winning the Anthony N. Brady safety medal in 1926. A monthly honor roll lists the operators who have gone without an accident for the past month; three months on it gives a man a day off with pay, and each consecutive month he remains on he gets a day off in the same way.

Serving many Mexican people who do not read or speak English, the company has met the complications of this international aspect of the transportation problem by displaying some signs in the Mexican language and befriending the people from the other side of the border in every possible way.

A modernization program included the complete remodeling of twelve cars of older type, installing rear exit treadle-operated doors, changing the fare box arrangement, improving the lighting equipment, upholstering the seats, and attractively painting all cars. Improvement of service was accompanied by a 7 per cent reduction of car-miles operated, principally by speeding up schedules.

The loyalty and efficiency of the company's employees were not secured by a mere wave of the hand. An extensive program for improving company employee relations includes welfare work, a loan fund which is available to employees, club rooms, meetings, home study encouragement and an Employees' Benefit Association providing medical service and insurance, an annual picnic, safety and sports contests, dances, safety banquets and various other events sponsored by the company. The management encourages home-study by refunding the cost of all correspondence courses completed.



The modernization program of the El Paso Electric Company included re-upholstering of seats, installation of treadle exit doors, and attractive painting as may be seen by comparing the upper two views with the lower two

Notable Financing Achieved at Fort Worth

BY PROPERLY advertising in advance its sale of three-year 6 per cent secured gold notes, the Northern Texas Traction Company, Fort Worth, another of the competitors in the Charles A. Coffin contest this year, distributed more than $1,000,000 of the issue to local people within six days. The success in selling these notes was largely due to public confidence which had been built up by the company in the preceding several years. The annual saving in reduced interest charges on this issue is a great advantage, although the railway management feels that the largest benefit will be the increased good will fostered through customer ownership of securities.

This property has been progressive in the rehabilitation of bus lines. By developing and employing efficient methods of rebuilding bus bodies, engines and chassis, it was able to produce practically a new machine from an old run-down bus at a total average cost of $2,130. Bus equipment which it thought was obsolete was discarded and eleven new buses purchased to replace it; the new equipment was introduced with a parade which attracted much favorable public interest. Hand in hand with improving the service on the Fort Worth-Dallas bus line, was an increased fare which riders accepted without protest.

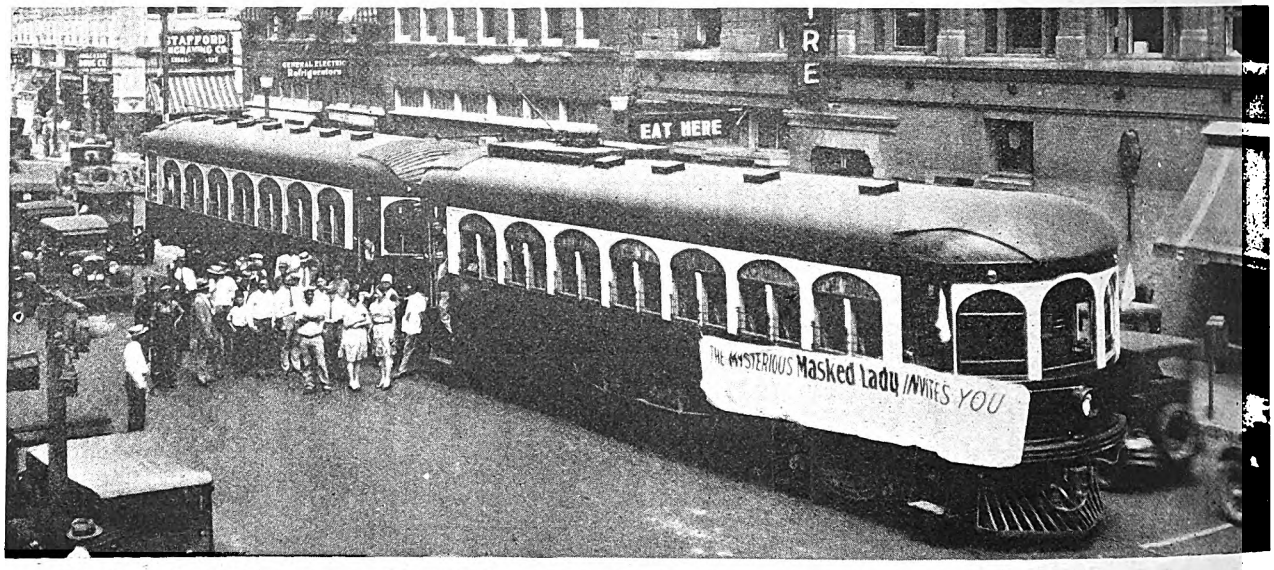
Reorganizing the safety campaign of the Northern Texas Traction Company by dividing the trainmen into teams, giving a bi-monthly dinner and entertainment for the one with the best safety record, and awarding distinguished service insignia to trainmen with a clear record, resulted in a reduction of 6.9 per cent in the total number of accidents from the figure of 1927, and a decrease in the cost of claims settlements in spite of increased traffic density in Fort Worth.

When the company decided to sell the notes locally, the first problem was to perfect an organization. It was decided that since good understanding and friendly relations existed between the company and its employees, the latter could be asked to assist in the note sale. The slogan of "Every Employee a Salesman," was adopted and general meetings of employees were held in which the purpose of the note issue and the procedure to be followed were explained. Each employee was given the necessary forms to sign up the prospect.

In talking to the different passengers boarding their cars, the trainmen attempted to interest them in the note sale, and after working-hours made calls on those who had indicated an interest. When a person was interested, but not ready to sign, his name was turned over to the inspectors of the division, who personally called on the prospect or turned in the name at the general office.

A group of employee solicitors consisting of one or more members of each department signed the employees who wished to buy notes. Due to the partial payment plan, a large majority of them purchased notes. A total of $127,900 of the entire issue sold and exchanged was absorbed by employees, demonstrating the friendly feeling of the employees for the company.

Of the $1,000,000 worth of notes distributed locally, $500,000 worth was reserved to exchange for the 7 per cent notes due March 1, 1928. The sale of the first $500,000 in notes started on Jan. 26. Beginning on Jan. 22, dash signs were carried on all street cars, and on Jan. 24, the first advertisement appeared in the papers. On Jan. 24, circulars giving the particulars of the issue were mailed to more than 40,000 persons in the surrounding territory. Telephone calls and letters reserving the right to purchase notes were received daily after the first publicity appearance. The demand for the notes was so great that in only four days the amount was oversubscribed, and a new record for the sale of securities among Stone & Webster companies was established.



Part of an advertising campaign of the Northern Texas Traction Company which was effective in attracting public attention

The rapid sale of this note issue may be interpreted as a recognition by the people of the need of a first class street railway and of the stability of the industry; also the position of the company has been strengthened with the local banks, and new money may be borrowed as the need arises.

The Northern Texas Traction Company has advertised consistently throughout the past several years. Most of the advertisements were planned with the idea of actually selling rides, rather than merely building "good will." It was also found that personal solicitation in selling its nickel pass established a contact with the people of the city which was valuable in dispensing information, and in getting suggestions.

New Equipment and Maintenance

Keynote of Engineers' Activities

F. H. Miller

LATEST developments in railway equipment, track construction and maintenance, both from an operating standpoint and from an economic point of view were given in the papers read and in the discussion that followed in the meetings of the Engineering Association. On Tuesday and Wednesday afternoons separate meetings were held by the Power, Way and Structure, Rolling Stock and Shops, and Purchases and Stores Divisions. On Tuesday morning and Thursday afternoon general meetings of the Engineering Association were held.

Officers of the Engineering Association for the ensuing year were elected at the Thursday afternoon session. They are:

President, W. W. Wysor, chief engineer United Railways & Electric Company of Baltimore.

First vice-president, L. D. Bale, superintendent of power Cleveland Railway.

Second vice-president, Charles H. Jones, general manager Chicago South Shore & South Bend Railroad, Michigan City, Ind.

Third vice-president, P. V. C. See, superintendent of equipment, department of railways, Northern Ohio Power & Light Company, Akron, Ohio.

Members at large are F. McVittie, electrical engineer New York State Railways, Rochester, N. Y.; E. M. T. Ryder, way engineer Third Avenue Railway, New York City; Howard H. George, superintendent of way Cleveland Railway; A. T. Clark, superintendent of rolling stock and shops United Railway & Electric Company of Baltimore.

The general meeting of the Engineering Association held on Tuesday morning opened with an address of President Frank H. Miller, in which the necessity of adequate maintenance was stressed. Due to the inability of Mr. Miller to present his paper personally, it was read by W. W. Wysor, vice-president. It was pointed out that the problem of the engineer is to give the operator of an electric railway that type of equipment, track and power which will permit the public to be served most economically with the highest speed consistent with safety and comfort. The problems confronting the engineer in car and bus design are weight reduction, noise elimination, improved lighting and appearance, comfort in boarding and leaving, and more rapid acceleration and braking, he held. The motor bus industry is becoming larger every year, and has brought about progress in design and operation, maintenance and housing, which are entirely different from the standard electric railway practices.

A. T. Clark, chairman of the judges of the maintenance contest conducted by ELECTRIC RAILWAY JOURNAL, awarded the prizes to the Cleveland Railway and the San Diego Electric Railway. A report of this award was published in ELECTRIC RAILWAY JOURNAL for August. After the presentation of the awards, H. H. Adams, superintendent of rolling stock and shops Chicago Surface Lines, read his paper "Car Design and Equipment Development," an abstract of which appears elsewhere in this issue.

Results obtained with conical and cylindrical wheel treads were given in a motion picture, which showed clearly the contacts made by the two types of wheel treads with the rails. The photographs recorded tests over new as well as old track.

At the Thursday general session a report was presented by E. P. Goucher on the work of the committee on co-operation with the U. S. Department of Commerce. It was approved without discussion.

Edwin W. Ely, chief of the division of simplified practice, Bureau of Standards, read a paper on "Synchronism." The electric railway industry is comparable in magnitude to some of the other manufacturing industries in the United States, he said. The electric railways are engaged in manufacturing—producing transportation in terms of either ton-miles or revenue car-miles. In 1928 alone the industry produced 2,190,000 revenue car-miles, representing an increase of 65,000,000 per year since 1922 despite a deletion of 3,000 miles of single track. Such a manufacturing schedule as that depends for its success on a well-balanced program of construction and reconstruction; additions to and amplification of power plants, substations and line equipment; purchase of new cars and car equipment and reconditioning of the old, and studied co-ordination of bus and car operation. The exact moment for undertaking each of these steps involves not only co-operation of people but synchronization of operations. That the planning in 1928 was sound is borne out by these facts: wages reached their highest point; receiverships dropped to a minimum, and the trend of credit pressed upward. Not only the association executives but people on the outside look optimistically into the future.

Since 1921, the division of simplified practice has assisted in synchronizing the efforts of these main elements of industry in the matter of eliminating waste, stated Mr. Ely. There are today in effect 105 simplified practice recommendations which, through surveys conducted by the various groups, contain the best thought

Digitized by Google

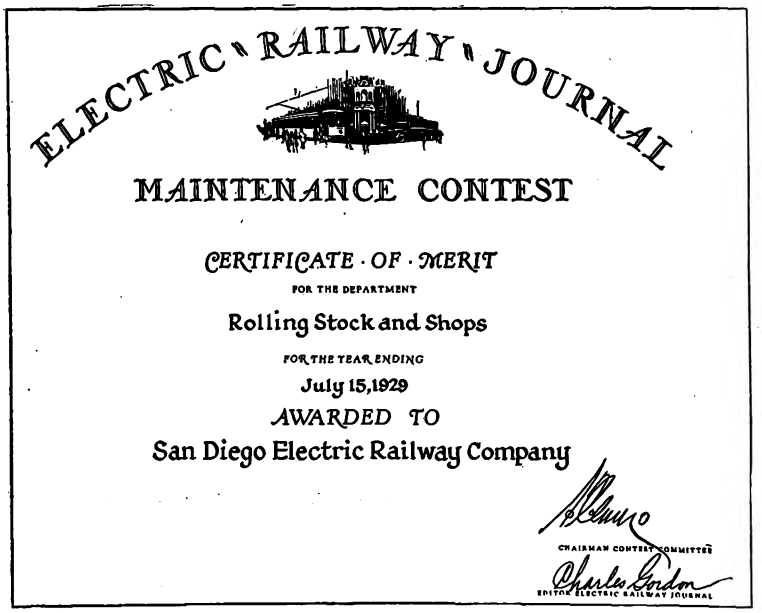
and practice. The list includes, for example, a 35 per cent elimination of plow bolt sizes and an 85 per cent reduction in the varieties of sheet steel.

Periodic re-surveys and audits keep these simplified lines abreast of changing conditions. Fifteen commodities, recently measured, showed that an average of 89.8 per cent of the volume had been produced in accordance with suggested practice.

Charles Gordon, the newly appointed managing director, assured those present that the engineering problems of the electric railway would still have his full attention. Mr. Gordon pointed out that G. C. Hecker, heretofore special engineer of the association, would be, temporarily at least, succeeded by A. W. Baker, who for several years has been Mr. Hecker's assistant and is familiar with the work of the engineering committees.

Mr. Hecker emphasized the fact that in his new capacity of general secretary he also is secretary-treasurer of the Engineering Association and thus will be in contact with it continually.

A. E. Harvey, engineer of way and structures of the Kansas City Public Service Company, presented a paper on "Some Comments Concerning Standards and Recommended Practices for Track Paving."



Certificate of merit presented to San Diego Electric Railway Company

In the discussion of Mr. Harvey's paper the question of whether the municipality should stand the expenses of track paving or whether these costs should be borne by the railway operator caused much comment. Those present were in favor of having the municipality install the track pavement after the track had been laid, which had been done in only a few instances, one case being in Atlantic City. E. M. T. Ryder thought that the conditions presented in the paper were about the same in every city, with only minor variations. Mr. Harvey stated that in Kansas City 75 miles of concrete pavement is installed and also a great deal of granite and asphalt, the latter being more expensive than concrete not only in first cost but also in maintenance. Brick pavement was said to give good results but is not superior to concrete.

The report of the committee on resolutions was approved, together with the report of the committee on nominations. Selection and installation of the new officers followed.

R. H. Dalgleish received the past-president's badge for Mr. Miller, and in behalf of Mr. Miller thanked the Engineering Association for the co-operation given him during the time he was president.

Rolling Stock

A. T. Clark, chairman, presided at the meetings of the Rolling Stock Division. He presented the report of the standing committee, which was approved. Special committee reports were presented by the chairman or vice-chairman, as follows: Manual review, W. C. Bolt; motor coaches, P. V. C. See; roller bearings, W. C. Bolt; limits of wear, W. T. Vivian; lubrication, J. H. Lucas; automatic coupler specifications, P. V. C. See; fire hazards in shop practices, E. J. Jonas; welding wheel flanges, W. C. Bolt; current-collecting devices, Hugh Savage. Progress reports only were presented by the committees on roller bearings, limits of wear, and fire hazards in shop practices. The completed reports were approved by the meeting. The one on current-collecting devices created considerable discussion. It was suggested that a standard length trolley pole be adopted, but it was held that this is not practicable.

The report of the committee on heavy electric traction was presented by H. F. Brown. This report was approved at the meeting.

The second session opened with a paper by W. A. Keller, on "Seeking Ideal Car Performance." The actual meaning of performance was interpreted to intend "production of results." Explaining the meaning of "ideal car," he stated that several of the qualities found in the present-day automobile should be found in the design of a modern street car. Much stress was laid on the appearance of the car body so as to give satisfaction from the standpoints of comfort, convenience, appearance and economy. Paramount importance was accorded the reduction of noise, as this was considered vital if the automobile-minded public was to be retained as car riders.

P. V. C. See started the discussion with a comparison of automotive acceleration and retardation with those of electric railway operation. He felt that if faster acceleration is obtained, higher braking rates are of vital importance to make operation safe. In discussing the weight of cars in relation to energy consumption, attention was called to the fact that with lighter cars, energy consumption may be decreased even though the speed is increased.

H. S. Williams, Detroit Street Railways, read the report on car design, which was approved without discussion. Mr. Adams then read in abstract a supplementary report just received from the Bureau of Standards in Washington. A lengthy discussion took place on the desirable speed in city operation.

The report of the committee on noise reduction was abstracted by H. S. Williams and received great attention. In the discussion which followed it was found that satisfactory results are being obtained in silencing wheel noise by welding a soft iron ring under the side of tread. Extensive tests were made by the committee with a number of silent brakeshoes placed at their disposal. It was found that the use of such a brakeshoe eliminated practically all of the sound caused by the

Speakers Who Helped to Enliven the Engineering Meetings

clattering of the shoe against the wheel. Various other means of sound deadening were discussed, and it developed that the resilient wheel showed the best characteristics, followed closely by a wheel to which a lead ring was added.

Way And Structures

Chairman E. M. T. Ryder of the way and structures division introduced W. W. Wysor, who commented on the improved condition of the industry, and stressed the duty of the engineer to assist in this improvement. High-class construction and the use of labor-saving equipment are needed to obtain efficiency, both as to cost and quality.

The report on special trackwork was presented by E. M. T. Ryder, who commented on the new standard switch, and the interest manifested therein, which extended as far as France. Various users of the new standard switch stated that it had proved very satisfactory.

The report on wood preservation was presented by C. A. Smith. He recommends that, so far as the subject relates to car construction, it be handled by a special committee to include members from the Rolling Stock Division.

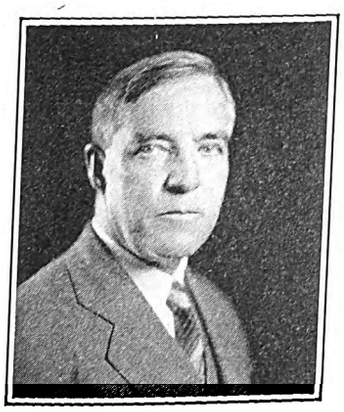
The report on pavement was presented by A. E. Harvey, chairman, who on account of difficulty in getting co-ordinated results from various railways suggests that the subject be treated in the future by considering principles of design rather than actual contours and plans, to include also specifications for material and workmanship.

Mr. Ryder reported on the activities of the committee on welded rail joints, which has confined itself at the present time to tests made on small specimens rather than on full-sized joints. This work is being carried on with the co-operation of the Bureau of Standards.

The second meeting was held on Wednesday, Chairman E. M. T. Ryder presiding. H. H. George presented the report on alloy steels other than manganese for special trackwork, in the absence of A. T. Spencer. N. Salsich explained a new compression drop test machine mentioned in this report. Motor bus garage design was the subject of the report presented by M. W. Rew. W. W. Wysor, chairman of the committee on rail corrugation, introduced Prof. D. D. Ewing who presented a report on track construction. This report brought forth considerable discussion, particularly in reply to an inquiry by C. A. Smith as to the comparative effects of corrugation on rigid and non-rigid track construction. The report on light section rail was presented by R. E. Miller in place of C. A. Alden. C. H. Clark made an oral report showing the difficulties of designing a track gage applicable to all rail sections, which was discussed extensively. H. F. Merker, chairman, reported on foundation and supporting structures for steam railroad crossings. C. F. Gailor, chairman, presented the report on arc welding.

Power

The first session of the Power Division was opened by chairman W. E. Bryan. J. W. Allen presented the recommended Manual changes and Dwight L. Smith abstracted the report of his committee on specifications for overhead material, but aside from a statement by J. F. Neild as to the great value of the latter, there was no discussion or comment.



J. R. Blackhall

S. B. Cooper

J. F. Neild

Men Who Contributed Stimulating Thoughts Before the Various Engineering Divisions

Digitized by Google

Mr. Neild, presenting the report on braking devices for trolley wire reels, emphasized that it was of less importance what other method was used so long as friction was not applied to the wire itself, and C. R. Harte pointed out the importance of the recommended practice and similar moves that substitute mechanical means for hand labor and overhead work.

On conduit specifications W. S. Quinn, chairman, started a discussion about ventilation. W. E. Bryan felt that the small size of the manholes was apparent only so long as they were used solely for railway service. S. B. Cooper, responding to a question in his paper, "Power Requirements of City Cars as Affected by Gear Ratio," said no general rule could be laid down for balancing of speed against resultant power costs because of the large number of variable conditions involved and the fact that a real value of any increase in speed is so difficult of specific determination.

The session was closed by Mr. Neild's paper, "Comparisons of Operating and Maintenance Results." The close relation of a specific case used in the report on trolley wire wear led to the recommendation by Chairman Bryan that the two subjects be discussed together.

The reports considered at the second session of the Power Division developed important and extended discussion. Power rectifiers, it was generally agreed, have proved satisfactory within a limited field, opinion varying, however, as to the extent of that field. A. W. Baumgarten, Harley Swift, L. D. Bale and L. J. Turley cited experiences.

Trolley wire wear, presented by J. F. Neild in the absence of Chairman H. S. Murphy, led to comment by L. R. Wagner that the cost of preventive measures must be weighed against their worth from operating and public policy standpoints, as well as simply maintenance matters, while W. T. Trautman stated that the regular live force could effect the necessary protection at little additional cost by consistent inspection and smaller repairs.

The subject of greatest interest was the report on proper trolley voltage for congested city districts. Dwight L. Smith questioned whether the disadvantages of 400-volt operation did not outweigh the economies to be anticipated. This question was argued pro and con by a large number.

Purchases and Stores

With A. A. Ordway in the chair and a representative group in attendance the meetings of the Purchases and Stores group got under way Tuesday afternoon. The paper of R. C. Cram, "Engineering Aspects of Purchasing," abstracted elsewhere in this issue, was generally commended. The speaker expressed the opinion that there should at all times be the fullest co-operation between the engineering and purchasing departments in the interest both of efficiency and economy.

The mechanics of the stores department, particularly as regards the receipt and storage of materials, was thoroughly covered by W. S. Stackpole, general storekeeper Public Service Co-ordinated Transport, Newark, N. J., the subject of his paper being "The Importance of a Good Stores Receiving System."

President-Elect W. W. Wysor spoke of the importance of a definite understanding which should obtain between purchasing agent and engineer. "In order to function properly," he stated, "the purchasing agent must have definite information, and he should receive that information from the engineer."

At the luncheon meeting a paper by B. J. Yungbluth, president International Railway Company, Buffalo, N. Y., was read by W. R. Young. Mr. Yungbluth, who for many years was connected with the stores and purchasing departments of several electric railways, pointed out the importance of the purchasing agent in any organization, and expressed his opinion that the man holding that position should familiarize himself with the details of practically every department in the company in so far as their ordinary requirements are concerned.

At the meeting on Oct 2 the principal address was by Edwin W. Ely, chief of the simplified practice division, U. S. Department of Commerce, who spoke on "The Advantages of the Simplified Practice Movement." The speaker stressed the willingness of his department to co-operate and assist in the advancement of the simplification and standardization movement. Standards, he explained, should be the servants of industry.

Engineering Aspects of Purchasing

By Roy C. Cram

Assistant Engineer Third Avenue Railway System, New York, N. Y.

In an address delivered before the Purchases and Stores division the point was made that nowhere is co-operation of more importance than between the engineering and purchasing departments.

R. C. Cram

NO ENTERPRISE of magnitude was ever long successful without co-operation. The engineer and the purchasing agent must recognize this fact and work together willingly and pleasantly.

The engineer can co-operate with the purchase and stores department in many ways that will greatly aid in keeping his own departmental costs somewhere near what his estimates and budgets call for. He should constantly endeavor to keep his specifications up to date, and his drawings for parts must be correct in showing those changes and revisions that use has made necessary.

When some device or material new to the property is being considered, a talk with the purchasing agent or the storekeeper will aid. They must be advised where to make price inquiries, and the question of where material is to be stored must be settled. It is better to do this before purchase than to handle the article several times.

Perhaps the greatest co-operation can be given in connection with obsolete material. The engineer does not worry much about such stock, perhaps because it is carried in the Material and Stores Account until used. Meanwhile it is eating its head off in overhead expense,

Digitized by Google

and if it should be used the engineer wonders why it costs so much. The engineer should see to it that obsolete material is used up or scrapped. It occupies space better used for storing active materials.

The co-operation should extend to the constant endeavor to utilize association standards to the fullest possible extent, while the various simplified practices promulgated by the U. S. Department of Commerce should be jointly studied and applied to the property. Where these things have been done, some remarkable economies have resulted.

Undoubtedly the engineer may help the stores department. He can aid in questions of design of buildings, selection of yards, interior arrangements and design of economical means for receiving, handling and storing.

The financial officer must have certain information if he is to provide for fluctuation in expenditures due to seasonal conditions. The more liquid he can keep his assets, the more readily can he provide against the emergency demands for purchase funds. Hence the engineer, by endeavoring to keep his stock requirement at reasonable amounts and by means of his construction and maintenance budgets, is in a position to advise along these lines. If there is no co-operation between him and the purchase department, very likely either too much money may be tied up in materials, supplies and emergency stocks or extraordinary costs may result due to unseasonal or inopportune timing of rush purchases.

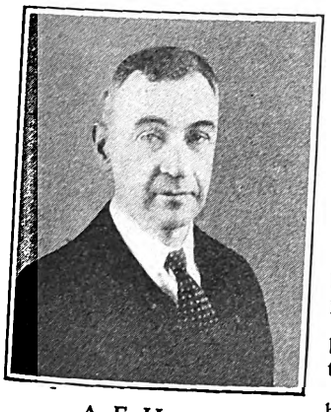
Sealing Track in Paving

Is Vitally Important

By A. E. HARVEY

Engineer of Way and Structures
Kansas City Public Service Company

That foundation is all important in track construction is the view presented in this paper, read before the general meeting of the Engineering Association.



A. E. Harvey

IN DESIGNING a pavement suitable for use on car tracks a few basic principles and requirements should be adhered to:

1. The track structure must be sound and so tamped that there is no appreciable movement under the load.
2. The paving foundation must be of sufficient strength to support vehicular traffic.
3. Paving foundation should be sealed around base of rail so that it is watertight.
4. The wearing surface should be of material suitable for the prevailing traffic and of proper sealing quality.
5. The paving should be sealed to the rail and watertight.
6. The contour of the surface should lie in a plane through the top of the rail as nearly as may be practicable.
7. All parts of the track and paving should be assembled and placed so there may be no appreciable movement of the various parts.

The foundation of any pavement must be sufficient to carry the loads imposed on it and there are ample statistics and information in regard to this so far as pavements themselves are concerned. Our problem is to build this pavement in connection with the track structure so as to insure its stability. This, to a certain extent, depends on the track structure and its foundation, as the paving base is either superimposed upon the track structure or built in connection therewith. As to the material for this base, there can be scarcely any question, as concrete is used almost universally. The specifications as to aggregates and mixing are fully covered by standard specifications.

In the placing of the concrete base in and around the track structure, however, assuming that the base is of sufficient thickness to carry the loads, we must take into consideration what effect, if any, the presence of the ties and rails in the base may have upon its strength and make special provision to reinforce it by additional depth of material or in changing some detail of the design.

Laying down rigid specifications and design as to the kind of paving surface that should be used in car tracks or defining the details of its construction is impracticable, as there are innumerable conditions as to service required, types of track construction, rail sections, climatic conditions and questions of finance, cost and local policy that must be considered by the individual company, but specifications should be available covering the quality and manufacture of each kind of paving material that may be considered, with information as to the comparative wearing qualities of each class under various conditions.

In the installation of these various kinds of pavement, secondary only to wearing quality is the matter of the proper sealing of the pavement. In the case of granite or brick there is a question as to the proper filling of joints. This is accomplished either by the use of cement grout or asphalt tar or other plastic material. As to the merits of each, there is a wide divergence of opinion, and any specification or recommended practice must be broad enough to include both methods.

Most excellent results have been obtained along this line in many cities where ballasted track is used with rail 7 in. and 9 in. in depth and where a deep foundation of concrete has been used that comes well above the base of the rail. This last point is exceedingly important. A base course that must stop at the base of the rail will not give the results in the way of protecting the structure against water, or in binding the various parts of the structure together, that is secured by bringing the concrete base well above the lower flange of the rail.

In order to secure the most satisfactory results in car track pavement it must be kept in mind that the life and efficiency of such pavement are dependent upon its being placed on a sound track structure and assembling that structure in such a way as to conform to the principles which have been mentioned; that the pavement and foundation must be sealed and watertight around the rail and that there may be no appreciable movement of one part in relation to the other. It is recognized that design and material have an important bearing on the quality of the work, but the most important matter to be considered is the character of the workmanship. With the most complete design and specifications and use of the best materials, indifferent results will be obtained unless these are assembled carefully under rigid specifications as to detail of workmanship.

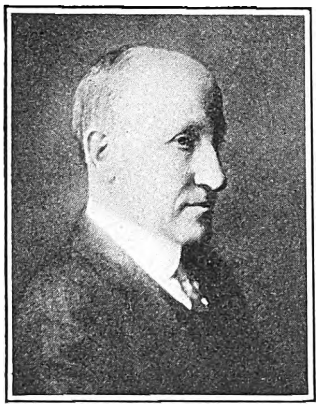
Competition and Rate Making

By PHILIP CABOT
Professor of Public Utility Management Harvard University, Boston, Mass.

That electric railways must abandon the accepted practice of determining price from cost, and reverse the order, is the view presented in a paper read before the Transportation & Traffic Association.



Philip Cabot

PRICE determines cost in practically all the competitive trades and even in those trades which are not literally competitive. Although the electric railway industry is regarded as a monopoly, no man familiar with its history can doubt that it is one of the most competitive and therefore the conditions which determine price in competitive markets must determine your prices also. The condition in which many of the companies now find themselves is due to their failure to recognize this fact.

Though your business is strictly competitive you continue to act as if it were a monopoly, using costs to determine and to justify your prices and allowing the regulating commissions to use them in determining whether your prices are just and reasonable. Such methods are now unsound and should be abandoned. There may have been a time when the formula of property value multiplied by a fair return as a method of determining the reasonableness of your profits was favorable to the railways but I think this is very doubtful.

By the continued use of an unsound principle the whole industry is being forced on to a service-at-cost basis which is against the interests of the public, for it means that competition, which is the best known regulator of price, has been excluded and that within limits the buyer must pay for the blunders and incompetence of the producer. This the buyer only allows if he is blind to his own interests and it is extraordinary to observe the number of cases where the owners of electric railway properties have been saved from the consequences of their own mistakes by service-at-cost franchises. Such devices are contrary to the public interest because they really amount to private ownership of the property with government operation, a division of responsibility which combines the most disadvantageous factors of both public and private ownership. The service-at-cost franchise at best is the equivalent of government operation, for when the spur of competition is removed nothing can prevent an operating organization from sinking into a bureaucratic lethargy.

But if such is the case, you may properly ask me what is to be done. If government regulation of the industry is to continue, what other method of determining price except by the cost can be employed? Is there any precedent in any regulated industry for the use of another method? It can hardly be said that there is, although there are some indications of one. In general, government price regulation of public utilities seems to be based upon the dogma that cost determines price and so far as the commissions really do regulate prices they assume to do it in this way. But it is worth noting that in the gas, electric, telephone and telegraph utilities price regulation is hardly attempted. An attempt is made to regulate profits but the making of specific prices is left very largely to the judgment of the companies. In the case of these other utilities cost as a method of determining the price of any particular service is rarely put to a practical test and in your business it is only used when it happens to coincide with the prices which competition has determined. Here, I think, we have a clew to the way out of the dilemma.

The time has come when we must face the facts and recognize that we also are dealing with a competitive industry. If this fact were really accepted and acted upon it would make two radical changes in the policy of railway managers: first, they would use value to the customer instead of cost to determine the best prices, as all men must in competitive trade; and second, they would study the desires and even the whims of their customers and would offer them a greater variety of services to suit their needs.

First as to price: this presents no more difficulty in your business than in any other. As the problem commonly presents itself money has already been invested in a railway system which is a going concern with established prices at which the service is being sold and it may be presumed that the owners want to make as much profit as possible. If this were an ordinary competitive enterprise they would experiment by making estimates of the profit which would result if various prices were charged. Such estimates, commonly called budgets, if made up by competent persons are particularly serviceable to electric railway rate-makers at the present time because they provide a clear view of the future unobstructed by consideration of past investments in property which is partly or wholly obsolete.

In this method of fixing prices the value of the service to the customer is the determining fact and the prices arrived at will be those which will give the owners of the property the largest aggregate profit. It will also show the largest volume of service which can be provided at a profit to the customers.

The unwillingness of capital to enter the electric railway field, from which car riders all over the country are suffering, is at least partly due to unskilful government price regulation, which is the inevitable result of the methods that have been used and both the public and the companies will continue to suffer until a new and sounder method of price regulation is employed.

It may turn out, however, that so far as the prices of your present service are concerned, competition has already done its work and that the use of a more intelligent method would not alter them materially. I therefore turn to the second effect which should follow a complete acceptance of the fact of competition: namely, the alertness of mind which characterizes competitors and leads them to recognize and study the

Digitized by Google

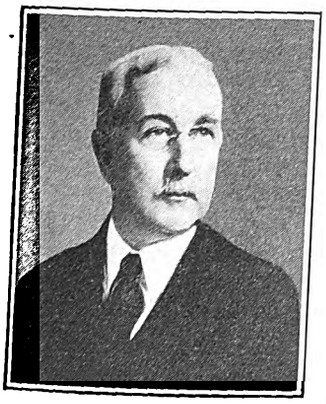
wishes of their customers. Failure to do this has been almost universal in your business. You have continued to supply one kind of service—and one which it so happens can not be sold at a profit. In the face of the fact that your customers clearly wished for a more comfortable form of transportation and were willing to pay for it, you have offered them a disagreeable and even unhealthful service at a low price. In short, to a great mass of buyers demanding an article of high quality you have offered low quality at a low price. It is true that your competitors have forced upon you the use of buses, but this was not done on your initiative but on theirs and you have done it grudgingly.

Where competition is active you must cater to your customers or they will leave you. You must spend great sums in studying their wants and trying to meet them or the investment which you have made in your business will continue to be unprofitable. The industry is thoroughly competitive. Competitive methods must therefore be employed and these rest in the last analysis upon value to the buyer and not upon cost to the producer. You must know what your customer wants and what he will pay for it. When this principle is clearly recognized and intelligently used by all parties the business of surface transportation of passengers will stand upon a sound basis and not till then.

Cars to Meet Today's Demand

By HARRY H. ADAMS
Superintendent of Shops and Equipment
Chicago Surface Lines

The author told the Engineering Association of developments which have been made to produce a street car of fairly light weight and which will give rapid acceleration and braking.



Harry H. Adams

IN THE early part of the campaign to modernize, all efforts were bent toward new cars following to a great extent the designs that had been in use for a number of years. Today's efforts are made in an endeavor to produce a car that will not only be new but will have rider appeal in the broad sense of the word. That is, new equipment to be truly modern today must have an ability to accelerate at a rate enabling it to keep up with automotive traffic. Hence it must be as light as possible, consistent with strength; it must be designed with an idea of reducing noise, and last, but not least, it must afford comfortable and safe transportation for the traveling public who make use of it.

In a number of modern sample or experimental cars aluminum has been used in many ways to reduce weight. According to estimates, the cost of securing such reduction in weight varies from 20 to 35 cents a pound.

Reducing weight is one of the first steps toward noise reduction. Another noise-producing item is the car wheel. Most experimental wheels have made use of rubber or other non-resonant substance as a sound-absorbing medium. Frequent braking raises the temperature of the wheel so that any material affected by heat is subject to deterioration.

The new cars are for single-end use because greater seating capacity can be obtained in the same space at lower cost per seat. In the design of the new 60-seat car as compared with the 51-seat car of three years previous many benefits have been obtained.

In selecting the electrical equipment entirely new motors were necessary. The problem was turned over to the electric manufacturing companies with the requirement that an increase of at least 10 per cent in schedule speed over that possible with our last equipments be secured with a motor to be used with 26-in. wheels. Their efforts resulted in 50-hp. motors rated at 70 amp., 900 and 995 r.p.m. at 600 volts and weighing approximately 2,200 lb., as compared with 60 hp., 85 amp., 725 r.p.m., at 600 volts, and 2,500 lb. for the previous motor which was used with 28-in. wheels on the last group of cars purchased.

As a result of our general study of car design and equipment developments it might be said in conclusion:

First—That a reduction in unsprung weight materially reduces the noise in street cars.

Second—That a reduction in the total and unsprung weight of the car may be secured, together with an increase in the horsepower applied, with no appreciable increase in energy consumption, when operated on comparable schedules.

Third—That with low-floor cars there is a definite need for the elimination of body brake rigging and a development of adequate independent air brake equipment on each truck.

Fourth—That while progress is being made, a satisfactory substitute for tread brakes has not yet been developed. Drum brakes and propulsion shaft brakes which have been tested with composition shoes are not satisfactory due to shortness of life obtained from the shoes.

Fifth—That the success of the high-speed, light-weight motor seems assured, but a light-weight truck with a minimum of unsprung weight is desired in order to secure the fullest benefits from the use of the high-speed motor, and while we have experimental trucks with such qualifications in service, further developments and improvements along this line can be expected in the near future.

Sixth—That it is believed to be thoroughly practical to substitute plates, shapes and some castings, when not too complicated, in design, with aluminum for similar steel members.

We believe that development in car design, electrical equipment and trucks, generally, has progressed far enough to warrant the industry in taking active steps in the replacement of existing equipment or the purchase of new equipment on a modernization program, and, further, it is our opinion that the industry can best be served by the replacement of old equipment with new, thus obtaining the advantages of higher schedule speeds, modern appearance and added comfort rather than attempting to remodel existing equipment.

Lively Discussions at

T. & T. Sessions

Address on competition and rates stirs group. Other important subjects presented were traffic, merchandising, equipment specifications, passenger needs and desires, and employee relations

THOSE who attended the three sessions of the Transportation and Traffic Association were well repaid, for a number of valuable papers and committee reports were presented, all followed by interesting discussions. Probably the outstanding feature of the entire program was an address by Philip Cabot, professor of public utility management of Harvard University, on competition and rate making. Professor Cabot expressed some rather radical opinions which evoked spirited discussion from a number of the members present at the meeting. The principal refutation concerned his statements relative to service-at-cost franchises. Those present agreed with his views on learning the desires of the customer, but there seemed to be general disagreement with some of the theories he propounded on the fixing of costs after determining the price.

W. H. Boyce

Other features of the program included an address by Miss Mary A. Brennan of Pittsburgh on "Street Car Service from a Woman's Viewpoint," an address by Labert St. Clair, A.E.R.A. director of advertising, on "Merchandising," and a trainmen's conference, presented by employees of the Atlantic City & Shore Railroad. Four committee reports, covering the important subjects of movement of the vehicle, the equipment, the passenger and the employee, also were presented and discussed at the meetings.

Traffic and Publicity Opening Topics

Evidence of an increasing interest on the part of electric railway men in the movement of all vehicles through the city's streets was shown at the opening session on Tuesday by the lively discussion which accompanied the presentation of the committee report on this subject. Two other high spots of the first day's program were an address by Labert St. Clair, director of advertising of the American Electric Railway Association, and a movie relating the story of local transportation. The meeting, which was attended by more than a hundred transportation men, was presided over by President W. H. Boyce, commercial manager of the Pittsburgh Railways.

In his presidential address, W. H. Boyce outlined the complete program of the association for the three days and told of the work done by the association committees during the past year. He emphasized the vast importance attached to the reports to be presented, and urged that those suggestions whose adoption promises improvement along the lines with which they are concerned be put into practice.

Commenting on the subject of movement of vehicles Mr. Boyce referred to the traffic movement as one of the greatest problems of thickly populated communities today. "So difficult has this problem become," he stated, "that managements of transportation companies know that their ability to attract revenue is dependent upon their success in moving their vehicles with regularity and adequate speed. It is not a problem in which transportation companies alone are interested, but one with which the entire community is vitally concerned. Much work of a remedial nature has already been accomplished in many sections through the co-operation of city officials and electric railways, but much remains to be done before the use of street space is based upon effective, scientific methods of traffic control and before beneficial laws and ordinances are properly enforced."

In closing, Mr. Boyce expressed the opinion that the future of the industry depends more upon the improvement of the vehicle than upon any other single factor. "We must insist," he said, "upon a type of vehicle which will adequately meet the requirements of our service in regard to rapid and smooth acceleration and braking, comfort, quiet operation, appearance and economy."

"There is no use merchandising with nothing to sell, but you have the goods and the salesmen, so why not sell?" With this forceful query, Labert St. Clair, the A.E.R.A. director of advertising, started a lively talk on publicity and merchandising. "We must merchandise intensively," he continued, "and ask the people often to buy our goods if we are to be successful in getting results. Persistency is the first thing in selling. A second important point to remember is that we must engage the attention of the customers with those subjects in which they are interested."

Mr. St. Clair named six subjects for the electric railways to sell: safety, tax reduction, traffic relief, business aid, property values, and rides, both retail and wholesale. Show the happy side, was his advice in preparing safety copy. On the subject of tax reduction, he mentioned

Digitized by Google

that it is the politician who will relieve the railways of taxes and that the politician to obtain results needs a defense for his action to take to his people. He also urged that the railways point out to merchants, civic organizations and all property owners, the value of a good transportation system to their interests.

Mr. St. Clair, in commenting on the selling of rides, stated that the industry would probably profit by selling rides in wholesale quantity and receiving payment for them at the end of the month. He also proposed that cities be divided into sections with a business manager in charge of each, to study the customers in every detail and to merchandise the service to them.

In the report of the committee on the movement of the vehicle, presented by Chairman D. L. Fennell, general superintendent of transportation, Kansas City Public Service Company, four specific subjects were developed: the control of parking; signals, traffic control, and boulevard stops; coach and car stops, and equipment. The several phases of parking control were outlined and discussed in the report, and a detailed account given of the results obtained by the Chicago Surface Lines on parking conditions in a busy community shopping center.

Various methods of traffic control were studied by the committee for its analysis of signals. The committee commented on the general practices and expanded somewhat on isolated signal lights, co-ordinated signals and through-street signs. The selection of coach and car stops and the use of safety zones and loading platforms occupied the third portion of the report. The report listed the factors to be considered in the selection of stops and named the several advantages of using safety zones and loading platforms. The section devoted to equipment was confined to a discussion of the specifications recommended by the committee on service betterment in its 1928 report, to make street cars suitable vehicles to fit into present-day street traffic. The report appears in abstract elsewhere.

The high points of each section of the report, as presented by Mr. Fennell, were discussed by several delegates. Those who participated were: J. B. O'Connel, division superintendent, Chicago Surface Lines; R. N. Graham, manager of railways, Penn-Ohio System; Adrian Hughes, Jr., superintendent of bus transportation, United Railways & Electric Company of Baltimore; F. A. Cummings, vice-president, Eastern Massachusetts Street Railway; A. R. Williams, vice-president and general manager, United Electric Railways; E. D. Merrill, president and general manager, Washington Rapid Transit Company; G. B. Anderson, manager of transportation, Los Angeles Railway; A. S. Scott, division superintendent, Boston Elevated Railway; J. A. Stoll, United Railways & Electric Company of Baltimore; J. B. Stewart, Jr., general manager Cincinnati Street Railway, and Paul E. Wilson, vice-president Cleveland Railway.

Following the presidential address the reports of the executive committee, the secretary-treasurer, the committee on resolutions and the committee on nominations were presented. Those selected by the nominations committee and who were elected to serve for the coming year are:

President—Samuel Riddle, vice-president Louisville Railway, Louisville, Ky.

First Vice-President—Paul E. Wilson, vice-president and secretary Cleveland Railway, Cleveland, Ohio.

Second Vice-President—George B. Anderson, manager of transportation Los Angeles Railway, Los Angeles, Cal.

Third Vice-President—R. N. Graham, manager of railways Penn-Ohio System, Youngstown, Ohio.

Secretary-Treasurer—G. C. Hecker, general secretary American Electric Railway Association, New York, N. Y.

Executive Committee—F. L. Butler, vice-president in charge of operation Georgia Power Company, Atlanta, Ga.; Adrian Hughes, Jr., superintendent of bus transportation United Railways & Electric Company of Baltimore, Baltimore, Md.; D. L. Fennell, general superintendent of transportation Kansas City Public Service Company, Kansas City, Mo., and C. H. Evenson, superintendent of transportation Chicago Surface Lines, Chicago, Ill.

Unusual Rate Views Presented

Although the second session of the Transportation and Traffic Association on Wednesday consisted of but one paper and one committee report, the meeting proved to be an extremely interesting one because of the views expressed in the address and the importance of the committee report. The meeting was again presided over by President W. H. Boyce.

Speaking on the subject of "Competition and Rate Making," Philip Cabot, professor of public utility management Harvard University, stressed the fact that although the electric railway industry is regarded as a monopoly it is one of the most competitive, and because of this, the conditions which determine price in competitive markets must determine electric railway prices also. Mr. Cabot scored the use of costs to determine prices and stated that by the continued use of this unsound principle the whole industry is being forced on to a service-at-cost basis, which is against the interest of the public, for it means that competition, the best known regulator of price, has been excluded and that within limits the buyer must pay for the incompetence of the producer. The address appears in abstract elsewhere in this issue.

Mr. Cabot's paper brought forth a considerable amount of lively and profitable discussion. Among those who participated were Paul E. Wilson, Cleveland Railway; Hudson Biery, Cincinnati Street Railway; H. W. Barnum, Boston Elevated Railway; Walter Jackson, fare and bus consultant; W. T. Rossell, Pittsburgh Railways; W. W. Holden, San Antonio Public Service Company; S. B. Way, Milwaukee Electric Railway & Light Company; R. N. Graham, Penn-Ohio System, and John Beeler, Beeler Organization. They concurred in the ideas of Professor Cabot relative to learning more about the desires of the customers, but did not agree with some of his statements concerning service-at-cost franchises. They maintained that although there were existing forms of competition the basic form of transportation, namely, mass service, had no substitute. They also held that unrestricted competition was not always in the interest of the public, and that although charging what the traffic will bear might be sound economically it is impossible to overlook the political and practical sides.

Three distinct phases of the subject were treated by the committee on equipment, whose report was presented by Chairman Adrian Hughes, Jr., superintendent of bus transportation, United Railways & Electric Company of Baltimore. These were the study of the facilities that should be provided on modern or rehabilitated car and bus equipment to provide the comfort and convenience required by the passenger; the determination of the general size, type and character of public

Digitized by Google

transportation vehicles most suitable for various classes of service; and the outlining of a method of accounting or cost keeping to provide needed data regarding the results of the operation of individual lines for both cars and buses in order to furnish a guide for efficient transportation management. The report appears in abstract elsewhere.

In the discussion which followed the presentation, Horatio Bigelow, South Carolina Power Company, told of the advantages of accounting analysis by lines on his property. "The cost of making up the monthly estimate is negligible," he stated, "and from it we are able to tell from day to day whether the system collectively or in detail is paying its way." He added that distribution is made as maintenance of way and structures; car maintenance; power cost; conducting transportation; traffic and general expenses; and cash, ticket and miscellaneous revenue.

A Woman's Viewpoint

Two features of the third session of the T. & T. Association, held on Thursday afternoon, were a trainmen's conference demonstration by employees of the Atlantic City & Shore Railroad and an address by Miss Mary A. Brennan of Pittsburgh on "Public Transportation from a Woman's Viewpoint." Two important committee reports, "The Passenger" and "The Employee," also were presented at this session.

Mary A. Brennan

Labert St. Clair

Speakers Who Addressed the T. & T. Sessions

In her presentation of "A Woman's Viewpoint" Miss Brennan portrayed a typical American family, the "Browns," and told of the riding habits and requirements of the individual members of this family and their various points of view of what constitutes attractive street car service.

"The principal use of street cars for Mrs. Brown is to go downtown for shopping," Mis Brennan related. "She cannot understand why the cars are not kept cleaner. She has decided opinions about the attitude and appearance of the trainmen and is at a loss to know why companies permit some of the men to appear as they do. She objects to the lack of courtesy on the part of the trainmen and would like a civil answer when she asks a question instead of being humiliated by being given scant courtesy before other passengers.

"Mrs. Brown would do more of her shopping downtown if the item of carfare were not present in the cost. It is possible that an arrangement might be made with merchants by which they would pay carfare, if the amount of the purchase was sufficiently large. A lower rate of fare applying only between the morning and evening rush hours might be effective in getting her to start home earlier, before the employees of offices and stores, and she would probably have a seat in the car. A lower rate of fare in the middle of the day would probably also fit in with a plan for downtown merchants to pay carfare and would stimulate additional riding where shopping was not the object of the ride."

The trainmen's conference demonstration, in which twelve employees of the Atlantic City & Shore Railroad participated, was led by David W. Gordon, director of service improvement Chicago Rapid Transit Company. Mr. Gordon asked the question "What is good information?" and received a number of interesting replies from the trainmen. The demonstration showed the manner in which subjects are developed and settled by the conference method of group meeting.

President Barnes Addresses Meeting

The work of the officers and committees of the T. and T. Association during the past year was praised by President Barnes of the American Association in a brief but pointed talk before the group. He spoke of the association's activities in developing better trainmen and commended in particular the educational conferences being held during the convention. "The trainman," he stated, "is the contact man of the railway, the one who best can sense the public's reaction, and the seeking of his advice on service by managements has been one of the most significant moves of the industry."

It was felt by the committee on "The Passenger," whose report was presented by Chairman W. W. Holden, manager traction department, San Antonio Public Service Company, San Antonio, Tex., that more attention should be given to the actual needs and desires of the traveling public. Accordingly the committee devoted most of its work to "Market Analysis," a consideration of definite investigations into the views of the riding public on street railway service.

To make a market analysis, the report stated, three phases of the situation should be considered: the source of the information, the agency by which the information is gathered and the method used to obtain the information. The three general sources of information available to transportation companies to determine the attitude and desires of the riders, according to the committee, are the general public, the car riders and the platform employees. The agencies by which information for a market analysis can be secured are confined to the company organization and the independent organization. The report is abstracted elsewhere.

Among those who entered into the discussion of this report were C. D. Palmer, Pittsburgh, A. Shapiro, Washington Rapid Transit Company, and D. J. Locke, United Railways & Electric Company of Baltimore.

The report of the committee on "The Employee," was presented by Chairman R. W. Emerson, vice-president and general manager, Cleveland Railway. The several aspects of the employee problem were considered under the headings of selection, training, informational education and accident prevention. In the discussions of present methods, improving selection and suggesting new methods, the committee brought out some valuable points on the selection of employees. The report is abstracted elsewhere.

Accountants Consider Depreciation *and* Bus Accounting

O. H. Bernd

IN HIS address upon opening the first meeting of the Accountants' Association president O. H. Bernd reviewed the work of the association for the past year, and made a plea for more individual memberships. In concluding he said: "I do not believe there was ever a time in the history of our association when the demands upon the electric railway accountant were more exacting, and the problems confronting him more perplexing, than the age we live in today. Increased taxes, increased wages and material prices, changed working conditions, the rapid improvement of our highways, the increasing use of the private automobile, the substitution of buses for rail cars, and the abandonment of rail lines, all seem combined in a relentless struggle to prevent electric railways from having satisfactory net results."

A detailed report was submitted by W. L. Davis on the proceedings of the 1929 convention of the National Association of Railroad and Utilities Commissioners. Reports were made by M. W. Glover for the committee on standard classification of accounts, and by E. A. Tuson for the sub-committee on bus accounting.

In an extended discussion on methods of accruing depreciation, C. Bancroft Hill of the United Railways & Electric Company of Baltimore advocated present-day undepreciated reproduction value as the base for the accrual, stating that adequate protection to the stockholders' equities could only be given by that method.

Dr. Thomas Conway, Jr., read a paper on "The Depreciation Problem From the Viewpoint of an Electric Railway Executive," which is abstracted elsewhere.

At the Thursday session G. J. Bunting, vice-president Illinois Central Railroad, in his paper "Electrification and the Modern Auditor," compared the accounting officer to the physician who counts the pulse beats of the corporation. Mr. Bunting said that statistical analyses of income, operating expenses, construction costs and other data serve as a barometer of the health of the corporation, and the accountant should be able to diagnose the case sooner than any other officer and be first to sense the success or failure of any particular method or undertaking. The speaker called attention to the extensive programs of electrification of steam lines and to the consequent increasing interest of steam railroads in proper accounting for their electrical operations. "The principles of accounting technique of interest to accounting officers of steam railroads are coming more and more to be in common with those involving purely electric lines," he said.

The responsibility of the accountant to the other officers of his corporation was stressed. In conclusion Mr. Bunting gave as his conception of the prime responsibilities of the accountant, those of the lawyer who interprets and obeys the laws, the doctor who diagnoses the ailment and prescribes the remedy, and the policeman who guards the rights and property of the stockholders and the public.

Reports were made by the committee on fare collection, the joint committee on purchases and stores, and by the resolutions committee. A special tribute was paid C. P. Glover and T. P. Kilfoyle, past-presidents of the association, for their regular attendance of meetings, and aiding in the work of the association. As the new officers were installed, they were called upon and made brief remarks. In the absence of E. H. Reed, the new president, C. E. Yost, first vice-president, received the gavel for the incoming administration. In accepting the gold badge presented to past-presidents, O. H. Bernd expressed his appreciation of the tribute of the association and said he would continue his active interest in association affairs as in the past.

G. J. Bunting, who addressed the accountants

The following officers were elected for the ensuing year:

President, E. H. Reed, assistant comptroller West Penn Railways, Pittsburgh, Pa.

First vice-president, C. E. Yost, treasurer and assistant secretary Delaware Electric Power Company, Wilmington, Del.

Second vice-president, J. E. Heberle, assistant to president, Capital Traction Company, Washington, D. C.

Digitized by Google

Third vice-president, E. A. Tuson, general auditor Public Service Co-ordinated Transport, Newark, N. J.

Members of executive committee: C. R. Mahan, L. T. Hixon, R. A. Weston, R. O. Crowe.

Secretary, Guy C. Hecker.

At the Accountants' luncheon, held on Wednesday, the discussion covered questions and answers relative to depreciation in a number of its phases, methods of fare collection, income tax difficulties, accounting for renewals and for leased line betterments, how, why and when weather conditions affect passenger receipts, and a number of other subjects.

H. N. Tyre, traffic auditor of the London General Omnibus Company, was present and compared the methods of fare collection he has found in effect in this country with the ticket receipt system used in London. Mr. Tyre is seeking information on a number of operating questions and expects to visit the properties in a number of the larger cities in various parts of the country.

Canada was represented by J. A. Wilson, chief accountant for the Montreal Tramways, and answered questions relative to their service-at-cost franchise.

The meeting was presided over by O. H. Bernd.

Depreciation Accounting
a Major Problem

Good business practice demands safeguarding the investment, said the speaker before the Accountants' Association. He made a searching analysis of the I.C.C. proposed regulations

By Dr. Thomas Conway, Jr.
President Cincinnati, Hamilton & Dayton Railway
Chairman Sub-Committee on Depreciation, American Electric Railway Association

THE problem of depreciation accounting is, in part, one of good business practice—of safeguarding the investment of the corporation—and in part one of complying with the regulations and requirements of the state commissions and of the Interstate Commerce Commission in so far as they respectively have jurisdiction in the premises. From both points of view the executive officers of the company, its board of directors and its stockholders are vitally concerned.

Dr. Thomas Conway, Jr.

The management of an electric railway property is charged with the very great responsibility of safeguarding its assets, as well as of making those assets productive. The problem of safeguarding the assets of a railway company is not essentially different from that of a bank. In the case of the railway, however, the turnover of its assets is exceedingly slow, a period of 30 years or more being required on most properties for the complete cycle of renewals. In the case of the bank the turnover is rapid; its capital is loaned out either upon demand or for short periods of time; its investments consist largely of securities having a determinable market value. Only a small part of its resources, as a rule, are invested in its banking house and fixtures or in other real estate. Under such circumstances it follows that the executives and board of directors of a bank are brought face to face at frequent intervals with the problem of evaluating the institution's assets to determine whether its surplus is increasing or decreasing, and of considering the problem of making provision against wasting or doubtful assets.

The obligation to make adequate provision for currently accruing depreciation is one resting squarely upon the executives and board of directors of every electric railway company. The fact that more attention is not paid to this matter is doubtless due in part to the meagre and subnormal earnings of most electric railway properties, and in part to the complex difficulties incident to and attendant upon any such investigation and determination. However, the fact that the determination is difficult does not absolve us from the obligation to make it.

We must always keep in mind the fact that the only valid purpose of accruals through charges to operating expenses for depreciation is to preserve, maintain and safeguard the integrity of the investment and of the physical property represented thereby. If we apply this test to every proposal with respect to the method by which the desired end is to be attained, most of the difficulties with respect to the matter will be minimized or entirely disappear.

By preservation of the investment and the physical integrity of the property, I mean that a sufficient sum must be set aside and either reinvested in the property by way of additions, betterments and improvements, or invested in securities, constituting the reserve fund, to offset accruing depreciation so that a valuation of the property, if honestly and equitably made from time to time, will show that the equity of the stockholders is at all times unimpaired, and that a sufficient sum has been set aside to enable the corporation from time to time to replace units of property when necessary as

Digitized by Google

the result of wear and tear, decay, obsolescence or inadequacy.

In practice, current accruals for depreciation are based largely, if not entirely, upon calculations founded upon estimated physical lives. In other words, the accrual is, in reality, based upon the assumption that in most cases the various units of physical property will be used and useful until they wear out or decay and therefore have to be retired for physical reasons. It is true that in stating the method employed we frequently find the assertion made that due consideration has been given to the factors of obsolescence and inadequacy in determining the amount of the current accrual, but as a matter of fact if we carefully check through the calculations upon which the accrual is based, we very frequently find that little, if any, consideration has actually been given to these most important factors.

Insufficient Consideration of Obsolescence

In addition thereto, the requirements of many state commissions and of the proposed system of accounting for steam railroads tentatively promulgated by the Interstate Commerce Commission, give little or no consideration to the factors of inadequacy and obsolescence. In its original order in the steam railroad case (No. 15100) the commission outlines its position in the following language:

> The choice is between permitting such an industry to charge rates which will enable it to make its depreciation charges large enough to meet every conceivable contingency and holding its depreciation charges down to a more moderate basis, but permitting the industry, in the case of some sudden and unexpected development, to spread the cost of retirements over a period in the future. In our opinion the latter course is the preferable one. . . .
>
> In estimating life expectance, it will be desirable for the reasons stated in an earlier part of this report to resolve doubts in favor of a longer rather than a shorter life. . . .
>
> In defining "depreciation" we have recognized that there are certain causes of the retirement of property which cannot properly be regarded as factors in depreciation. Such are contingencies, like fires, which cannot be foreseen and against which insurance is the appropriate means of protection, and also sudden and unforeseeable improvements in the art or similar public requirements. But while such causes of retirements ought not to be taken into consideration in determining prospective service lives, simplicity in accounting demands, we think, that when such retirements occur the full loss in service value should be charged to the depreciation reserve. Compensation for such charges, which the depreciation reserve will theoretically not have been built up to meet, may be obtained in two ways.
>
> In the case of a retirement due to a cause which is not recognized as a factor in depreciation but against which the carrier is protected by insurance, compensation may be obtained by crediting to the depreciation reserve the full amount of the insurance recovered.
>
> In the case of a retirement due to a cause which is not recognized as a factor in depreciation and against which the carrier is not insured, if it can be shown by the carrier that the charge to the depreciation reserve resulting from the retirement will unduly deplete that reserve, the amount charged to operating expenses on account of depreciation may be increased, with our approval, over a period of years in the future to the extent necessary to make good such depletion. This will in effect be similar to the present rule, which permits retirements that would unduly distort the operating expenses of a single year to be spread, without approval, over the operating expenses of a period of years.

Commissioner Eastman's proposed revised order, promulgated on Aug. 13 last, does not recommend any substantial change in the commission's position on this point.

It is obvious that such a system of accruals for depreciation, even if expectable physical lives could be determined with accuracy, will not provide sufficient funds to enable the corporation to renew its properties before the expiration of the physical lives if and when obsolescence and/or inadequacy make this necessary or desirable, and the executives and board of directors of the corporation must, therefore, assume this hazard and presumably make provision therefore, either out of surplus or, in the manner recommended by the commission, through larger accruals in later years.

Let us examine the reasons given by the commission for its attitude on this question. The commission states, in its original opinion at page 313:

> Some considerable period of time ordinarily elapses after inventions before they are perfected for commercial use. Advance information is thus possible as to the time when changes in the art are likely to render changes in property advisable. Nor is it beyond reason to anticipate the time when business will outgrow existing plant or when various requirements will be made by public authorities.

Apparently the commission fears that if the officers and directors of the steam railroads are permitted to discount the future contingencies of obsolescence and inadequacy, the charges made to passengers and shippers will be inordinately high. The commission evidently prefers the alternative of accruals which may prove inadequate and spreading the deficiency out over future years rather than running the risk of allowing the corporation to set up more than may later be required. The soundness of such a theory is open to very serious question.

Commissioner Eastman in his opinion recognizes the fact that the procedure contemplated by the commission in this respect may place the carrier in the embarrassing position of never being able to recoup the losses resulting from inadequate accruals by offsetting the deficiency in future years through higher accruals for depreciation. The decision of the Supreme Court of the United States in Board of Commissioners *vs.* New York Telephone Company, 271 U. S. 23, while not dealing specifically with this matter, strongly supports the view that each year must stand by itself and that past deficiencies cannot be charged to patrons in the future. In discussing this case, Commissioner Eastman makes the following very frank, if comfortless, statement:

> If a company has charged too little for this purpose in the past, it is out of luck, and on the other hand, if it has charged too much, it is in luck.

The dangers of such a situation are obvious if and when such an order, applicable to the steam railroads and the electric railways, is promulgated. Unless and until this plan of depreciation accounting is modified by the courts, the carriers would be in the embarrassing predicament of being unable to make adequate provision against obsolescence and inadequacy, for the interstate commerce commission act provides that

> the carriers subject to this act shall not charge to operating expenses any depreciation charges on accruals of property other than those prescribed by the commission, or charge with respect to any class of property a percentage of depreciation other than that prescribed therefor by the commission.

The practical effect of this situation, as I see it, is that the carriers may be forced, for a time at least, to make provision for obsolescence and inadequacy by charges to surplus rather than to operating expenses or, in other words, by setting aside a part of their net return for this purpose of safeguarding their investment against these hazards.

In so far as this industry is concerned, we are in a period of great uncertainty as to the economic life of many of our more important classes of property. If the industry is to prosper, there must be a tremendous technical development within the next few years as regards cars and many other classes of property. As we look

Digitized by Google

back over the history of the last few decades, we are struck by the fact that our retirements were prompted in large part by obsolescence and inadequacy, by municipal requirements and other circumstances having little or nothing to do with physical life. Estimates with respect to the useful life of property under such circumstances are bound to contain a large factor of error, no matter how carefully they may have been prepared, and frequent readjustments upward or downward in the accrual must be made. Therefore, it follows that the prudent executive and careful board of directors will insist upon periodical re-examinations and restudies of the amount which should be set up for depreciation for the purpose of making such corrections in the accrual as may be necessary.

As a practical matter, it is almost impossible to determine and set up an accrual which, in the light of subsequent experience, will exactly accord with the amount which actually should have been set up during that period. The factors of obsolescence and inadequacy can be guessed at, but cannot accurately be foretold. As the Interstate Commerce Commission stated in its original order the determination of prospective service life

> is after all, the crux of depreciation accounting. . . . The accuracy of the record with respect to the consumption of property in service which such accounting is designed to afford, is wholly dependent upon the accuracy with which prospective service lives are estimated.
>
> . . . It is by no means an inevitable conclusion that service lives in the future will be the same as they have been in the past. Not only do types of property change in construction and character, but the conditions under which they are used change, often very radically. . . . There seems, indeed, to be no way in which prospective service life for the future can safely be estimated through an automatic or mechanical process. The estimate must needs be made by combining the results of actual past experience with the best available engineering advice as to the probabilities of the future.

In view of the admitted and inevitable inaccuracy of estimates of service lives and of the resulting accruals for depreciation, it seems to me that, as a practical matter, the mathematical refinements incident to a large part of the calculations upon which accruals for depreciation are often based, are apt to create a feeling of accuracy and infallibility which, in fact is not justified. For the same reason, I am inclined to believe that the interests of investors will, in the end, be better safeguarded under most circumstances, through the use of the straight-line method of accruing for depreciation than under the so-called sinking fund method. The latter postpones a large part of the accrual to later years, relying upon the earnings in the depreciation reserve to accumulate a substantial part of the required amount. If service lives are over-estimated, the danger is multiplied because the relief upon accruals in the reserve fund in later years will not be forthcoming. In advancing this suggestion, I want it to be clearly understood that in so doing, I do not mean to infer that the straight-line method is universally preferable; there are more circumstances under which the sinking fund method is most appropriate. The point I desire to stress is that at best depreciation accounting is but an approximation and that any attempt to make it an exact science is bound to be fruitless.

Taking Commissioner Eastman's tentative revision as the basis for our analysis, it seems clear to me that, if and when it is adopted by the Commission and thereafter applied to our industry, it will work a revolution not only in our present methods of accounting but in the financial affairs of many of the companies subject thereto. I believe that it will be only a short time until substantially similar orders are promulgated by most if not all of the state commissions.

As you know, the Interstate Commerce Commission's proposed system of accounting transfers a large part of what we have heretofore regarded as "maintenance" into the field of "depreciation." Such property as ties, rails, other track material, ballast, right of way fences and paving, which we have heretofore renewed through maintenance, would, under the new system, be replaced through charges to depreciation. In other words, our maintenance expense would be gradually reduced and in place thereof would appear a much larger accrual for depreciation than any company of which I have knowledge has heretofore set up, covering not only accruals against the items of property which we have formerly replaced through the depreciation reserve but also charges to cover replacements of the classes of property which we heretofore have replaced through maintenance.

Comparisons of financial results and of operating statistics covering periods before and after the change in accounting methods would be difficult if not quite impossible, and, what is of even greater importance, the possibility of elasticity in our operating expenses, which we have heretofore achieved through reduced maintenance programs in lean years, would be greatly reduced if not entirely eliminated. Such a change would be a serious matter for many companies whose earnings fluctuate widely throughout the year and throughout the business cycle. The sub-committee on depreciation has consistently urged, and proposes to continue to urge with all the force at its command, the necessity for flexibility in the annual accrual for depreciation, both as a matter of necessity and because it believes it can demonstrate that it is scientifically correct.

System of Depreciation Accounting Proposed by I. C. C. Would Have Crushing Effect

A system of depreciation accounting such as that proposed for the steam railroads would fall with crushing effect upon this industry, which has been struggling to continue operation and carry its fixed charges in the face of adverse conditions which have unbalanced our budgets by reducing our revenues beyond our ability to cut expenses. I believe that sound public policy dictates that the serious difficulties of this industry be recognized and that no arbitrary accounting requirements for electric railways be imposed which would have the effect of bringing about wholesale receiverships and financial embarrassments and which, in very many cases, would prove to be the last straw which would break the camel's back. The stockholders, and indeed the bondholders, of a large proportion of the electric railway properties realize that their investment is in hazard. They understand the difficulties of the industry, the fact that many lines may have to be junked and other financial sacrifices made, against which they cannot now be insured by depreciation accounting or by any other device.

We are in the grip of an inexorable economic situation in which the life of a substantial part of the industry is at stake. What part of the industry will survive is a question which time alone can tell. Every opportunity should be afforded to it to carry on the struggle for existence and to endeavor to reestablish its economic equilibrium. This view I am sure, will be strongly urged upon the commission when it comes to consider the electric railways as a group.

Negligence Laws

Interest Claims Association

L. F. Wynne

THAT claims men of electric railways should make a united effort to secure modification of certain existing statutes which are considered too harsh was the viewpoint expressed by L. F. Wynne, president of the Claims Association, in opening the meetings of that organization.

Mr. Wynne advanced the belief that to attempt to secure the enactment of certain statutes modifying the existing common law with reference to common carriers would do more harm than good at the present time, as such action would probably intensify the opposition to the railway's cause instead of securing beneficial changes. He pointed out that a reaction might occur which would aggravate the present situation.

He did feel, however, that where an effort is being made by certain classes of lawyers, who desire legislation advantageous to themselves, to secure the enactment of outrageous statutes, the railway claims men are justified in employing every reasonable and honorable means to prevent it.

Mr. Wynne also pointed out that safety in operation is of such importance and so positive in its results that the direction of this work should be under executive control. He advocated the organization of a general safety council in each railway composed of the heads of the departments, who, in turn, should organize the foremen and supervisory forces. The latter should be responsible for seeing that the men in their departments do their work safely. He pointed out that startling reductions in public accidents have been effected on properties adopting this plan, and that the reduction of preventable accidents is of paramount importance from an economic point of view.

In his paper on "Efforts of the Bench and Bar To Correct Ambulance Chasing Evils in New York City," A. C. Mayo, trial attorney of the Third Avenue Railway System, stated that while this evil is not yet a dead issue in his city, nevertheless, the ambulance chasers are declining in numbers every year. The decade between 1917 and 1927 was really the "golden age" for this ignoble "profession," according to Mr. Mayo.

Bert C. Wood, general claim agent, Pennsylvania-Ohio Public Service Corporation, Youngstown, Ohio, called attention to the fact that similar efforts to curb the practice of ambulance chasers had been made in Youngstown, but that at first they were unsuccessful due to a lack of harmony and co-operation upon the part of those seeking to bring about the reform.

"The number of cases filed against our company has decreased about 40 per cent in the past year," Mr. Wood said. "We have every reason to believe that the good results obtained will be permanent because our local Bar Association passed certain rules which prohibit the solicitation of any cases whatsoever."

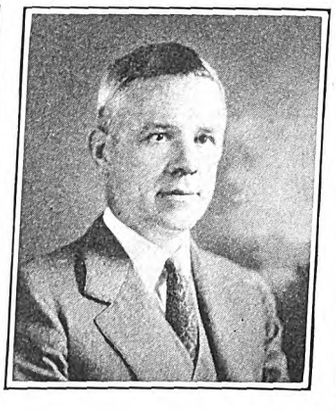
"What a Claim Agent Can Do for His Company and His Community Through a Public Safety Campaign" was the subject of a paper prepared for the last session by C. E. Redfern, claim agent of the United Electric Railways Company, Providence, R. I. In his absence the paper was read by Bert C. Wood of Youngstown, Ohio.

It is Mr. Redfern's contention that the claims man can do much to minimize accidents by taking an active part in city-wide safety campaigns, by helping to organize a safety council if there is no such organization in his city, and by impressing upon his own company's employees the absolute necessity for eternal vigilance.

Speakers Who Presented Papers Before the Claims Association

C. E. Redfern

P. W. Klabunde



Phillip Carlton

Seth W. Baldwin

Digitized by Google

W. Muir, who also addressed the Claims Association

Wallace Muir, general attorney of the Kentucky Traction & Terminal Company, Lexington, Ky., presented a paper on "The Importance to Companies of the Attendance of the Claims Men at the Annual Conventions of the American Electric Railway Association," in which he pointed out that all street car equipment has a standard value—a fixed price—but the only guide the claims man has is experience and the advice of those in the same line of business. "This advice can only be obtained in meetings of this kind," said Mr. Muir, "and every man who comes here goes back home with new ideas, new methods of handling his affairs, puzzling questions solved and knowledge received, resulting in a saving to his company many times greater than the cost of sending him here."

The association adjourned following the presentation of the past president's badge to L. F. Wynne.

The following officers were chosen for the coming year:

President, W. E. Foley, claim agent Third Avenue Railway System, New York, N. Y.

First vice-president, C. E. Redfern, claim agent United Electric Railways of Providence, R. I.

Second vice-president, J. W. Giltner, chief claim agent Northern Ohio Power & Light Company, Akron, Ohio.

Third vice-president, L. H. Butterworth, claims attorney Boston Elevated Railway, Boston, Mass.

Members of executive committee, Seth Baldwin, Bert C. Wood, Trevor Neilson, J. A. K. Caskie.

Efforts to Correct

Ambulance Chasing Evils

in New York City

By A. C. Mayo

Trial Attorney Third Avenue Railway System
New York, N. Y.

Ambulance chasing is by no means a lost art in New York City, according to this statement made before the Claims Association, but the "Golden Age" is unquestionably past.

ALTHOUGH it was perfectly apparent to a majority of the members of the bar, and certainly to every member of the trial bench, that the negligence business was flourishing on such a large and increasing scale, and that so much of it was in the hands of a few attorneys that ambulance chasing was rampant, no move was made by either the bench or bar to check or discourage it until millions of dollars had been crookedly extracted from the pockets of defendants. When the final exposé came so many lawyers had become involved that the impression was created in the minds of the public generally that the legal profession as a whole was dishonest.

In 1926 there were approximately 30,000 cases on the Supreme Court calendar in New York County alone, and all of the calendars in the lower courts were clogged. This situation engaged the attention of the Bar Association of the City of New York and a special committee, known as the special calendar committee, was appointed to devise ways and means of relieving this congestion. It was found that a great majority of the cases on the Supreme Court calendar in New York and Bronx Counties were founded in negligence and that a great many of them were brought by a comparatively few attorneys. At the urgent suggestion of this committee, the New York Legislature passed a bill increasing the fees before a trial from $6 to approximately $40. From that time on the number of Supreme Court actions began to decrease by leaps and bounds.

A. C. Mayo

An examination of the records of the Third Avenue Railway shows that in the year 1926 there were 797 Supreme Court actions brought against it. In 1927 there were 437 actions and in 1928 the number fell to 225, a reduction of more than 72 per cent from the year 1926. As I view it in retrospect, it was the work of this committee which was the real beginning of the movement which finally culminated in bringing dismay into the ranks of the ambulance chasing fraternity. Composed of the leaders of the bench and bar, its conclusions and recommendations were accepted and acted upon and finally paved the way for what followed.

Acting upon the petition of several bar associations in the counties of New York and the Bronx, the Appellate Division designated Justice Wasservogel to conduct an investigation of the illegal and improper practices in connection with negligence in the First Judicial Department, comprising those two counties. In the fall of 1928 Justice Wasservogel filed his report, in which he cited 74 lawyers for disciplinary action. As a result of a similar investigation by Justice Faber in the Second Judicial Department eighteen lawyers were cited for disciplinary action. These records do not give much comfort to the ambulance chaser.

In the early part of 1929 the Appellate Division of the First Department made special rules regarding application, solicitation, champerty and maintenance, statement as to retainers, deposit of collections notices, compromise of claims or actions belonging to infants, combining or grouping of claims, prohibition of communication with adverse party, preservation of records of claims and actions, penalties for violating the foregoing rules and jurisdiction of special terms.

The most important of these rules are those pertaining to retainers and jurisdiction of special terms. The requirement under the first one—that a notice of all retainers be filed with the clerk of the court within ten days—in my judgment will act as a great deterrent to ambulance chasing activities.

The second named rule provides the machinery for future investigations of this character when and if the

Digitized by Google

occasion arises. The knowledge on the part of attorneys with ambulance chasing proclivities that there is already in existence a tribunal clothed with the power of subpœna before which they may be hailed upon proper application, will, no doubt, deter a great many and dampen the ardor of even the more daring.

The chief results of all these regulations and investigations so far as they have affected the work of street railway claims departments are a reduction in the number of suits brought and in the lessened activities of "runners" immediately after the happening of a serious accident. There has been a reduction in suits brought in all courts against the Third Avenue Railway and associated companies of almost 30 per cent since 1927.

Another result of the investigation has been to divert a great many cases from the hands of the regular negligence lawyers into the hands of a number of lawyers whose names are new in this line of work. This is no doubt an advantage to the claims department as past experience has shown that it takes, with rare exceptions, a number of years for a negligence lawyer to develop to a point where he can frame his cases with any high degree of success, and it is the clever "framer" who is the thorn in the side of the claim agent.

Ambulance Chasing Checked

in Youngstown

By Bert C. Wood

General Claim Agent
Pennsylvania-Ohio Public Service Corporation
Youngstown, Ohio

The general public is interested in curbing the activities of ambulance chasers and will take action when aroused, according to a statement made before the Claims Association.

Bert C. Wood

FOR the past twenty years there have been numerous attempts made to correct the ambulance chasing activity in the city of Youngstown. Most of these have been short lived; some seemed to result in increasing ambulance chasing. It might be fairly said that the reason for our failure in Youngstown in the past to correct the ambulance chasing activity has been due to a lack of harmony and co-operation upon the part of those seeking to bring about the reform. In the past small groups, at different times, upon the spur of the moment, without the proper preparation and without the proper organization, have sought to combat this evil. Those efforts in the past have been short lived.

From year to year the number of ambulance chasers had been increasing to a great extent. About half a dozen lawyers or law firms had been gradually building up powerful organizations. These reached the high point of their career about two years ago, when their efforts in solicitation extended not only throughout the state of Ohio but even into Pennsylvania, New York, Indiana and Kentucky.

With the ambulance chasing business progressing and extending by leaps and bounds and with large verdicts being returned for the plaintiff in personal injury and wrongful death cases the situation finally came to a point where the individual citizens rebelled against the injustice which the transportation and public utility companies had been tolerating for years. This primarily was brought about by the fact that from year to year the bureau of underwriters fixing the rates for liability insurance in Youngstown had been increasing the rates.

About the first quarter of 1928 the leading insurance companies compiled statistics comparing their experience in Youngstown with that in other cities of larger size in Ohio and other states. The figures revealed that the claim frequency was considerably higher in Youngstown than in any other city and that the claim costs on the average were higher in Youngstown than in most of the other cities.

About this time both newspapers in Youngstown united in giving much publicity to the high cost of insurance rates. This naturally led to propaganda to curb the ambulance chasing evil, which was regarded as the real basis for the high cost of insurance and for the high verdicts. Then the various civic clubs throughout the city took up the fight. Next the Bar Association joined in, trying to correct the evil, and the courts became very severe in criticising "fee witnesses" testifying for the ambulance chasers. In 1928 our fight against the chaser seemed to be succeeding.

While the matters just stated above refer more particularly to cases involving accidents with automobiles and also to insurance rates, the public utility and transportation companies also benefited by the reform brought about. The general benefit which was felt we believe is a lasting one because in the midst of the fight there was organized a citizens committee composed of persons experienced in claim work and persons from various civic organizations, all having a community interest at heart. The citizens committee conducted its campaign in order to maintain the benefits obtained in ousting the ambulance chaser.

The citizens committee upon making its investigations and giving suggestions reported to the master commissioners, a body composed of fourteen lawyers appointed by the judges of the Court of Common Pleas of Mahoning County.

During the activities of the citizens committee and the master commissioners, the ambulance chasers were almost completely exterminated. During the last half of 1928 and to date in 1929, there have been rare instances of an ambulance chaser being active when we have been proceeding to settle cases brought against our company. Of course we do run into this situation at different times, but compared with what it had been before the campaign started early in 1928 it is practically negligible.

Executives Review

A.E.R.A. Committee Work

PRESENTATION of committee reports was the principal business of the session of the executive committee of the American Association held on Sunday evening, Sept. 29. After conducting routine business, relating principally to the convention, President J. P. Barnes called on the chairmen of the committees for summaries of the work carried out during the association year. Formal reports were not presented by certain of the standing committees. Abstracts are given below of the formal reports which were prepared for publication in the proceedings of the association.

National Relations

DURING the year the national relations committee forwarded as much as possible the movement to obtain legislation from Congress on two major projects, clarification of the interstate commerce act in its relation to electric railways and the regulation of motor buses engaged in interstate commerce.

The bill more clearly to establish the status of electric railways under the interstate commerce act has been the subject of frequent conferences with the Interstate Commerce Commission and the state railroad or utility commissioners. Conferences with the two commission groups are still being held for the purpose of composing the differences in viewpoints and a new bill covering this subject will no doubt be introduced at the next regular session of Congress.

Various minor matters are constantly arising in Washington that require the action of the committee.

Publicity

DURING the year the activities of the advertising section were expanded along the lines of motion pictures, posters, newspaper advertising and company organ news service. There now are six reels of motion pictures available, dealing with safety, traffic congestion, readiness to serve, use of the electric car, advantages of the electric car over private automobiles and new types of cars.

The loose-leaf advertising folder has been expanded, now containing about 8,000 advertisements and posters. Two new features were added to the poster service during the year, one a series for carhouses intended to increase courtesy and neatness among employees; the other a single sheet series urging people to use local transportation.

Personal counsel is available at association headquarters in connection with particular campaigns and through a special arrangement with Barron G. Collier, Inc., the advice of its sales, copy and art organizations also is available without charge. Under a new arrangement with the Collier organization at least one space in the racks of every car in the United States was devoted to a special card urging the use of electric cars. The cards were prepared, printed and placed without charge by the Collier organization.

Insurance

THREE lines of action have marked the work of the committee on insurance during the past year. It has been in constant touch with the insurance rating authorities, it has continued the securing of the insurance experience of the industry and it has increased its efforts to emphasize the importance of fire prevention.

In conference the representatives of insurance companies expressed the opinion that the records afforded justification for reconsideration of existing schedules used for making rate applications. Assurances were given the railway group that the insurance representatives would bring this situation to the attention of their executive boards. Negotiations were continued during the current year and a revised edition of the schedule for rating traction properties was presented to the committee, accompanied with specific illustrations that showed favorable consideration of numerous items contained therein. Quite sweeping alterations had been brought about. The proposed action was designed broadly to benefit electric railways, particularly through reductions in the basic rates for buildings and rolling stock and in deficiency charges.

The committee recommends that the revised schedules be studied carefully and that through insurance agents and brokers applications be made for benefits accruing under the new schedules to which members may be entitled. Outstanding items are: (1) The base rate "A" for incombustible buildings has been reduced 50 per cent; (2) the base rate "B" on other structures has been reduced 16⅔ per cent; (3) more favorable treatment has been accorded buildings of superior construction (rated under base rate "A") and deficiency charges for such buildings have been lowered in numerous instances; (4) occupancy charges for motor buses have been lowered 25 per cent and 20 per cent respectively and other charges have been reduced 50 per cent; (5) watchman deficiency charge has been reduced 50 per cent when base rate "A" is used; (6) external protection charges (items 33-40) are reduced one-half when base rate "A" is used; (7) deductions have been introduced for semi-steel cars; (8) a 33⅓ per cent reduction has been allowed in the basic rate for rolling stock on tracks and in yards; (9) charges covering defective wiring and heaters for cars on tracks have been reduced 50 per cent under stated conditions.

Success in fire prevention, states the committee, as in any other sphere of operation, can be attained only by

24. J. N. Shannahan—Advisory Council.

perseverance. It cannot be taken up today and lost sight of tomorrow. But if persisted in it will eventually yield abundant returns for the time and effort expended on it. The committee then goes on to list several elements in fire prevention, including correct building construction and location, fire protection equipment and maintenance.

A number of tables in the appendix give insurance statistics showing the experience of electric railways in 1928 as compared with 1927.

Industrial Relations

OUTLINE of a program for future work was the principal feature of the report of the committee on industrial relations which is the successor to the committee on education. The outline of the field of industrial relations was prepared by a special research sub-committee of which Leslie Vickers, economist of the American Electric Railway Association, was chairman. According to his report, it is felt that the first two things necessary in connection with industrial relations work of the association are (1) to emphasize in the strongest possible way to the industry the importance of industrial relations work and (2) to set forth the desirability of having in every organization some highly placed executive in charge of the industrial relations work of the company who can speak with at least as much authority as those who manage and control the physical affairs of the organization. Mr. Vickers states that he is personally convinced that the proper analysis of the problem of industrial relations starts with the focal point of the employee as a unit and studies him in his various relations. This has the advantage not only of being the simplest approach, but also of being the one most liable to clarify our thinking and bring about the clear statement of problems. This proposal is, therefore, that the employee be studied from the five following points of view: (1) In relation to his work; (2) in relation to his fellow-worker; (3) in relation to his supervisors; (4) in relation to his employer, and (5) in relation to the public.

The field is so broad, he states, the tasks are so numerous and the responsibility so great that they merit the serious attention of a highly placed executive whose authority in this field will be unquestioned. The executive in charge of personnel relations will need the help of trained specialists in several branches, such as an engineer, competent to provide proper shops in which to work; a medical staff conversant with the duties to which men are to be assigned and experienced in the effect of the work upon employees; and a personnel specialist, possibly having the co-operation of a psychologist, to select and train employees and then to determine from their reactions their suitability for remaining in those tasks, for transfer or for promotion. He recommends that five separate sub-committees should be appointed to deal with the five problems of the worker enumerated above.

The sub-committee on employment, remuneration and advancement, including pensions and thrift, states that present-day competition requires a higher type of employee than in former years and that employment procedure in industry as a whole is becoming more scientific due to a recognition that methods of previous years were of the "hit-and-miss" variety. It is recommended that the employment official be a highly qualified, if not technically trained, man and that the remuneration for the employment official be commensurate with the responsibility. It is also recommended that the employment office have appointments equal to those of the general offices of the company and that some form of mechanical or psychological test be used, supplemental to the general employment procedure, in order to secure the highest type men, particularly for positions of trainmen and coach drivers.

Other sections of the report give

Digitized by Google

a digest of the records of personnel activities of the American and affiliated associations for the past twenty years, a list of former members of the several committees dealing with these subjects and references to recent articles and books on personnel or industrial relations.

Street Traffic Economics

CONTINUING the analysis begun last year, the committee on street traffic economics investigated several subjects, such as the principles of city growth and development, the use of staggered hours in business and office practice, analysis of taxicab operation and practices in use of streets. Adequate reports on these subjects cannot yet be made, states the committee. This year's report, however, covers statements of principles on the usefulness of signals and on the problem of parking control.

The effectiveness of streets is dependent on the elimination of wastefulness and the promotion of the greatest good to the greatest number by adequate administration of the rights of street users. Application of the principles expressed in these two sections will result in improved traffic conditions, in betterment for business and in greater convenience for an overwhelming majority. The third section is a brief presentation of potential improvements in traffic convenience at intersections of streets or of highways adjacent to cities. It is intended to illustrate the possibility of eliminating most of the intersection interferences by construction of a traffic circle at a very low cost. The possible traffic flow along a street can be tremendously increased if the major intersections are fitted with traffic circles, and the delays or inconvenience at such intersections become negligible.

The mere existence of delay to some vehicles or to pedestrians at outlying intersections does not justify signal control, in the opinion of the committee. Many intersections should be equipped with "through street" stop signs requiring stops on one or both streets instead of having the existing signals. The delay would be less and yet all vehicles would enter the intersection under control and so safety should be adequately provided. However, there comes a time when the density of travel is such that the delay due to the interlocking of trails of the vehicles or of vehicles and pedestrians is measurably greater than would occur under the orderly movement of the streets in alternate periods of time with signal control.

A measure of this volume of traffic has been set up in Chicago after very careful analysis. The established standard is that the intersection of two roadways each having two free lanes for movement in each direction must have at least 1,200 vehicles passing through it in the maximum hour, and at least 25 per cent of this in the lighter travelled street to justify the installation of signals for use only in rush hours. If the intersection has this standard in rush hours and at least 16,000 vehicles in a sixteen-hour period, the signals may be operated all day. If the volume of traffic falls below 800 vehicles per hour, the signals should not be operated for such periods and an illuminated "stop" sign or "caution" sign should be displayed.

The length of cycle should be kept short. For a single intersection the green for one direction should be just long enough for those vehicles and pedestrians which are substantially in position waiting to cross to clear the intersecting street. When a signal is part of a system, the length of cycle is established for the needs of the group of intersections and when properly arranged the vehicles moving at the speed for which the system is set will pass through the successive signal control intersections without delay. The most efficient length of cycle will range between 40 seconds and 100 seconds. Accuracy in fitting the length of cycle and the split of the cycle between the two streets is a determining factor in the success of the signal in serving its purpose of minimizing delay while promoting safety and convenience. Properly adjusted signals create better freedom of movement than can be obtained by having officer control, states the committee. Pedestrians have particular advantage at signal-controlled or officer-controlled intersections because the vehicular movement occurs on only one street at a time. Police officers are necessary at many intersections having signal control in order to insure observance of the traffic regulations and so to expedite traffic.

Much discussion of the method of changing from a "green" or "go" indication to a "red" or "stop" indication has failed to develop a standardized practice. The use of the amber at the end of the red period serves several definite and useful purposes, principally to assist pedestrians to complete the crossing of the street and to prepare vehicle drivers for the impending change to the "go" signal.

On the subject of parking the committee states it is not correct to make the general statement that parking should be prohibited in all sections on all streets or to say that uniform general regulations as to length of time allotted for parking should prevail. It is not important that vehicle drivers be saved all cost for the use of storage space, because when a driver is willing to spend from 8 to 15 cents per vehicle-mile he can well afford to pay an additional reasonable fee for the safe-keeping of his machine in off-street storage. The solution of the parking problem lies in a proper balance between the use of the streets for movement and their use for storage purposes. Without movement there can be no inter-communication within the city and therefore no business activity. Without suitable terminal facilities for motor cars of all kinds the utility of these vehicles is lessened.

From a legal standpoint there is little question as to the status of parking. It is purely a privilege and not a right. With reasonable restrictions parking presents few hazards. Primarily it is a problem of a business character and any restriction or regulation of the parking privilege must be considered in the light of the effect which such regulations will have upon the general facility of traffic and transportation movements. Where the parking of vehicles does not interfere with primary travel requirements, there is every reason why it should be permitted under such regulations as are requisite to provide for an equitable distribution of the available storage space among those who require its use. On the other hand, where such storage use of public ways does interfere with travel requirements, its elimination or restriction is not only possible from a legal standpoint but highly desirable from the standpoint of business activity.

Several methods for the relief of congestion are discussed, such as the providing of orderly traffic control methods, readjustment of routings and loading positions of the utility vehicles or electric cars, clearing the streets of obstructions, prohibiting parking in certain sections of the streets, arbitrary prohibition of certain types of traffic, regulation of delivery of goods or unloading of

Digitized by Google

materials, widening of existing streets and creating additional streets or added levels.

There is not only competition for street space between stored vehicles and moving vehicles but there is likewise a competition between various individuals who desire to use the available curb area. Statistics are quoted to show that the number of persons entering department stores in the central business district of various cities is a comparatively small part of the total customers. It is apparent, then, that the importance of the curb space as an accommodation to motorists has not been so great as popularly supposed. A discussion of the various types of parking and relative importance in the traffic problem is given and regulations are proposed for the manner of parking.

Comparisons are given of treatment of important intersections which are "bottle-necks" by means of grade separation as compared with traffic circles. The committee states that traffic circles are very satisfactory and can be established at a cost very much less than that for grade separations.

Taxation

THE committee on taxation wrote to operators asking them to tell exactly how they were affected by taxation and imposts and to relate their experiences, whether successful or not, in obtaining relief. Several meetings were held for the purpose of considering the material which was collected.

By utilizing the services of the staff of the association, means of approach to problems and avenues for relief were suggested. The committee emphasized the splendid work done by Mr. Vickers in gathering and interpreting material in furtherance of this tax study.

The committee believes that its work is only the beginning of a movement to reach the automobile-owning business man who seldom uses public transportation services and has not been awakened to a consciousness of the part that local transportation plays in his community. Many of these men are astounded when they learn of the extent to which their street railway services are taxed and of the illogical and indefensible burdens which they still bear. In some small measure the committee has been able to create a sense of civic responsibility and to renew the hope in the minds of some of the best business men of our communities that they can have a good local transportation service if they will give to its needs the same thought that they give to other civic enterprises. It is in the creation in the minds of business men of the concept of our business as a civic enterprise that the hope of relief lies.

The committee is convinced that to effect this two things are necessary:

1. The sympathetic interest must be gained of those important and influential local bodies such as the Chambers of Commerce, etc., whose business depends in large measure on the successful carrying out of our service obligations.

2. Efforts must be made to obtain or set up some tax and impost relief plan to which the industry as a whole could subscribe.

The committee suggests that not only in the national organization, but in every state and sectional association, there should be special committees set up to study this subject; and further, that where possible in every community where tax and impost charges are burdensome the local companies use every possible means, by publicity or by committees drawn from other organizations or by personal contact, to stress the unfairness of the burdens and point out the intimate connection between taxation relief and service betterment.

Depreciation

DEVELOPMENTS relative to the Interstate Commerce Commission's proceeding on depreciation charges of telephone companies, depreciation charges of steam railroads, general revision of accounting rules of steam railroads and depreciation charges of electric railways were reviewed from Nov. 2, 1926, when the commission first prescribed a plan of accounting for depreciation and for setting up accruals as a part of operating expenses to offset accruing depreciations, to the present date. The most significant development reported was a proposed order by Commissioner Eastman, submitted on Aug. 15, 1929, and modifying substantially a number of the most important administrative provisions of the previous orders. A comparison of the most important differences of the former orders and the proposed orders was prepared and included in the report.

The changes recommended by Commissioner Eastman do not modify the commission's position as regards the necessity for making provision for accruing depreciation through charges to operating expenses, but do modify substantially a number of the most important administrative provisions of the previous orders. The proposed modifications, in the judgment of the committee, are in the main helpful to the carriers immediately concerned and if extended to the electric railways would be of great benefit thereto.

Research

THE committee has made a survey of the research activities conducted by operating member companies and also of such work conducted by the association through its committees and headquarters staff. With this in view, a questionnaire was sent to operating companies explaining the purposes of the committee and asking for a statement from each company indicating both the character of work in which they were engaged and any suggestions they might care to make regarding work which should be undertaken.

In response to this inquiry the association received letters from 61 operating companies, all of which have been carefully reviewed. In addition the committee has reviewed the committee activities of the association during the past few years, and the activities of the association staff—as for example, the work of the bureau of information and service.

The principal conclusion of the committee is that there is available to members a wealth of information resulting from the research activities of both members and the association itself. The committee wishes to commend operating companies upon their initiative and originality in undertaking various kinds of research disclosed in the replies to the questionnaire. It believes that it is unquestionably the prerogative and privilege of the operating companies to conduct such studies. It believes, however, that it is important that the industry as a whole should be promptly advised of these studies conducted by individual properties and that so far as possible the association should act as a clearing house for this purpose. The committee has prepared a complete summary of research activities conducted by individual properties and a comprehensive review of these activities conducted by association committees and staff members, all of which is available in the form of association bulletins upon request by members.

Digitized by Google

Much Progress Made by

Engineering Committees

COMMITTEE WORK of the Engineering Association during the past year has been fruitful of results. Many projects have been taken up and progress is reported along all lines. The number of standards promulgated for approval by the association indicates healthy activity in all departments.

Reports of the committees which have completed the major portion of their assignments for the year are reviewed briefly in this article, although there are several committees which did not prepare formal reports.

Chairmen of Engineering Association Committees

1. H. F. Brown—Heavy Electric Traction.
2. E. D. Dreyfus—Engineering Accounting.
3. A. T. Clark—Electric Railway Journal Maintenance Contest.
4. H. H. George—Subjects.
5. E. P. Goucher—Co-operation with U. S. Department of Commerce.
6. E. M. T. Ryder—Engineering Manual.

Heavy Electric Traction

SEVEN projects were reported on. Manual Section W101-15, protection of contact rail where protected third rail is used, was revised for advancement to the grade of standard.

The sub-committee on track and third rail bonds for heavy traction work continued the subject during the year jointly with committee No. 12 of the American Railway Association. Considerable information concerning rail joint clearance and its effect on rail bond design was collected. It was recommended that these data be presented to the rail committee of the A.R.A. with a request that bonding of the rail joints be taken into consideration when designing the splice bars.

A summary of the experience of seventeen railroads using oil-electric locomotives and a table showing orders of rail motor cars and trailers for the past seven years were included. Further information on articulated trains was presented in a tabulation showing installations throughout the world.

Data on electrified railroads and electric locomotive tonnage were tabulated and a diagram gave the total mileage of steam railroad track electrified, along with the total electric locomotive tonnage. A comprehensive table showed the electrical and mechanical characteristics of all electric locomotives in service throughout the world. Complete statistics were given on 2,136 alternating-current units and 1,217 direct-current units.

ROLLING STOCK DIVISION

Manual Review—Revisions were prepared of several of the sections in the Rolling Stock Division of the Manual. A number of corrections were made in equipment Section E 3-26, design of axles for electric railway motors. There also was included a design of a 6x11-in. axle and a table of static axle stresses for the A.E.R.E.A. standard axles. Several changes were made in Manual Section E14-27, dimensions of A.E.R.E.A. steel wheel designs.

* *

Motor Coaches—The subject of motor coach design and standardization was continued, co-operating with the motor coach division of the Society of Automotive Engineers. A code for testing buses has been started and a composite inspection schedule has been developed. The accessibility of wearing parts was discussed. A recommendation for desirable brake performance and a proposed inspection schedule for large bus companies were included as appendixes.

* *

Car Design—The study of car equipment with special reference to appearance, comfort and convenience this year has included car nosing, ventilation, the need of a thrust device for journal boxes and the relative economies of new types of car drives. Data on some of the latest types of car drives have been submitted by the equipment manufacturers. Computations have been made to cover a variety of conditions, based on 16,000-lb. and 22,000-lb. car bodies mounted upon conventional trucks and present standard equipment, as compared with the same bodies mounted on new trucks of various builders and equipped with lightweight, high-speed motors.

The committee recommends continuation of the investigation of gear efficiencies being conducted at the Bureau of Standards and the study of the applications of these new types of trucks.

* *

Lighting—During the past year considerable information was collected on signal lights, emergency lights and illuminated signs which it is proposed to include in Manual Section E121-28.

Methods of lighting motor coaches were investigated. Multiple lighting with 12-16 volts and the efficient use of reflecting accessories with automotive type incandescent lamps were

Digitized by Google

recognized as essential for best results. An intensity of 6 foot-candles on the 45-deg. reading plane 33 in. above the floor is recommended. A brief review of battery and generator requirements for different sized coaches was prepared, although the committee feels that this latter subject should have a more comprehensive study. Appendixes give information on motor coach lighting and a table showing the comparative annual demand for street railway lamps, together with other information on lamps and lighting.

* *

Lubrication—Information was obtained on the use of light-bodied or low viscosity car oils. The advantages claimed include saving in energy consumption, lower bearing temperatures, less bearing wear, longer life of waste and in some cases economy through the use of the same oil in summer and winter. As the oil companies are prepared to offer low viscosity oils for experimental purposes it is expected that there will be more tests under actual service conditions in the near future.

* *

Automatic Coupler Specifications—Revision of the present M.C.B. automatic coupler specifications as contained in Manual Section E100-12 was considered. A proposed new recommended specification for automatic couplers for interurban cars was submitted as a revision of the present manual section. This specification includes parts of the A.R.A. specifications for standard "D" couplers, pertaining to manufacture, chemical and physical properties and tests, which were revised to 1925. It also includes drawings of the three types of drawbars now in use on interurban and freight cars, locating the position of the guard arm and the abutting wall, which have been added to the standard A.R.A. and M.C.B. couplers to prevent the radial couplers from buckling and pushing cars around short radius curves.

* *

Noise Reduction—Tests on cushioned wheels were reported, showing the proportionate amount of noise reduction that may be accomplished. A report is made of the relative value of the sound deadening of steel wheels accomplished by welding an iron ring to the under side of the wheel tread. Tests of silencing brake shoes show that this type of shoe improves conditions materially. Car wheels with a ring of micarta used as a deadening material inserted between the wheel hub and tire were tested by installing them on a car and operating it over a section of track. The car speed was recorded and the sound intensity measured. Comparison was made with standard steel wheels. It was found that the noise effect of the standard steel wheel being 100 per cent, that of the wheel deadened with micarta was only 90 per cent.

Tests performed on the silencing of the ringing of gears by the use of an iron ring welded to several points on the inner side of the gear ring showed that the welded iron ring has a value between a wood block and a lead insert attached to the gear.

Tests were also made on special brake shoes essentially of the same shape as the standard shoe but with spaces cored out of the wearing surface and filled with a compound of a nature similar to that used for brake blocks on automotive equipment. The use of such a brake shoe, it is stated, will eliminate practically all of the sound caused by the clattering of the brake shoe against the wheel. Its life and service are shown to be entirely comparable with that of the ordinary iron shoe with chilled ends.

* *

Welding of Wheel Flanges—Flange welding as carried on at the present time is generally satisfactory and economical, the committee states. Its use is increasing and improvements are being made. The mileage added to the wheel by flange welding instead of turning down the treads is from 35 per cent to 60 per cent. The total annual wheel cost is reduced on the average about 25 per cent by the roads reporting. The cost of welding and finish grinding ranges from $3 to $4 per wheel, including labor, material and fixed charges.

The report contains details of the methods used by several companies for flange welding and gives figures on the cost. A comparison is made between the cost of turning and welding. The cost of a wheel and two turnings was $22.65 for 38,000 miles, or 60 cents per 1,000 miles. With the cost of the wheel the same as before, with three weldings and finishings the total cost was $30.96 for 69,000 miles, or 45 cents per 1,000 miles. Thus the saving per 1,000 miles is 15 cents or 25 per cent.

* *

Current Collecting Devices—Designs and general information have been agreed upon. Specifications were prepared to be included as recommended designs for trolley wheels, trolley harps, and trolley bases. Diagrams were also prepared showing contact pressures for maximum and minimum heights and clearances at minimum heights and for the determination of pole lengths which it is proposed should be approved as miscellaneous methods and practices.

Rolling Stock Division Committee Chairmen

1. H. H. Adams—Car Design.
2. R. W. Cost—Lighting.
3. A. T. Clark—Standing Committee.
4. E. J. Jonas—Fire Hazards in Shop Practices.
5. J. H. Lucas—Lubrication.
6. W. T. Vivian—Special Committee No. 13—Limits of Wear.
7. H. S. Williams—Noise Reduction.
8. Hugh Savage—Current Collecting Devices.
9. P. V. C. See—Motor Coaches and Automatic Coupler Specifications.

Digitized by Google

Digitized by Google

welding of various alloy steels suitable for use in electric railway track was given.

* *

Motor Bus Garage Design—Two projects were considered. The first was to continue co-operation with the National Fire Protection Association in arranging such revisions of bus garage regulations as may seem necessary before final adoption by the N.F.P.A. The association representatives on the committee of the N.F.P.A. co-operated in this work. It was recommended that the regulations presented in an appendix be adopted by the association.

A study of bus washing facilities was made and a questionnaire sent out to various properties. It was felt by the committee that considerable attention should be paid to cleaning of buses in order to make the service attractive and to improve the morale of the drivers, mechanics and supervisory force.

* *

Rail Corrugation—The collection of data was continued from companies which are now co-operating. The report contains an extensive experimental and theoretical study of the pressures existing at the wheel-rail contact, which indicates that (1) the pressure between wheel and rail is extremely variable; (2) the high pressure spots are spaced very much as are the waves of corrugation; (3) the decrease in modern car weights, accompanied as it has been by the use of smaller wheels, has not resulted in lower unit pressures at the wheel-rail contact areas. A survey of the subject of rail grinding sets forth the more recent types of equipment and methods of grinding which have been developed to combat corrugation. A report on car spring deflection indicates that (1) car spring vibration is only an indirect factor in producing corrugation; (2) equality of wheel loading may be affected by spring conditions; (3) an extensive study of the problem of car springing is desirable. In addition to this the bibliography which was presented in previous reports has been augmented and brought up to date. In an appendix a very complete summary of the tests on wheel-rail contact pressures made in Baltimore, Philadelphia and Detroit is given.

* *

Light Section Rail—Through the efforts of the committee a uniform system of rail branding has been adopted by the American Electric Railway Association and the American Railway Engineering Association. A revision of Manual Section W16-24, specification for carbon steel rails of standard section, was made and is presented as an appendix. As revised it is identical in substance with A.S.T.M. specification, serial designation A1-27, except for additions to cover 62-ft. rails and bond and tie rod holes and orders for small lots of rails.

Foundation and Supporting Structures—Foundation and supporting structures for steam railroad crossings were considered by this committee. Questionnaires were sent out and the work of the American Railway Engineering Association was studied. As a result Plan No. 721 of the A.R.E.A. was presented as information. It was recommended that the subject be continued to complete the assignment in regard to tie layouts for special trackwork.

PURCHASES AND STORES DIVISION

Manual Review—Particular consideration was given to the classification of scrap materials, Manual Section PS100-24. The advisability of preparing a detailed alphabetical index of the A.E.R.E.A. classification of materials and supplies, Manual Section PS200-26, also was considered. The scrap classification, Manual Section PS100-24, was arrived at after careful study and consideration, the committee states, of a number of classifications in use by electric and steam railways as well as the U. S. Department of Commerce simplified practice recommendation No. 58, "Classification of Iron and Steel Scrap." A proposed revision of the classification of non-ferrous scrap appearing in Manual Section PS100-24 is included as an appendix.

Purchases and Stores Division Committee Chairmen

1. John Fleming—Manual Review.
2. A. A. Ordway—Standing Committee and Methods and Practice for Keeping Price Records and Pricing Materials and Supplies.
3. W. E. Scott—Unit Piling and Standard Packages.
4. W. S. Stackpole—Investment in Material and Supplies and the Cost of Operating Stores.
5. W. H. Staub—Reclamation of Used Materials and Sale of Scrap and Salvage.

Unit Piling and Standard Packages—The committee has studied the advantages and economies of these items and is planning to follow out an equitable method whereby a standard package as approved by the committee will not only be of benefit to the larger company but to the smaller one as well.

* *

Investment in Material and Supplies and the Cost of Operating Stores—The work for the year was confined to a study of investment in material and supplies and the cost of operating stores with an analysis of the underlying data as to what is charged to the account of store expenses. The committee has worked on the Interstate Commerce Commission classification under Account 95. Replies to a questionnaire have been received tending towards clarifying its definition of this account.

It was recommended that the principle be established that the cost of keeping stores, price records, pricing and expending requisitions and distributing the cost of stores issues to primary accounts shall be charged to Account 95, Store Expenses, regardless of where such work is performed. A list of items of expense which should be included in this account and another list which should be considered as not chargeable to the account is included.

* *

Simplification and Standardization of Stock—A method for the simplification and standardization of stock is recommended for adoption as a Manual Section. A method of procedure is outlined which will keep the committee in touch with the work of and allow it to co-operate with the division of simplified practice of the U. S. Department of Commerce. The committee especially stresses the

Digitized by Google

importance of delegating final authority on the disposition of materials to the standardization committee.

* *

Reclamation and Salvage — Reclamation of used materials and sale of scrap and salvage were studied. It was recommended that some system of reclamation of used material is desirable and that member companies should establish such a system in either one of the forms suggested under the supervision of the stores department.

POWER DIVISION

Manual Review—Several Power Division sections in the Engineering Manual were reviewed. The principal revision was that of Manual section D 10-26, specification for rubber insulated wire and cable for power distribution purposes, to conform to American Standards Association and composite messenger cables as well as insulators were studied. There also is a tabulation of catenary installations in America and elsewhere.

* *

Trolley Wire Wear—Data on trolley breaks have been brought up to date, using the methods of previous reports and also giving information on a car-mile basis. Causes of trolley wire wear and breaks, particularly those other than normal wear, were studied.

Tables give by companies the percentage of breaks occurring under three major headings: Causes other than normal wear inherent in the overhead line; outside causes such as pull-downs, etc., and failures due to normal wear. Another table classifies a six-year comparison covering per cent of failures due to causes other than wear, sub-divided as in the other tables. Breaks due to crystallization at normal wear are tending to hold a constant relation with a slight decreasing tendency. Breaks due to outside causes increased strongly from 1922 to 1927 but receded slightly in 1928. The over-all increase in this group, however, comparing 1922 with 1928, is more than 30 per cent. Many of the breaks are due to carelessness of the car operators and are within the control of the companies. It is rather discouraging to the line maintenance forces to realize that 35 out of every 100 trolley breaks are beyond their power to prevent.

* *

Trolley Wire Reels—Some of the reasons are set out why proper braking devices should be used on reels for stringing trolley wire and a general design is given for such a device. Two methods of using the device are shown, one for a square shaft, the other for a round shaft. The design and methods are proposed for inclusion in the Manual as a recommended design.

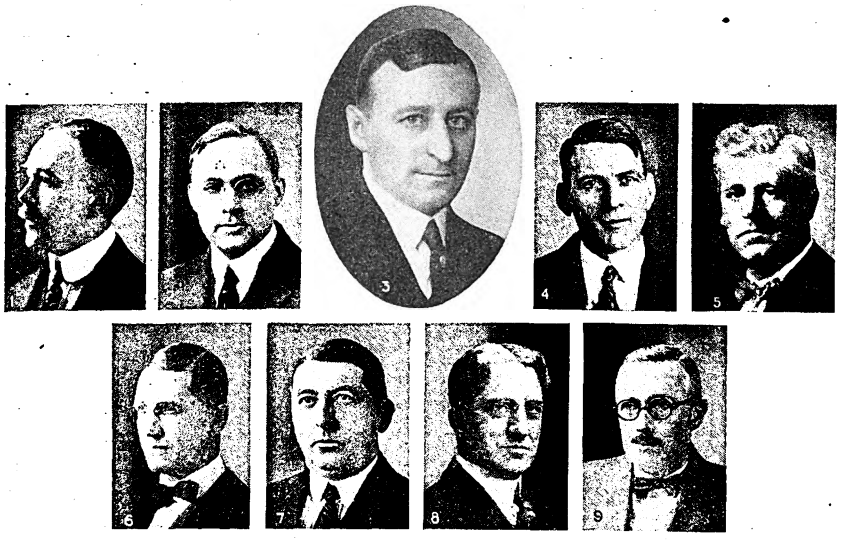
* *

Conduit Specifications — Manual Section D200-26, specification and form of contract for electrical conduit construction, has been given a comprehensive revision. New drawings are included showing a suggested standard line manhole, standard corner manhole, and standard crossing manhole.

* *

Proper Trolley Voltage for Congested City Districts—Trolley voltage for congested urban distribution has been studied from the standpoints of operation and economy, to include the determination of the lowest trolley voltage which is suitable in city areas where it is impossible to reach the normal operating speed of the car. This year's committee developed a plan of test and standardization of data to be secured. Tests were run in Chicago, Pittsburgh and Cincinnati, and other tests are planned in Detroit, Montreal and Philadelphia.

The committee believes (1) that the proper voltage for congested districts may vary from 400 volts to 540 volts, depending on the facilities for changing the trolley voltage; (2) that in frequent-stop service in congested city districts, calculations indicate that 400 volts potential will give the most economical energy consumption (actual service tests on several properties confirm this reduction of energy consumption with lower trolley voltage in congested districts); (3) that all urban districts have some congested territories which should be studied.



Power Division Committee Chairmen

1. J. W. Allen—Ferrous and Non-Ferrous Materials.
2. H. W. Codding—Mercury Power Rectifiers.
3. W. E. Bryan—Standing Committee.
4. A. J. Klatte—Proper Trolley Voltage for Congested City Districts.
5. H. S. Murphy—Trolley Wire Wear.
6. J. F. Neild—Trolley Wire Reels.
7. W. J. Quinn—Conduit Specifications.
8. R. H. Rice—Power Contracts.
9. D. L. Smith—Catenary Specifications.

specification C8dl. A copy of this proposed revision is included.

* *

Power Rectifiers—The emphasis of the present report is on the results of operating experience. A number of companies submitted a standard log sheet from Sept. 1, 1928 to date. A record of American installations and a bibliography on the subject have also been brought up to date.

* *

Catenary Specifications—Catenary specifications, Manual Section D102-21, were revised and combined with the specifications for catenary materials prepared in 1928. The new specification is proposed for adoption as a recommended specification. Alloy

Digitized by Google

Affiliated Association Committees

Study Important Subjects

CONCENTRATING on five broad subjects for the year, the committees of the T. & T. Association developed a wealth of useful data and information for presentation at the convention. The subjects assigned were the small city, movement of the vehicle, the equipment, the passenger, and the employee. The small city committee report was not accepted by the executive committee because it had not yet secured sufficient information for making any general recommendations and, accordingly, was not presented to the members. The committee, however, is to continue its study during the next year to complete the good work it has started. The other four reports were formally presented and discussed at the regular sessions.

A report of the activities of the Accountants' committees and the abstracts of two Claims committee reports appear below the T. & T. reports.

Movement of the Vehicle

WITH the realization that no greater problem confronts large cities today than the movement of traffic through their streets and that the ability of urban transportation companies to attract revenue depends upon their ability to move their conveyances with regularity and adequate speed, the committee on the movement of the vehicle of the T. & T. Association pointed out in its report some of the things which may be done now by the street railway industry to improve traffic conditions generally and to better each company's operation. It is possible both to facilitate the regularity and greatly to increase the movement of vehicles by means of a more scientific and effective use of wasted street space, and the report in analyzing this problem detailed practices in general use and gave opinions of the results those practices indicated.

Four divisions of the subject were studied by the committee during the year: Control of parking; signals, traffic control, and boulevard or through-street stops; coach and car stops, and equipment. Editorializing on the control of parking, the committee stated that this problem is but one phase of what should be a comprehensive civic program devoted to gaining the maximum utilization of existing street facilities. It recommended that the matter of parking control be dealt with by a civic-minded committee composed of representatives of those businesses upon which the area is dependent for its continued prosperity and men competent to marshal the facts and present them to this group.

Chairmen of Transportation and Traffic Association Committees

1. W. W. Holden—The Passenger.
2. Ralph W. Emerson—The Employee.
3. D. L. Fennell—The Movement of the Vehicle.
4. Adrian Hughes, Jr.—The Equipment.

Four specific phases of parking control were analyzed by the committee: (1) Position in which the vehicle is permitted to park; (2) types of vehicle affected by parking restrictions; (3) locations in which vehicles may park, and (4) length of time vehicles are to be permitted to park. The last two phases, being interconnected, were broken down, in turn, into six classifications regarding parking restrictions: (1) Limited time parking, varying from no limit to half hour parking; (2) no parking within certain distances of cross-walks, intersections and fire hydrants; (3) no parking in front of certain business establishments at any time; (4) no parking on main thoroughfares of the district during morning and evening peak hours; (5) no parking in the central district during peak hours, and (6) no parking in the central district during normal business hours. In analyzing the effect of "no parking" ordinances the Chicago plan was referred to.

The best means that a transportation company has at its disposal to promote the proper control of parking, the report stated, is the ability to gather and present in forceful form statistical data which will prove decisively to the merchant and shop owner that uncontrolled parking in business centers is harmful, that the parking privilege is being abused by employees of his own establishment and that surprisingly few of his customers are actually making use of parking space, much to the inconvenience of the great majority. It should be proved to him that the relegation of parking to non-business streets in the vicinity, or other proper control measures, will add materially to the accessibility and therefore to the desirability of the neighborhood as a place in which to do business. It was with this end in view that the Chicago Surface Lines undertook to make a complete survey of parking conditions in a busy community shopping center. The report told of this survey, listing the field checks which were made, the procedure followed in acquiring the miscellaneous material, the method of tabulating and summarizing all field data and how these data were analyzed.

Signals, traffic control and boulevard stops were discussed from the angle of reducing the delays, eliminating confusion, facilitating movements and reducing accidents. Two important opinions were advanced—

Digitized by Google

first, that traffic signals have been the subject of much discussion and of too much experimentation without engineering analysis on which to base installations and, second, that the cost of installations and of maintainance of the best signal system is very slightly more than that of the cheapest system.

As a matter of general information to be used in preliminary work in a study of the control problem the report discussed briefly certain types of signs and signals now in use. The co-ordination of signals was urged and particular stress was laid on the use of the flexible progressive system, to give the proper proportion of time to the through traffic and the cross-traffic at intersections.

In the selection of coach and car stops there are two major factors to be considered—stops frequent enough and so located as to serve the traveling public with reasonable convenience and stops far enough apart to enable cars or coaches to maintain average schedule speeds high enough to be attractive. Stops were discussed from the angle of average speed and the consideration of a number of factors in the study of any plan for a reduction in the number of stops was recommended.

On the subject of safety zones and loading platforms the advantages of safety zones to the automotive vehicle, the street car patron, the street railway and the pedestrian were pointed out and section 4 of the American Engineering Council committee's report relating to safety zones was quoted, with comments on the various recommendations and with additional recommendations.

In its study of the last subject, equipment, the committee reprinted sections of the report of the committee on service betterment for 1928, giving qualifications required to make street cars suitable vehicles to fit into present-day street traffic and commented on the specifications and gave additional information.

The Equipment

"ONE of the most pressing necessities of our industry today is new equipment. Before new equipment can be purchased the operator must know what to buy; the manufacturer must know what to build; and the price must be brought within the economic limits of the business." With this foreword, the equipment committee of the T. & T. Association delved into its first report, this subject formerly being confined solely to the Engineering Association. The assignment was considered under three headings, as follows: (1) The study of the facilities that should be provided on modern or rehabilitated car and bus equipment to provide the comfort and convenience required by the passenger; (2) the determination of the general size, type and character of public transportation vehicles, both car and bus, most suitable for various classes of service, and (3) the outlining of a method of accounting or cost keeping to provide needed data regarding the results of the operation of individual lines for both cars and buses in order to furnish a guide for efficient transportation management.

The report covers a preliminary consideration of the vehicle, both street car and bus, from the point of view of the comfort and convenience of the customer and its ability to meet the traffic requirements. The most important outcome of the year's study has been the development of a practical method of determining upon a few sizes and types of uniform vehicles which will permit manufacturing on a production basis with a resultant decrease in price to the purchaser.

A method of analyzing operating results by lines also is included. Such an analysis, the report states, is essential as a basis for the application of modern merchandising and research methods to the industry. The lack of such information has been a handicap to efficient management and it is recognized today that this simple, fundamental principle of economic control which has been applied in every other business must also be applied in the public transportation business.

Under the subject of facilities to be provided on modern or rehabilitated equipment is presented a specification in some detail of all the features to be considered in the production of the ideal vehicle for city service from the standpoint of comfort, convenience and appearance. The specifications, classified for cars under the headings exterior, interior, fixtures and fittings, signs, operators and operation of cars, are very comprehensive, covering every phase of car design. Particular emphasis is laid on the increase in the speed of braking made possible by the use of a quick-acting valve. In discussing the design principles and details for buses, the report points out that many of the features of design recommended for street cars apply also to buses.

Under the subject of the determination of the general size, type and character of public transportation vehicle, a method illustrated by several examples is shown for determining the economic size of vehicles for various classes of service. The authors refer to this study as a preliminary to the development of a more accurate method and to the actual determination of the fundamental economics of vehicle sizes.

Under the third subject is presented a suggested method of prorated costs to lines or individual parts of the transportation system, in order to obtain a detailed analysis of operating results. In the distribution of expenses to car routes, the report stated that greater accuracy would result by adhering to the following general recommendations: (1) That the I.C.C. classification of accounts be used; (2) that equipment and power costs be kept by groups of cars of similar type and age; (3) that direct charges be made to routes wherever possible, and (4) that such items of expense as prescribed by the I.C.C. classification which cannot conveniently be charged directly to routes be prorated according to the unit which best determines their variation. The units recommended in this suggested method are the car-mile, track-mile, operating car-hour, gross revenue and the car.

The Passenger

UNDER the subjects of "Merchandising Transportation" and "Service Betterment," the subject of "The Passenger" had been previously studied by the T. & T. Association. It was felt, however, that more attention should be given to the actual needs and desires of the traveling public. Accordingly this year the committee on the passenger concentrated on this phase.

In its preliminary comments the committee stated that a great many of the efforts made by public transportation companies to secure more passengers had been made without any particular understanding of the reaction they would have upon the prospective or potential passenger and that a more definite knowledge of the real attitude of the passenger to the street railway service should be secured. It was felt that definite investigations into the views of the riding public on street railway service would be of value in any given situation, and it was to a consideration of this investigation, which is termed

Digitized by Google

"Market Analysis," that the committee devoted most of its work.

To make a market analysis, the report stated, the following phases of the situation should be considered: (1) The source of the information—the general public, the car rider and the platform employees; (2) the agency by which the information is gathered—the company organization or an independent organization; (3) the method used to obtain the information—preferably by some method of personal interview. Mention was made of the very broad factors upon which the attitude of the public as a whole depends, and it was pointed out that it is desirable to ascertain what the public sentiment in regard to the transportation company is in order to make a satisfactory market analysis. The value of personal interview also was emphasized because it tells a complete, accurate story and has the added value of showing the public the interest the company has in giving real service.

Three general subjects were listed for use in a market analysis, which is considered of first importance: (1) Analysis of the elements involving physical service, such as the construction and comfort of cars, the operation of a bus line on one street in preference to another street and the extension of bus or car routes; (2) analysis of all those factors entering into the broad head of personal convenience, such as a determination of headways entirely apart from that dictated by the seating capacity of a car, loop arrangements at the ends of lines and the installation of turn-back points on either car or bus lines; (3) an analysis of all other elements entering into the service given apart from those dictated by physical factors or the convenience of passengers, such as the impression made by the operators, their personal habits in regard to cleanliness or uniforms and their method of answering inquiries.

The report mentioned that several companies had given considerable attention to market analysis and listed a few significant results obtained by a house-to-house sales campaign of a western company and some interesting situations which were disclosed in a survey made by an outside organization for another company.

In an attempt to learn just what the passenger desired in his individual service, questionnaires were sent out for information to obtain a definite classification of these desires. The consensus of opinion was that speed was the first desire, with comfort and fares second and third, respectively.

Two other related fields were covered, the reasons for falling revenue and the methods of stimulating off-peak travel. The decreasing of revenue was attributed to the greater speed of competing forms of transportation, the creation of outlying communities and the general opinion of the street car service as a whole formed by those who ride principally during the rush hours.

Methods of stimulating off-peak travel discussed were increased speed, street car tickets sold on time, supply of tickets to be sold by meter readers, regular and effective advertising of car service, appeal to women, unlimited passes and adherence to schedule time.

The Employee—His Selection, Training and Service

GUIDED by the knowledge that there is a need of giving to the human force that same serious consideration which has long been expended upon the mechanical side of the industry, the T. & T. committee on the employeee proceeded to make a thorough study of this important phase of railway operation. We are engaged in a highly competitive business, the committee stated, which has as its fundamental problem that of obtaining more car riders and of winning back some that have been lost. For this task are needed not only the most carefully selected group of workers, but also that co-operation and interest which come only from an understanding of their problems on the part of the officials and an understanding of the company's problems on the part of the employees. For years managements have striven for and have obtained improvement in mechanical methods. The study of the human element has not kept pace with this development.

The committee named the favorable results obtained by transportation companies pursuing employee programs for definite periods and urged upon individual managements the necessity of waking up to the great importance of a full and balanced policy in obtaining and maintaining a body of thoroughly competent and interested employees. The report covered the employee problem under the four headings selection, training, informational education and accident prevention.

In answering the three questions, what are the present methods, how can selection be improved and what new methods can be suggested, the committee gave some valuable information to aid in clearing the ground for an understanding of the problem of selection. Reference was made in answering the third question to the interviewing of men by industrial psychologists.

Under the discussion of training the committee outlined the present training programs on the larger properties and urged that employees be trained as carefully as they are selected.

The committee expressed the belief, in developing the subject of informational education, that an intimate knowledge of the economic factors and managerial problems that determine the policies of a company is necessary in enlisting the sympathy of the employee, and added that information must be given continually to the employee in as attractive a way as possible, not only to keep him interested in his job, but to keep him abreast of the times in a constantly developing and improving industry.

Two important facts were mentioned as necessary to keep in mind: The need of properly organized follow-up work and the education of employees already in service. The actual nature of the informational education to be given to employees was outlined by the committee in connection with the follow-up of new men and the introduction of such methods with employees already in service.

The general principles underlying a suitable set-up were outlined under the heads: Material, Personnel and Methods. The committee left three fundamentals to be kept in mind in developing any educational program: (1) There must be an expression of sincere desire to give information, backed by an honest recognition of proper functional reaction; (2) the instructor must be well posted, and (3) the material must lend itself to practical application.

To secure suitable data to aid in the study of accident proneness, the committee inquired of several companies regarding the proportion of accident prone men, the handling of men who have accidents and the proportion of collision accidents which are charged to operators. The replies indicated that 27 per cent of the employees on an average have 53 per cent of the collision accidents, indicating that in all companies there is a certain pro-

Digitized by Google

portion of accident prone men. The committee supplemented the procedure for investigating the causes of accidents and handling the men who have them with the suggestion that more intensive studies should be made of the past records, personality and operating habits of the high accident men and that the instruction which these men receive at the hands of superintendents should be supplemented by some special instruction on the job, either by the training department or by the supervisory force. The results of the inquiries regarding the proportion of collision accidents shows that accidents are viewed quite differently by officials and that there is need for the adoption of a uniform basis.

In connection with the study of accident prone men the report referred to the work being done in Boston and Cleveland.

ACCOUNTANTS' ASSOCIATION

Chairmen of Accountants Association Committees

1. Wallace L. Davis—Representative to Annual Convention National Association of Railroad and Utilities Commissioners.
2. Walter Shroyer—Freight Accounting.
3. E. A. Tuson—Bus Accounting Sub-Committee of Standard Classification of Accounts Committee.
4. M. W. Glover—Standard Classification of Accounts.
5. R. A. Weston—Stores Accounting.

NO FORMAL reports were presented this year by the committees on standard classification of accounts, and fare collections, nor the sub-committee on bus accounting of the Accountants' Association. The report of the committee on stores accounting was presented briefly, being in substance the same as the report of a committee of the Purchases and Stores Division of the Engineering Association, which has been studying the same subject.

CLAIMS ASSOCIATION

Chairmen of Claims Association Committees

1. John J. K. Caskie—Subjects.
2. Bert C. Wood—Safety.
3. J. S. Kubu—Uniform Negligence Law.

Safety

ACTING as a committee from the claims standpoint, the safety committee of the Claims Association, of which Bert C. Wood, general claim agent Pennsylvania-Ohio Public Service Corporation, was chairman, did not enter into the work of accident prevention from the operating angle. It was the belief of the committee that more could be accomplished where there is brought about a centralization of prevention work around and through which revolve the correlative values of the various departments and associations. "It appears to the operating man that the claims department is concerned in the settlement of claims only," the report stated, "and on some properties where individuals have participated in the accident prevention work, it has generally resulted in confusion through statistics assembled, methods of classification and procedure taken to bring about corrections. It is in an effort to avoid these complications and to remove the complexity of our work in its relation to other departments that we seek the consideration of the membership of the recommendations of this committee pertaining to the classification and definition of accidents."

The committee recommended the adoption by the several states of the Hoover conference on uniform traffic law as a safety measure in its uniformity and covering of vehicle traffic and the driver; that the president of the Claims Association appoint a committee to define "accident," to outline specifically what accidents shall be counted in the totals reported in competition for the Brady or other awards, to determine exactly what items of expenditure shall be considered in the calculation of total claim department costs now generally used in computation of percentage of the gross income, and to define what "gross" is to be used; that the operating or accident prevention departments compile and keep a detailed account of trainmen experience, recording all factors having to do with efficiency of operation and reduction of accidents; that a five-year comparison, under classification as to nature of occurrence, be made of accident causes, and that members compete for the Brady and other awards for safety and claims work.

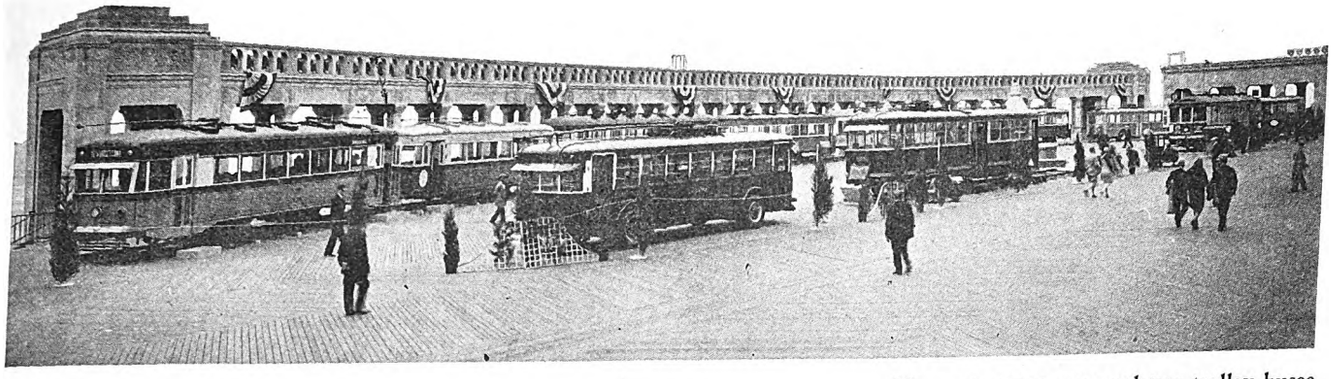
Uniform Negligence Law

THE report of the committee on a uniform negligence law was presented to the Claims Association on Wednesday afternoon by J. S. Kubu, chairman. The committee drafted an act on imputed negligence for the purpose of presentation to the legislatures of the various states for their consideration. The act follows:

"1. In any action for personal injuries or wrongful death resulting from collision or other accident to a vehicle, and sustained by a person who at the time of said collision or other accident was riding in such vehicle, the plaintiff shall not recover damages from any person from whom the driver of said vehicle or the operator or owner thereof could not recover any damages sustained by said driver, owner or operator of said vehicle as a result of said collision or accident because of the contributory negligence of such driver, owner or operator. Provided, that this section shall not apply to any action against the person driving said vehicle or owning or operating the same. Provided, further, that this section shall not apply to any action for personal injuries to or for the wrongful death of a person who at the time of such collision or other accident was a passenger in a vehicle of a carrier for hire. Provided, further, that this section shall not apply to any action brought for personal injuries to or the wrongful death of any minor under the age of sixteen years at the time of said collision or accident."

The committee collected information and opinions from a number of members of this association that proved exceedingly helpful and reported that it was gratified with the intense and universal interest in the matter now under consideration. Regarding the constitutionality of the act, the committee reports that it is now awaiting the opinion of counsel.

Digitized by Google



Nine new street cars and two trolley buses were shown on the Boardwalk at Atlantic City

Many Innovations in EQUIPMENT and APPARATUS Shown in Most Attractive Exhibit

New Car Designs Recognize Demand for Higher Speed—Larger Capacity a Feature of Latest Type Buses—Track Construction Machinery Improved—Betterments Made in Overhead Line Material

SURPASSING all previous exhibits in attractiveness of arrangement, this year's show in the magnificent Atlantic City Auditorium set a record of accomplishment for the annual convention of the American Electric Railway Association. In size the exhibit was almost exactly the same as those of the past two years at Cleveland. A total of nearly 105,000 sq.ft. of floor space was used for the display. Of this amount approximately one-third was utilized by the bus exhibit. Nine of the latest type street cars and two trolley-buses were shown on the Boardwalk in front of the Auditorium.

New Cars Designed for Higher Speeds

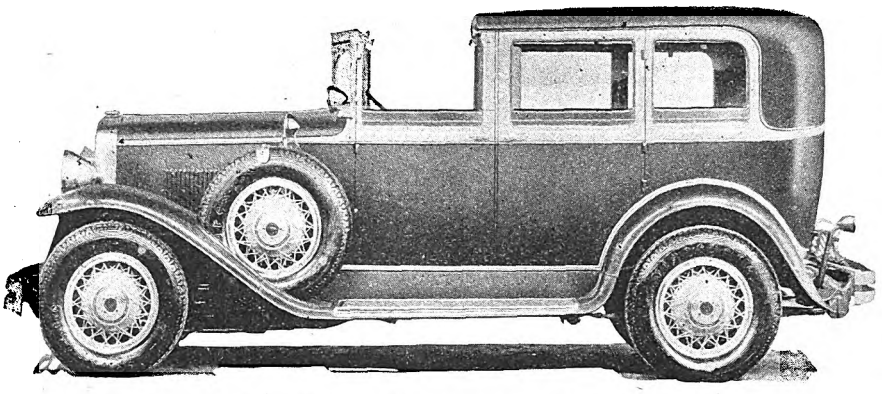
Foot control, center exit doors and reduction in unsprung weight are interesting features of the cars shown in this year's exhibit. Cabinet inclosure of control apparatus, increased attention to operators' comfort, improved seating arrangement and growing use of composition flooring are other outstanding elements in the latest designs.

The most radical departure from conventional design was the lightweight, double-truck car built by the Twin Coach Corporation for the Brooklyn & Queens Transit Corporation. This car, with a length of 45 ft. and seats for 52 passengers, weighs only approximately 30,000 lb. The four motors are full spring suspended, being directly attached to the car underframe and connected to the axles through propellor shafts with universal joints. Entrance is at the front where a Perey turnstile is located. Exit is through a treadle-operated folding door located just back of the center of the body. The car is arranged for double-end operation. Special attention has been paid to the insulation of sound-producing parts.

Another interesting front-entrance, center-exit, double-end car was that built by the Cincinnati Car Corporation for the United Traction Company of Albany. This car has an overall length of 42 ft. 8⅜ in. and seats 44 passengers. Aluminum sectional construction, single panel windows and elimination of the letter board are features of the design. The trucks are equipped with Hyatt roller bearings and magnetic track brakes. The electrical equipment consists of four 30 hp. motors with foot control. This car weighs 32,450 lbs. complete. Door-operating devices as well as electric heaters are Consolidated Car-Heating Company design.

Other center exit designs included a car built by the Department of Street Railways, Detroit, mounted on Timken 52-A trucks and a car built by Brill for the Chicago Surface Lines with four 50-hp. motors mounted on 76-E-2 trucks. The Peter Smith mechanical ventilating

Digitized by Google



New model taxicab shown by General Motors Truck Company

system is an interesting feature of the Detroit car.

The Osgood Bradley Car Company exhibited a medium size, double-end, double-truck car similar in general design to the cars developed by this company for the street railways in Worcester and Springfield. The standard double-truck, one-man, two-man city type car used in Milwaukee was shown by the St. Louis Car Company.

Both the four-wheel and the eight-wheel type of Brill master unit cars were shown. The eight-wheel type is mounted on 177-E-1-X trucks with four 35-hp. motors. This car was built for the Lynchburg Traction Company. The four-wheel car is mounted on a truck frame of special design with a long wheelbase arranged with sufficient axle play to permit easy passage of sharp curves. It is equipped with two 50-hp. motors with foot control.

The light-weight, high-speed car built by Osgood Bradley Company for the Pittsburgh Railway equipped with the new 52-A Timken trucks was also exhibited on the outdoor track. The seats are of the individual bucket type placed at an angle of 45 deg. along the sides of the car. Each truck has two motors with armature shaft brakes and automatic acceleration.

A trackless trolley with aluminum body was shown by the Cincinnati Car Corporation. This is similar in general to the vehicles built by the same company for the Utah Light & Traction Company. Another interesting trolley bus in the outdoor exhibit was that built by the Twin Coach Corporation for the New Orleans Public Service, Inc.

In the Auditorium exhibit, the J. G. Brill Company displayed a new low-level truck, model 188-E, with swivel supported journal boxes. The Timken Detroit Axle Company exhibited its recently designed 52-A truck with armature shaft disk brakes. A graduated spring suspension truck was shown in the indoor exhibit of the St. Louis Car Company.

Trend Toward Larger Capacity in Buses

In the bus exhibit the general trend appeared to be toward vehicles having seating capacities ranging from 35 to 41 although a few buses were exhibited providing seats for 21 passengers. Front entrance and rear exit arrangement was characteristic of many of the larger types.

The General Motors Truck Company exhibited five Yellow Coaches and three chassis, one of which was of the gas-electric type. A city service bus with all-metal body having unusual aisle width and headroom was an interesting feature of this exhibit. The apparent ease of maintenance and the lightness of construction of this design created a favorable impression. A novel feature of the General Motors exhibit was a new model taxicab.

The Saf-T-Cab Corporation also showed a four-passenger cab of the sedan type with a compartment for the driver separated from the tonneau.

Six buses, ranging in seating capacity from 12 to 41 passengers, and a stripped chassis were exhibited by the White Company. A model 54 chassis was shown with two body types. The "Parlor Pullman," which normally seats 25 passengers, has auxiliary seats giving a maximum carrying capacity of 31 passengers. A combination passenger-baggage-express bus accommodates fifteen passengers but this number can be increased to 21 if no baggage is carried. The model 54-A, which has the same general specifications as the model 54, has a wheelbase of 250 in. instead of 240 in., thus making it possible to carry a larger pay load.

A 21-passenger bus was shown with double seats on one side and a row of single seats on the opposite side with an exceptionally wide aisle, thus allowing ample room for standees.

The International Motor Company exhibited three models of Mack buses, including the four-cylinder model AB, the six-cylinder model BK, which replaced the former model AL, and a new model BC. The latter which develops 100 hp. is mounted on the so-called Mack straight frame. This type of bus is built with either a 202- or a 231-in. wheelbase. A noteworthy feature of the various Mack types is the degree of standardization of body parts.

Studebaker exhibited a new 220-in. bus chassis with an eight-cylinder, 125-hp. motor. The frame has eight cross-members, three of which are of the tubular type. This is said to decrease frame distortion to a marked degree. A 25-passenger parlor coach mounted on the 220-in. chassis was shown also and a 21-passenger street car city type bus in addition to a de luxe model of the same type.

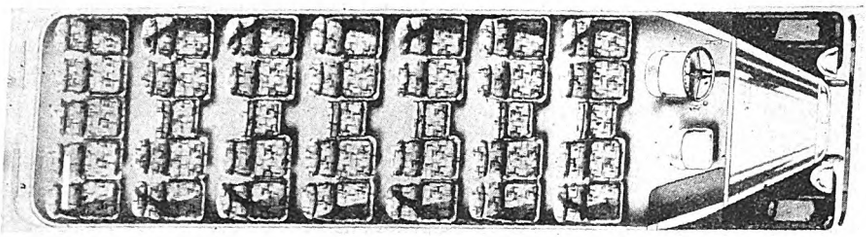
The Twin Coach Company exhibited for the first time its new 21-passenger urban coach with center entrance. The feature of this type of bus is that at peak hours it has space available to carry double the number of passengers who can be seated. The wheelbase is 140 in., enabling the coach to turn within a 25-ft. radius. Its parts are interchangeable with the larger models. Various larger Twin Coach models were shown also.

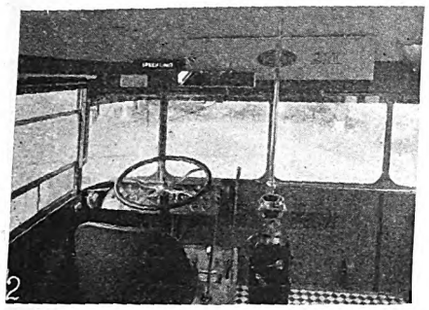
The Dodge Brothers Corporation exhibited one bus of the 16-passenger parlor type and one of the 21-passenger city type. The engine develops 78 hp. and the transmission has four speeds. Four wheel brakes of the internal expanding hydraulic type are provided. A new combination of generator and motor which can be installed in any conventional type of bus was displayed by the Fraser Electric Transmission Company. The Fraser unit consists of a d.c. generator, which is directly connected to and driven by the bus engine, and an electric motor which takes current from the generator and drives the propeller shaft, all in a single housing.

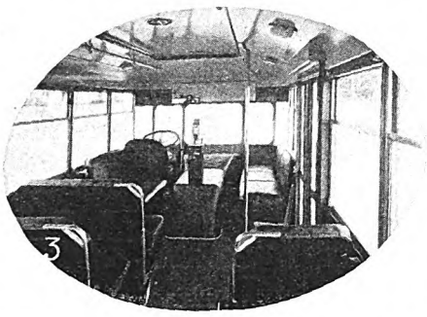
A Pickwick "Nite Coach" showed much ingenuity in its design. Accommodations are provided for 26 passengers in thirteen compartments equipped with hot and cold running water. Kitchen and toilet facilities also are provided.

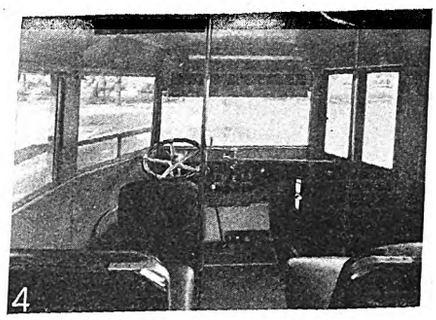
Recent models shown by the Lang

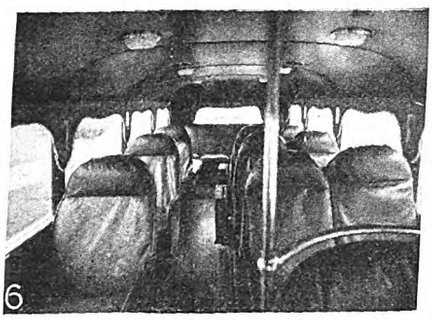
Digitized by Google

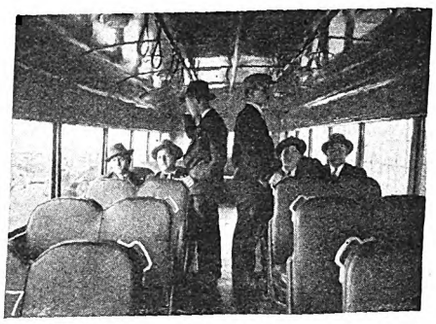


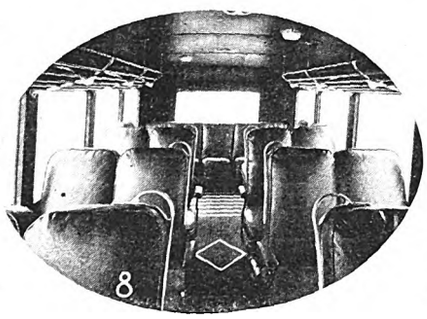












Some of the Features in the Bus Exhibits

1. This new model Yellow Coach has six tilting seats between the regular seats.
2. Device showing when predetermined speed limit has been reached is located above driver in the Twin Coaches.
3. Seating arrangement at front of new baby Twin Coach.
4. Commodious entrance of new Mack city type bus.
5. Interior view of new 39-passenger Yellow Coach with Lang body for city service.
6. Folding aisle seats increase capacity in this model shown by Bender Body Company.
7. Wide aisle and ample headroom feature White model 54-A bus.
8. Interior of Studebaker de luxe 21-passenger street car type bus.

Body Company include a body accommodating 39 to 41 passengers made for the Cleveland Railway, an all-metal, de luxe parlor car built for the Greyhound Lines and a body of semi-metal construction which was exhibited for the first time.

The Bender Body Company exhibited three different models—the fifteen- to eighteen-passenger parlor chair coach, the standard city type bus and a parlor-pullman coach. The first of these was mounted on a White six-cylinder chassis, model 61, with a wheelbase of 170 in. The standard city type bus affords seats to 21 passengers while the aisle width of 23 in. permits the carrying of a considerable number of standees. The parlor pullman coach seats 33 passengers while nine more can seated on folding or tilting seats, making a total of 42. Both the first and last mentioned designs have ample space for carrying baggage on the roof or inside on a wide overhead rack.

Four and six-cylinder motors for bus service were shown by the Hercules Motors Corporation. A feature is the integral casting of the crankcase with the cylinders.

The Waukesha Motor Company displayed various types of engines, including the latest rail six-cylinder motor, which develops from 200 to 400 hp. at a speed of approximately 1,000 r.p.m.

A Viking large model six-cylinder rail car engine was the feature of the Sterling Engine Company's exhibit. This motor has a cylinder 8 x 9 in., developing 465 hp. at 1,200 r.p.m.

A de luxe model 10 observation parlor coach mounted on a Reo GB bus chassis was shown by the Fremont Metal Body Company. A feature is that the body is provided with a rub rail composed of three runners of $3\frac{1}{2}$-in. molded hard rubber reinforced with steel, thus affording protection against denting of the lower panel. The Büssing Motors Company of America exhibited an imported chassis of German make. Its motor with a bore and stroke of $5 \times 6\frac{1}{2}$ in. develops 110 hp. at 1,000 r.p.m. The radiator is of the sectional type while the six-cylinder engine is cast in three blocks of two cylinders each and is mounted with transmission in a subframe suspended in rubber blocks. The Brooks Steam Motor, Inc., exhibited its first bus, preparatory to its start on a production basis. The Farnham Nelson Company, manufacturer of bus bodies, exhibited a parlor observation coach and a 39-passenger bus of the street car type with rear exit.

A 25-passenger bus built by the Anderson Body Company, with inside and outside baggage facilities having an all-metal body and roof of the monitor type, had also an all-metal interior, equipped with de luxe head-roll chairs. All seats face forward.

Digitized by Google

The American Car & Foundry Motors Company exhibit featured recent models for intercity service. In these designs special attention has been given to the outside and interior finish, producing an extremely pleasing effect.

Innovations in Electrical Equipment

Visitors to the exhibit of the Westinghouse Electric & Manufacturing Company's exhibit were greatly interested in the demonstration of the VA variable automatic control. In this apparatus the control is actuated by two pedals placed in front of a comfortable seat for the operator. By means of a series of lights traveling around the frame the speed of the car is indicated corresponding to each action of the controller. The mechanism itself is placed in front of the operator, so that he can see at once the result of each movement of his feet on the pedals.

Other features of the exhibit included a complete truck for a double-truck street car, equipped with two 516-D railway motors and WN drive. One of the No. 1426BT, 50 hp. motors for use with the Timken drive also was shown. A large model of the Deion indoor circuit breaker was on display. There was also an automatic switching equipment, a Rectox polarity insuring equipment for railway converters and automatic d.c. feeder equipment.

Trolley bases and trolley harps and wheels for trackless trolleys were a feature, as were automotive air brakes. A demonstration of the voice-actuated control unit was given, attracting great attention. An entire section of the exhibit was given over to parts for modernization of equipment. Renewal parts of the latest design were shown, covering many lines of railway equipment.

Features of the General Electric display included the wide range of products made by this company. There was a working demonstration of the new PCM pedal-operated motor control with dynamic braking feature. A chart drawn with colored neon lights gave a graphic comparison of the smoothness of acceleration obtained with the PCM control with its eighteen points as compared with the K-75 control with eight points.

Other equipment displayed included a model of the synchronous selector supervisory for the centralized supervision of the Cincinnati Street Railway system, an atomic hydrogen arc welder, railway motors and controllers, gears and pinions and overhead line equipment.

A scene depicting a modern city with its skyscrapers, with a street car, a bus and an airplane in the foreground, gave an excellent opportunity for showing the possible uses of the products of the Aluminum Company of America. Underneath this picture was a display of many of the products of this company, ranging from large beams and casings to screws and nails. Windows and doors for cars and buses as well as for general building purposes were shown. There was an exhibit of castings and moldings used in the Blackhall car. Another display showed roofing and corrugated sheathing, while seamless tubing in various sizes was featured. One collection included screw machine parts such as bolts, nuts and machine and wood screws.

Track Exhibit Impressive

Among the several newly developed and improved devices and materials for track construction and maintenance which were shown at the exhibit were a uniform tension bolting machine, a new type of shallow tie, a new compression drop testing machine, improved rail grinders, tapered wood ties, a new design of rail welding preheater, bars and plates with bends for rail joints, a combination cover and tool box for a welding outfit and a concrete mixer heater. In all the groups of equipment—ties, rail joints, special work, rail bonds and track machinery there were many interesting and valuable exhibits.

Twice daily demonstrations of the "mortar flow" principle to give a uniform concrete bond between ties, rail and concrete, featured the exhibit of the International Steel Tie Company. The company also had on display a compression tamping machine, a uniform tension bolting machine to be operated by one man, a D.S.R. tie layer, a mortar flow pulsator, a modernized type of twin tie and a new precision type rolled steel rail clip. The company also showed samples of hand-tamped and pulsated concrete and steel bonds, a section of Detroit track that had been in service for eight years, the stone ballast and grout method for finishing track in three days and a type of tie construction for renewal on an old concrete base.

A number of models showing the Dayton method of track construction were included in the exhibit of the Dayton Mechanical Tie Company. The company also showed three types of shallow ties, booster joints, steel ties for special work and tilted rails.

A short section of track consisting of standard rails and Carnegie steel cross ties, along with several types of steel sheet piling, was shown by the Carnegie Steel Company. A pair of wrought steel wheels mounted on a heat treated axle completed the exhibit.

The W. S. Godwin Company demonstrated the use of its keystone tapered wood tie, wide on top and narrower on the bottom, which allows further spacing of the ties with additional strength. A small model with both tapered ties and regular square ties embedded in concrete, with the required spacing of each, was shown. The company also displayed its steel paving guards for increasing the edge bearing strength of pavement.

Samples of ZMA poles, cross arms and ties, preserved against decay and termite attack with zinc-meta-arsenite, were displayed by the Curtin-Howe Corporation. The samples demonstrated adequately the cleanliness of the timber after treatment and the ability of the treated wood to receive paint.

A newly developed compression drop testing machine and a large display of silico-manganese steel trackwork featured the exhibit of the Bethlehem Steel Company. This trackwork included a crossing, a tongue switch and mate and two diamond frogs. The company also displayed a track section of steel ties, samples of Keystone fin tail, open center and straight end steel ties, adjustable switches, bolts, a car wheel and an axle upon which were mounted a gear and two car wheels.

Special trackwork, including switches and crossing parts, as well as wood models showing construction of various special trackwork parts was included in the Lorain Steel Company exhibit. A flange bearing rail section also was shown.

Two solid manganese steel tongue switches, one a new flexible wall type and the other the proposed A.E.R.A standard type, were shown by William Wharton, Jr. & Company. This company also displayed a manganese steel half crossing of a scientifically designed type, a double point complete with stock rail and adjustable guard and a manganese steel tongue point complete with stock rail and heel casting.

The Metal & Thermit Corporation featured a new design of rail welding preheater in its exhibit. The

Digitized by Google

company also displayed materials and equipment for Thermit rail welding, a welding tool wagon completely equipped, two new designs of rail clamps and specimens of Thermit welds made by various methods.

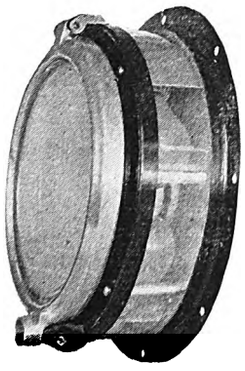
Una arc welders of the latest type for track welding, bonding and shop welding, Una arc welders of a.c.-d.c. types for shop use, samples of welds and high tensile rods were

Reclining chair exhibited for either car or bus by Heywood-Wakefield Company

shown by the Una Welding & Bonding Company. The company gave interesting demonstrations of its Goodspeed automatic welder.

The exhibit of the Railway Trackwork Company included the improved Atlas rail grinder equipped with a Bakelite wheel, the Vulcan rail joint grinder, an Ajax electric arc welding outfit, the Eureka rotary grinder, several grinding wheels and bricks and a track curve oiler.

A number of applications of Elastite, including rail filler, rail cushion,



Headlight exhibited by Electric Service Supplies Company illuminates the dash of street cars

asphalt plank, expansion joint, third rail covering, cable trunking and foot blocking, were displayed by Philip Carey & Company.

Several types of continuous joints and special angle bars adapted to the latest practice of welding were exhibited by the Rail Joint Company.

Samples of special trackwork, including a tongue switch, mate, frog, crossing and various types of spring boxes, were exhibited by the Buda Company. Photographs of assembled special trackwork layouts completed the company's display.

Steel plates and bars of various sizes for rail joints, shaped with a U-bend in the center to allow for expansion and contraction and designed for welding on the base and web of the rails, were shown by the Moisselle Welded Rail Joint Company.

All types of rail bonds, including steel arc weld, gas weld, copper arc weld, brazed and signal bonds, were displayed by the Electric Railway Improvement Company. The company also showed two electric arc furnaces, welding rods and rheostats and a wheel-mounted welder which also is portable. The cover for this welder was fitted with wheels allowing its conversion to a tool box when not used as a cover.

The American Steel & Wire Company also showed several types of rail bonds, signal bonds and rail bonding appliances, as well as welding wire, wire rope, wires and cables for all purposes.

A complete line of compressed air equipment for track construction and maintenance, including a compressor outfit, portable air compressors, tie tampers, paving breakers, drills, back fill tampers and other pneumatic equipment was displayed by the Ingersoll-Rand Company. This exhibit also included a safety saw and an air hoist.

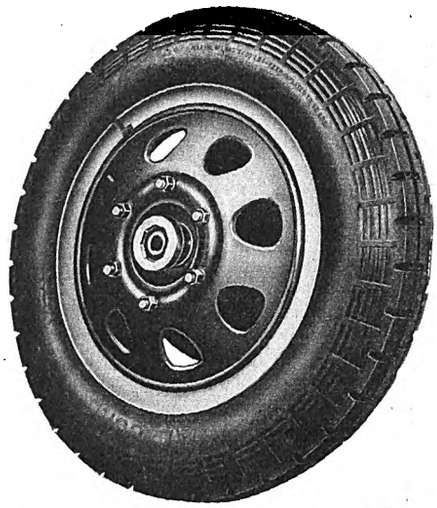
The Duff-Norton Manufacturing Company displayed a complete line of jacks for railway use, including track, automatic lowering, car repair, journal, self-lowering ball-bearing screw and air motor operated screw jacks. The company also showed pinion pullers and tie spacers.

Templeton, Kenly & Company, Ltd., also displayed several types of jacks for car, track and motor bus service. Among the jacks exhibited were some for pushing pipe under streets and tracks, pulling together rails and expanding rails.

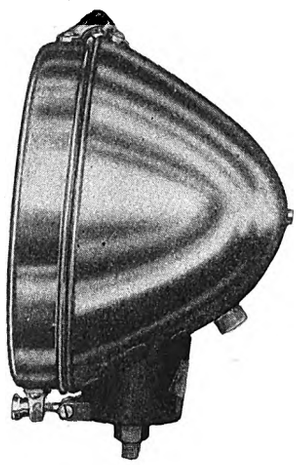
Several tools for railway use, including ballast and tamping forks, rail forks and rakes for gravel, cinders, etc., were exhibited by the American Fork & Hoe Company. The company also showed its True Temper products—tapered rail joint shims—and its rail anchors.

An oil burning tar kettle on wheels, a concrete mixer heater, a kerosene torch for general purposes mounted on wheels, a portable kerosene torch and a track sander comprised the exhibit of track equipment of the White Manufacturing Company.

Many improvements were shown in overhead line construction material. The Anaconda Wire & Cable Company and the American Brass Company jointly exhibited high-tension control wire risers used in catenary systems. A feature was the "Hi-tenso BB" wire, for which an 82 per cent conductance is claimed. Other products shown included copper composite cable, Anaconda hollow conductor, Everdur copper bus bars and tools, and commutator bars. The Malleable Iron Company's exhibit included adjustable mounts and overhead clamps for "H" columns, railroad electrification catenary clamps and cables, and insulator hangers.



Spoksteel single front wheel exhibited by the Motor Wheel Corporation, Lansing, Michigan



Golden glow chromium plated bus headlight has a diameter of 9 in.

The Cheatham Electric Switching Device Company showed an automatic electric switch point throwing device

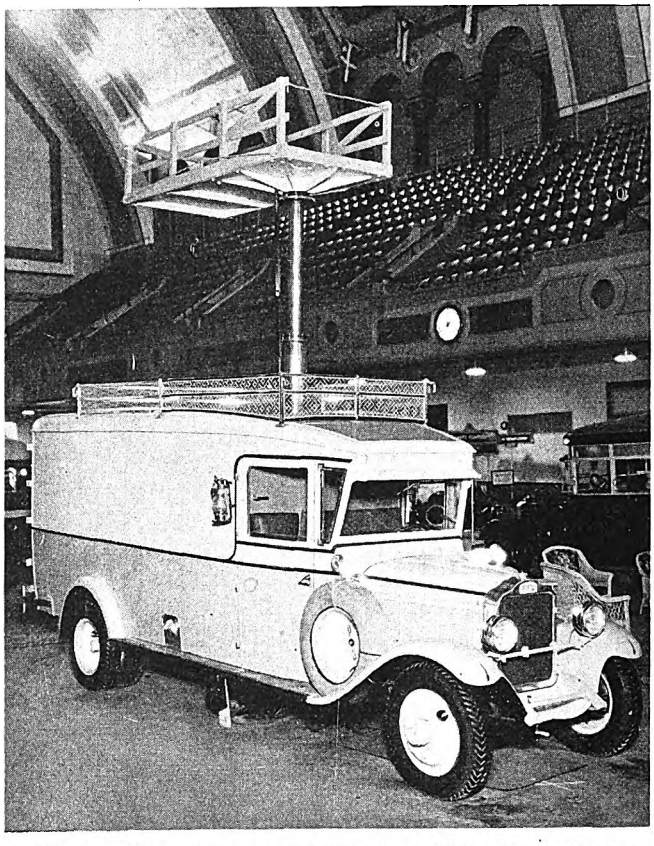
Digitized by Google

which is operated by the motorman through the controller on the car. The Westinghouse Electric & Manufacturing Company had a complete line of overhead construction material, such as splicers, frogs, section insulators, turnbuckles, etc.

A particularly interesting feature of the overhead line equipment exhibit was a tower wagon mounted on a 51-A White chassis. This is built in three sections and is hydraulically operated. The raising of the platform up to its highest position takes place in fourteen seconds. A maximum elevation of 25 ft. is obtainable.

An extensive line of overhead construction material was shown by the General Electric Company.

Catenary construction material was shown in the exhibit of the American Cable Company, which also had on display an interesting flexible belt and dead head sling.



New model tower wagon mounted on White 51-A chassis

Recent developments in overhead line material were shown in the exhibit of the Ohio Brass Company. Among the features were samples of the various parts used in the overhead system of the Cleveland Union Terminal. A newly-designed crossover for use in overhead systems for trackless trolleys operates automatically, thus preventing jumping of the trolley wheel which is more likely to happen with trackless trolley operation than in ordinary street railway operation. A section insulator has been designed for use in connection with this crossover. A splicer for high-speed operation was exhibited. This is especially recommended for pantograph operation and is made from a bronze aluminum alloy. A duplex removable pan of the frog facilitates its removal without disturbing the trolley wire or guy wire installations. A removable section-insulator design facilitates its replacement if necessary without disturbing the other parts of the overhead system. A spring lock hanger takes up the shocks applied to the trolley wire when a trolley wheel passes an ear. A special trackless trolley harp has been especially designed for application on the trolley bus to reduce the tendency for the trolley wheel to jump the wire. A cushion silencer which consists of a rubber insert into the trolley pole holding the trolley harp reduces the noise materially; it was shown for the first time. A removable trolley shoe attached to the harp by one bolt was shown also.

Flooring of various types was exhibited by the Johns-Manville Corporation, including Masticoke, truss plate steel flooring and other materials suitable for street cars and buses.

New 1-gal. pressure type fire extinguisher made by the Pyrene Manufacturing Company

The Irving Iron Works Company exhibited Safkar steps and Irving open-steel flooring.

The Alan Wood Steel Company showed the "AW" diamondette steel floor plates for use in the transportation industry.

Chanarch aluminium and steel car doors were featured by the Morton Manufacturing Company.

Porcelain enamel stanchions, hand rails and door hangers were included in the exhibit of the Ellcon Company.

Fyr-Freez exhibited portable fire extinguishers.

Meters to register energy consumption of electrical equipment and gasoline consumption on buses were featured by the Economy Electric Devices Company. At the same booth was shown a new type reverse-flow ventilating system.

De Walt Products Corporation had on display direct-driven power saws for ripping, crosscutting and other operations in coach work.

Highway crossing signals were this year's feature of the Nachod & U. S. Signal Company. The maximum traffic control device was installed in addition to the existing traffic signal installations. A turn-right signal to prevent sideswiping of cars with automobiles also was shown.

The Okonite Company and the Okonite-Callender Cable Company exhibited samples of rubber-covered and cambric insulated cables and various types of tape and ignition wire.

Motion picture apparatus with a portable sound collecting device was shown by Electrical Research Products, a subsidiary of the Western Electric Company.

Among the unusual displays was that of the Public Service Co-ordinated Transport. At the back of its booth were transparencies illustrating various phases of its extensive services. A large wall map of the territory served by the company's transportation lines, bus and electric, was the central feature of the exhibit, supplemented by time tables and descriptive literature.

Timken products were shown in two allied exhibits. The Timken Roller Bearing Company showed the use

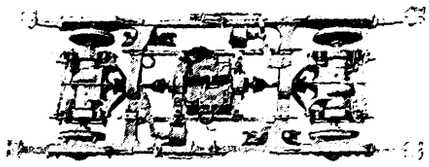
Digitized by Google

Cabinets inclose all control apparatus at front of car exhibited by Cincinnati Car Corporation

of its products in the form of railway journals and in the car of the Cleveland Railway. The Timken-Detroit Axle Company exhibited various types of bus axles and the new model 52 worm-drive street car truck.

The Clark Equipment Company showed a new bus axle designed for use with the Clark spoke type dual pneumatic wheel.

Single front and dual rear pneumatic wheels for trucks and buses were exhibited by the Erie Malleable Iron Company. The construction of these wheels permits free circulation of air around the brake drums which



New Brill 283-A truck for four-wheel cars

helps to keep the drums and tires at a normal temperature.

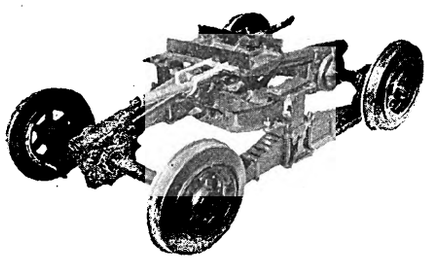
The National Malleable & Steel Castings Company exhibited a new wheel made of spun steel.

Ball and roller bearings of the latest types were shown by the Norma-Hoffmann Bearings Corporation, as well as bus generators and magnetos.

Bearings for axles and armatures were featured in a great variety in the exhibit of the National Bearing Metals Corporation.

The Spicer Manufacturing Corporation and its affiliated companies, the Brown-Lipe Gear Company and the Parish Crushed Steel Company, exhibited a line of propeller shafts and universal joints both of metallic and fabric type. Other products displayed were the latest bus transmission units and bus springs, side rails and other metal stampings.

A new ticket printing register was the feature of the Ohmer Fare Register Company's exhibit. This register is electrically operated. Instead of using a push button, a short

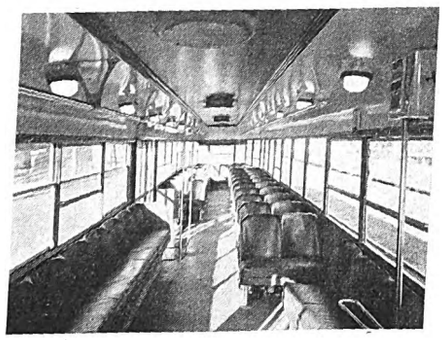


Twin Coach car has motor suspended from car body

hand lever is used which receives pressure from the palm of the hand. An indicator shows the amount of fare paid in large figures at the top of the register. Other exhibits were the standard ticket-printing register, toll bridge register and other types of cash and ticket registers.

Various types of fare registers for railway station and bus or car use were shown by the National Cash Register Company. The bus registers shown, print tickets which are issued to the passengers on payment of fare.

The Cleveland Fare Box Company



Interior view of new Twin Coach street car

exhibited its latest portable and stationary registers, coin-counting machines and tokens. Ticket and transfer-issuing machines were shown by the Macdonald Manufacturing Company.

The Perey Manufacturing Company had a display of passimeters and coin recorders.

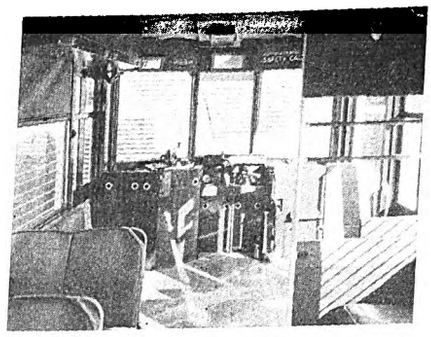
A number of types of coin-counting, coin-sorting and coin-wrapping machines were exhibited by the Sattley Company.

The Hyman Register Corporation showed devices for the mechanical issuing of transfers.

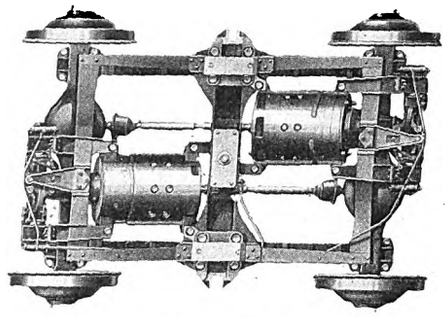
The Globe Ticket Company had a large display of transfers and railway tickets.

The Rochester Printing Company exhibited various types of railway transfers and tickets.

Electric car heaters of various types were shown by the Consolidated Car Heating Company. Motor resistor heaters which utilize the heat ordinarily wasted in resistance grids were also shown, as well as various other pieces of electrical equipment for cars, including relays, thermostatic control equipment and similar devices.



New arrangement of control apparatus in St. Louis car



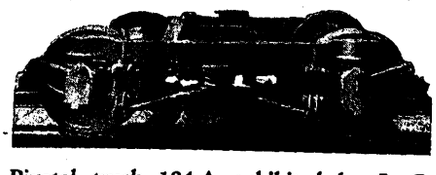
Timken model 52 worm drive truck with armature shaft disk brakes

The Gold Car Heating & Lighting Company exhibited various types of car-heating equipment and in addition switches, ventilators and miscellaneous sundries.

Two new models of the "2000 type" bus heater were featured by the Nichols-Lintern Company, along with a dual roof ventilator and a coach fan.

The Motor-Car Ventilator Company exhibited various types of

Cincinnati Car Company truck with track magnetic brakes



Pivotal truck 184-A exhibited by J. G. Brill Company

Digitized by Google

ventilating systems, known as the "Vac-Vent," for buses. It is stated that these are especially adapted for the removal of carbon monoxide gas fumes and complete motor and body ventilation.

Upholstery leathers in the latest shades and in several grades formed the exhibit of the Radel Leather Manufacturing Company.

The Cleveland Tanning Company showed high-class upholstery leathers of all kinds.

The Eagle-Ottawa Leather Company showed various kinds of leather suitable for the upholstery of electric cars and buses.

Chase Velmo upholstery for interurban electric railway and bus equipment was shown by L. C. Chase & Company.

Blanchard Brothers & Lane had an attractive exhibit of leather upholstery for cars, buses and household and office furniture.

Reclining chairs for cross-country buses and rotating chairs, both double and single, for cars and buses were included in the display of the Hale & Kilburn Company. Other seats for transportation service were shown.

Specimens of Rol-Man products made of rolled and forged manganese steel were exhibited by the Manganese Steel Forge Corporation. The exhibit consisted principally of parts for use on cars and trucks, such as journal boxes, pedestal liners, bolsters and transom chafing plates.

Sound proofing of gear cases to reduce car noises was demonstrated by the Chillingworth Manufacturing Company.

Electric railway and bus equipment of many kinds was exhibited by the National Railway Appliance Company. Among the products were brake-testing machines, electrical test benches, drum screw lathes and similar machinery used in repair of cars and buses. The Fraser gas-electric drive and the Walter snow plow also were shown.

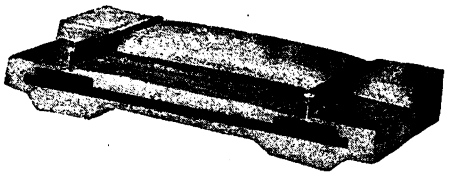
One of the latest developments shown by the Griffin Wheel Company was a chilled tread wheel with a chilled back flange and a chilled rim.

The American Brake Materials Corporation exhibited various types of brake shoes, brake bands and brake lining material.

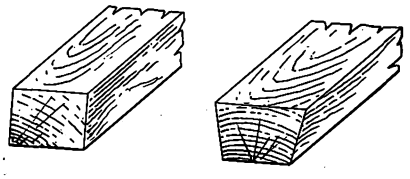
Brakeshoe linings for buses and trucks were displayed by the Russell Manufacturing Company.

Several types of wheel truing brake shoes were shown by the Wheel Truing Brake Shoe Company.

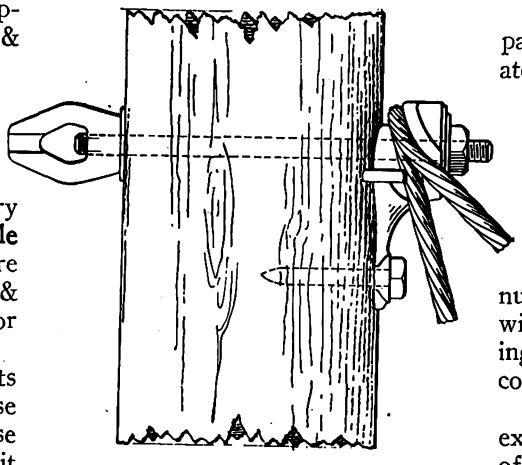
A working exhibit of the Anderson Brake Adjuster Company demonstrated the improved types of non-vibrating slack adjusters made by it. The adjuster is designed to prevent wear caused by vibration.



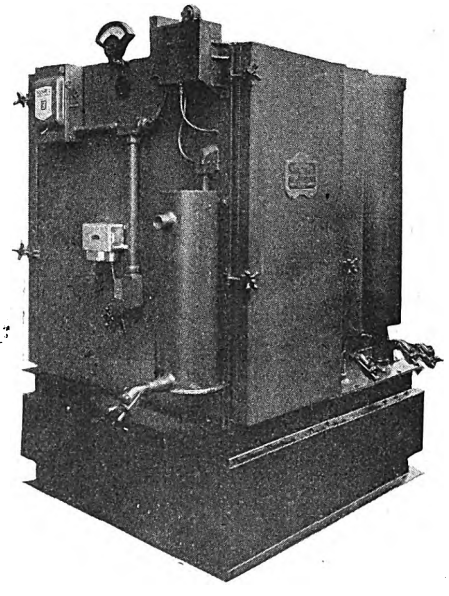
Cross-section of Dayton tie in track showing how it reinforces concrete beam



Keywood ties which are tapered for prolonging the life of track, shown by W. S. Godwin Company, Inc.



Guy hook and eye nut assembly manufactured by the Malleable Iron Fittings Company



The "Refineroil" oil reclaiming machine operates continuously 24 hours a day on 110 or 220 volts, a.c. or d.c.

In addition to the standard Peacock brake the National Brake Company exhibited new models of brakes, including an eccentric cam type and also a sheave type, both for vertical operation.

The Hunt-Spiller Manufacturing Corporation showed a new brake drum of air furnace gun iron for buses and trucks.

Electric Service Supplies Company was featuring a new type of headlight which illuminates the dash. The edges of the case are of glass, permitting the light to flood from the dash. Another headlight of parabolic shape for use on buses also was shown.

The Robert Bosch Magneto Company displayed magnetos, generators and other automotive equipment.

A complete line of electric starting, lighting, voltage regulation and other electric equipment was shown by the Leece-Neville Company.

Steering gears for buses and trucks were shown by the Hannum Manufacturing Company, along with a cut-away steering gear showing the variable ratio and large thread contact.

The National Pneumatic Company exhibited full-sized working models of door engines, treadles and similar equipment. The light-weight differential engine, the vacuum door engine for buses, a new treadle reversing machine and a treadle switch were other features.

The North East Electric Company featured a line of heavy duty electrical equipment for bus service, including starting motors, ignition units, magnetic horns, voltage regulators and junction boxes.

A new type of anti-friction bearing for railway journals was the feature of the display of SKF industries. It also was shown installed in a street railway motor.

Quick removable metal sash for street cars and buses was shown by the O. M. Edwards Company, along with samples of the Edward's metal filing cabinets.

Working models showing mechanical window lifting devices were installed in car sections in the exhibit of the Briggs & Stratton Corporation. Another display of this company was the Basco four-cycle gasoline engine.

The National Carbon Company showed a complete line of carbon graphite and metal graphite brushes for motors, generators and other electric railway equipment.

The Safety Car Devices Company

Digitized by Google

had a complete display of safety car equipment, including foot-actuated brake valves, "E" relay valves and other detail parts. Wabco gaskets and packing cups also were shown.

The Saf-T-Cab Corporation displayed a four-passenger cab of the sedan type with a compartment for the driver separated from the tonneau.

The Hilliard Corporation, which makes the "Refineroil" oil reclaiming machine for the General Electric Company was showing its latest machine of 50 gal. per day capacity.

Aqua Oil Service displayed gasoline and oil storage equipment together with meter service as provided with Aqua nozzle control.

Samples of lubricating oils were shown by the Texas Company, displayed with working models of car axles, journal boxes and bearings.

The Crew Levick Company had a display of motor oil, differential oil, lubricating oils and greases, and a new grease gun developed for reaching the several bearings.

Cleaning material for bus and railway use was featured by Oakite Products and a model tank equipment in actual operation demonstrated how tenacious grease and dust can be removed from car trucks and buses.

The Arco Company showed its various types and shades of paint and lacquer finishes.

Haskelite Manufacturing Corporation showed samples of Haskelite plywood and Plymetl for use in cars and buses and for paneling and interior trim in building construction.

The De Vilbiss Company showed a model spray painting outfit together with exhaust equipment for spray painting and lacquering. Another display was a portable air compressor used in the spray painting of bridges and other outside structures.

Cut-away models of transmissions and clutches for buses and trucks electrically driven to show transfer of power through the various reductions were shown in the booth of Fuller & Sons Manufacturing Company.

Gruss air springs in various models for use on buses, taxis and trucks were displayed by the Cleveland Pneumatic Tool Company. The exhibit also included a working model of the "Cleco" multi-power automobile brake.

The Bragg-Kliesrath Corporation exhibited its B-K vacuum power brakes for all types of gasoline-driven motor vehicles.

The uses of Pantasote for car-seating and curtain material, of "Thermasote" insulating board and of "Homasote" floor-insulating material were featured at the booth of the Pantasote Company. Models also showed the correct and incorrect manner of applying "Agasote" for headlining and paneling.

Budd Wheel Company had a display featuring the double capnut mounting which separately locks each of the rear wheels of the bus or truck.

Seating equipment, including adjustable back reclining seats for long-distance bus operation, as well as seating equipment for street cars, was included in the display of the Kelton-Aurand Manufacturing Company.

The Heywood-Wakefield Company exhibited a complete line of seats for use on city or interurban cars. The exhibit also featured a three-position reclining seat for use in long-distance bus operation.

Malleable iron hardware for bus body work, including door controls, bus seat frames, folding steps, corner irons and windshield hinges, was shown in the booth of the Eberhard Manufacturing Company.

Houde Engineering Corporation displayed its full line of hydraulic double-acting shock absorbers for controlling spring action. The company's standard bumpers also had a place in the exhibit.

A full-sized as well as a miniature model of the "Handy Sandy" distributor, for spreading sand, cinders or salt on icy pavements, was displayed by Highway Service, Inc. The device can be easily attached to any truck.

Ypsilanti Reed Furniture Company had a showing of some of its latest car and bus seating equipment, including a reclining chair for long-distance operation.

Zenith-Detroit Corporation was represented by its line of carburetors and fuel filters.

"Tool Steel" gears and pinions for electric railway service and the "Tool Steel" single reduction gear unit for high-speed motors formed the exhibit of the Tool Steel Gear & Pinion Company.

Skinner Automotive Device Company showed in operation its standard oil reclaimers for reconditioning crankcase drainage.

Oxalite Corporation had a display with Oxalite rail welding materials, with alloy steel clamps, molds and crucibles in place. There were also shown oxalite rail welds on various types of joints, together with the apparatus used in performing the work.

Stevens-Walden Company exhibited its line of wrenches of various types, including special sets for electricians, millwrights, and automotive mechanics, as well as other shop equipment in its line.

Standard Steel Works Company showed a special rolled steel wheel and a tempered steel axle, both supplied to well-known railway operators.

Deluxe Products Corporation exhibited its light-weight cast-iron piston, which is especially adapted for heavy-duty bus and truck service.

Goroco Mechanical Spreader Company showed a miniature working model of its device for spreading and distributing sand, cinders or gravel. It is said to be easily attachable to any truck and can be operated with one or with two men.

Hyatt Roller Bearing Company exhibited its latest standard journal box designed for standard A.E.R.A. pedestals.

Overhead trolley line material for direct suspension work, including trolley frogs, hangers, crossovers and ears, was exhibited by the Electric Railway Equipment Company. This company also had on display sample sections of tubular steel poles and pole fittings.

C. I. Earll showed working models of trolley catchers and receivers in operation.

A new type of integrating gasoline meter, designed especially for buses, and a new type of air rectifier for preventing frozen equipment on railway cars were in the exhibit of the Illinois Motive Equipment Company.

International Register Company showed a complete line of single and double fare registers, for electrical foot or manual operation. The exhibit also included a saw for cutting plywood.

Upholstery leathers, both in full hides and on bus and car seats, featured the display of the General Leather Company. Products of this company were also used in upholstery work by a number of the other manufacturers of standard seating materials as exhibited at the convention.

Aligning and boring fixtures for main bearings and connecting rods, a main bearing thrust facing and radius tool, a connecting and trimming tool, a brake drum gage and a drum lathe were exhibited by the Waddell Engineering Company.

The Tuco Products Corporation showed its "Tucolith" composition

Digitized by Google

flooring for cars and buses, with working models showing the proper application at door entrance and at trapdoors. The exhibit also included samples of the Tuco waterproof roofing canvas and Tuco window screens.

H. H. Robertson Company displayed a model substation ventilated by means of stationary roof ventilators and illuminated through Robertson side wall sash.

Railway Utility Company exhibited a full line of heaters, heat regulators and ventilators, fitted with its Chromalox heating units.

Wood Conversion Company had in its booth samples of balsa wood insulation for passenger and refrigerating cars and for buses. The uses of this material and of its "Nu-wood" insulating board were shown by means of an automatic motion-picture apparatus.

Motor Wheel Corporation showed samples of its "Spoksteel" drop-forged wheels for buses and trucks.

The exhibit of the Ohio Varnish Company consisted of a display of the raw materials entering into the manufacture of that company's paints and lacquers.

Ahlberg Bearing Company was represented by a line of its CJB master ball bearings and ground bearings.

Continental Motors Corporation had a display of its complete line of bus and truck motors mounted on revolving standards. Some of the models were cut away to show the action of the pistons while in motion. Included in the display was the new 150-hp. bus motor.

Dayton Steel Foundry exhibited its single and dual pneumatic steel bus and truck wheels.

Bonded asbestos brake lining, which is said to possess special qualities of resistance for high-speed service, was exhibited by Ferodo & Asbestos, Inc.

Johnson Fare Box Company displayed its line of stationary automatic registers and electric fare collection systems. Change-makers were also displayed.

New Departure Manufacturing Company had in its booth two heavy-duty bus axles cut away to show the installation and operation of "New Departure" bearings in gears, differential and pinion shaft. A four-speed heavy-duty bus transmission was cut away to show the application of the bearings to all shafts.

Winchester Repeating Arms Company had a display of its cartridge core radiators for buses and heavy-duty trucks.

Apparatus shown by the Miller Oil Purifier Company restores used lubricating oil to its original quality. It is automatically controlled by an electric thermostat and the used oil is pumped into the treating chamber with a mechanical compound and heated to flash temperature, after which it is filtered.

The Wadell Engineering Company exhibited main bearing and connecting rod boring apparatus and other fixtures used in the finishing of gasoline motors.

Ross Gear & Tool Company in its exhibit featured its recently developed "roller mounted" cam and lever steering gear, which is said to permit of greater ease in steering.

At the Bridgeport Brass Company booth were samples of the overhead line materials made by this manufacturer.

Charts and Statistics in A.E.R.A. Exhibit

One of the most interesting exhibits at the A.E.R.A. booth was a series of 26 wall charts and graphs depicting recent trends in electric railway and motor bus operations. These covered such subjects as distribution of revenues, passenger traffic, relation of passenger automobile registration and of material employment to passenger traffic, wages, fares, distribution of operating expenses, increase in bus operations, bus depreciation rates in use, relief from paving burdens, percentage of gross earnings paid for accidents, etc.

All of the available bulletins and reports prepared by the statistical department were on display. These covered nearly the whole range of subjects that are of vital interest to electric railways and motor bus operators. Other publications of the association also were displayed.

News *of the* Industry

Market Street Railway's Position Favorable

In a review of the affairs of the Market Street Railway, San Francisco, Cal., Hubert J. Soher, writing in the *Chronicle*, says:

"Market Street Railway earnings this year are showing a slight improvement over the previous year in spite of the fact that quotations on its bonds and prior preferred stock are at the lowest point in history. The bonds are quoted at $89 and the stock at $23 with junior stock issues selling at less than $10 per share.

"It is quite apparent that the improvement has been reflected in recent months rather than during the year and the improvement in earnings in the last few months over the corresponding period of last year is the best criterion by which to judge the company.

"While earnings have declined, the drop has been due largely to conservative bookkeeping methods invoked by the corporation, although gross has declined to a slight extent and operating expenses have increased substantially in the same period.

"The company holds $330,000 in its treasury and $2,309,000 in its sinking fund. The company reduces its outstanding funded debt at the rate of $500,000 each year from 1925 to 1932, inclusive, and at the rate of $300,000 per annum thereafter.

"The sinking fund has been rather stringent and will continue so for another two and a half years, but with payments cut down by $200,000 the company will be in a much better position up to maturity in 1940.

"The Market Street Railway people, at least, are in the interesting position of having their first franchise expire in November and the city in the somewhat embarrassing position of having no solution to offer the citizens or the company as a result of the impending expiration.

"The company will probably continue to operate under a temporary charter extension, but the matter will necessarily have to come to a head before long. Under the circumstances, the bonds paying $7 are yielding nearly 8 per cent at the present time. The company is apparently able to continue to pay its funded debt without difficulty and to meet its sinking fund requirements promptly."

Duquesne Wants Contract Similar to Pittsburgh

Public Service Commissioner Shelby conducted a hearing recently at which the city of Duquesne and the Pittsburgh Railways sought the commission's approval of a contract entered into a month ago by the city and the company, providing for creation of a traction conference board to assist in the management of the company.

The contract is similar to those entered into with many other municipalities in Allegheny County, being in effect a duplicate of the contract the company entered into with the city of Pittsburgh in 1921. It provides for an annual payment to the municipality in lieu of paving charges.

No opposition to approval of the contract developed.

City Renews Its Plea for Relief from Purchase Obligation

Mayor Edwards of Seattle, Wash., has asked A. W. Leonard, president of the Puget Sound Power & Light Company, to present a request to the officers of the company in the East for a two-year moratorium on payments of principal under the terms of the contract by which the city is purchasing the company's railway lines. In the event the railway deal is not promptly refinanced, the Mayor asks that the moratorium be granted so the lines can be rehabilitated, new, light cars purchased, better service afforded, expenses reduced and a general breathing spell afforded to the city. Interest payments, it is definitely understood, would be met promptly.

The city executive makes it clear that the moratorium is asked only in the event the negotiations for refinancing the debt, to be taken up when President Leonard returns about three weeks later, are delayed for any reason.

Getting After the Boston Taxis

Police Commissioner Herbert A. Wilson, testifying before the special commission investigating the taxicab situation at the State House, said that prior to 1927 he had had no difficulty regulating the public and private stands but that after that time infractions had piled up and he began to prosecute the offending drivers. He said that attorneys for the taxicab companies had adopted the attitude, "Let Wilson prosecute. We'll have it nol-prossed upstairs."

Commissioner Wilson upheld his original position that, unless he is allowed a continuation of his present authority to regulate the situation, it will become impossible to control.

In response to questioning, he said he was opposed to establishment of a separate body for control of taxis, if the matter of street regulation were still to remain as a police function. He was inclined to think, he said, that even in cities where such a body exists, taxi control ultimately remains with the police.

Twin City Company Against School Fare

Owing to the request that the Twin City Rapid Transit Company, Minneapolis, Minn., put into effect a 5-cent fare for school children similar to that granted recently in Duluth, T. Julian McGill, vice-president at Minneapolis, has found it necessary to review anew the conditions under which the Duluth-Superior Traction Company granted this concession. Mr. McGill pointed out that the 5-cent fare for Duluth school children was granted only after the Duluth Council had agreed to the following concessions:

To revoke present council orders for street railway extensions.

Not to order any additional extension for two years..

To agree to the removal of certain bus lines that were not paying.

Not to appeal to the United States Supreme Court the State Railroad and Warehouse Commission's fare decision.

Mr. McGill is understood to feel that the principle of a school children's fare is unsound economically, and that there is no accurate basis for applying this fare only to the needy.

He also pointed out that in Duluth 10-ride coupon books, sold for 50 cents, must be used within 15 days. Coupons unused after that period are void.

$31,109,174 for Cars and Subway Equipment in New York

Requisitions aggregating $31,109,174 covering seventeen different items affecting rapid transit construction facilities came before the Board of Estimate of New York for approval at its first fall meeting Sept. 26. All but $98,970 of this sum is for the city's new subway system. The main items in the list for the city system follow:

300 steel cars	$9,145,000
600 motors and controls	2,659,100
Signal equipment	5,598,750
Power substations	2,743,174
Schermerhorn Street contract	4,934,000
Queens Boulevard contract	5,250,000
Duct line in Fifty-third Street	286,500
Completion of Central Park West	51,000
Real estate fund requirements	100,000

In the Interest of Brooklyn's Civic Beauty

Co-operating with the Brooklyn Downtown Association and the merchants on lower Fulton Street in their efforts to improve the appearance of Brooklyn's principal downtown shopping street, the Brooklyn-Manhattan Transit Corporation has begun the work of repainting the "L" structures in Fulton Street from Hudson Avenue to Myrtle Avenue and in Flatbush Avenue from Livingston Street to the north side of Fulton Street. For these sections of the "L" a color scheme has been adopted which is expected to make the structure more pleasing in appearance. Included in the color combinations are light buff, light green and dark green. The B.-M.T. is also planning to remove any unnecessary signs and wires from the structure, and has arranged to move the feeder wires now attached to the side of the structure between Boerum Place and Flatbush Avenue to a less conspicuous place under or on the structure.

Bellingham, Wash.—Paving between tracks of the Pacific Northwest Traction Company on South State Street, will be started at once. The work will cost $25,000.

Late News Briefs

Indianapolis, Ind.—Public hearings on the proposed $70,000,000 Indiana utility merger affecting gas, interurban and power companies of the state, will be opened Dec. 2 by the Indiana Public Service Commission. When all audits, appraisals and exhibits have been submitted, a recess will be declared to permit the evidence to be studied by all parties. No statement has been made for some time relative to progress of the forces at work in the field studying the properties, but it is understood that practically all work has been completed and exhibits now are being prepared.

Palo Alto, Cal.—The Peninsular Railway has been authorized by the Railroad Commission to abandon operation of its interurban line between Mayfield Junction and the Southern Pacific Company's station at University Avenue in Palo Alto. Service will also be abandoned on the Stanford University line from the Southern Pacific station at University Avenue to the campus. The company has, however, been authorized to operate a new service between Mayfield Junction and the Mayfield station of the Southern Pacific.

Boise, Idaho.—A miniature traffic war has been peremptorily ended, with the department of law enforcement ordering an invader of the territory of the Boise Traction Company off the streets. The invading transit company had a permit to operate between Boise and Idaho City but during the past several days has been moving just ahead of the regular bus, hauling passengers free of charge.

Indianapolis, Ind.—Final hearing on four suits seeking a permanent injunction against consummation of the Insull deal for the Union Traction Company of Indiana will be held before Judge Harry O. Chamberlin in the Circuit Court in Indianapolis on Oct. 29. Counsel for the protesting bondholders have agreed that a temporary restraining order issued by the court a fortnight ago should continue without hearing on the application for a temporary injunction and that the issues in the cases should be heard all at the same time unless action should be taken before Oct. 29 by the defendants to have the restraining order dissolved.

Atlanta, Ga.—A conference has been called between bus operators and members of the Georgia Public Service Commission relative to placing of bus lines under the commission in accordance with an act of the recent legislature.

Columbus, Ohio—In commenting on the report of Harry Allensworth, expert for the city in its investigation of the railway department of the Columbus Railway & Light Company, the Columbus *Citizen*, a Scripps-Howard paper, says: "When a new street car rate is put up to the voters of Columbus they have a very practical business problem to decide. They must decide whether or not they want street cars and, if so, at what rate they may be assured of having them."

Baltimore, Md.—Within a year the United Railways plans to relocate the entire stretch of rails on York Road between Towson and the city line, moving the rails to the center of the street.

New York, N. Y.—The Manhattan Railway stockholders' protective committee has announced through its chairman, Nathan L. Amster, that it has filed a formal request with Chairman Delaney, of the Board of Transportation, and also with William G. Fullen, chairman of the New York State Transit Commission, to be joined, as party of primary interest, in any of the conferences, hearings and negotiations between those parties and the Interborough Rapid Transit Company.

Washington, D. C.—Preparations for the resumption of hearings on the application of the Capital Traction Company for an increase in fare have been started by the Public Utilities Commission with indications that a final and determined effort will be made to mold a new plan of merger that will be acceptable to both the public and the companies. The hearings were recessed Sept. 10 to permit the commission to dispose of a mass of accumulated routine matters. They are now about to be resumed.

Toronto, Ont.—While many of the members of the Council have expressed themselves as being in favor of the investigation of the affairs of the Toronto Transportation Commission, it is felt by others that there has not been sufficient evidence produced to warrant the city to involve itself in an investigation that has been estimated to cost $240,000. In the official communication forwarded to the Council, the Board of Control recommended that a judicial probe be instituted "with respect to each and every allegation, statement and insinuation contained in the letter of Acting Chairman E. J. Lennox, and that, in conjunction with the judicial investigation recommended, an independent audit of the books and accounts of the T.T.C. should be ordered."

Providece, R. I.—Use of the one-man system on Broad Street, by the United Electric Railways which also operates in Pawtucket and Central Falls leaves Providence proper with only one electric line continuing to operate on the former basis of two operators.

Montreal, Que.—The wants of the South Shore in matters of transportation were explained to the transport interests at a conference held recently, attended by delegates of the South Shore Transportation Commission, the Montreal Tramways, the Canadian National Railways and the Provincial Transport Company. Those demands were held confidential, since within a few weeks there will be another meeting at which first lines of a definite transportation plan may be drawn. The South Shore Commission intends to communicate that plan first to each municipality across the St. Lawrence.

Lynchburg, Va.—When the one-man car is placed in operation by the Lynchburg Traction & Light Company in this month, the one man who will operate it will be called the "operator." The operator will be clothed with a new style uniform. It will comprise khaki trousers and coat, military style. The shoes will be high black, and black puttees will be used. The cap will be visor style, with insignia above visor. The badge will be worn on left coat breast. The shirt to be worn by the operator will be khaki, soft collar, low roll, and worn with a black tie.

Springfield, Mass.—One of the exhibits at the Eastern States Exposition here is the first electric freight locomotive ever constructed. For comparative purposes, the New Haven Railroad, the owner of the old locomotive, has on display one of its most modern electric freight engines in use between New Haven and New York. The first electric freight locomotive was built by the Pullman Car Company for the Ansonia, Derby & Birmingham line, now a part of the Connecticut Company, a New Haven road subsidiary. It was delivered in 1888.

Seattle, Wash.—The new cross-town bus and railway service for the north end has been started by rerouting of the Green Lake and Third Avenue Northwest buses of the Seattle Municipal Railway system. Terminals of both bus lines will be changed to effect connections with street cars on the Green Lake, Wallingford, Montlake, University, Eastlake, Broadway and Fifteenth Avenue Northwest lines. Rerouting of the lines will give a new loop service to a large area not heretofore served.

Kansas City, Mo. — The crosstown street-car line of the Kansas City Public Service Company in Independence did not stop at midnight on Sept. 11 as scheduled, but will continue for thirty days. The railway some months ago applied to the Public Service Commission to discontinue the line because it was losing money. The request was granted, but the discontinuance has been put over several times.

Atlanta, Ga.—The fortieth anniversary of the advent of the trolley car in Atlanta was celebrated by *Two Bells*, publication of the Georgia Power Company, with a special edition. The first car appeared on Aug. 23, 1889. Joel Hurt, president of the East Atlanta Land Company, was master of ceremonies. Coincident with this event ex-President Cleveland was fishing. John L. Sullivan and Jake Kilrain were in trouble for fighting in Mississippi, natural gas had just been discovered at Dalton, Ga., and the Prince of Wales was wearing a sash with his summer costumes.

Newark, N. J.—Public Service Coordinated Transport is said to have no intentions of using any special equipment on the railway in the canal subway. The present plans provide for sending trolleys through the canal subway. It was asserted that the canal bed is not available for rapid transit in the same sense that the New York subways are.

St. Louis, Mo.—The Public Ownership League on Sept. 21 decided to circulate initiative petitions providing for an election on the question of the acquisition and operation of a municipal transportation system. The proposal will first be presented to the Aldermen. If the board fails to pass the bill the league will go direct to the voters. To refer the question to the voters at the next election signatures of 5 per cent of the registered vote at the last mayoralty election must be obtained. This is approximately 18,000 signatures.

East St. Louis, Ill.—The East St. Louis & Suburban Railway has been appointed an official ticket agent for the Universal Aviation Corporation to sell airline tickets in East St. Louis, Alton, Highland, Greenville, Vandalia, Collinsville, Belleville, Lebanon and O'Fallon.

Personal Items

Dr. A. A. Mitten Heads Mitten Management

Dr. Arthur Allen Mitten was elected president of Mitten Management, Inc., at a special meeting of the board of directors on Oct. 3. He succeeds his father, the late Thomas E. Mitten.

Dr. Mitten has long been identified with the Mitten enterprises. In 1927 he succeeded to the chairmanship of the executive committee of the Philadelphia Rapid Transit Company. For a long time before that he was the silent influence and power in the company's co-operative welfare and public relations work.

His activity with the company began on May 1, 1919, when he became secretary of the Co-operative Welfare Association. Ever since that time he has taken an active part in the co-operative activities of the company and is personally known

A. A. Mitten

and highly regarded by thousands of the company's employees. At the same time Dr. Mitten became secretary of the employees' Co-operative Association he also assumed the duties of supervisor of welfare and employment.

T. E. Mitten's only son was educated as a physician and surgeon. He entered the electric railway industry in 1915 as industrial surgeon with the railway in Milwaukee. When the United States entered the World War Dr. Mitten went to France as captain of an ambulance company, was twice severely gassed, was wounded and then captured in August, 1918. He was imprisoned at Villingen until after the armistice was signed.

On May 15, 1922, Dr. Mitten was elected a director of the company and he has served in that capacity without interruption since that time. Until his election as chairman of the executive committee he acted as secretary of the board of directors. Dr. Mitten also served for several years as vice-president of Mitten Management, Inc., which operates both the Philadelphia Rapid Transit Company and the International Railway, Buffalo, N. Y.

George E. Tracey, general superintendent of the Southern New York Railway, Mohawk, N. Y., has been appointed to the post of general manager of the Schuylkill Valley Traction Company, Norristown, Pa. He had been with the Southern New York Railway since 1918. Richard M. Roberts will succeed him at Mohawk.

Charles H. Forsgard Manager at Toledo

Charles H. Forsgard, superintendent of the Community Traction Company, Toledo, Ohio, has been made general manager. He succeeds J. Frank Johnson, whose resignation as vice-president and general manager has been accepted. Election of Mr. Forsgard as a vice-president is expected to follow at the regular meeting of the board.

In 1915 he joined the organization of the Houston Light & Power Company, Houston, Texas, and later had charge of the operations of ice and light plants of the Boston Operating Company. In 1918 he became associated with Westinghouse-Church-Kerr & Company. In 1921 he joined Henry L. Doherty & Company, who operate the Toledo property. He went to Toledo from Durham, N. C., two years ago to accept the position of superintendent of the Community Traction Company.

A marked increase in revenue has been effected and public relations have been vastly improved at Toledo since the original Milner service-at-cost franchise was revised. In all of the rehabilitation work at Toledo Mr. Forsgard has played a very prominent part.

Henry L. Sanders Retires from Cincinnati Car Corporation

Henry L. Sanders, president of the Cincinnati Car Corporation, whose resignation was effective Oct. 1, terminated at that time a career of 25 years activity in the Cincinnati street railway service. A desire to take a long rest on his plantation in South Carolina dictated the move on Mr. Sanders' part.

For a quarter of a century Mr. Sanders has been an important executive identified with what in former years were known as the Schoepf interests. He succeeded the late W. Kesley Schoepf as president of the Cincinnati Car Company, predecessor of the corporation of similar name, at the latter's death in May, 1927.

During his incumbency as head of the company the acquisition of the Versare Corporation was made, and the many details of working out this amalgamation and merging the activities of the two concerns fell largely on his shoulders. Now that the combined company is fully organized, Mr. Sanders felt that it was an opportune time to relinquish his duties.

Mr. Sanders' first postion in Cincinnati was as assistant purchasing agent for the Cincinnati Traction Company, the Ohio Electric Railway and the Cincinnati Car Company. He served successively as auditor, treasurer and vice-president of those companies, finally being made president of the Cincinnati Car Company after it had taken over the remainder of the Schoepf interests following the return of the street railway system to the Cincinnati Street Railway.

As noted previously in the Electric Railway Journal News, Mr. Sanders will be succeeded as head of the Cincinnati Car Corporation by C. E. Morgan, formerly vice-president and general manager of the Brooklyn City Railroad.

Guy C. Hecker, the Association's New Secretary

Guy C. Hecker, elected general secretary of the American Electric Railway Association to succeed James W. Welsh, has been special engineer of the association since 1922. His connection with the electric railway industry dates from 1903, when he started with the Citizens Traction Company of Oil City, Pa. After spending five years with that company as wireman, substation operator and power station operator, he entered the Carnegie Institute of Technology in the electrical engineering course, working evenings as load dispatcher for the Pittsburgh Railways. Two years later he became load dispatcher on the regular force.

In 1912 Mr. Hecker was made chief electrician and in 1918 was promoted to the position of electrical engineer. In 1920 he went with the Westinghouse Electric & Manufacturing Company as a general engineer. During the next two years he spent a great deal of time in the analysis of the economies of automatic substations on many electric railway properties. It was from this position that he resigned in 1922 to become special engineer of the association.

The selection of Mr. Hecker to fill the post vacated by Mr. Welsh when he accepted the position at Cleveland was a natural one. Schooled under Mr. Welsh, Mr. Hecker is thoroughly familiar with the routine of the work of the secretary, and, moreover, in the post of special engineer to the association, he has the knowledge of the men in the industry so helpful to the incumbent of the position of secretary. He is affable without being fulsome, and is both a capable engineer and executive. Very important, he enjoys the confidence of the entire personnel of the association staff.

H. A. Metz Re-elected to Interborough Board

Herman A. Metz has been re-elected a public director of the Interborough Rapid Transit Company, New York, without the recommendation of the State Transit Commission. He now is in the position of representing the state commission on the Interboro directorate without any official credentials from that body as contemplated when the provision for public representation on the board was made. With no definite recommendation from the commission—which holds the power of nomination under the stock trust agreement—the trustees of the voting trust, Frank Hedley and Frank L. Polk, re-elected him for a full three-year term.

The voting trustees also filled six other vacancies. They elected, on nomination of the Manhattan Elevated, Finley J. Shephard to succeed Bertram J. Cutler, resigned, and William Roberts, to succeed himself. On nomination of the bondholders, John E. Zimmerman was re-elected a director, and the three regular stockholder directors, Edward J. Berwind, chairman of the board,

Digitized by Google

Mortimer N. Buckner and Charles E. Dunlap, whose terms expired, also were re-elected. All were chosen for three-year terms with the exception of Mr. Shephard who fills an unexpired term of two years.

R. W. Woodruff Heads White Company

Robert W. Woodruff has been elected president of the White company, Cleveland, succeeding the late Walter C. White. Mr. Woodruff has been on the board and executive committee of White Motor for several years and has been connected with the company for seventeen years. He is also president of the Coca Cola Company.

In commenting on current conditions Mr. Woodruff states:

"The situation as the White Company enters the final quarter is pre-eminently satisfactory. Our production and sales for the first nine months considerably exceeded the same period of 1928. Inventories both of new and used care are the lowest in our history. Orders on hand are larger than a year ago and prospects for the remainder of the year are bright."

New Indianapolis Department Organizes

Henry L. Dithmer, Indianapolis, has been elected president of the board of directors of the Indianapolis Utilities Department, created by act of the last session of the Legislature to manage any utility properties that may be taken over by the city under municipal ownership. John J. Madden has been named vice-president. Other officers chosen are Guy A. Wainwright, secretary, and Almus G. Ruddell, treasurer. Brodhurst Elsey, Edward A. Kahn and Eli Lilly, the other members of the board, have been named as a committee to write the by-laws and rules. The board expects to meet monthly.

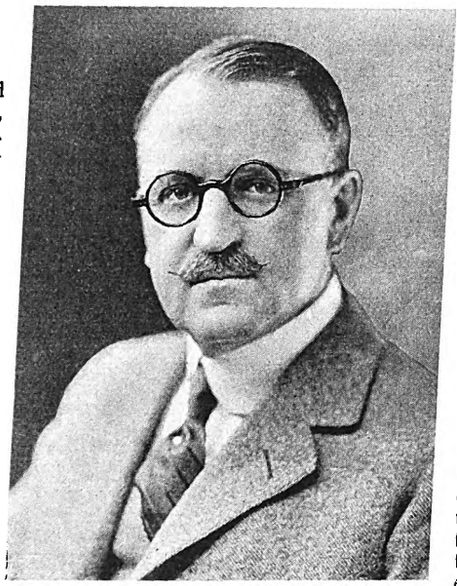
Labor Man Named Boston "L" Trustee

Ernest A. Johnson, secretary of the Boston Building Trades Council, has been nominated by Governor Allen for appointment as a member of the board of public trustees of the Boston Elevated Railway, Boston, Mass. Mr. Johnson succeeds Stanley R. Miller.

C. Peter Clark has been elected president of the Old Colony Railroad, Boston, Mass., to fill the vacancy caused by the death of Fayette S. Curtis. Mr. Clark was born in Jamaica Plain, Mass., on Sept. 12, 1858, and was the son of Charles P. Clark, for many years president of the New Haven Railroad. Charles Peter, Jr., entered the service of the old New York & New England Railroad at the age of eighteen and worked his way up the ladder until in 1896 he was appointed general manager. He later became general manager and second vice-president of the Buffalo & Susquehanna Railroad. In 1913 he entered the employ of the State of Massachusetts in the Public Utilities Department. On Sept. 12, 1928, Mr. Clark's seventieth birthday, he was retired from State Service, in accordance with the Massachusetts laws.

T. E. Mitten

Rehabilitator of Properties in Buffalo, Chicago and Philadelphia Drowned in Accident on His Pocono Estate



Thomas E. Mitten

IN THE death by accidental drowning on Oct. 1 of Thomas E. Mitten this industry loses one of its outstanding characters. One does not have to subscribe to all that Mr. Mitten did to accord him the measure of recognition that properly was his. As the rehabilitator of railway properties first in Buffalo, then in Chicago and lastly in Philadelphia the work that he did was prodigious and the results likewise were beneficial and lasting. He pioneered in many directions. He worked largely alone. Under him men came and men went, but certainly in Philadelphia he rounded out a system which was a credit to the city and a source of admiration generally.

If, in some of the things he did, Mr. Mitten departed from accepted standards he may be forgiven. Of late he had become a storm center because of the interlocking of P.R.T., Mitten Management, Mitten Bank and Mitten Bank Securities Corporation, but any feelings that may have been engendered by the zealousness of Mr. Mitten in guarding the undertaking he had so large a hand in fashioning are forgotten by the public and the press in their appreciation of the work of the man.

That everything he touched reflected the glow of Mr. Mitten's imagination and the warmth of his enthusiasm certainly is true. Just as true is it of him, as Owen D. Young, chairman of the board of the General Electric Company said, that he was an heroic figure. He certainly was. So replete is the career of the man with outstanding achievement that it would be utterly impossible to encompass his record within the bounds of a biography confined to present space limitations.

He had very definite ideas of what a transportation system should be and certainly he achieved them in Philadelphia. He had very definite ideas of relations between management and men and these also he achieved. If his attitude on labor was paternalistic, as has been charged, the result still stands that in Philadelphia he quickly brought order out of chaos and made of his men self-respecting citizens with a share in the ownership of the property for which they worked.

As the *Public Ledger* so aptly said, this is not the moment to discuss the issues involved in the transit litigation nor the controversies that characterized the recent political contest in Philadelphia. Whatever may be the outcome of these differences of opinion and purpose, Mr. Mitten must be judged by what he did in Philadelphia and by his remarkable achievement in carrying out his theories of what should be the proper relations between labor and capital, between employers and employed.

Coming in 1911 to Philadelphia as technical adviser and head of the Rapid Transit Company, then on the verge of bankruptcy with its personnel in the throes of violent internal dissension, Mr. Mitten was able to bring order out of chaos. He built up an efficient transit system on the wreck of the old and gained the support and confidence of his employees. The system was virtually made over. Instead of going on through recurring strikes and disorders, the transportation service has been carried on efficiently and without interruption during the entire period. And he built up an organization among the men of the P.R.T. which for loyalty to the company and for efficiency of service to the public has probably no peer in the transit industry.

Mr. Mitten's first experience in the field of electrically propelled transportation came about 1890, when, as general superintendent of the Denver, Lakewood & Golden Railroad, he changed the line from a steam road to one electrically equipped.

His opportunity to enter the electric railway industry came in 1896, when he was made assistant superintendent and later general superintendent of the electric lines of Milwaukee, Wis. He left this post in 1901 to become general superintendent of the International Railway, Buffalo. So successful was Mr. Mitten in solving the complex engineering and transit problems presented to Buffalo by the Pan-American Exposition in 1901 that at the close of the exposition he was made general manager.

In 1905 Mr. Mitten went to Chicago and became president of the Chicago City Railway, which system he rehabilitated. He resigned this position to go to Philadelphia. Mr. Mitten at once became the outstanding figure of the Philadelphia Rapid Transit Company upon his arrival early in 1911, fresh from his triumphs in the management of the Chicago City Railway. In June of the same year he was elected chairman of the executive committee of the P.R.T., and on the death of Charles O. Kruger, president of the company, Mr. Mitten was elected to succeed him. He held the post until February, 1923, when he resigned, retaining, however, the chairmanship of the board of directors and of the executive committee, his influence in shaping and carrying forward the policies of the P.R.T. being unimpaired.

Mr. Mitten took up his work in Philadelphia in 1911 at a time when the affairs of the Philadelphia Rapid Transit Company were at a low ebb. E. T. Stotesbury, who had undertaken the financing of the corporation to relieve it from its many embarrassments, was largely instrumental in inducing Mr. Mitten to relinquish his Chicago connection, admitting that in planning to lift P.R.T. from

Digitized by Google

its difficulties he had been guided by his faith in "one of the best street railway men in the country."

Mr. Mitten's passing throws great responsibility on the organizations in Philadelphia and Buffalo. They will be subjected to a severe test. But Mr. Mitten has constantly contended that he builded with the idea of succession in mind so that the work he started could be carried on uninterrupted.

D. L. Huntington

David Lynde Huntington, president of the Washington Water Power Company, Spokane, since 1910, president of the Spokane United Railways and prominently identified with the electrical development of the Northwest, died at his home in that city Sept. 27. He had been confined to his home for the past two years, but he was able to devote some attention to company affairs.

Mr. Huntington was an important factor in the growth of Spokane utilities and it was largely through his vision and guidance, in association with the late Henry M. Richards, the preceding president, that the company has reached its present position. The last big undertaking of Mr. Huntington as active head of the Washington Water Power Company was the building of the Chelan hydro-electric plant, in connection with which project he personally supervised the details of the purchase of the site, the award of contracts and the financial program formulated to see the enterprise through.

George W. Palmer, Jr.

George W. Palmer, Jr., long-time electrical engineer of the properties now the Eastern Massachusetts Street Railway, Boston, Mass., died at Larchmont, N. Y., on Sept. 26.

One of the oldest members in point of service of the Engineering Association, for many years he was an outstanding figure in the old power distribution committee, of which for several years he was chairman, while as a member of the executive committee he did much to advance the standing of the association.

He was compelled by illness to relinquish all offices before he had held the presidency. When it was realized he would be unable to return to active work, he was elected, as a well earned recognition of his services, the only honorary member of the Engineering Association.

His death removes another of the older men who were outstanding figures in the engineering field, and although he had long been ill his death is a great shock to those who knew him.

Willard E. Winner

Willard E. Winner, pioneer in the security business in Kansas City, Mo., and promoter of important subdivisions of Kansas City, died on Sept. 3. He was 41 years old when the land boom in Kansas City collapsed. The eight preceding years had seen his rise from a clerkship to the control of many millions, much of the money his own, and his loss of all of it. Beginning in the '80s with about $9,000, he organized the Winner Investment Company. Within a few years he headed nineteen corporations. He opened one homesite addition after another. When an addition did not move quickly because of lack of transportation he built an electric railway to it or through it.

Walter C. White

Walter C. White, president and executive head of the White Company, bus and truck manufacturers, of Cleveland, Ohio, died on Sept. 29 as a result of injuries received in an automobile accident the previous day. Mr. White was driving in from his estate, the Circle Farm, 7 miles outside of Cleveland, when his auto collided with a smaller car which backed out of a farmyard adjoining the highway. Mr. White's car turned over several times following the collision and landed across his body. He was extricated with difficulty. Owing to the remoteness of the place where the accident occurred it was nearly two hours before medical attention was possible.

The White Motor Company, of which he was president, dates back to the earliest days of the industry. During the early part of the current century, the White company was the leading producer of steam automobiles in this country. It controlled many valuable patents and was an outstanding leader in the competition which developed between steam cars and gasoline cars for a leading place in the motor industry. When it was apparent that the gasoline motor was gaining supremacy, the

Walter C. White

White company changed its policy and began production of a gasoline passenger vehicle which met with success. Later the company discontinued production of passenger cars and concentrated on the production of trucks and buses and it was with this phase of the company's activities that Mr. White was identified.

During the World War he was chairman of the commission sent to France by the United States government to assist in organizing repair and maintenance of motor vehicles in military transportation. For his war work, Mr. White received the decoration of Chevalier of the Legion of Honor of France. In the early days Mr. White made many demonstrations of White motors in races and hill-climbing tests throughout the country. He became vice-president of the White Motor Company in 1906 and its president in 1921. He was also president of the White Motor Securities Corporation, the White Motor Realty Company and other Cleveland companies.

Mr. White was born in Cleveland on Sept. 8, 1876, the son of Thomas H. and Elmira Greenleaf White. He was graduated from Cornell University in 1898 and took his bachelor of law degree from the New York Law School the following year.

James R. Henry, railroad builder and superintendent of construction of the Chicago-New York Air Line, an electric road built in Laporte, Porter and Lake Counties, Indiana, in 1910, is dead at Valparaiso, Ind. He was born in Rochester, N. Y., 79 years ago, and when a young man entered the service of the Michigan Central Railroad. He later undertook railroad contracting work and assisted in building the Chicago & Erie, Michigan & Ohio and Rock Island extension in Kansas.

Henry Fisher

Henry Fisher, who financed the construction of the first three-phase hydro-electric plant in the United States for long-distance transmission, died on Sept. 6 at Santa Barbara, Cal. His age was 86. His career included organization of the Redlands Street Railway and the San Bernardino Valley Traction Company. He organized the Fisher Oil Company in the early years of the petroleum industry in Pennsylvania and was one of the originators of the pipe line method of oil transportation. He served as a director of the Pittsburgh Petroleum Exchange and as first president of the Washington Oil Company, later controlled by Standard Oil.

After taking up his residence at Redlands in 1893, Mr. Fisher became president of the Redlands Electric Light & Power Company, the parent company of the Southern California Edison Company. He was a director in the latter until eight years ago, when his son, John H. Fisher, president of the Equitable Investment Corporation of Los Angeles, took his place. Mr. Fisher, Sr., also was a director of the First National Bank of Los Angeles and the First National Bank of Redlands.

F. R. Henry

Franklin Redman Henry, president of the Majestic Manufacturing Company, makers of stoves and ranges, died on Aug. 21 in St. Louis, Mo. He had been an officer of various railways in St. Louis for 26 years before he resigned in 1908 to become connected with the Majestic Manufacturing Company, of which he was elected president in 1923. Mr. Henry began his business career in 1884 as a clerk for the Missouri Railway, now part of the St. Louis Public Service Company. He was general auditor for the United Railways Company when he resigned in 1908. Mr. Henry was born in St. Louis 62 years ago.

John L. Mier, manager of concessions at the Creve Coeur Lake Amusement Park of the St. Louis Public Service Company, St. Louis, Mo., died on Sept. 7 at Overland, Mo. Mr. Mier retired as a division superintendent for the Olive Street lines of the old United Railways thirteen years ago after having been with the railways in St. Louis for thirty-seven years. He was 67 years old.

Albert E. Smith, comptroller and assistant secretary of the Electric Bond & Share Company, New York, N. Y., died recently. Mr. Smith was one of the original members of the company when it was formed in 1905. He had held the offices of assistant treasurer, assistant secretary and treasurer, and since 1918 he had been comptroller and assistant secretary. He was 53 years old.

Charles J. Moore, retired automobile manufacturer and since 1927 vice-president of the National Safety Council, is dead.

Volume 73 New York, November, 1929 *Number 21*

Crystallized Opinion on Car Design Needed

DEVELOPMENTS which have been made in car design during the past few years show real progress. But this progress has been slow compared with the needs of the situation. While it is almost universally admitted that cars should be improved, there is no general agreement as to how it should be done. On the one hand the railways are not sure what kind of cars they want, and on the other hand the manufacturers are hesitant to offer new designs.

Railway men are firmly convinced that transportation by street car will continue to have a real place. They realize that modern cars have undoubted advantages, but opinion has not crystallized as to what a modern car should be. Although a number of new designs have been brought out, purchases have been largely confined to cars of conventional type. Apparently this has not been due to any particular dissatisfaction with the new designs but rather to lack of definite conviction that they are a practical answer to the operators' problems.

Good cars are available today for the railways which are urgently in need of new rolling stock. Radical improvements have been made in essential features. Bodies, doors, trucks, motors, control and other parts are now available that far surpass the best of a few years ago. Nevertheless, it appears that nothing yet offered has sufficient appeal to tempt operators who are on the fence.

Purchases will lag as long as this situation continues. Widespread modernization of rolling stock is the industry's great need, but it cannot be looked for until opinion has been crystallized with regard to the essentials.

An Unusual Piece of Financing

VARIOUS devices to make fixed income securities more attractive to investors have been adopted during the last few years, in fields other than that of local transportation. In Baltimore, however, a particularly interesting plan of this kind has been undertaken recently in connection with the maturing obligations of the United Railways & Electric Company. Due to uncertainty and to early maturities the interest bearing securities of this company have been selling at a substantial discount and the stock, paying nothing, has been quoted around $10 a share. But the company has improved its financial position and has now announced a program which, at a single stroke, will meet a large volume of maturing obligations, decrease its funded debt and effect a substantial reduction in annual interest charges. The company will offer stockholders $2,500,000, par value, of bonds now in the treasury and will use the proceeds together with accumulated cash reserves, to retire a total of $4,000,000 of bonds and notes. Since the interest requirements on the new securities will amount to only $125,000 a year as against $225,000 on the outstanding issues, the direct reduction in fixed payments is $100,000.

These bonds will be offered to stockholders at present market prices, but with special stock rights attached. That is the unusual feature. The bonds to be offered are $1,500,000 of first consolidated United Railways & Electric 4's at 58 and accrued interest, and $1,000,000 of Maryland Electric Railways first and refunding 6½'s at 80 and interest. Accompanying the former will be option warrants for seventeen shares of common stock while the latter will have similar warrants for 24 shares of stock. Holders will have two years in which to exercise the warrants at $15 a share. If this is done the company will receive $750,000 additional funds without increasing its funded debt.

Both parties should benefit by this arrangement. United Railways & Electric consolidated 4's mature in 1949, and Maryland Electric Railways 6½'s in 1957. Thus at present prices the yield to the purchaser is a little more than 8 per cent. On the other hand, $1,500,000 of obligations are being permanently retired and the company's annual interest reduction of $100,000 will amortize the entire discount in about eight years.

Short Riding—A Neglected Opportunity

WITH all the attention that has been devoted in recent years by the local transportation lines to the development of new business, comparatively little consideration has been given to that one-time mainstay of the street car, the short rider. Twenty-five years ago there were relatively few long lines, and the persons who rode for distances of less than a mile constituted the bulk of the traveling public. As the routes have been extended farther and farther, more and more attention has been paid to the suburbanites who live near the outer ends. Demands have been made for extensions of even the longest routes, so that patrons could settle still farther away from the business districts.

With all the attention paid to these commuters—for they really are in much the same class as the suburbanites living along the steam railroads—less care has been devoted to the provision of service specially suited to hold the short-distance rider. Modern schedules use the cars efficiently on the long lines, and they are made to fit in on the trunks as best they can. Then, too, the large cars that have been in use for a number of years make short headways less necessary than did the smaller cars that were common in the past. So the frequency of service, even on the heaviest trunks, often is less today than it was a generation ago. Traffic congestion has made it more difficult to give an attractive short ride.

Rapid transit is no answer to the demand for this class of service. People will not climb up and down

Digitized by Google

stairs when they wish to ride only a few blocks, particularly when they do not know if a train will be available for some minutes after the platform is reached. Where surface lines have been taken off and rapid transit lines substituted, a source of revenue has been lost irretrievably.

That there still is a demand for this class of service is seen in the enormous growth of the taxicab business in recent years. By far the greater portion of taxicab rides are for short distances. Even though this business is limited by the fares that must be charged, its total volume is amazing. The taxi, however, cannot take the place of the street cars or bus lines, if proper attention is given to the demand of the public.

What is needed to make short distance riding more popular is, first of all, frequency of service. This is even more important than speed, as the total time of the trip is short. The best results can be obtained with "car-in-sight" service, for then the patron knows at once that his wait will be only a matter of seconds. That idea was widely accepted during the vogue of the Birney car, but appears to have been forgotten now. Safety zones for the street cars and well-marked stopping places for the buses are essential. The vehicles themselves must be carefully marked to eliminate any possibility that the passenger may go wrong. The cars or buses should be easy of access and reasonably comfortable. Fares should be as simple as possible. The old-time nickel had a certain advantage from the standpoint of simplicity and ease of collection. Car and bus operators, it goes without saying, must be courteous and helpful to appeal to the non-necessity rider.

No reason exists for believing that it is impossible to get back the short riders. In some places they have come back, and in considerable numbers. Sidewalks today are more congested than ever, and the business of the aggressive transportation man is, above all things, to get the people off the sidewalks.

Better, If Not Bigger

NOW that the 48th annual A.E.R.A. convention has passed into history the time has come for an appraisal of what it really meant to the electric railway industry. Although attendance and exhibit space fell somewhat short of the figures of the three previous gatherings at Cleveland, this fact has little bearing on the success of the convention. Compared with the 1925 convention, the last held at Atlantic City, the attendance was almost exactly the same, while the exhibit space exceeded the amount taken on that occasion. In diversity, attractiveness of arrangement and interest this year's display surpassed any of its predecessors. Undoubtedly, it was a show that made a deep impression and will long be remembered.

The exhibitors themselves express entire satisfaction with the results. They say that the operators were more seriously intent upon getting the most out of the assembled exhibits than at any convention in recent years. "Well repaid for our trouble and expense," "attention and interest good; better than heretofore," "the most productive form of advertising in which we engage," "more than usual amount of interest displayed," are but a few representative comments.

Operators, too, have expressed themselves as well pleased with the convention. In the wide range of subjects considered this year's program exceeded anything that preceded it. Informative discussion took place on topics of immediate interest to the delegates as well as on general topics of interest to the entire industry. Undoubtedly everyone attending this year's convention felt well repaid for the time and effort so expended.

Chicago's New Start Toward Unification

CHICAGO still has a long way to go to effect unification of its transportation facilities, but the progress made since the passage of the necessary enabling bills and their signature by the Governor represent two important steps forward. True, there has been a disposition toward criticism on the part of those who had hoped that the program might go before the voters this fall, but considering the magnitude of the problem that was a little too much to expect. The new legislation simply opens the way for the City Council to negotiate a franchise which will include provisions deemed necessary to permit the various companies to be brought together in combination with subways still to be constructed. The resulting franchise, whatever its terms, must then be approved by a public referendum. There still remains, therefore, a long road to travel before the much needed consolidation, co-ordination and expansion of transportation facilities in Chicago can be carried out.

Despite the obstacles that are still ahead a renewed start toward settlement of the franchise problem has been made under auspices more propitious than those which have existed for many years. In the first place, the public itself seems to realize that the purpose sought is sound. Secondly, the sponsorship of the measures recently passed by the state Legislature was such that no motives other than those of the public good and provision for sound city development can be attached to them. The matter was first threshed out before the citizens' traction settlement committee, headed by James Simpson, an organization adequately representative of various shades of opinion.

Finally, and perhaps most important of all as a favorable influence in the present situation, is the growing public confidence in the present management of the Chicago transportation properties. The people of the city are gradually coming to understand that in the midst of political scandal and turmoil, and despite franchise and consequent financial difficulties, transportation service in the city has been steadily improved. They are gradually becoming conscious of the fact—generally recognized throughout the electric railway industry—that despite all the trying conditions imposed by the unsettled franchise situation, the transportation properties in Chicago are among the best managed and most efficiently operated systems in the world. Certainly the latest proposal, calling for the expenditure of $300,000,000 for subways and for extensions, augurs well for the future.

It now remains to be seen whether, under these favorable circumstances, a franchise settlement can be worked out which shall be conceived from the public's point of view not to drive the hardest possible bargain with present investors in the property, but with terms under which the city may be assured the best possible transportation service for the future as well as the present. It is to be hoped that the emphasis will be laid on public convenience and comfort rather than minimum fare; that every precaution will be taken to insure maximum efficiency of operation, rather than minimum possible return to investors—in short, that the negotiators for the city will

Digitized by Google

adopt the modern business concept of insuring full value for the car riders' fare in return for a fair profit to the company; a concept which offers the only known method of insuring financial backing and management competent to give that kind of service. That these necessary factors are being taken into account to the extent they deserve is indicated by the statement of one of the members of the general financial committee entrusted with the work of planning for the $200,000,000 of new capital to be raised within the next four years to the effect that the committee will advocate a balanced division of securities, adequate earnings and a level of fares adequate to meet the charges on the new money. On no other basis can the plan be made a success.

Canadian Railway Prosperity Continues

FOR some years the results of operation of the Canadian electric railway systems have been showing a healthy and steady improvement. Whereas revenues have scarcely held stationary in the United States they have increased year after year in Canada. At the same time operating expenses have been held down so that there has been a gain in net each year since 1924.

Results for 1928 not only confirm the general trend; they strengthen the position of the Canadian roads appreciably. Revenues reached a new high for all time at $55,632,761. This was 3.8 per cent above the figure for 1927. At the same time operating expenses were $38,782,719, or only 3.1 per cent higher than in 1927. The net operating revenue accordingly went up to $16,850,042 or 5.8 per cent more than in the preceding year. The improvement came from an increase of 3.3 per cent in passengers and 16 per cent in freight.

Gains such as these are the more noteworthy when it is considered that while 59 properties are listed in the Dominion, almost exactly half of the revenue comes from two of them—Montreal and Toronto. Of the other properties only one, the British Columbia Electric Railway, has a gross revenue in excess of $2,000,000. At the other extreme are sixteen properties with revenues of less than $100,000 and fifteen between that figure and $200,000. Such companies are frequently considered hopeless. Yet 21 out of 31 in this classification did better than cover operating expenses and sixteen of them covered fixed charges and showed a surplus for the year.

Reasons for the good results obtained by the Canadian roads would be instructive if they could be definitely determined. Passenger and freight revenues are not shown separately, but even crediting all the revenue to the passenger business, the receipts are at the rate of only 6.9 cents per pasenger. This is considerably below the current rate in the United States, so that higher fares scarcely can be the cause of the increase in gross. Of course, automobile registration is below that for the United States, and the climate is such that there are comparatively long periods during the winter when automobiles are little used. Still it seems doubtful if this is sufficient explanation for the favorable results. Canada is a growing country, and the trend of population toward the cities is just beginning to be felt. This may be an important factor, although the steady gain in riding for each year since 1925 would tend to discount it. In any event, a study of the results in Canada indicates that there is something to be learned from the experience of these small roads that have been able to show such excellent results.

New Application of "Skip Stop" Plan

HIGHER speed is unquestionably an extremely important feature in improving street railway service, and one of the most effective means of attaining this result is the limited or "skip stop" plan. During the World War many electric railways were compelled to eliminate stops to save fuel. However, with the passing of this temporary requirement most of them returned to their original stop spacing. A feeling has existed that the average passenger would prefer to take a longer time for his ride and be subject to a more frequent stopping of his vehicle rather than to be compelled to walk a somewhat greater distance to reach the boarding point. Objections voiced by business interests have also been an important factor in dissuading the railways from the use of "skip stops." Generally speaking, the popularity of the plan ceased at the end of the war.

Now appears a reviving interest in this idea. Following the victory of the "skip stop" plan in Cleveland, where it was adopted only after exhaustive discussion, came the approval of the Public Service Commission of Maryland for the installation of a similar system in Baltimore. The most recent revival is in Kansas City, where the plan has lately been adopted on three important lines. The excellent results obtained are told in an article appearing elsewhere in this issue. Exclusive of the business district where no stops were eliminated, the total number of stopping points was reduced from 321 to 187, or about 42 per cent. Scheduled speed has been increased from 9.2 to 11.5 m.p.h., making actual savings ranging from five to eleven minutes for a single trip.

Higher car speed is, of course, the biggest advantage of the limited stop plan. There are several others, however, that are worthy of mention. These are reduced operating cost, greater comfort resulting from the less frequent starting and stopping, increased good will on the part of the patrons, and a possible gain in revenue. Although the system has not been in operation long enough in Kansas City to make possible any definite conclusions as to its effect on revenue, it is expected that the three lines on which the experiment is being made will show substantial increases in riding when the public realizes the advantages of the improved service.

One-Man Cars Adopted at Des Moines

EMPLOYEES of the Des Moines Railway have at last consented to revise their long-term labor contract and to accept the one-man car as a fact. This is most encouraging. That they remained adamant on the issue so long is unfortunate, both to them and the company. Even if it isn't easy to reduce a course of this kind to terms of dollars and cents, the fact remains that both the men and the company were the losers. Des Moines needs the one-man car if service there is not to be reduced to the mere skeleton of lines that might be expected to support two-man service. Just how far the company will go in its operation of the one-man car is still a matter of conjecture, but it is reasonable to suppose that it will be applied advantageously and that the service will be so strengthened as to frequency that it will be made much more attractive than it could be under two-man operation, and that the employees will gain at the same time the railway stands to profit.

Survey Shows TRANSIT

Changes in Riding and Service in the Period 1918-1927 Are Included for Leading American Communities. Demand for Public Transportation Service Has Continued Despite Enormous Increase in Automobile Registration in Every City Studied. Gross Revenues and Per Capita Earnings Have Increased Generally

MUCH progress has been made in city transportation since the end of the World War. Many of the properties in cities large and small are earning more, both in the aggregate and on a per capita basis, than they were in 1918. Almost without exception they are giving more service and on most of the properties the bus has been introduced to good effect in supplementing the street car. The story is told effectively in the comparative figures included in the main table published with this article, which brings together operating results for 23 important cities in the United States and Canada. The figures were collected and analyzed by the Beeler Organization, New York, and have been arranged for publication in a single tabulation. With one exception, Lexington, Ky., the cities included are of more than 100,000 population, and five of them had more than 1,000,000 inhabitants in 1927 in the territory served by the transportation systems. Population statistics were obtained from various sources, usually the local authorities, and represent the closest available estimates for the respective dates.

Although every one of the cities included in the survey has had a gain in population, there have been wide differences in amount. Houston shows the largest proportional increase, having 70 per cent more inhabitants in 1927 than in 1918. Other cities in which the growth has been large are Lexington, Ky., with a 46.2 per cent increase in the same period; Atlanta, 39.6 per cent; Cleveland, 35.1 per cent, and Portland, Ore., 37.3 per cent. Detroit has grown 30.43 per cent in five years. The growth has been slow in some of the cities, Cincinnati showing an increase of only 5.6 per cent and Omaha 9.6 per cent. The remaining cities in the group studied show gains ranging between 10 per cent and 26 per cent.

Street car and bus riding has varied over a wide range in these 23 cities in the period under consideration. Oddly enough, the maximum gains in riding have occurred in the cities at the two extremes of population —Lexington and New York. In Lexington the number of revenue passengers has gone up 58 per cent, while in New York the corresponding increase was 56.7 per cent.

COMPARISON OF PER CAPITA RIDING AND AUTOMOBILE OWNERSHIP, 1927

City	Population Served	Rides per Capita	Automobiles per 1,000 Population
New York	6,217,260	485	74.7
San Francisco	576,000	461	198
Chicago	3,102,800	376	128.9
Toronto	585,628	331	137.2
St. Louis	832,000	324	170
Boston	1,220,434	301	125
Baltimore	855,000	265	185.8
Cincinnati	459,500	244	185.8

Houston	259,000	159	200
Lexington, Ky	60,312	105	177.1

In each of these instances the gain was at a materially greater rate than the increase in population. Other cities where there has been a gain in riding on the public transportation systems in excess of the rate of increase in population are San Francisco, with a 34.4 per cent increase in revenue riders; Chicago, 31.5 per cent; St. Louis, 16.4 per cent, and Pittsburgh, 13.55 per cent. Several cities included in the survey have shown an actual decrease in riding. These are Denver, Des Moines, Baltimore, Kansas City, Omaha, Cincinnati, Cleveland and Portland, Ore.

General Increases Made in Service

Service rendered by the transportation systems, as measured in vehicle-miles operated, has been increased very generally. The only cities included in the survey where less vehicle-miles were operated in 1927 than in 1918 are Denver, Omaha and Portland. Toronto had less car-mileage in 1927 than in 1922, but this period represents the transition from the service given with cars which were in use immediately after the Toronto Transportation Commission took over the property of the Toronto Railways to the modern service now given, with larger cars and improved routing.

Buses were an inconsiderable factor in providing service in 1918. Only three cities, New York, Chicago and Baltimore, show bus passengers in that year. There were some independent bus lines, principally of the jitney class, which existed in several of the cities, but which had almost entirely disappeared by 1927. By that year, however, the bus had become an important factor in the permanent local transportation scheme in all of the cities included except Denver and Memphis. In certain of the cities the use of the bus made possible a reduction in the number of car-miles operated in 1927 as compared with 1918. Those cities showing such a decrease in car-miles are Boston, Detroit, St. Louis, Omaha, Cincinnati, Cleveland, Portland, Toronto and Winnipeg.

Fare Increases Are General

Fares, as measured by the receipts per revenue passenger, have gone up to some extent in every one of the 23 cities except San Francisco, where they have remained almost stationary. In Toronto the figures for 1928 show virtually the same rate as for 1922, the slight increase being due to a different distribution of cash and ticket riders. Cities where the average fare has increased

TRANSIT TRENDS *in 23 Cities*

more than 50 per cent are Atlanta, Des Moines, Boston, Cincinnati, Cleveland and Richmond.

The revenue rides per capita, likewise, show a great range. The highest riding habit was in New York, with 485 rides per capita in 1927. It was followed closely by San Francisco, with 461. Chicago, with 376 rides per capita, was third. As might be inferred, the revenue vehicle-miles per capita were highest in the same three cities, being 69.42 in New York, 66.88 in Chicago and 62.97 in San Francisco. The revenue rides per vehicle-mile of service rendered are highest in San Francisco, being 7.32. This figure is approached closely in New York, with 6.99 rides per vehicle-mile, and Cleveland, with 6.73 rides.

Widespread Use Made of Buses

Widespread growth in the use of buses for urban service is indicated clearly in the columns in the table giving the relative percentages of street car and bus passengers and vehicle-miles. From practically nothing in 1918 the bus has increased its usefulness in nearly all of the cities. In Lexington the buses are used to give 41.85 per cent of the vehicle-miles of service and carry 29.7 per cent of the revenue passengers; in Cincinnati they are giving 29.7 per cent of the service and are carrying 16 per cent of the riders, and in Richmond they are giving 29.6 per cent of the service and carrying 20.6 per cent of the passengers. In no city studied were buses carrying more than 1 per cent of the passengers in 1918.

Among the cities included in the tables, New York, Boston and Chicago are the only ones which give service with rapid transit trains run in subways or on elevated structures. There is only one other American city in the same class. In Boston the entire transportation system is under one management, and services with rapid transit trains, surface cars and buses are closely coordinated. In Chicago the rapid transit lines, which are all elevated, the surface cars and a portion of the buses are run by independent companies. To some extent these services overlap and are in competition. New York is served by two distinct rapid transit systems and a large number of surface car companies independent of one another. Most of these surface lines have no connection with the rapid transit systems. Bus service is given by one principal company, which from an operating standpoint is independent of any of the other transportation systems. In addition to it there are several bus systems of minor character, also independent.

Of the cities without rapid transit, San Francisco has two separate and competing street car systems. Both of them run buses. In Detroit all of the street cars and most of the buses are under one management, although one important bus line is competing. In St. Louis the street railway runs a portion of the buses, although the larger portion of them are under an independent management. The principal services in each of the other cities are supplied by a single management.

The rapid transit situation is of such importance, particularly at the present time, with many cities investigating propositions for construction of subways, that a supplementary analysis is given for New York and Chicago to show separately the two classes of transportation. In New York, it will be noted, 60 per cent of the total passengers ride on the rapid transit lines, which furnish 70 per cent of the total vehicle-miles. Even so, there was a gain of 16.6 per cent in surface car riding during the period, although there was a reduction in service given with the street cars.

In Chicago, on the contrary, the rapid transit lines are not nearly of such great importance as they are in New York. In 1927 they carried only 19 per cent of the riders and furnished 28 per cent of the service offered to the public. The riding on the surface cars is increasing at a greater rate than the population, while the riding on the rapid transit lines is not quite keeping up with it.

Figures on Boston, segregating the several forms of

transit, are not available, as the methods of fare collection and transferring from one type of vehicle to another preclude the obtaining of the necessary data.

Perhaps the most striking comparison that may be seen in the entire table of statistics is the growth of motor vehicle registration. In no city shown did the increase in registrations of motor vehicles between 1918 and 1927 amount to less than 100 per cent. In Detroit, renowned as the motor city, the increase was 88.3 per cent in five years. However, the registration in Detroit for 1923 was far and away above any other city, being 170.45 motor vehicles per 1,000 of population. Incidentally, Detroit still remained at the head of the list in 1927. Des Moines just failed of doubling the ratio of vehicles to population during the period. From 109 per 1,000 of population in 1918 it went up to 217 in 1927. The total number of vehicles in the city, however, increased 151 per cent.

As it stands today, there is an average of about 200 automobiles per 1,000 of population in the cities included in the survey, or five persons per automobile. Those with less than 4.5 persons per automobile registered are Kansas City, Portland, Ore., and Milwaukee. At the other end of the scale are Pittsburgh, with 7.2 persons per automobile; Chicago, 7.8; Boston, 8; Richmond, 12.8, and New York, 13.4. The two Canadian cities also show relatively few automobiles, Toronto having 7.3 persons for each one registered and Winnipeg 12.4.

A comparison of the per capita riding and automobile registration was made to see if there is more riding of public conveyances in those communities where the automobile registration is small. Results are shown in the table on page 1032. The cities are arranged in order of rides per capita. The population and the number of automobiles per 1,000 of population also are given. New York, with the largest population and the smallest proportional number of automobiles, heads the list. Richmond and Winnipeg, which have, next to New York, the smallest relative automobile registration, are far below it in riding habit, having respectively 221 and 197 rides per inhabitant. Apparently mere size is by no means the only determining factor in inducing riding, since there are several cities of moderate size that exceed some of the communities with 1,000,000 or more as regards riding habit.

Per Capita Revenue Increasing Greatly

Revenue per capita has continued to grow very generally despite the enormous increase in automobile registration. The only city included where there has been a recession is Portland, Ore., and there the total gross increased. In Detroit the revenue per capita has gone down 8.48 per cent since 1923, and in Toronto it has gone down 5.46 since 1922. In both of those cities the situation was peculiar in that the municipality had recently taken over the transportation system and that the riding was abnormal in the earlier year. Comparable figures for 1918 are, of course, not available.

Included in the list of cities with revenue per capita of more than $20 is Toronto, with $20.42 in 1928, as against $21.60 in 1922. The other cities, in all of which the comparison is between 1918 and 1927, include Cincinnati, which has gone up from $12.89 to $21.20, or 64.47 per cent; San Francisco, from $20.08 to $22.81, or 13.6 per cent; St. Louis, from $17.25 to $24.17, or 40.11 per cent; New York, from $17.59 to $24.99, or 42.1 per cent; Chicago, from $17.26 to $27.56, or 59.7 per cent; and Boston, which heads the list, having gone up from $18.52 to $27.86, or 50.43 per cent.

Rochester Traffic Study Proves Importance of Street Cars

Increasing use of buses and taxicabs is also indicated by comparative figures for the years 1927, 1928 and 1929

FOR three consecutive years the traffic committee of the Rochester Engineering Society has conducted traffic surveys in the city of Rochester. Each time these surveys were made with the assistance of about 1,000 Boy Scouts. The counts were made at the same time of the year, on the same day of the week, during the same hours of the day, covering the same streets, so that the figures were in every way comparable. These surveys showed clearly the value and importance of street cars as a means of transportation. Compared with other vehicles they carry many times the number of people per unit of street space occupied. They are responsible for a very small portion of the traffic accidents and are used to a greater extent by shoppers than any other means of transportation.

A cordon traffic count around the business district was made at exactly the same locations for three consecutive years. For the three years the count of the passenger automobiles entering and leaving the district during a twelve-hour day was as follows:

	Automobiles	Passengers	Passengers per Automobile
1927	120,969	192,308	1.58
1928	126,523	198,861	1.57
1929	138,092	214,910	1.56

This shows an increase of nearly 5 per cent for 1928 over 1927 and a 9 per cent increase for 1929 over 1928. Another trend shown is a small but constant decrease in the number of passengers per automobile. Trends in other classes of traffic are shown in the following table:

Year	Miscellaneous	Commercial	Street Cars	Taxis	Buses
1927	4,596	39,545	5,246	1,582	122
1928	4,137	29,021	6,215	1,386	119
1929	4,090	30,028	6,563	2,519	256

Miscellaneous vehicles, which are mostly horse-drawn, show a decrease each year, as might be expected. Commercial vehicles showed an increase in 1929, although there was a falling off the previous year.

Street cars show a constant increase, 1929 being 25 per cent greater than 1927, the increase in passenger automobiles over the same period being only 14 per cent. Taxicabs, while showing a decrease in 1928, showed a large increase in 1929 due to a taxi war in which rates have been cut to a point where a minimum number of four people riding together can be transported at a rate which is often less than the street car fare would be. The increase in bus operation in Rochester is reflected in the traffic count of buses, which increased over 100 per cent in 1929.

At the point of maximum traffic where the greatest number of vehicles and passengers pass, an analysis or street efficiency chart was made. At this point it was found that street cars constituted 5 per cent of the vehicles using the street but carried 60 per cent of the passengers. On the other hand, passenger automobiles constituted 75 per cent of the traffic but carried only 40 per cent of the passengers. At another location near the center of the business district a check taken the following year during the rush hour showed that automobiles averaging 1.67 passengers each constituted 81 per cent of the total vehicles, while street cars averaging 48 passengers comprised only 10 per cent of the vehicles but carried 79 per cent of the traffic.

The surveys show that while the number of parked automobiles in the downtown district has increased from 2,847 in 1927 to 4,137 in 1929, the percentage of violations of the parking restrictions is less. In 1927 it was found that 58 per cent of all the automobiles parked

Main Street, Rochester, N. Y., where surveys show that street cars comprising 5 per cent of the total number of vehicles carry 60 per cent of the total passengers

in the downtown district between 10 and 11 a.m. were parked in violation of some regulation. In 1928 this had decreased to 48 per cent and in 1929 to 36 per cent. The major portion of the violations were due to overstaying the time limit, but some violations of every parking rule were encountered.

In addition to a count of the number of automobiles parked in the streets, the 1929 traffic survey included all the private parking stations in the downtown district. The check was made at 10:30 a.m. when 3,005 automobiles were found parked in the 88 stations. These stations had a maximum capacity of 8,591 cars.

The 1929 survey included a pedestrian count made on sidewalks at important points in the business district, a demand for such counts coming from many stores, real estate concerns and advertising companies. A maximum of 85,000 people was found to pass one point on Main Street during a twelve-hour period, 50,000 of these being on one side of the street. The maximum pedestrian peak occurred during the noon hour.

A Twin Coach street car with motors full spring-suspended is an outstanding recent development

Lightness and Speed

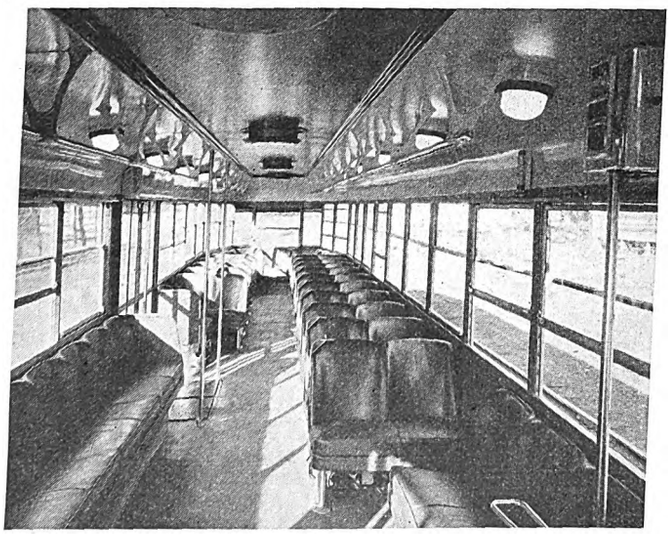
Mark New Car Designs

Many innovations in vehicles exhibited at A.E.R.A. Convention. Extensive use made of aluminum in body construction. Unsprung weight reduced. Higher rates of acceleration and braking attained

MAJOR improvements in the design of electric railway cars were an outstanding feature of this year's convention of the American Electric Railway Association. Not since the first appearance of the so-called "automotive type" street car several years ago has there been so marked a departure from established practice. Among the interesting developments are: more extensive application of aluminum in body construction, wider use of light-weight high-speed electric motors mounted on worm drive trucks, introduction of foot control, innovations in door arrangement, and improvements in seats not only for passengers but also for the car operator.

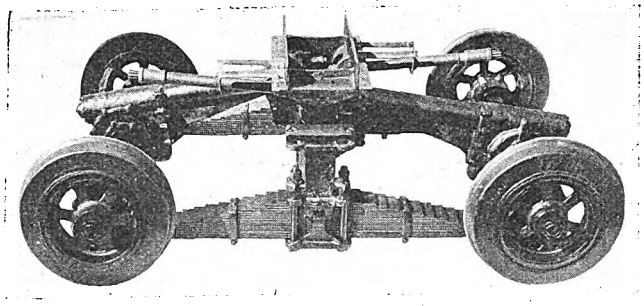
A radical departure from previous designs was seen in the new Twin Coach double-truck street car. The motors are mounted on the under side of the car body and connected to the axles through propeller shafts with universal joints. By this means the weight of the truck has been reduced to 3,500 lb., giving an extremely small total unsprung weight. The truck has a wheelbase of 72 in. and is arranged for either 24-in. or 26-in. wheels, which are keyed and press-fitted to the ends of 4-in. solid chromium nickel heat-treated axles. The axle is driven by a worm, with a $7\frac{2}{3}$ to 1 gear ratio. The elliptical springs are rubber-insulated. Side-sway oscillators are center-pivoted under substantial cross-supports anchored to the body framing, thus permitting free movement of the trucks on turns. In order to reduce noise the wheels are rubber-cushioned.

The four 35-hp. motors are mounted on body cross-members through rubber insulation. Remote control is foot-operated. The foot control consists of a dynamic and air brake pedal



Seats and ventilators of novel designs are features of the new Twin Coach car

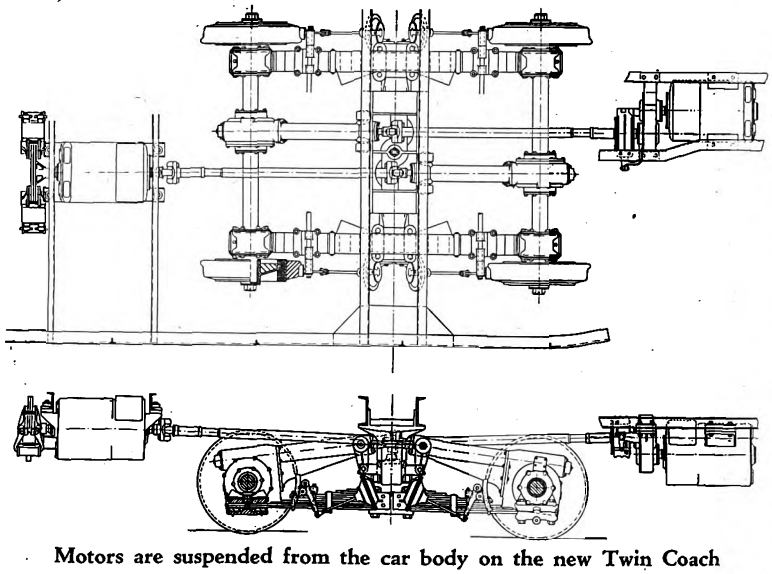
Digitized by Google



Lightness of construction is the outstanding feature of the Twin Coach car truck

operated by the left foot. The power accelerator pedal is operated by the right foot.

General dimensions of the car are shown in the accompanying table. The body is of semi-flexible construction and is supported by main frame cross-members, trussed and diagonally braced directly above the truck bolsters. The car is designed for single-end operation with front entrance and center exit. The double-leaf doors open inwardly, giving a passageway 4 ft. 4 in. wide. They are actuated by means of National Pneumatic controls with step treadles for the center exits. A combination turnstile and fare register that is located just behind the operator's seat facilitates one-man operation.



Motors are suspended from the car body on the new Twin Coach automotive type car

There are 52 seats of the semi-bucket type, and there is an extra wide aisle space, leaving ample room for standees. A longitudinal seat extends from the front door to the center exit on the right-hand side, while a three-passenger longitudinal seat is located at the left-hand side near the front. Behind this are ten transverse double seats, while along the rear half of the right side five transverse double seats are available. A built-in seat is placed against and around the rear end of the car.

Aluminum Extensively Used in Albany Car

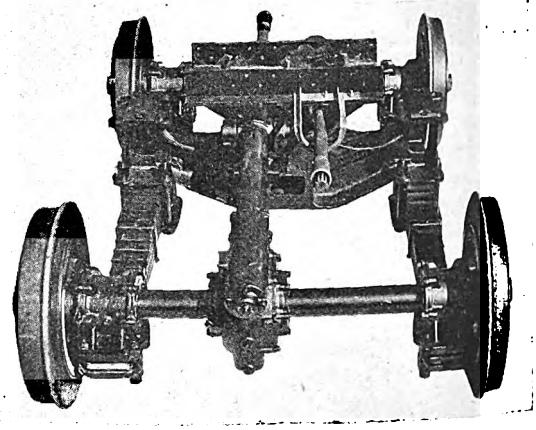
Another striking design was the new double-end, front-entrance, center-exit, double-truck car built by the Cincinnati Car Corporation for the United Traction Company of Albany, N. Y., according to the design of Edward Murphy, general manager. This car deviates from the conventional body design in many details and also differs in truck construction. Aluminum is used more widely than heretofore, the underframe being made entirely of this material. The side sills also are made of aluminum, an angle extending in one continuous piece from the front body corner-post to the center-exit door and from the center exit to the rear vestibule corner on both sides of the car. Another feature of this car body is in the framing, which has sufficient strength to permit elimination of bulkheads. In the roof, the carlins are braced by individual cast aluminum purlin separators, located in pairs and arranged to accommodate lighting fixtures. Braces are bolted to the carlins and form a continuous tie from one end of the roof to the other.

The cars are equipped with two four-wheel arch-bar trucks with spring-pedestal cantilever type journal boxes, combination rubber cushions and semi-elliptical spring-bolster suspension. This truck is designed to negotiate curves of 30-ft. radius. The wheelbase is 5 ft. 4 in. The axles are of the journal-bearing type and the wheels have a diameter of 26 in. The brake equipment is of the foot-operated type with full safety features for one-man operation. Besides wheel brakes the trucks are designed and constructed to carry magnetic rail brakes if desired.

The electrical equipment consists of four 35-hp. motors with PCM foot control. The gong, sander and doors are operated by hand through small levers on the dash mounted in front of the motorman. The front-entrance doors are operated by the motorman also and are of the double two-leaf folding type. The center-exit doors are of the same type but are treadle-operated.

Seats are provided for 44 persons on twenty double seats, each 35 in. long and 18 in. wide, and on two double seats placed longitudinally beside the end doors. The aisle width is 22 in., thus giving adequate space for standees during the peak hours and enabling the passengers to circulate easily through the car.

A new one-man, double-truck, double-end car was built for the Milwaukee Electric Railway & Light Company by the St. Louis Car Company. At the right of the operator are double doors, one for entrance and the other for exit. The door at the rear end is equipped



The Twin Coach truck is worm-driven and connected to the motor by a propeller shaft provided with universal joints

Digitized by Google

with an automatic step treadle. Much attention was given to the interior appointments. Six dome lighting fixtures provide the necessary illumination. Steel panels conceal the air piping and electrical apparatus at each end. Seats are available for 48 passengers and there is ample room for standees.

The trucks are of the St. Louis Car Company type E.I.B.-58, with cast-steel equalizers having a special feature in the mounting of the detachable journal boxes. The side frames are of cast steel with gussets and brackets for transoms, with which the brake and bolster suspensions are cast integrally. The transoms are of rolled steel bulb beams. There are only four joints in the entire

of the truck frame. All wearing surfaces are fitted with easily renewable heat-treated high-carbon steel wear plates and bushings. The truck is equipped with a fully graduated system of springs, consisting of a combination of full elliptic and helical springs. The brake gear is inside hung and fitted with anti-rattle devices, and the motors are inside hung. Each truck has two 25 hp. motors.

Rapid Acceleration and Braking Feature Detroit Car

Light weight, rapid acceleration and high free-running speed are features of an experimental car built by the Department of Street Railways, Detroit. Factors which have contributed to keeping down the weight are: light-weight motors and trucks, reduced amount of steel framing in the car body, absence of heavy brake rigging, use of aluminum as the material for the trolley pole, bumpers, door engines, air compressor and piping. In general, the car follows the Peter Witt design now standard on this system. Four Westinghouse 300-volt 60-hp. motors are mounted on Timken model 52 trucks. General Electric sixteen-point automatic control is used.

The braking system is straight air, but has the novel feature of using a foot-operated brake valve of the G.E. VB-2 type. This is a balanced air-pressure valve and gives an operation akin to that of braking an ordinary automobile. The pedal is spring-controlled and may be locked in the application position.

Forced ventilation is used, following a design developed by the Peter Smith Heater Company. With this system air is admitted to the car through intake ventilators on the roof and exhausted through four grilles inserted in the floor. The exhaust is accomplished by means of a motor-driven exhaust fan suspended under the car floor and connected to the floor grilles by flexible metal tubing.

Several noise reduction features have been incorporated in the design, including worm gear drive, rubber spring supports, rubber motor supports, rubber mounting of air compressor and trolley base, and sound insulating of the floor with felt. Details of the construction were given in an article appearing in the August issue of this paper.

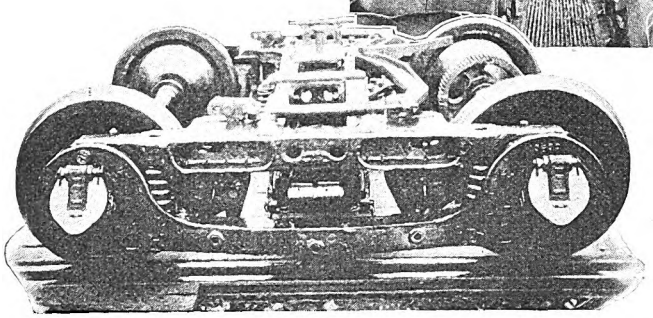
Above—Double-end car built by the St. Louis Car Company for the Milwaukee Electric Railway & Light Company

At right—Control apparatus on the Milwaukee car is entirely inclosed

Below—Truck used under the new Milwaukee cars



Extreme lightness of weight and electro-pneumatic control with pedal-operated accelerator and dynamic brakes are features of an experimental car of the Pittsburgh Railways, built by the Osgood-Bradley Car Company. The car was built with the lightest possible car-body framing construction consistent with the necessary strength and regard for manufacturing considerations. Metallic parts of the body construction and the various items of equipment have been made of aluminum wherever possible. Special aluminum alloy was used throughout the structure where special strength requirements are important, while commercial aluminum was used for the various items of interior finish.

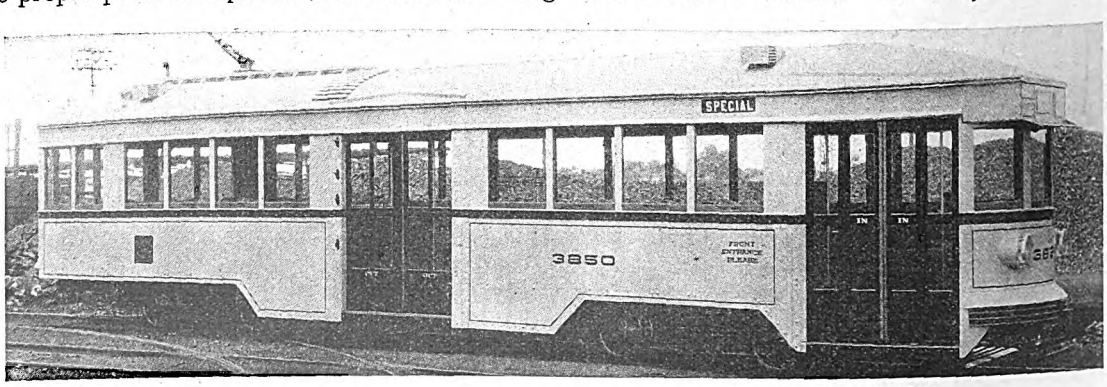
The master controls, both for acceleration and braking, are foot-actuated through two pedals. They have been designed to resemble the controls of an automobile. Variable rates of acceleration and braking may be obtained, and are approximately proportional to the distance the proper pedal is depressed, the maximum being obtained with full depression. A full description of this car was published in the July issue of ELECTRIC RAILWAY JOURNAL.

Larger seating capacity at lower cost per seat is an outstanding feature in the single-end car built for the Chicago Surface Lines. The weight has been brought down from 820 lb. per seat to 740 lb., and the weight per horsepower from 0.173 tons to 0.111, or a reduction of 36 per cent. The electrical equipment has been changed from previous designs because it was decided to use 50-hp. motors. Having this power available on four axles the acceleration rate was stepped up from 2 m.p.h.p.s. to 3 m.p.h.p.s., permitting an average speed of 14 m.p.h. instead of 12 m.p.h. Having attained rapid acceleration it was considered that rapid braking was also of paramount importance to safe operation. The new car has in its braking system a quick-service valve, in connection with a straight air brake with emergency feature. An application up to 50 lb. per sq.in. in the brake cylinder can be obtained in 0.85 seconds.

As the doors are on one side of the car only the left side-panels have been combined so as to form one straight panel, thus accentuating the low lines obtained through the low truck design. In the interior, straps are omitted and standees are provided for by grips on the backs of the seats along the aisle, while above the longitudinal seats a horizontal bar has been placed to take the place of straps.

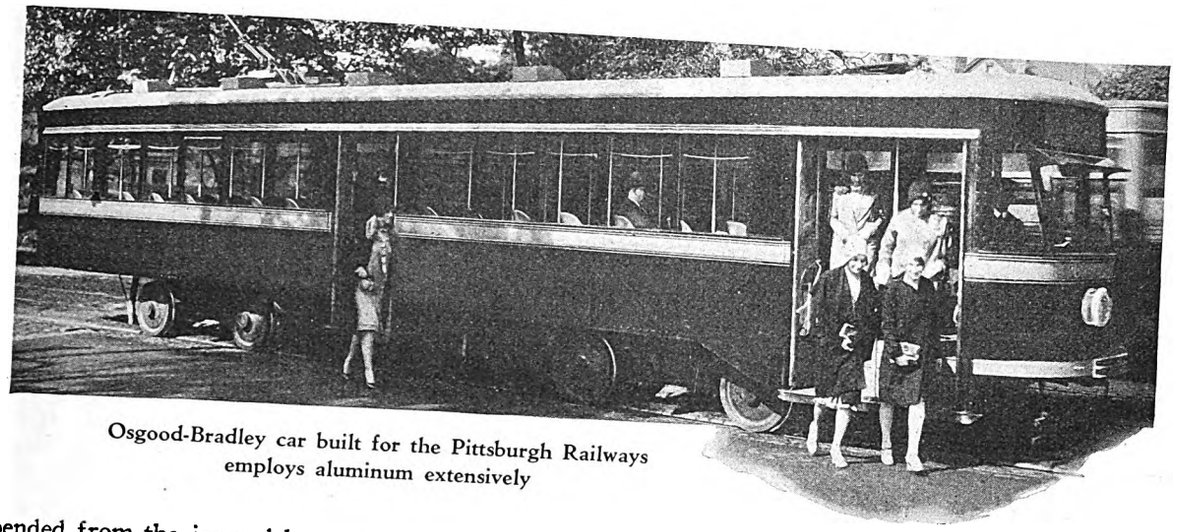
SINGLE TRUCK CAR WITH LONG WHEELBASE BUILT BY BRILL

Unusual in many respects is a new single-truck car built by the J. G. Brill Company. This car has the new Brill No. 283-A four-wheel truck with a 12-ft. wheelbase. It is equipped with 28-in. diameter solid wheels pressed on and fixed to solid axles, which through a special type of suspension at the journal boxes permit sufficient radial motion to enable the car to negotiate short radius curves. Its alloy steel side frames



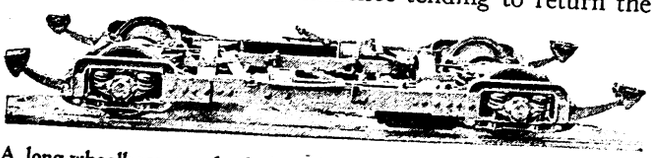
Large capacity car of the Department of Street Railways, Detroit, mounted on Timken worm-drive trucks

Digitized by Google

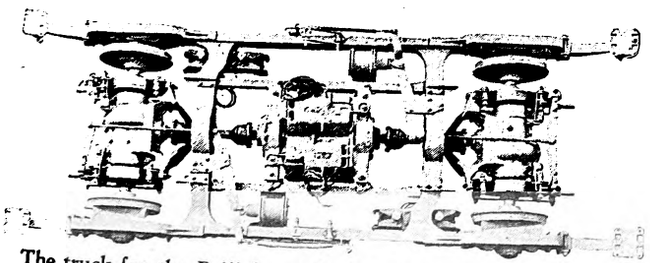


Osgood-Bradley car built for the Pittsburgh Railways employs aluminum extensively

are suspended from the journal boxes by double spring-cushioned links, each having a single bearing at the top and double bearings at the bottom of the journal yoke casting, which contribute greatly to the riding stability of the car. This arrangement permits a radial motion of each wheel and axle assembly on curves. At the same time it exerts a powerful influence tending to return the wheel and axle assembly to its normal position in relation to the tangent rail and to keep it there until a curve in the track again sets up this radial motion. This feature together with the suspension of the car body on four cantilever alloy steel springs, 19-ft. spring base, assures steady and comfortable riding action.



A long-wheelbase truck designed by Brill for a four-wheel car. The axle mounting permits sufficient movement to negotiate sharp curves



The truck for the Brill four-wheel car is equipped with both magnetic track brakes and air brakes

Two 50-hp. high-speed automotive type motors are jointly spring-supported in the center of the truck on two longitudinal angle members extending between the two large crossing castings, on which also the wheel and axle assemblies pivot when radial motion is set up. Each motor drives its axle through a conventional type propeller shaft, on the center line of the car. There is a single spur type gear, the housing of which is directly connected to the motor frame, which reduces the propeller shaft speed over that of the motor armature in the ratio of 3.25 to 1. At the center of each axle there is a secondary bevel gear transmission which reduces the speed of the axle to that of the propeller shaft in the ratio of 2.5 to 1. Both sets of reduction gears run in oil, to insure long life and a minimum of noise.

Two external contracting type clasp drum brakes, air-actuated, are mounted on each axle, supported by the bevel gear housing. The total brake pressure of these drum brakes is 100 per cent of the loaded car weight. Supplementary to these brakes, if desired, a magnetic

Wide aisles with grip-handles instead of hand-straps facilitate the carrying of heavy loads in the Chicago car

track brake may be installed on each side of the truck, supported by the truck cross member.

Another interesting double-end car was one of the twenty built for Lynchburg, Va., by the J. G. Brill Company. The dimensions of these cars are given in an accompanying table. Full details appeared in an article published in this paper Jan. 26.

Somewhat similar to this is a car built by Osgood-Bradley for the Scranton Railway. This follows closely the design of cars previously built for the railways in Worcester and Springfield.

Trucks are of the conventional four-wheel pivotal type. They employ 26-in. diameter solid wheels, pressed on cylindrical seats on heat-treated solid parallel axles. Journals can be either of the anti-friction type or plain type. The conventional axle-borne type motors with single reduction are used. Foot operated electric control and air brakes are provided.

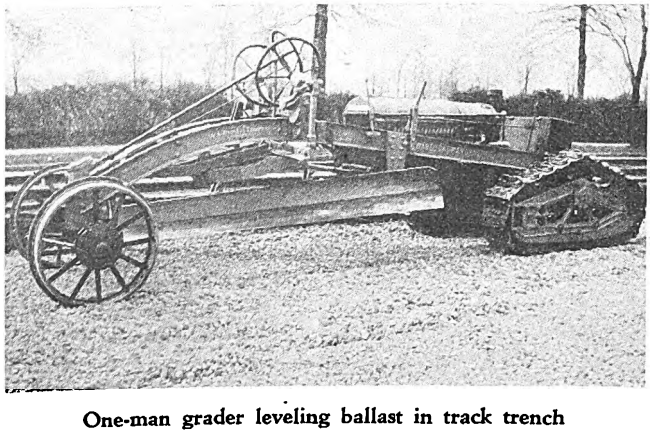
Handling Ballast With a Grader

By H. H. George

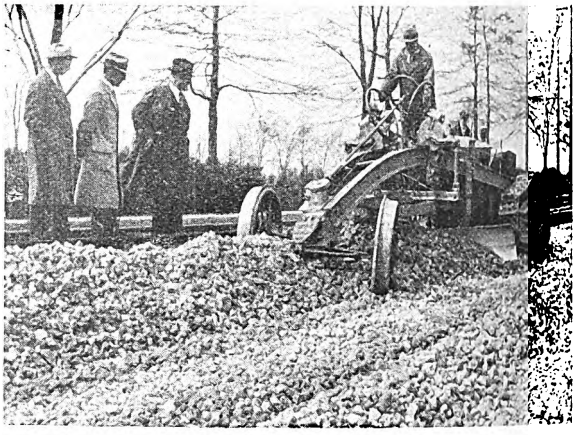
Superintendent of Way, Cleveland Railway

SPREADING ballast in a track trench in preparation to rolling has always presented a problem to the track engineer because of the amount of labor involved in handling it by stone forks or shovels, and the time required in the operation. It is usually deposited in the trench after the ballast has been graded and rolled, from side-dump car equipment, which is, of course, a relatively simple operation. From that point on, the labor cost of spreading ballast has usually been quite expensive. During the current season, the Cleveland Railway made some experiments in handling and spreading ballast in single and double track trenches by using a tractor-propelled road grader of the type illustrated.

The result of the first hour's operation was more than sufficient to justify every claim that had been made, and far exceeded expectations. The machine was able to spread the ballast, which had been dumped along one side of a double-track trench, evenly over the entire trench, and did as many lineal feet of trench in approximately six hours as had been accomplished previously by twenty men and a foreman in three eight-hour days,



One-man grader leveling ballast in track trench



Condition of ballast after spreading

using shovels and stone forks. By using a slightly shorter blade in single track trench, the machine was found to be equally effective. In addition, the man who operates this machine also operates the roller and, because of the rolling effect of the wide tractor treads, the work of the roller is much simplified.

On the day the equipment was first placed in service, it was possible to do away with eighteen laborers and one foreman. Two of these units are now in use on the Cleveland Railway. In addition to spreading the ballast, they level the subgrade behind the electric shovels.

Traffic Lights Operated By Approaching Train

TRAIN controlled traffic lights for street crossing protection were put in service recently by the South Shore Line at Chicago Avenue in Michigan City, Ind. Designed by the company's engineers, the apparatus consists of standard traffic signals installed on the right hand at corners close to the railroad's tracks. These signals allow automobile traffic to pass across the tracks until an approaching train closes a track circuit 1,500 ft. from the crossing, at which time the light goes to yellow for a moment, then to red. The light remains red until the train has crossed the street. The motorman is given a green indication when the red light appears to halt the cross traffic.

Local Transportation Improving Its

Industrial Relations

Electric railways active in educational work. Wages have increased more rapidly than cost of living. Strikes are becoming rare. Fundamental principles outlined

By
LESLIE VICKERS

IN A RECENT statement the executive council of the American Federation of Labor declared its intention "to conduct an investigation of the policies of public service corporations in general, including holding companies, in order to determine their attitude toward labor and in consequence the attitude of the Federation toward them." This statement was issued after considering the support that the American Federation should give the Amalgamated Association of Street and Electric Railway Employees of America in its fight against the New Orleans Public Service, Inc., whose employees have been on strike since July 2. This announcement of the intent of the American Federation of Labor to investigate the labor policies of our industry provides an opportunity to state the principles which govern the relationship between local transportation companies and those whom they employ in public transportation work. The author has had long and intimate contact with this phase of the industry's activity.—EDITOR.

IN THE electric railway industry, operating in many different cities, under many different managements and in the midst of varying industrial conditions, it would be futile to expect uniformity of thought on the part of the operators and managements, or unanimity of agreement as to the proper treatment of labor. It is safe to say, however, that the liberal, forward looking operators greatly outnumber the conservatives, and that there is little trace to be found today of any harsh, oppressive or intolerant attitude on the part of street railway operators. Whatever change has occurred in the attitude toward labor has been in the direction of liberalism, a change not actuated always by motives of humanity but sometimes because operators have come to realize that contented employees make for efficiency and thus for success.

But the term "contentment" as applied to employees is a relative one. Few of us are thoroughly content with our lot and ambitious nature makes us strive for better things which usually can be achieved only through the possession of more money. As the standards of living of our neighbors advance, we naturally desire to keep pace with them and enjoy the physical benefits which civilization has to offer. This is as true of the worker in his overalls or blue uniform as of the white collar man who sits in his office. It is a tendency which every reasonable man wishes to encourage. For this reason many of our companies have established schools where the employees, without cost to themselves, may improve their education and thus fit themselves for more responsible positions either within or without the company.

The movement to educate the worker is growing. In so far as it is improvement in the technique of his work which this education is calculated to bring out, it naturally helps the employing company. But when that improved education is destined, as happens frequently, to raise the standards of our employees to such an extent as to cause them to leave us to fill jobs where higher earnings are justified, then it represents a loss to the company not only for the education thus imparted but also on account of the necessity of filling the place which the worker has vacated.

It can be said to the credit of our companies that they have gone ahead with such educational programs as they could provide, not merely with the selfish motives of improving the workers in their own tasks but with the unselfish end of making those workers fit for better jobs.

This industry is awake to the necessity for good industrial relations. It does not regard its employees as pieces of machinery which it can "hire or fire" as it pleases. It recognizes them as partners in an enterprise entitled to as favorable conditions and as good a living as the business will warrant. It is a public utility. It is supplying an essential service which must be given day in and day out and will permit of no hindrance. The workers in the shops, the clerks in the department stores and offices and the customers that enter these stores and offices to transact their business are, in general, carried to and fro by our public transportation systems. The business must be carried on without interruption and it relies upon the faithfulness of its employees and their recognition of the essential nature of its service to prevent any interruption.

It is for this reason that, in so many of our contracts, there is a provision that disputes regarding wages and working conditions shall be submitted to arbitration. The writer knows of no other industry where arbitration is so generally set forth in the agreements between employer and employee as in ours, nor any other industry that has put the control of its expenses for wages and for working conditions so completely in the hands of the public through impartial boards of arbitration.

On the whole our arbitrations have worked out well. Seldom have they been entirely satisfactory to both sides of the controversy, but they have prevented strife, they

Digitized by Google

have maintained continuous service and they have presented an opportunity for both sides to express their views and grievances.

But there are varying lengths to which representatives of managements are willing to go in the matter of arbitration. Some few of them feel that any dispute with the employees or with a single one of the employees is a fit subject for arbitration. Under this system, conflicts with the management are liable to occur over petty details and the initiative is taken away from the management to a degree that sometimes becomes intolerable. The great majority of electric railway companies feel that wages and working conditions can be arbitrated but that there should be no trespassing by labor on the field of management. Some companies have met the difficulty, in a certain sense, by appointing representatives of labor on the board of management. But since these labor representatives have always been outnumbered by those of the management, it is difficult to say how far the mixture of management and labor on a single board has been a success.

Individual disputes in our industry are decreasing, as is shown by the following tabulation prepared by the United States Department of Labor, published in ELECTRIC RAILWAY JOURNAL NEWS Aug. 3, page 111.

Year	Number of Strikes	Result: Favorable to Employers	Result: Favorable to Employees	Result: Compromised	Result: Undetermined	Year	Number of Strikes	Result: Favorable to Employers	Result: Favorable to Employees	Result: Compromised	Result: Undetermined
1919	75	11	20	25	19	1925	5	2	3	..	..
1920	59	10	10	23	16	1926	7	5	..	1	1
1921	11	2	1	6	2	1927	2	..	1	..	1
1922	18	3	5	4	4	1928	3	1	1	1	..
1923	20	11	1	5	3	1929	1	..	..	..	*1
1924	13	2	6	3	2	*Not settled.					

The bureau's records do not show strikes which provoked "sympathetic" or general strikes. Upon several occasions general strikes have been threatened but the bureau is unable to find any record of a general strike having taken place in any city in recent years.

This is relatively a splendid record and managements ascribe to their employees their full share of credit for the fact that this industry has been so little disturbed in recent years by industrial strife. It is fair to say that, generally speaking, the industry has granted to its men, either by arbitration or by agreements, as great wage increases as could be afforded. At the present time the electric railways are not prosperous, as that word is applied to many manufacturing industries today. We have passed through, or are passing through, a time of great transportation changes made possible by the invention of the automobile and its manufacture at a price which brings it within the range of almost all. This industry is not generally in a position to pay premium wages or to do many of the things that have been done in other industries not subject to regulation and where prosperity abounds. But trainmen's wages today are more than double those of the basic year 1913, while the cost of living is generally only about 65 per cent above what it was in that year, which means that the employees have shared in the increase in national wealth and have been able to purchase with their wages a higher standard of living. Besides this, their working conditions have been vastly improved by the shortening of hours and the installation of labor-saving devices.

The electric railways recognize the necessity for paying a living wage. This statement has been made consistently by managements in every arbitration case with which the writer has been associated and in every wage agreement but it would be foolish to suggest that there has been unanimity of opinion as to what constitutes a living wage. As a matter of fact, we all know that what will constitute a living wage for one man in one place may be a starvation wage for another and comparative luxury for still a third. Agreement in the matter as to what constitutes a living wage cannot be expected and we can only be guided by a careful observation of the living conditions of our employees, by a study of comparative wages in other industries, and by a determination from scientific studies of what is the cost in various localities of maintaining a decent American standard of living. This industry is well aware of its responsibilities in this direction, but it must be realized by the labor it employs that while it is in a position to be just it is in no position to be generous.

INDUSTRIAL RELATIONS PRINCIPLES SUMMARIZED

The principles of industrial relations which guide the managements of street railway properties today have been set forth in the report of the industrial relations committee of the American Electric Railway Association. Without doubt they express the views of a large part of electric railway managements. In condensed form they are:

1. To pay all employees adequately for services rendered.
2. To maintain reasonable hours of work and safe working conditions.
3. To provide continuous employment consistent with business conditions.
4. To place employees in the kind of work best suited to their ability.
5. To help each individual to progress in the company's service.
6. To aid employees in time of need.
7. To encourage thrift.
8. To co-operate in social, athletic and other recreational activities.
9. To accord to each employee the right to discuss freely with executives any matters concerning his or her welfare or the company's interest.
10. To carry on the daily work in a spirit of friendliness.
11. To recognize the fact that the street railway business is a public utility.

These principles express not merely the ideal at which we should aim but the actual fundamental principles which have for many years guided and are today guiding the activities of electric railway managements. They represent humanitarianism and good business at the same time, and there is not an industry in the United States today that has the interest of its workers more at heart than have the electric railways. As an industry, we have nothing to fear from a labor investigation. If it is made impartially it should bring credit to us. If, on the other hand, it should expose some sore spots or some cases in which managements are not yet enlightened as to their own best interests, the electric railways will be the gainers thereby, for remedial changes must soon come about. The industry is jealous of its record and will look askance at the continuation of conditions which militate against its progress and run counter to its idea of fair dealings with its employees. It is essential, however, that managements and labor both realize the fundamental nature of this public service, its competitive nature today as opposed to its comparatively monopolistic character a few years ago, and its dependance for its continuation on fair dealing to capital and managements as well as to labor.

In this heavy service locomotive the hoods are made high to house a large battery. Sloping side covers of hoods are hinged and can be folded back so as to permit battery trays to be removed by crane. This locomotive runs either from third rail, side trolley or storage battery. Trucks are articulated.

Choosing Electric Locomotives To Fit the Service

It is important to have an electric locomotive fitted to the class and weight of trains it is to haul. While some provision must be made for future growth in traffic, this should be carefully studied so that the efficiency meanwhile will not be impaired too much

By

W. R. TALIAFERRO

Railway Equipment Engineer
Westinghouse Electric & Manufacturing Company

BEFORE undertaking the design of an electric locomotive it is desirable to determine not only the characteristics of a machine that will meet the requirements of the present, but also to consider, as far as can be foreseen, the requirements of the future. The weight, speed, voltage, power and physical dimensions of a machine can seldom be made to meet these requirements in the most economical manner, on account of the conflicting factors involved.

Consider, for instance, locomotive speed. There is a speed for each road at which freight can be moved most cheaply consistent with satisfactory delivery to users of the service. However, several outside factors determine the freight train speed. The chief element that tends to raise the speed above that most economical theoretically is the need of preventing delay to other traffic.

Closely related to the economical speed are the weight and tractive effort of the locomotive. Long trains may be moved at any speed by heavy locomotives with greater economy than small trains, but here again other factors enter. Long trains require long passing, side and classification tracks, which may be too costly or even impossible to install. Hence smaller trains and locomotives may be more economical on a road. Two or more small locomotives with multiple-unit control can be coupled when greater power than a single unit is needed.

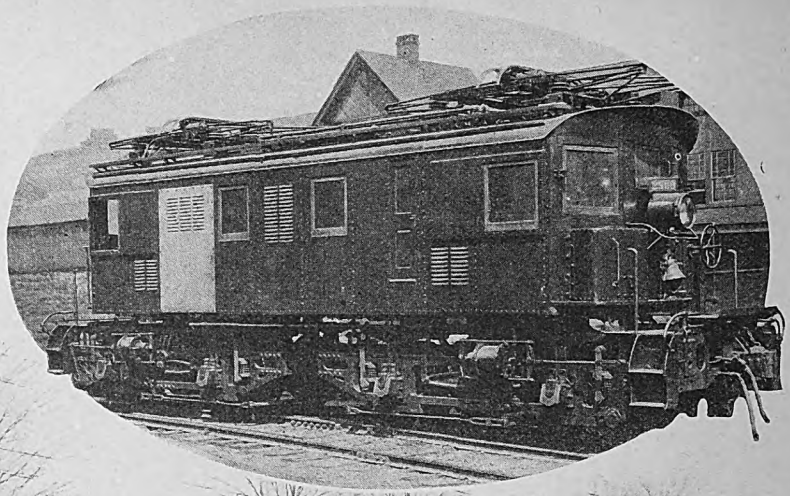
The question of voltage is too involved to go into deeply here. In general, if it is not already fixed the line voltage should be as high as physical conditions and over-all costs permit. While there is a most economical voltage for each system when it is laid out, the possibility of expansion must not be overlooked, as the voltage most economical today may be too low tomorrow. The most useful voltages are 600 to 750, 1,200 to 1,500, and 3,000 volts d.c. for small and medium-size electrifications and 11,000 volts a.c. or higher for extensive heavy ones.

The limiting physical dimensions of a locomotive are determined by the road clearance required, while within these limits the actual dimensions are determined by the particular design adopted.

The cab or body and the trucks or running gear of an electric locomotive are built in many forms. The most conventional types of locomotive cabs are generally known as "box" type and "steeple" type, the box type

Digitized by Google

being similar to an ordinary car body except for window and door arrangement, while the steeple type takes several forms, the most usual being



The conventional box type cab and articulated trucks are used on locomotives for light or heavy duty

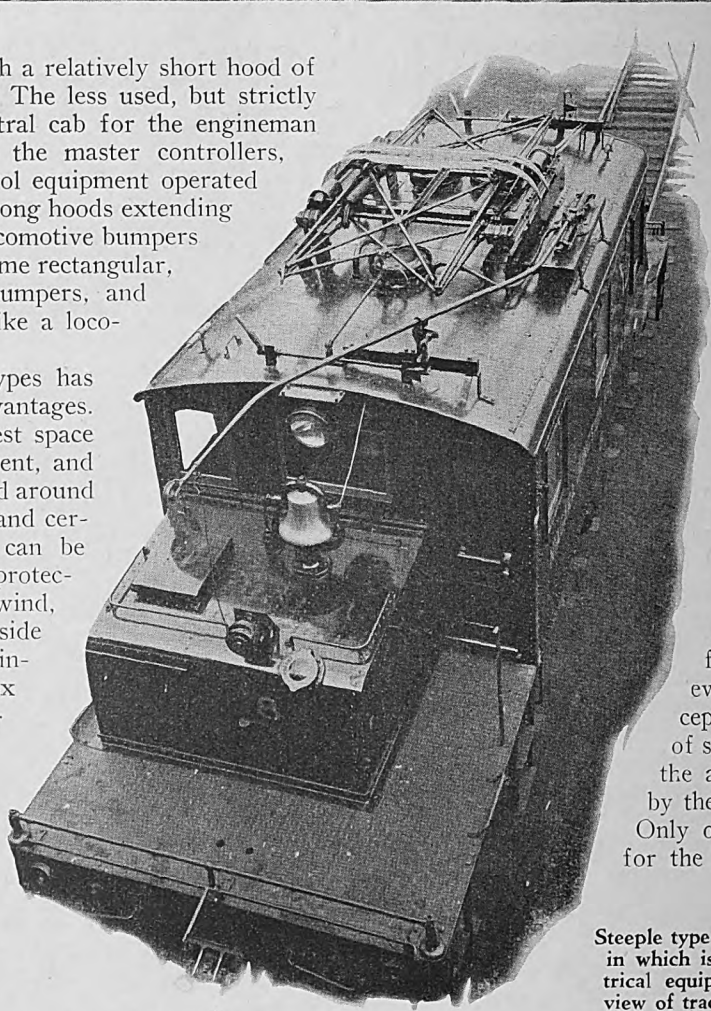
Below — This locomotive for heavy passenger service has exceptionally long rigid wheel base, with two large motors on each end, geared to a jack shaft which drives the side rods

a medium length box cab with a relatively short hood of reduced height at each end. The less used, but strictly steeple type has a small central cab for the engineman and helper, containing only the master controllers, brake valves and other control equipment operated directly by the engineman. Long hoods extending from the central cab to the locomotive bumpers are made in several forms, some rectangular, some sloping toward the bumpers, and others rounded on the top like a locomotive boiler.

Each of the above cab types has certain merits and disadvantages. The box type has the greatest space for the mounting of equipment, and good clearance can be obtained around apparatus so that inspection and certain repairs of equipment can be made inside the cab with protection from rain, snow and wind, when they must be made outside of the shop. The cost of maintenance is low with a box type cab because of the accessibility of the apparatus.

The air compressors and blowers for cooling the electric motors make considerable noise in a box type cab. In the steeple type cab these pieces of equipment are mounted under the hoods. Since inspection of blowers and compressors is simple and the machines are rugged and not likely to give trouble, this imposes no hardship. It has the great advantage of permitting them to be removed and installed by means of a crane. To do this the hoods must be arranged so that they can be lifted off as a unit. The other equipment is located in the central cab between the engineman's compartments, where it is accessible.

The short hood steeple cab is preferable for small, medium and even large locomotives, except when the equipment is of such size and quantity that the additional space provided by the box type cab is needed. Only one advantage is claimed for the long hood steeple cab—



Steeple type of cab with low hoods, within which is contained most of the electrical equipment. Driver has excellent view of track ahead or to rear

Digitized by Google

greater visibility for the engineman when looking or running backward. Maintenance and inspection costs will be high with the long hood steeple type cab.

The three general types of trucks used on electric locomotives are swivel, articulated and rigid. Each type may carry two or more driving axles and one or more idle axles. In the swivel truck locomotive, like the ordinary railroad car, the load is pulled through the cab or car underframe and transferred to the trucks through center pins. The articulated truck locomotive pulls its load through the truck frames, by means of a drawbar or hinge connecting the two trucks and couplers on the outside ends. The cab is carried on center pins but takes no drawbar pull. The rigid truck is used for small two-axle and three-axle locomotives and also for some of the largest types having as many as four driving axles. Drawbar pull is taken through the truck frame.

For locomotives of not more than about 100 tons for freight haulage at speeds not exceeding 40 m.p.h., two four-wheel swivel trucks are the most economical in first cost and maintenance. For higher speeds and weights, articulated trucks should be employed. The rigid truck is generally limited to industrial locomotives and to locomotives for heavy service at either high or low speed.

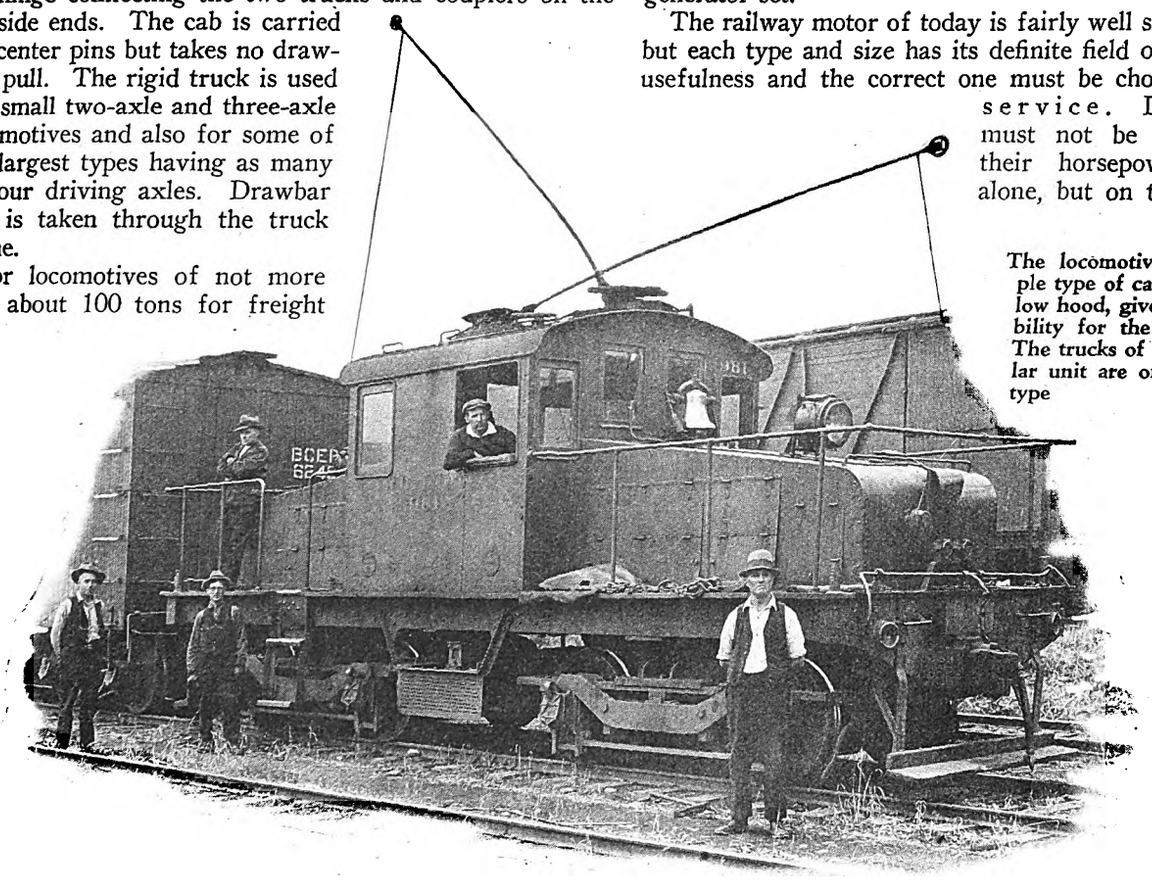
Locomotives should have double-end control, that is, with an operating compartment in each end of the cab, except that when two units are permanently coupled to form one locomotive, the outside ends only need operating compartments.

In direct-current locomotives, the grid resistors require careful design to insure correct starting characteristics and the resistors must have sufficient capacity to meet the service. A properly designed passenger locomotive will not carry resistors suitable for freight service, nor will a freight locomotive carry resistors suitable for heavy switching service. However, if such double duty characteristics are specified, the locomotive can be designed to perform it, although with less economy than for a locomotive designed for a single service. Relays, contactors, fuses, etc., must be carefully chosen for the service and must be vibration-proof.

Power for energizing the control circuits may be taken directly from the line through a control resistor. This method, known as line control, is suitable for locomotives operating on voltages up to 750 volts d.c. and is most economical in first cost and maintenance. It has the disadvantages that the electric lights cannot be used when power fails and that the control cannot be tested when power is off the line or when defects on the locomotive prevent the raising of a pantograph or other collector.

While line control is used on some 1,500-volt installations, battery control is to be preferred. The storage battery may be charged in series with the ground lead of the blower and compressor motors or by a small motor-generator set.

The railway motor of today is fairly well standardized, but each type and size has its definite field of maximum usefulness and the correct one must be chosen for the service. Locomotives must not be judged by their horsepower rating alone, but on the tractive effort-speed characteristics in the service which they are to perform.



The locomotive with steeple type of cab and short, low hood, gives good visibility for the motorman. The trucks of this particular unit are of the swivel type

An important feature of any locomotive should be field control of the driving motors, with which tractive efforts for starting heavy trains may be obtained at considerably lower currents than would otherwise be required. This reduces the cost of power and often the size of the substations required.

Field control is obtained by two means: tapped fields and shunted fields. The tapped-field motor has two field windings. When both are in series the motor has high tractive efforts at low speeds for relative low values of current. When only one field winding is in the circuit the tractive effort is lower for a given current but the speed is higher. These changes are made by suitable switches. For shunt control the motor is built with but one field winding, corresponding to the full field winding of the tapped field motor. To obtain higher speeds the motor field is shunted by a resistor and an inductor in series.

The tapped field motor itself is more costly than the shunted field motor, but including the inductive shunt, the shunted field motor is more expensive. Valuable space in the locomotive cab is taken up by the inductive shunts and the total weight is greater.

Chartered Bus Revenue Increased by

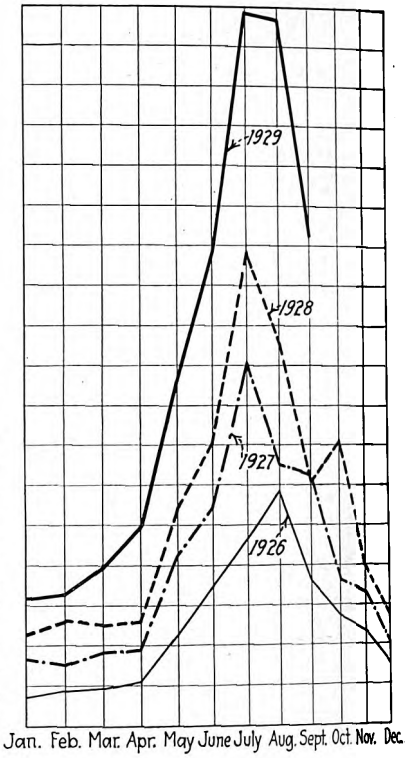
Skillful Merchandising

BUS operation was commenced by Public Service Co-ordinated Transport, Newark, N. J., in the latter part of 1923, and during the next three years the principal effort was directed to perfecting the organization and developing the vehicles to the highest possible degree. As time went on, however, more and more special service was rendered, and it was realized that this type of business could be made a source of considerable profit if more attention was given to it. In 1927 a special department was created to stimulate this kind of service, and subsequent results have more than justified this expectation.

More than 8,000 buses were used in chartered service in 1927. During the next year this service was increased to nearly 15,000. The first six months of this year show a considerable increase over 1928, and if this trend continues the average number of buses for this type of service will be 60 each day, or about 18,000 for the year. An example of the great demand for this special service is the fact that on May 30 of this year 133 buses were operating for special service. During each of seven Sundays in 1928 more than 100 buses were chartered. The maximum week-day schedule calls for slightly less than 2,000 buses in ordinary service, while on Saturday the maximum schedule is not more than 1,800 and on Sunday it is considerably less than that—not over 1,400. This leaves available for special service at least 200 buses on week days and 500 on Sundays. Hence, the chartered service utilizes vehicles which would otherwise be standing idle.

The fleet of the Public Service Co-ordinated Transport consists mainly of two types of buses—first, the city service bus, and second, the so-called de luxe bus, which differs from the first-mentioned type mainly in the seating arrangement, and the type of seat itself.

The rates of the chartered service vary with the type of equipment used. For the city-service bus, 50 cents per mile is charged for the first 50 miles, 45 cents per mile for the next 25 miles, and 40 cents per mile for all trips over 75 miles, while a charge of $2 per hour is made for layover time, unless the mileage rate exceeds $50. However, if the total elapsed time exceeds fifteen hours, the layover time is added. Necessary bridge, ferry or tunnel tolls and parking charges are added, while the minimum rate per bus, regardless of mileage, is $10. The charge for the de luxe equipment is 60 cents per mile straight, and a charge of $2 per hour for layover time is charged in the same way. In cases where it is not possible to charge the mileage rate, as for instance on funerals, a flat rate of $5 per hour, or any fraction thereof, is charged from the time the bus leaves the garage until it returns therein. The approximate seating capacity of the equipment is 30 passengers, which makes a rate of about 2 cents per passenger per mile or less, when a full load is carried. About 95 per cent of the total mileage operated in chartered service is for one-day trips. However, there have been several instances in which buses have been chartered for weeks at a time, and distances of 5,000 miles have been covered per trip. Recently, trips were made which lasted sixteen days and started in New York, covering Washington, Cincinnati, Chicago, Niagara Falls, and back to New York, a total distance of 2,000 miles.



Yearly increase in chartered bus revenue

The special service department is under the direction of H. B. Whitman, passenger agent. Immediately after its organization, a mailing list was compiled containing the names and addresses of all organizations and individuals that had used this type of service in the past. Contact was established with all churches, Sunday schools, lodges, athletic associations, large employee organizations, political clubs, high school teachers' associations and athletic coaches. The development of the real estate field, where sales of lots were taking place, was followed up also. A list is kept up to date of the officers of the aforementioned organizations, particularly of the chairmen of entertainment and outing committees, and literature, advertising outings by means of buses, is continually sent out to the names appearing on the above-mentioned mailing list. The daily newspapers are looked over carefully each day to see where an outing is being planned, personal calls being made on the individual in charge, and buses are suggested as a means of conveyance. A considerable part of the chartered special service results from the athletic activities of high schools. This is obtained by securing from the proper authorities of each school schedules of the games and then mailing to the coach a letter quoting rates for each game away from home. An outstanding example of transportation of a large number of people is furnished by the Prudential Insurance Company Athletic Association excursions from Newark to Asbury Park, where almost 3,000 people had to be transported. Previously, this was always done by trains of the steam roads, running in three and four sections. Last year the Public Service Co-ordinated Transport discussed this method with the company, with the result that 96 buses were used for conveying 2,900 people, and after the excursion was completed it was declared that the steam road would not be used in the future, although the charge of the bus company was 25 per cent higher than the steam road rate.

Gains Continue on Canadian Properties

Statistics compiled by Canadian Electric Railway Association and Dominion Bureau of Statistics show increased traffic and greater gross and net revenue in 1928 than in any previous year

REVENUES of the Canadian electric railway systems continued to mount in 1928, reaching a new peak of $55,632,761, which was 4 per cent above the figure for 1927. This was produced largely by an increase of 3.4 per cent in the revenue passengers carried on the cars and buses of the properties. Figures are now available from two sources and are presented in this article.

Statistical information relative to Canadian electric railways has been prepared for the third year by the Canadian Electric Railway Association and is published in a 36-page booklet under the title, "Electric Railway Statistics." The information included consists of charts and tabular material obtained in part from the Dominion Bureau of Statistics and supplemented by questionnaires sent out by the association. Some of the most interesting of the charts are reproduced herewith. Others included in the pamphlet are similar to those prepared by the Canadian association last year, and reproduced in ELECTRIC RAILWAY JOURNAL for Dec. 1, 1928, page 951. Following is a digest of a portion of the material in the booklet.

Passenger revenue by five-year periods from 1900 to 1920, and annually for the last four years, is shown in the first chart. In 1900 there were 675 miles of single track operated in the Dominion; in 1928, 2,502 miles. Table I gives the passenger revenue, total and per mile of single track, along with the operating expense per mile of single track, for the years included in the chart. It is interesting to note that the passenger revenue per mile of single track was approximately the same for 1905, 1910 and 1915. Owing to increased cost of operation, fares were increased shortly after, thus increasing the revenue per mile of single track in the later years. The passenger revenue per mile of single track is now 2.44 times as great as it was in 1900 but the trend of operating expenses shows a greater increase, the present cost per track-mile being 3.14 times as high as in 1900.

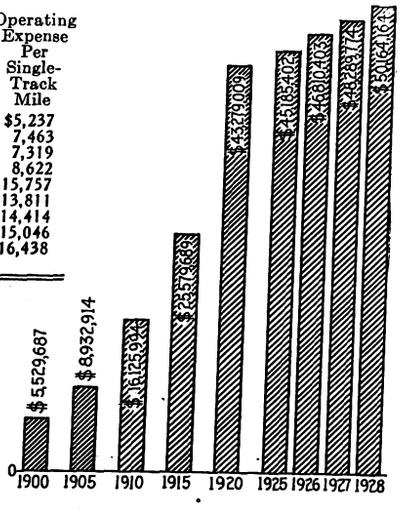
A second chart shows the passenger revenue and operating expenses in cents per car-mile from 1901 to 1928. From 1901 to 1912 there was a gradual increase from 17.46 cents per car-mile to 27.45 cents. As this was a period of fixed fares, it would indicate increasing density and the use of larger cars. When the war period was reached revenue fluctuated considerably and would have been exceeded by expenses had not relief been obtained in the form of increased fares.

A peak in revenue was reached in 1922 at 40.36 cents per car-mile. The recent drop is due largely to extensions of bus services which have not as yet developed full revenue in relation to miles operated and which may not require so much to justify their operation. The number of car-miles increased more than 17 per cent in this period, whereas the revenue increased only 9.5 per cent. Revenue per car-mile increased 120.5 per cent from 1901 to 1927 and operating expenses per car-mile 173 per cent. It is interesting to note the decline in operating expenses since 1921. The use of one-man cars has been an important factor in that movement.

TABLE I—PASSENGER REVENUES OF CANADIAN ELECTRIC RAILWAY SYSTEMS SHOW CONTINUED GROWTH EVER SINCE 1900

Compiled by Canadian Electric Railway Association

Year	Passenger Revenue Total	Per Single-Track Mile	Operating Expense Per Single-Track Mile
1900	$5,529,687	$8,192	$5,237
1905	8,932,914	11,265	7,463
1910	16,125,994	11,660	7,319
1915	25,579,689	12,211	8,622
1920	43,279,009	17,832	15,757
1925	45,185,402	17,616	13,811
1926	46,810,403	18,516	14,414
1927	48,289,774	19,521	15,046
1928	50,164,164	20,050	16,438

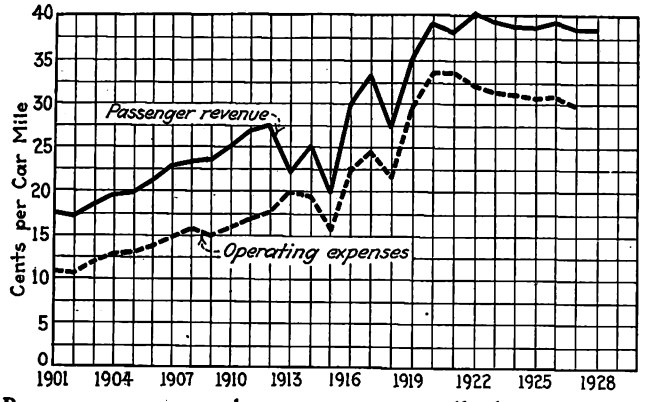


Operating expenses in 1909 absorbed 56.24 per cent of the gross revenue; in 1911 only 54.88 per cent. Costs then began to mount, the peak being reached in 1921 with an operating ratio of 74.59 per cent. Since that time conditions have been more favorable and in 1927 a ratio of 63.79 per cent was secured.

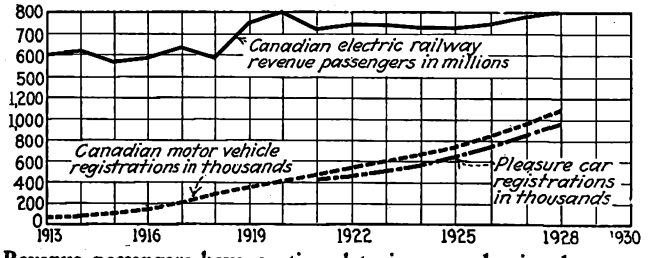
Deductions from income have grown steadily. In 1909 the portion of gross revenue absorbed in this way was 9.61 per cent; in 1927 the percentage was 27.48. This was because bonds have been issued to finance electric railways which have been transferred to public ownership whereas formerly stock was issued. In 1921 there was 19.5 per cent of the total revenue available for payment to investors and for capital reserves. In 1927 this had grown to 32.96 per cent, as compared with 32.5 per cent in 1926. This is pointed to as a very favorable indication of the stability of the electric railway industry in Canada.

Another chart, not reproduced, compares the cost of living in Canada with electric railway fares and wages. In 1918, with fares the same as in 1913, wages increased 42.9 per cent. From 1918 both fares and wages con-

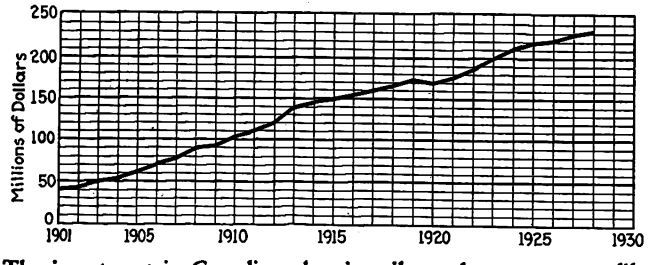
Digitized by Google



Passenger revenues and expenses per car-mile have both increased, but for the past few years have shown a slight recession



Revenue passengers have continued to increase despite the enormous growth of motor vehicle registration in Canada



The investment in Canadian electric railways has grown steadily over a period of nearly 30 years, with only minor halts in its advance

tinued to climb, the latter at a higher rate. In 1920 wages reached their peak at 94.2 per cent above the 1913 level, while fares had increased only 22.5 per cent and did not reach their peak until 1925, when they were only 46.76 per cent higher than in 1913. The cost of living outran wages until 1920 and reached a peak of 83.1 per cent higher than the 1913 value in that year. In 1921 the cost of living dropped back to 53.3 per cent above 1913 and has continued at much the same level since. Up to the end of 1928 the increase in fares was still considerably behind the increase in wages. Fares were 49 per cent higher than in 1913, whereas cost of living was 53.8 per cent higher. Wages were 94.1 per cent higher than in 1913, or nearly 5 per cent higher than in 1927. Wages, therefore, show an increase almost twice as great as shown by fares and living costs.

An interesting comparison is made in the chart showing motor vehicle registration in Canada and revenue passengers. The automobile registrations have increased from 50,000 in 1913 to 1,058,000 in 1928. For the first three years of this period the annual increase was at the rate of 24,000 vehicles per year. Since then the increase has been greater, with an average of nearly 78,000 annually. The number of revenue passengers continued nearly constant until 1918 at an average of 595,000,000. From then the number increased until 1920 when 804,711,333 were carried, or 35.2 per cent over 1918. In 1921 there was a decrease of 85,405,892 passengers from the preceding year, or 10.6 per cent. From 1921 to 1925 the number of passengers showed little if any change. In 1926 the figure went up to 748,710,836 against 725,491,101 in 1925, an increase of 3.2 per cent. In 1927 a still greater improvement was made, 781,398,194 passengers being carried, or 4.5 per cent above the preceding year. In 1928 the revenue passengers totalled 804,630,491, or practically the same as in the peak of 1920.

In the face of the large increase in automobile registrations during the past three years this showing is particularly encouraging. In 1928 automobile registrations were 12.5 per cent above those in 1927 and 28 per cent above 1926. Returns for the first seven months of 1929, however, indicate an average gain of 3.8 per cent in revenue passengers over the corresponding period of 1928. Thus it appears that by the end of the current year the peak of 1920 will be substantially exceeded.

In one of the charts the total investment in Canadian electric railways from 1901 to 1928 is shown. Although this differs slightly from figures given elsewhere in this article, the discrepancies are slight and are undoubtedly due to differing sources of information. A steady growth has taken place from 1901, when only $40,553,170 was invested, to 1928 which shows $234,586,755. This is taken as indicative of the enormous part electric railways play in the life of the Dominion, and the stability of the investment is shown by the continued increase. Profits on electric railways have not been very great in recent years. The latest figures available are more encouraging, the net income as reported by companies in 1927 being $3,229,943 as against $1,240,477 for 1925 and $2,361,750 for 1926.

The remarkable development of the motor bus and motor coach in Canadian transportation is shown in another chart. This year, for the first time, it has been possible to distinguish between the feeder buses operating and the special coaches used for interurban work, special fare routes, charter, sightseeing and similar services. From thirteen buses in 1921 the total has grown to 488 in 1928. The growth is particularly marked in the past three years. The use of motor buses for feeder service has increased considerably during the past year or two. There undoubtedly is a field for their use in outlying districts which have not yet developed sufficient traffic to justify extensions of tracks and distribution systems. The chart shows that more than half the buses and coaches owned by electric railways in Canada are used in feeder services.

There is a distinct trend toward the absorption of independent bus lines by the electric railways. Many of

TABLE II—STATISTICS OF CANADIAN ELECTRIC RAILWAYS FOR 1928

Complied by the Dominion Bureau of Statistics

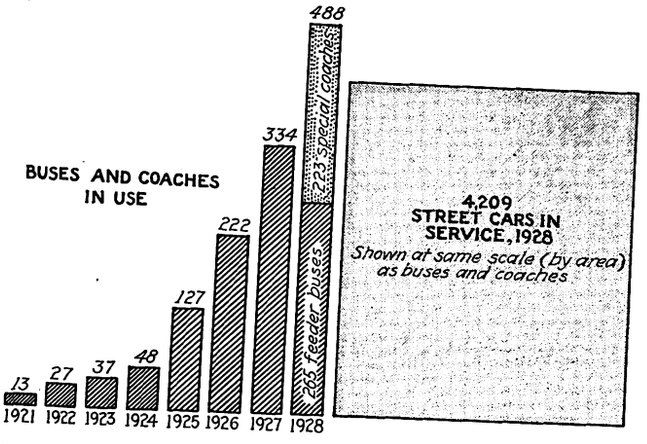
Total gross revenue	$55,632,761
Total operating expenses	$38,782,719
Net revenue from operation	$16,850,042
Total income from operation	$22,388,331
Taxes	$1,994,192
Interest on funded and unfunded debt	$8,973,632
Total deductions from income	$11,946,944
Surplus for year	$10,441,387
Reserves and special charges	$7,485,663
Dividends	$3,012,493
Total miles of track	2,218.78
Fare passengers carried	808,023,615
Tons of freight carried	3,892,114
Total car-miles	133,689,589
Conductors, motormen and conductor-motormen	9,095
Total employees	18,697
Total salaries and wages	$26,494,063

Digitized by Google

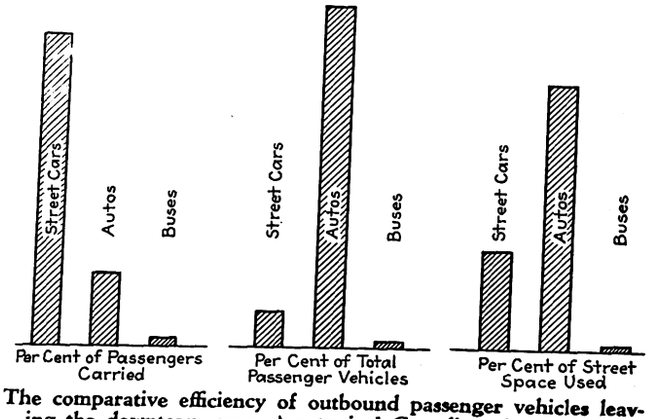
these lines running on suburban and interurban routes have been carrying passengers to the centers of cities and depriving the street railways of their passengers. During the past year a greater number of independent bus lines has been purchased by electric railways than in all previous years.

A portion of the booklet is taken up with a discussion of traffic problems. Typical comparisons of the relative efficiency of street cars and buses and automobiles are made in charts and text. The diagram reproduced was made up from a count of all traffic leaving the downtown area of a typical Canadian city during the evening rush hour (5-6 p.m.) on normal week days during February, 1929. Street cars comprised only 9.04 per cent of all passenger vehicle movements and 5.35 per cent of all traffic movements. They carried 80.77 per cent of all passengers and occupied 26.4 per cent of the street space taken up by passenger vehicles. Buses comprised only 0.66 per cent of all passenger vehicle movements, carried 1.17 per cent of all passengers and occupied 1.25 per cent of the street space taken by all passenger vehicles. Automobiles comprised 90.3 per cent of all passenger vehicle movements, carried only 18.06 per cent of the total passenger traffic and occupied 72.35 per cent of all street space taken up by passenger vehicles.

The foregoing count shows that on any basis of comparison which takes into account the number of vehicle movements or street space occupied in relation to the work done in transporting passengers, the street car is by far the most efficient vehicle in mass transportation.



Buses and coaches have become an important factor in the Canadian transportation industry. The growth is shown here along with the relation of the total number of buses to the street cars in service



The comparative efficiency of outbound passenger vehicles leaving the downtown area of a typical Canadian city during the evening rush hour is seen in this chart

Statistics Bureau Figures Show Gains

Canadian electric railway systems carried 808,023,615 passengers during 1928, according to the preliminary report of the Dominion Bureau of Statistics, released separately in manuscript form. This is an increase over the 1927 traffic of 3.4 per cent. The totals include passengers carried on both cars and buses of electric railway companies. Gross revenues amounted to $55,632,761, an increase of 4 per cent over 1927, and operating expenses were increased $1,166,151. The net operating revenue accordingly was $16,850,042, or $960,209 more than for 1927.

On account of a number of minor fare increases during the year the average fare for all railways, measured by revenue per revenue passenger, was 6.27 cents against 6.25 cents in 1927.

Of the 59 railways reporting, including the Hamilton & Dundas Street Railway, which leased its facilities, and the Yarmouth Light & Power Company, which discontinued operation Aug. 20, eleven railways failed to earn operating expenses. The other 48 reported a net revenue from operation of $17,122,658. After paying interest, rentals and other charges against income, 21 railways showed a loss and the other 38 reported a net income of $11,403,130. Six railways paid dividends.

Nine properties had gross revenue of more than $1,000,000; eight between $500,000 and $1,000,000; eleven between $200,000 and $500,000; fifteen between $100,000 and $200,000, and sixteen below $100,000. Of the eleven companies with receipts of more than $700,000, all earned a surplus over charges. Sixteen of the seventeen properties between $200,000 and $700,000 gross earned operating expenses and eleven of them had a surplus at the end of the year.

TABLE III—STATISTICS OF CANADIAN ELECTRIC RAILWAYS, 1922–1928

Compiled by the Dominion Bureau of Statistics

	Capitalization			Operating Revenues and Expenses		
	Stocks	Bonds, etc.	Total	Gross	Expenses	Net
1922	$76,949,185	$111,309,789	$188,258,974	$49,660,485	$35,986,872	$13,673,613

One of the typical electric track switch installations in Toronto

Constant Vigilance Needed in Maintenance of Electric

By

L. H. McADAM

General Inspector of Electric Switches and Signals
Toronto Transportation Commission, Toronto, Canada

AN OPERATING electric track switch is an asset, but an electric track switch not operating is a liability. To keep electric switches in good operating condition requires constant vigilance on the part of the maintenance staff. There are 87 operating switches in use on the lines of the Toronto Transportation Commission. While at first they were looked upon with some measure of suspicion, the switches now have the complete confidence of the operators. This result is due to improvements introduced by the manufacturers and particularly to the careful system of maintenance.

Five different types of switches are used. Three of these represent various stages of improvement for the same switch. A fourth represents a greater improvement with radical changes in all parts. The fifth is the product of an English company. All are actuated by the well-known "power on" "power off" system. No locking devices are used. The mechanism is called upon to throw a point weighing from 200 to 250 lb. as used with the 122-lb. steel rail.

Switches are inspected at intervals varying from six to twelve days, according to the season. This work requires two men almost constantly on patrol, cleaning, greasing and gaging the parts. In rainy weather these men are employed renewing cylinder coils or contactor plates.

In addition a tower truck is employed with a crew of four men under a foreman, whose duties include the care of switches, signals, headway recorders, etc. These men inspect and maintain the overhead parts of switches, but seldom do any of the regular inspection work on track parts. They are, however, required to make a number of complete overhauls every week based on the gage reports of the two inspectors or on emergency trouble reports. For this purpose they carry a complete stock of spare parts.

The early winter season discloses the weak spots, if there are any. The switches are working in a mixture of salt, sand, oil and slush. All cylinder and conduit joints receive a severe test and sometimes they break down. For this reason as many switches as possible are

Digitized by Google

Track Switches

The winter season is a difficult period because slush, water, salt, sand and oil combine to give all mechanical parts a severe test. Careful analysis of most frequent troubles assists in better maintenance

given a complete overhaul just before the winter. It is at this time that the greatest number of part replacements are made. For the same reason the inspection work becomes more intensive as the winter advances.

Analysis of the principal causes of trouble with electric switches is helpful. One of the most frequent troubles is a tight graphite plunger in the circuit breaker. This causes the circuit breaker arm to remain in a closed position and if a car stands on the contactor the resistance coil is burned. If the circuit breaker arm is left in the open position the switch will not operate at all. A careful setting of the plunger is necessary to prevent this trouble, which, however, due to recent improvements, does not occur in the new type of switches.

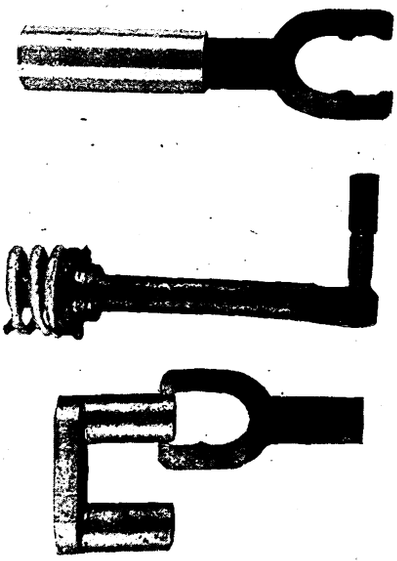
Sometimes a slight arc occurs that welds the plunger to the curve contact, or there is some loosening of the mica back plate that holds the circuit arm in the open position. This causes the switch to throw only for the curve. Careful cleaning of the contactor at each inspection and installation of a new back plate when required will keep this trouble down to a minimum. Instances occur, however, when sleet forms in the circuit changer box and freezes one or the other contact, so that it will not move. This can be prevented only by making the boxes as weathertight as possible.

With a tilted contactor the switch will miss for some cars and operate for others. This trouble may be caused by a wild trolley pole, by trolley wire being out of line or by a loose contactor tip. The remedy is obvious. Although contactors as supplied by manufacturers are large and heavy, they are easily installed. None of the lighter types have proved satisfactory in Toronto, most of them having a tendency to bow under the strain of the trolley wire.

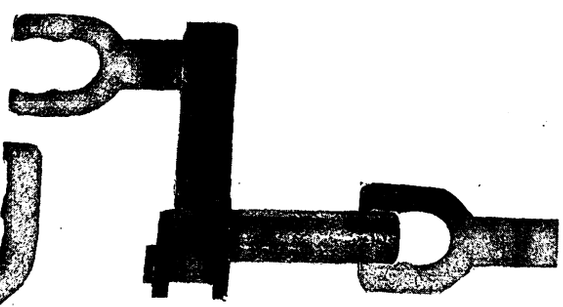
A loose or broken connector is characterized by lessened, or entire absence of, spring pressure; the point may be left in any position and may cause a derailment. The Toronto Transportation Commission uses a new connector invented by F. Drowley of the way department, which has proved satisfactory and will go a long way toward correcting this trouble. Details of the new connector were given in an article published in the maintenance contest section of ELECTRIC RAILWAY JOURNAL for Oct. 20, 1928, page 732.

Cylinder trouble is sometimes caused by a broken lead in the cylinder or by the entrance of water into the cylinder. Although a switch may work while almost completely covered with slush and brine, due to the drain being plugged or frozen in winter weather, it is only a matter of time before the cylinder will fail, no matter how well the parts have been put together.

When the inspectors lift up the end of the cylinder for cleaning or to examine the recoil spring, the leads are moved. This happens frequently and in course of time the leads, unless carefully watched, will break off and cause trouble. The leads may break off close to the end of the conduit, in which case it is difficult to pull



Checking bushings. When the gage goes all the way down in the bushing it must be renewed



The use of the gages is shown. When the part under test goes between the inner jaws of the gage it must be discarded

the cable. Sometimes, owing to the presence of water in the conduit, the cable freezes and under these circumstances cannot be pulled without breaking. In order to get the switch back into service as soon as possible, it may be necessary to dig up the conduit line. We have to some extent lessened this trouble by the use of the auxiliary track box at the track end of the conduit line, which is shown in the illustration at the bottom of page 1053. The design of this box was described in an article published in ELECTRIC RAILWAY JOURNAL for Dec. 15, 1928, page 1043. Close co-operation exists between the general inspector of switches and the general foreman of the frog shop. Due to the latter's wide experience and knowledge of mechanical problems, he is an ever-present help in time of trouble. Switch trouble on the lines of the Toronto Transportation Commission is infrequent, but we are not relaxing our efforts to keep the apparatus in such good condition that there will be freedom from failures.

Paving in the Track Area

Way engineers are keenly interested in this important subject. A survey of the practices followed on more than a score of leading electric railways will appear in the December issue.

Concrete Duct for Track Switch Control Wires

BY H. A. BROWN
Foreman Return Circuit, Switch and Signal Division
Cleveland Railway, Cleveland, Ohio

BY USING concrete duct for wires running from electric track switch boxes to poles located at the curb line, difficulties due to corrosion of iron conduit pipes have been avoided by the Cleveland Railway. The duct mold is a piece of 1½-in. rubber hose. A trench of necessary depth is dug as straight as possible between the ground box and pole, and a 2-in. concrete base is poured, upon which the rubber duct mold is placed. At the pole end of the duct line the rubber mold is run through a vertical piece of 1½-in. iron conduit approximately 8 in. long, which is threaded on one end. This short piece of pipe is placed in such a position that the threaded end extends just above the surface of the ground adjacent to the pole to which the electric switch-operating wires are run. At the track box end of the duct line another piece of 1½-in. iron conduit is placed in position, with the threaded end extended about 2 in. beyond the concrete of the duct line. Concrete is then carefully tamped around the rubber mold and the two short pieces of iron conduit. After the concrete has set for 24 hours the mold is withdrawn, leaving a smooth concrete duct into the ends of which the two pieces of iron conduit are firmly lodged. After the wires have been pulled through the duct a special watertight Crouse-Hinds type "CGB" contactor is screwed on the iron conduit at the track box end, to prevent water and dirt from entering the duct line.

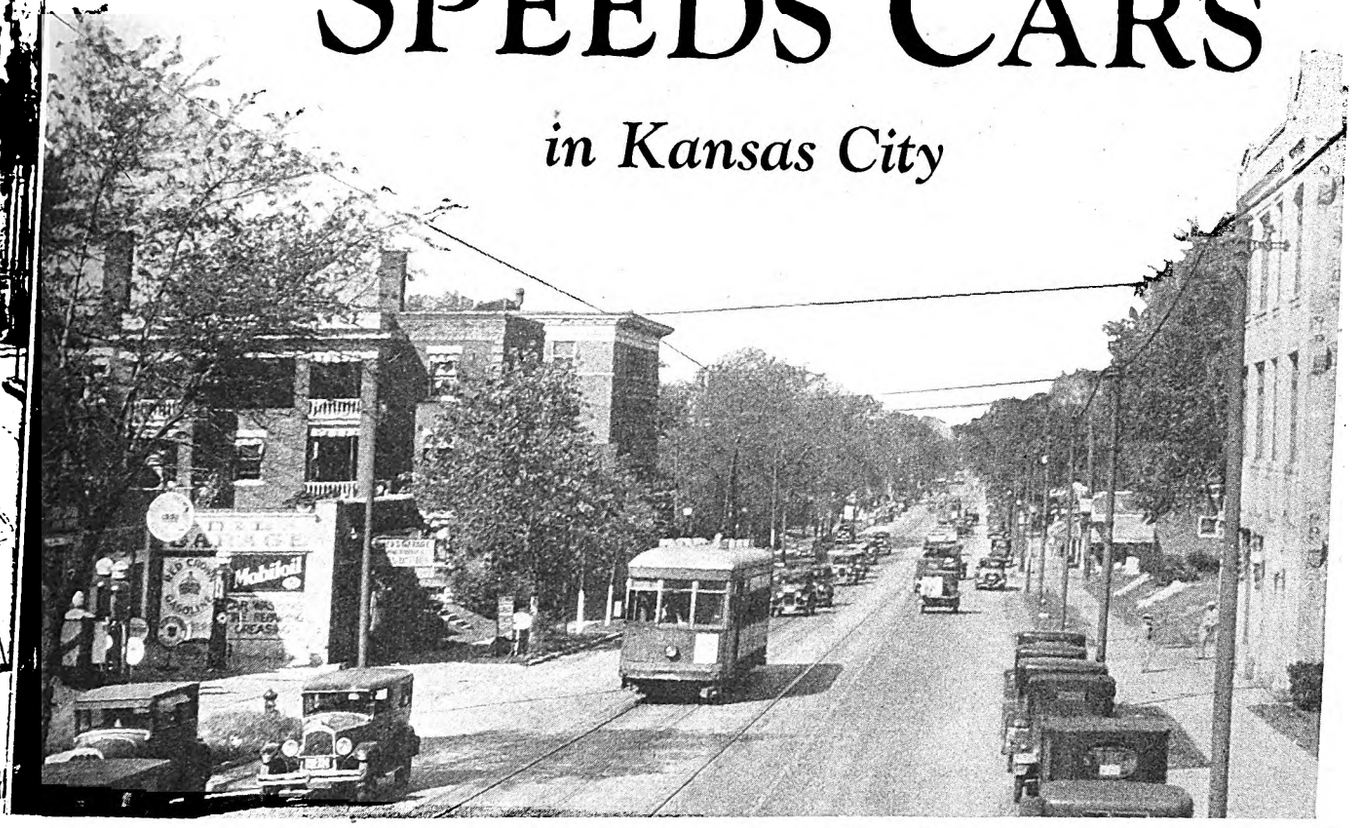
Limited Stop Plan

SPEEDS CARS

in Kansas City



Patrons of the high-speed lines can reach the business district from outlying parts almost as fast as by automobile

By

D. L. FENNELL

General Superintendent of Transportation
Kansas City Public Service Company
Kansas City, Mo.

RECOGNIZING that automobile competition is a major factor in reduced revenues, electric railways are faced with the necessity of improving service. Much has been said as to the need for greater comfort to patrons and attractive appearing equipment, but without higher speeds, making possible less time spent on cars between home and place of employment or shopping, the advantage is still with the automobile as a means of transportation. To overcome this advantage the Kansas City Public Service Company on June 16, 1929, adopted, on three of its important car lines, a system of selected or limited stops along arterial streets.

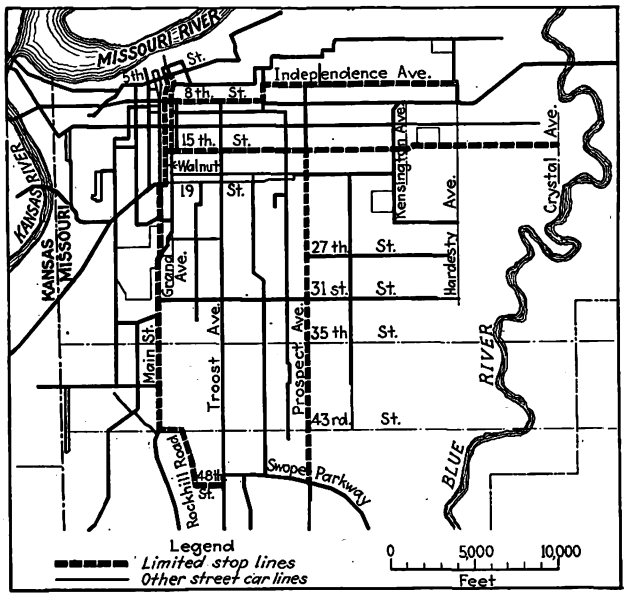
The three lines, known as Independence-Rockhill, Fifteenth Street and Prospect Avenue, are all heavily traveled and serve characteristic residence, business and industrial parts of the city. Their relation to the entire system is shown on an accompanying map.

The plan has greatly increased car speeds on these lines and other lines for that portion of the time that they operate over the limited stop routes. Average speeds on weekday schedules have been increased from 9.2 m.p.h. to 11.5 m.p.h. Reductions in time per trip, in one direction, are from five to eleven minutes. By such a plan, with speeds greatly increased and trip time materially reduced, it is possible either to furnish the same service as formerly at a much reduced operating cost, or to reduce headways, making more service available without increasing the number of cars on the lines. Car speeds now effective on these three lines render it possible for patrons to make the trip from outlying parts of the city to the business district and return almost as fast as by automobile, considering the time necessary to find parking space in the downtown business center.

Not only is there convenience to the car riders in this saving of time, but the reduction in number of stops adds to the comfort of the passenger, in that much of the former slowing down, starting and stopping has been eliminated. The patrons in general are well pleased with the plan, and many letters commending the high-speed service

Outside of business district, total stopping points on three lines were reduced from 321 to 187, or 41.7 per cent. Stops per mile now only 5.4 instead of 9.6. Average speed increased from 9.2 to 11.5 m.p.h. Time savings range from five to eleven minutes one way

Digitized by Google



The limited stop plan was adopted on three heavily-traveled lines, serving characteristic residence, business and industrial parts of the city

have been received, asking that the plan be extended to other lines.

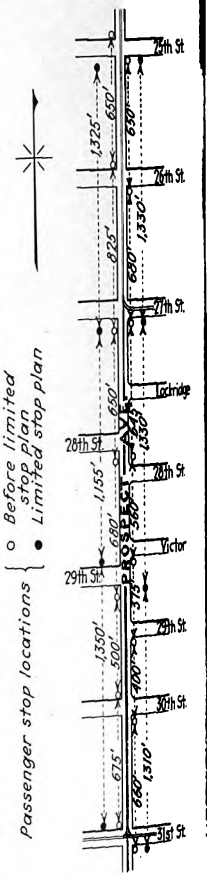
The plan has not been in operation a sufficient length of time to justify accurate predictions as to its effect on revenues. However, there has been no falling off of patronage, and, in fact, the first two months of operation showed an increase in revenues on these lines of 0.2 per cent, as compared with the balance of the system. For the same two months of operation on the entire system, as compared with 1928, there was a loss in revenue of 1.1 per cent.

Extensive Reduction of Car Stops

In Kansas City, east and west streets are divided approximately sixteen blocks to the mile. Car stops on these streets were on an average of ten to the mile. With the installation of the "limited stop" plan, however, a stop was located, in general, at every third block, or at an average of approximately 1,000 ft. apart. On the north and south streets outside of the business center there are approximately eight blocks to the mile, with occasional shorter ones, and there were car stops at almost every cross street. The new plan called for stops at alternate blocks on the north and south streets, or approximately 1,330 ft. apart. It was necessary to provide for stops at all transfer and principal loading points, and in the actual laying out of stops they were located at the most advantageous places. No change in stop location was made in the central business district. After 11:30 p.m. cars stop on signal at all street intersections for receiving or discharging passengers.

The accompanying map of Prospect Avenue illustrates how the locations of old and new stops compare. The total possible passenger stops in both directions on the three lines were reduced from 399 to 265, 33.6 per cent, or from 9.7 to 6.4 per mile. Excluding the business district, the reduction in number of stop locations was from 321 to 187, 41.7 per cent, or from 9.6 to 5.4 per mile. This gives a general average of approximately 980 ft. per stop outside of the business or congested district. These figures are shown in greater detail for individual car lines in Table I.

Another accompanying chart, comparing distances covered by cars from the central business district, gives the actual time required to travel outbound over the different routes before and after installation of the limited stop plan. Time on the Fifteenth Street and Prospect Avenue lines is measured from Fifth Street, the north terminus of both lines. For the Independence Avenue - Rockhill line, the time is measured from Twelfth Street, a mid-point on the line. The greatest reduction in time, eleven minutes, was made on the Prospect Avenue line during the afternoon peak period. The others show reductions of five, six and seven minutes. These differences are caused partly by the variations in the lengths of the lines, grades and traffic congestion. Time savings effected in most instances were slightly less in the non-rush periods than they were during the rush hours.



Comparison of passenger locations and intervening distances on section of Prospect Avenue, before the limited stop plan was put into effect and after

On weekday schedules, terminal to terminal speeds are 11.5 m.p.h., exclusive of layover time, and 10.7 m.p.h., including layovers. On Sunday schedules on these lines, terminal to terminal speeds exclusive of layover time, average 12.2 m.p.h. Including layover time, they average 11.6 m.p.h. Previous to the adoption of the limited stop plan the layover times at outlying ends were three minutes where wyes are used and two minutes where loops are in use. Under the new plan the layover time for both loop and wye is four minutes.

Following its decision to speed up service by some effective plan, the Kansas City Public Service Company made a careful study to select lines for the experiment. The Independence Avenue-Rockhill, Fifteenth Street and Prospect Avenue lines were selected, partly because of the volume of traffic and territory served by them and largely because a part of their routes was on streets already designated by the city as arterial highways. Surveys of car speeds, number of passenger stops being made, length of stops and passengers carried, disclosed that with the number of stops then effective it would be impossible to increase car speeds appreciably, and that to obtain higher speeds a material reduction would have to be made in number of stops for passengers. These studies also disclosed that, at street intersections where stops were not actually made for passengers, it was necessary for operators to reduce greatly the speed of their cars, because of the danger of collisions with cross vehicular traffic.

After completing surveys and making selection of stops desired, the company requested from the City Council the designation as "safety stop" or arterial streets the entire routes of the Independence-Rockhill, Fifteenth Street and Prospect Avenue lines. An ordinance was drafted and passed by the Council on March 25, 1929, making all the desired streets arterial, with the exception of those in the downtown business section. The ordinance requires all cross traffic to stop before coming into these streets, with exceptions at points where boulevards cross car line streets and where automatic signals are installed. A total of 220 stop signs were needed on the streets intersecting the new arterials. These were installed by the company at a cost of approximately $3,100.

Having already secured the indorsement of the Chamber of Commerce and the Kansas City Safety Council for the proposed experiment, the next step was to secure the consent of the Missouri Public Service Commission, which has jurisdiction over service, stops and routings.

Round trip, including layover time	8.4	10.3	1.9	22.7

After the plan was submitted to the commission a few complaints from business interests were received by the company, and merchants in one outlying business center made protest to the commission as to location of stops in their vicinity. They protested at a hearing held on May 2, and since their request for a change in plan seemed to be well founded a compromise was effected. On June 4 the Public Service Commission issued an order authorizing installation of the limited stop plan and retaining jurisdiction over the matter.

Before the commission authorized the change the two daily papers announced the plans as proposed and carried a list of the relocated stops. The papers also made favorable editorial comment, stating in effect that higher speed was a much-needed improvement, and that while, no doubt, there would be some slight inconvenience to a few of the patrons, the greatly reduced time over that then necessary to make a trip would more than compensate for such inconvenience. They also commented on the fact that no doubt complaints would be received from small stores and other business interests at locations where stops had previously been effective, but that any slight inconvenience or damage that might result was secondary to the convenience of car riders.

Immediately following the authorization, publicity was given to the plan becoming effective. Circulars were placed in all cars showing locations of all stops and the savings in time to patrons at different periods of the day. The new operation was started on Sunday, June 16, 1929.

Positive Safety Stops Decreased

The transportation company in Kansas City has been required to install many "slow orders" or "positive safety stops" where, in the opinion of the operating officials, they were not considered necessary. Installation of these stop and slow orders has caused vehicular traffic to put the burden of safe operation entirely on street car operators, slowing up the movement of cars and

Digitized by Google

having a tendency to increase vehicular accidents, as drivers expect car operators to either slow up or stop, even at streets where slow orders or positive stops are not effective. Establishing "safety streets" on these routes, giving right-of-way over cross traffic, has made possible the removing of a majority of the positive or safety stops. While slow orders have not been reduced in total, they have been relocated so as to be of greater assistance to safe operation.

By the removal of a number of positive stops, the speeds attained between stops were increased from an average rate of 18 m.p.h. up to 25 m.p.h., which is the maximum allowed in Kansas City for street car operation. The greater distance between stops and protection given from cross street traffic permits cars to accelerate to full speed and makes possible the maintaining of this speed over a great portion of the route.

Few More Accidents at Start

Before putting the limited stop plan in effect, it was recognized that the higher speeds would for a time at least increase the number of vehicular accidents. This proved to be correct, particularly during the first few weeks of operation. However, as motorists and other drivers are becoming familiar with the fact that cars are traveling at a much higher speed, they are becoming more cautious and are giving the street cars the right-of-way to which they are entitled. Despite the increase in vehicle accidents, with one possible exception these have been of minor importance, both as to property damage and personal injury. Approximately 80 per cent of these vehicle accidents are caused by the carelessness of vehicle drivers. There has been no perceptible increase or decrease in other classes of accidents.

While few objections were received prior to adoption of the limited stop plan, there have since that time been several requests made for additional stops. Most of these originated from drug stores or business interests located on streets, formerly stops but now skipped. Drug store owners at several of these locations sponsored petitions, and in some cases, placed large signs in their windows, requesting persons to sign petitions to have the stops restored. As the plan was put into effect only after a careful survey and with the approval of the Public Service Commission, no changes are likely to be made without thorough investigation by the commission.

At 26th and Prospect, the community business interests banded together, secured petitions with several hundred signers, employed attorneys and made request of the Public Service Commission that stops be restored in their district. The commission recognized their objection and held a hearing in Kansas City on July 26 and 27. Prior to the hearing, the traffic department of the company prepared a large spot map on which were shown the locations of business concerns, residences and population characteristics in the vicinity of 26th and Prospect, as well as at other points along the Prospect line, formerly stops, but which under the new plan, have been eliminated. Residence locations of signers to this petition were also spotted on this map, showing graphically that many of those who had signed the petition were more convenient to a car stop a block north or south of 26th and Prospect. It also developed on cross-examination at the hearing that a number of the persons who had signed the petition were not car riders. After a two-day hearing the commission took the matter under advisement. It has not yet rendered a decision. There have not been any other objections filed with the commission.

Stop signs were installed at all streets intersecting those designated as arterials for the limited stop plan

Edinburgh Moves With the Times

Lower fares and improved equipment, capable of higher speed, are establishing new records in popularity

By

WALTER JACKSON

Consultant on Fares and Motor Buses
Mount Vernon, N. Y.

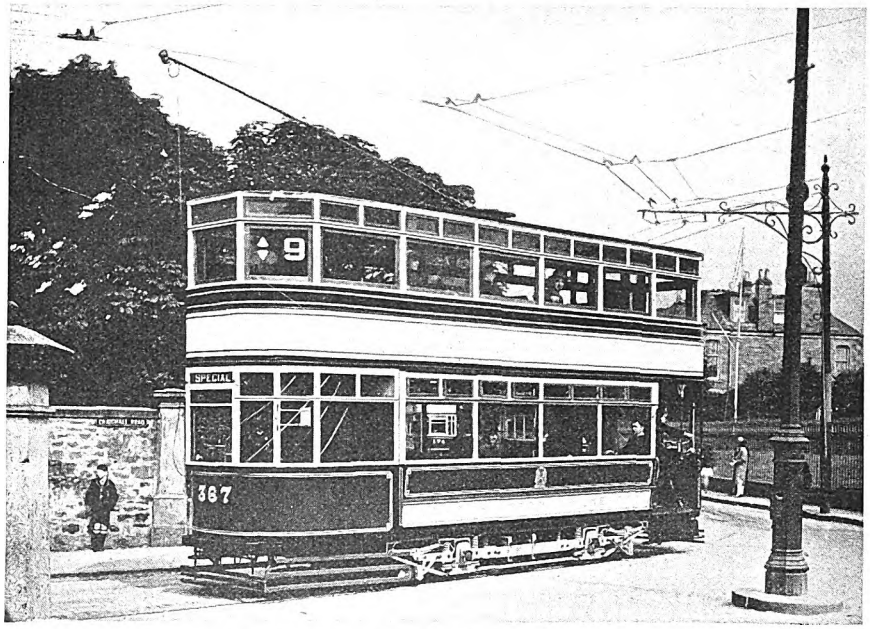
IN TRAVELING from tramway to tramway throughout Great Britain one is struck by the evident effort being made to modernize equipment. In some cases, the work has not advanced beyond the recommendations of the general manager to his committee, but in others, fine progress has been made. A notable example is the Transport Department of the city of Edinburgh. R. Stuart Pilcher, formerly general manager of the department and now general manager of the Manchester Corporation Tramways, can properly be regarded as a pioneer for what the Britisher is calling "Pullmanized tram cars." A decade ago, while general manager of the Aberdeen Corporation Tramways, he installed upholstered seating in some cars at a time when no one feared the motor bus or automobile. No doubt, many of the Aberdonians were aghast at such liberality to a mere tram-car rider.

Late in 1925, after the electrification of the original cable system was well advanced, Mr. Pilcher took the bold step of introducing air brakes. Previously, all braking had depended on hand and magnetic brakes. The present equipments were used on lines with grades exceeding 7.7 per cent. The track brakes were applied by air, and the magnetic brakes were used in an auxiliary capacity. In later equipments, air has been used for less strenuous conditions to secure higher schedule speeds with less fatigue to the car operator. At present, 97 out of 345 cars in Edinburgh are equipped with air brakes.

Digitized by Google

All 56-passenger double-deck cars are fitted with 24 40-watt, 90-volt, gas filled lamps of the inner frosted type. Mr. Pilcher likens the tram car to a shop window and believes that it should be well advertised by good lighting.

During 1927, the equivalent of $50,000 was voted for the inclosure of the top deck of 162 cars. This was accompanied by a change from rigid wooden seats to reversible upholstered seats. There are now 235 cars of this type in service. During 1927 and 1928, the lower deck seating of approximately 106 cars was changed from longitudinal to the cross seat type with either green leather or cloth upholstery. It is Mr. Pilcher's view that while the cross seats are less convenient at busy times, the comfort they give during non-rush hours clearly offsets this temporary disadvantage. The combination of upholstered seats and duralumin fittings has been found to give the attractiveness which he believes to be so vital to successful transport at the present time. In addition to these improvements, the car program included the building of twelve new cars during 1928. A new feature of these cars is the use of stainless fittings.



Latest type of car placed in service in Edinburgh. It has a seating capacity of 58, has both ends fully enclosed and is equipped with magnetic, air and hand brakes

More Speed and Less Noise

Up to 1928, the maximum running speed on the level of the ordinary car in Edinburgh was 21 m.p.h. This speed is now being raised to 30 m.p.h. through re-gearing. Primarily, this is being done to demonstrate to the public the better speed characteristics of the car in contrast to the bus. In Mr. Pilcher's experience, it is not so much the schedule speed of the vehicles that matters as the actual maximum speed which the vehicle can maintain.

The nosing or "jazzing" of single truck, double-deck cars has been a common fault on many systems, due largely to the age of the rolling stock. Edinburgh, however, has been practically free from this complaint. Nosing cars not only produce heavy upkeep costs for the cars themselves, but also seriously affect the permanent way. Above all, they produce discomfort to the passenger.

Mr. Pilcher believes that most of the noise on a car is due to worn gearing, and that operators should not be so reluctant to scrap old gears. For nine years, Edinburgh has operated 350 cars with wrought-steel gears and pinions which are hardened by the "Shorter" process. The gears run in oil. The motors are of high-speed type, but regular inspection shows very little gear wear. As a result, the cars are less noisy than on many other systems.

Edinburgh is the center of a great bus traffic, there being some 450 vehicles in the district aside from the buses and char-a-bancs of the municipality. Since legislation cannot effectively prevent the pick-up of local riders, the Transport Department must depend upon its service and fares to win passengers. This situation has doubtless had its effect in lowering fares, although the management recognizes that higher fares will not keep people off buses if the latter are appreciably faster.

On Aug. 27, 1927, there was a cut in fares, lengthening the penny distance to an average of 1.5 mile. On May 16, 1928, a further reduction was made, permitting a possible 4½ mile ride between the city boundary and the city center for a fare of 2 cents. Close to 70 per cent of the riders pay only the penny fare. Bus fares are the same as tram fares except that the buses have no workmen's round trips. Tourist fares and char-a-banc services are special. In general, car fares have been so reduced that for many rides they are actually below prewar rates. Following the institution of the lower fares, the revenue fell behind, but this loss is gradually being regained, with the tramways continuing to hold their leadership.

Rapid Transit Speed High in Boston

IN BOSTON the highest speed attained by subway trains is 45 miles per hour in the Cambridge subway, between Harvard Square, Cambridge, and Ashmont Station in Dorchester. The average speed between terminals to keep schedule time is 26.3 miles per hour.

On the elevated section, which includes subway operation under Washington Street, the highest speed is 40 miles per hour, and the average schedule speed between terminals is 16.5 miles. The stations on this line are close together and the frequent stops reduce the average speed materially.

On the East Boston Tunnel, a short line with three stops, the highest speed is 30 miles, and the average 12.7 miles.

The Cambridge Tunnel has the largest cars. They are 69 ft. 6 in. long, weigh 86,412 lb., and have seats for 72 passengers.

The elevated subway cars are 46 ft. 11 in. long, weigh 69,448 lb., and have seats for 44 passengers.

The East Boston Tunnel cars are of the same size and seating capacity as the elevated cars, but weigh only 44,000 lb. All subway and elevated cars have two motors.

Standard copper graphitic brush showing shunt attachment

Maintaining Carbon Brushes for Good Commutation

Brushes should be designed to fit the characteristics of the railway motor or other electrical machine on which they are to be used. The maintenance of brushes is equally important

By
J. V. DOBSON
Chief Engineer Stackpole Carbon Company

VERY strict design limitations fix themselves around the commutator and the current collecting mediums in electrical machines. Immediate future developments will be in commutators, brush-holders and brushes and in the improvement of commutating characteristics. Not a great deal may be expected in higher efficiencies. Weight economy will be secured by higher armature peripheral velocities and higher current densities. Present design limitations to higher speeds must be pushed back. Just as electric motors and generators are designed for specific service, so also the brushes must correspond. Long commutator life is emphasized on a power generator, motor-generator set, rotary converter or on a railway motor. It is not of commanding importance on utility motors for household appliances such as vacuum cleaners, fans or the like. Quietness of brush operation until recently has not been as important on railway motors, as it has been on refrigerator motors, fan motors, elevator motors, etc. With the trend toward greater riding comfort, the need for noise elimination in railway motors is in the foreground.

Successful brush operation, briefly, demands long commutator and brush life. Of the two, the former is usually the more important because the cost of a commutator and the cost of removing a motor for commutator turning greatly outweigh the cost of brushes used.

With the trend toward higher armature peripheral velocities a brush of low frictional resistance is extremely desirable. Some brushes possess practically ideal electrical characteristics but, lacking mechanical strength, they are entirely unsuited for railway service. The railway motor passes through a continuously varying temperature cycle, with relatively great expansion and contraction. Not all commutator bars are affected identically. Between turnings the condition of the commutator is gradually impaired, due possibly to the brush, the commutation characteristics, changes in the commutator itself, or to flashing, overloads or excessive brushholder wear. Recent tests have shown that extremely small eccentricity variations between adjacent commutator bars will cause severe brush vibration, chattering, chipping or breakage. Rough track or worn gearing may impose severe shocks.

Possibly in the past too much attention has been given to the continuous rated current capacity and too little to short-time overloads. Experiences both in this country and in Europe show that carbon brushes are deteriorated more rapidly by short-time overloads than by continuous loads of lower peak values. In comparative laboratory tests some brush grades of the same continuous capacity will show a difference of over 33 per cent in their overload rating. In comparison with other classes of service the railway motor accelerating current is very high in respect to its continuous load. In actual figures this may mean 100 to 150 amp. per square inch with a continuous rated capacity of 50 amp. per square inch, which is high for a carbon brush. It is even higher because not all of the brush is making intimate contact with the commutator. This explains the glowing that is observed frequently in abnormally severe acceleration.

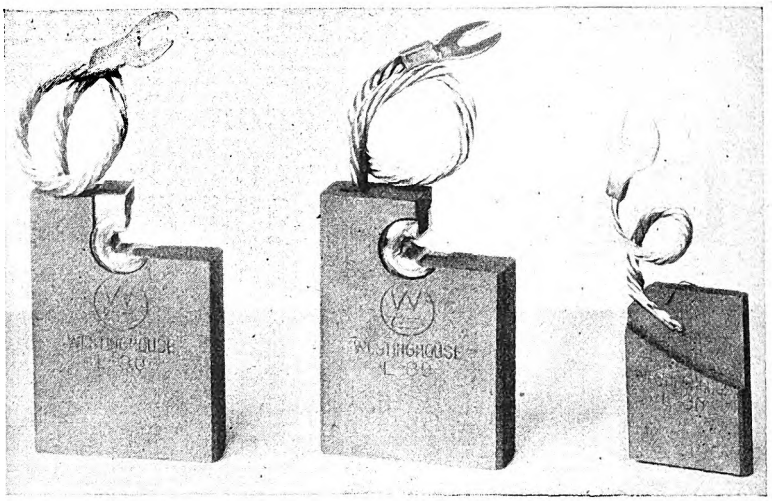
The hardness and abrasiveness of a carbon brush

Digitized by Google

should not be confused. A hard brush may be almost non-abrasive while a soft brush may be highly abrasive. The hardness of a brush depends upon the manufacturing process while its abrasiveness is controlled to a large degree by the materials used and, in an electro-graphitic brush, the degree of graphitization.

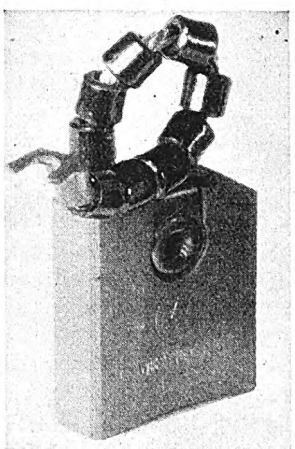
A soft brush usually cannot withstand severe mechanical stress. A hard brush is ordinarily stronger, but if too hard it is subject to chipping and breaking.

Undercutting of railway commutators has become almost universal. This practice has permitted the use of so-called non-abrasive brushes. However, a certain low proportion of abrasive is found desirable in practically all brushes. The proper amount of abrasive is difficult to determine. Too much cleaning action scores the commutator and causes rapid wear, too little permits smutting. This becomes cumulative and usually results in burned commutator bars, flat spots, eccentric commutators and flashing. Coupled with the abrasive in the brush is the cleaning action of sand, brakeshoe dust, etc., which enter the motor with the ventilating air, and in effect become even a grinder of the commutator. The velocity at which the commutator scrubs the brush and the amount of cleaning due to other dirt determine also how abrasive the brush should be.



Three standard types of brushes showing method of shunt attachment

The railway motor has considerable running at no load when the car is coasting or braking. This is very effective in cleaning and polishing the commutator and therefore in large part corrects for the damage of the immediately preceding heavy acceleration. This is doubtless the reason why the railway motor can safely withstand the heavy duty.



Carbon brush showing beaded shunt

Brush contact is important. For railway work there is not much permissible variation. There may exist a relatively small variation between one approved railway brush grade and another which, along with the other above noted characteristics, may give differing results. In the main, however, the brush drop may be classed as "high."

The types of brushes in common use include:

(a) Plain carbon brushes; (b) plain graphite brushes; (c) carbon and graphite brushes in varying proportions of mix; (d) electric-graphitic brushes in which by heating in the electric arc the carbon is converted into graphite; (e) metal graphite brushes; (f) carbon, graphite or metal-graphite brushes bonded with bakelite or similar material; (g) carbon brushes impregnated with a lubricating material. Of these the electro-graphitic, the carbon-graphite and graphite brushes are the most important for industrial, power and railway use on commutator machines and the graphite, electro-graphitic and metal-graphite are the most important for use on slip-rings.

Plain carbon grades will carry 35 to 50 amp. per square inch continuously. The highest graphite grade will carry 65 amp. per square inch and the metal graphite brushes will rate 125 to 150 amp. with momentary overload capacity of 450 amp.

Operating conditions affecting commutation and carbon brush performance are: (1) Mechanical vibration, (2) overloads, (3) dirt, (4) flashing. The first two of these conditions have already been discussed.

The brush should move freely, otherwise arcing, flashing, or excessive brush and commutator wear may result. Dirt in some types of motors and on some railroad properties has presented a difficult problem. Sand or brakeshoe dust entering with the ventilating air may cause binding of the brush in the brush box. The insulating of the brush from the pressure finger by small sand particles may cause undue heating of the brush and brushholder. This has been corrected by closing the bottom commutator openings; by closing off the commutator chamber from the entering air or occasionally using the so-called dust-cap brushholder. The writer wishes to emphasize, however, that where dirt exists, inspection periods should be such as to insure that the brushes move freely in the box.

There is much less trouble due to flashing today than there used to be. Its causes are better understood and corrective measures are taken.

In the maintenance of brushholders, brushes and commutators the following points are outlined:

1. Turn and undercut railway commutators, being careful to remove mica slivers. Remove burrs and rough edges from the surface of the commutator. If sandpaper is used finish with fine paper, with armature turning in lathe or in its own bearings. A good practice is to tighten the commutator bolts or commutator ring nut when the armature is out for commutator turning, and with the commutator hot. Keep the commutator and its V-ring free of oil or grease.

2. Establish condemning limits for worn brushholders. Standards have been worked out for new brushes and new brushholders and similar standardization should be adopted for worn brushholders.

3. Inspect brushholders for broken shunts to prevent overheating. By far the best performance will be obtained when the commutator brushes and holder are operating within the temperature limits of the A.I.E.E. rules.

4. Maintain correct and uniform spring pressure. In general 5 lb. per square inch is good practice on d.c. motors and 3 to 3½ lb. on a.c. motors. In some instances pressures considerably in excess of this are necessary, as on rough track or to correct a flashing tendency.

5. Keep brushes free in box. A brush should drop slowly but freely through the box when it is held in a vertical position. Many ills result from stuck brushes.

6. Maintain a uniform clearance of ⅛ in. between the brush-

Digitized by Google

holder and the face of the commutator. Brushholders too close to the commutator produce brush chattering.

7. Maintain neutral setting, parallelism of brushholder and commutator bars and correct brushholder spacing.

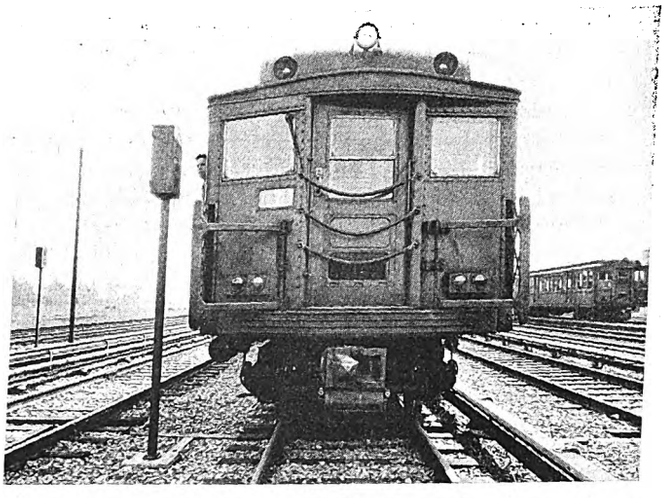
Many railroad properties have adopted the one-piece brush to good advantage. For some at least this has upset some past theories. This subject, the writer understands, has been considered by a committee on carbon brushes in the A.E.R.E.A. The old theory was that two or even more brushes per holder were better than one, as they would provide a more intimate brush contact by reason of a better brush follow in the face of the small irregularities of the commutator. The theory behind the one-piece brush is that because of the wider seat on the commutator the mechanical stability is greater and that even though the brush is heavier it follows the commutator better. The adoption of the one-piece brush should be made only after tests to prove its satisfactory performance. It is recommended that when such tests are made the commutator should be newly turned; otherwise the large brush will probably not seat itself on the commutator.

Dispatching Trains by Loud Speaker

System developed for Philadelphia subway yards to enable motormen to communicate with dispatcher without leaving trains

INSTALLATION of a loud speaker system in the Broad Street subway yards in Philadelphia for the dispatching and controlling of trains marks the first large scale use by any transportation company of the loud speaking telephone principle with audio amplification. The system, designed by engineers of the city of Philadelphia, Mitten Management and T. & T. Engineers & Constructors, Inc., is proving particularly effective at the Fern Rock yards where trains are dispatched and routed at intervals of two or three minutes.

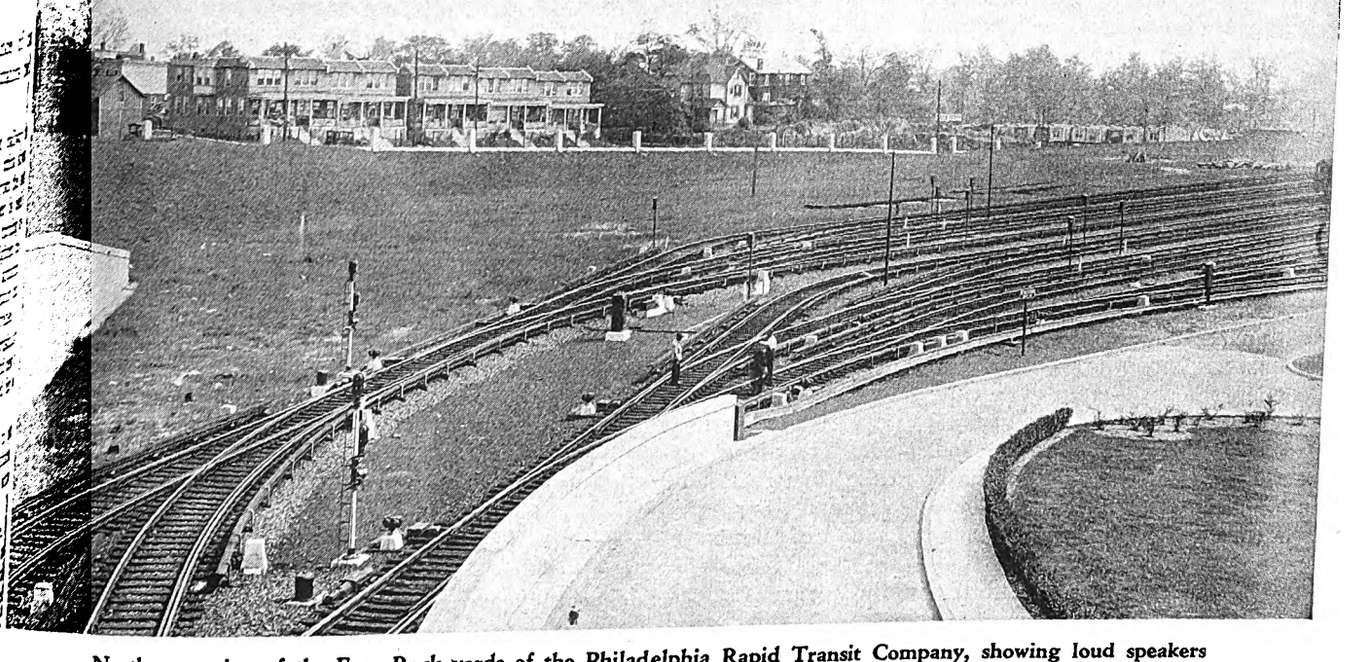
A four-track tunnel connects the yards with the subway proper. Converging at the mouth of this tunnel are 22 tracks, eleven on each side of the inspection and repair shops situated in the center of the grounds. The control tower, from which the signals, lights and switches are operated, is located directly over the mouth of the tunnel and commands a clear view of the yards below.



The motorman stops his train beside the speaker box, pushes a button and then talks to the dispatcher

The making up and dispatching of trains and the routing of cars from one track to another present difficult problems. Some cars must enter the shops for inspection, others for repairs. An enormous volume of shifting and shunting over the maze of yard tracks is necessary and this work must be accomplished rapidly, without confusion, and with a minimum of labor. During the morning and evening peak hours when trains run as closely together as is consistent with safety, a delay in shifting or dispatching produces disastrous results.

Formerly this work was conducted with the aid of an interyard telephone system connecting the dispatcher in the signal tower with strategic points throughout the property. Yard operators and motormen, under this plan, were compelled to leave their cabs, make their way



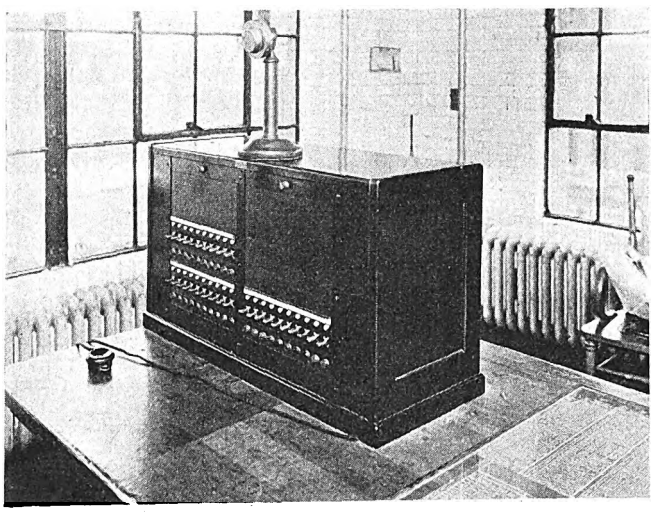
Northern section of the Fern Rock yards of the Philadelphia Rapid Transit Company, showing loud speakers located along each track for dispatching trains on the Broad Street subway system

Digitized by Google

to the nearest telephone, and receive their directions from the tower dispatcher. This system was found to have several disadvantages. Precious time was lost by the motorman in leaving and re-entering his cab. Noises caused by moving trains and shop machinery made hearing difficult, and lastly, the dispatcher, his hands occupied with the telephone, could not operate the battery of signal and switch levers several feet away.

To secure a more rapid and orderly method of dispatching, a study of the problem was made in order to remedy the various flaws which made the usual telephone system impracticable. This study continued for several months with the result that the present method, developed through a combination of the principles of telephone and loud speaker, was installed.

A microphonic type of transmitter closely resembling a telephone in appearance is located in the signal tower directly above a telephone switchboard. This transmitter through an amplifier is connected by underground



Microphonic transmitter in the signal tower through which the dispatcher communicates with the trainmen

wire to 22 telephone boxes, located one along each track just far enough beyond the point at which it converges upon the adjoining tracks to provide safe clearance for cars. The boxes are placed on poles at a height exactly level with the window in the motorman's cab and about 18 in. to the right of each track. Thus a motorman or operator, no matter on what track he is located, can bring his train to a stop in a position which will enable him to speak into the transmitter in the box. It is only necessary for him to push a button near the face of the box, after stopping at the speaker.

Each of these 22 yard boxes is equipped with a sensitive telephone transmitter and a loud speaker used as a receiver. The mechanism for both is contained within the box, which itself is devoid of all levers and hooks, its smooth surface being broken only by two copper screened circular openings located one directly beneath the other. Behind the top opening is the loud speaker carrying the amplified sound from the dispatcher's microphonic transmitter in the tower. Behind the bottom opening is a sensitive telephone transmitter, equipped with a horn to gather the sound of the motorman's voice.

The microphonic transmitter in the tower is so adjusted as to send in clearly the voice of a speaker standing 10 ft. away. The dispatcher's receiver consists of an ordinary telephone earpiece worn around the head. A push of a button on any of the yard boxes is immediately reflected by a light on the tower switchboard associated with that particular station. Should there be occasion for the dispatcher to cut off a motorman in the middle of a conversation, the board is so arranged that this can be done without the disappearance of the attention-attracting light.

Under this new dispatching method the objections to the former system have been eliminated. The dispatcher can stand at almost any point in the tower and while operating his switch levers speak across the room into the microphone. His voice coming through the amplifier receiver can be heard by the motorman or operator just as clearly as he hears a radio program at home through his loud speaker. In fact, tests have shown that the dispatcher's voice is clearly audible for a distance of 40 or 50 ft. across several rows of tracks even though he be speaking only in a normal talking tone. The motorman has no ear-piece, hook or lever to manipulate in the yard box. He merely stops his train beside the box, pushes a button which makes the connection and reflects a light on the board, and then talks. The horn which surrounds the transmitter gathers in his voice and carries it clearly to the dispatcher. The loud speaker receiver brings back the directions which he is to follow. There is no lost motion on either end and the possibility of misunderstanding through failure to hear clearly, with resultant confusion, has been removed.

The Readers' Forum

Well-Informed Operators a Valuable Asset

IRVING IRON WORKS COMPANY
NEW YORK, N. Y., Oct. 21, 1929.

To the Editor:

In my travels—and I do not use an automobile—it is frequently necessary for me to ask directions and my point of departure is not always from a station where information can be secured. In order that discomfort may be avoided I endeavor to get the information from hotel clerks or sometimes from police officers; but this much I can state without fear of contradiction—the mass of misinformation given out by motormen and conductors, and the lack of information bureaus for the street railway lines, are appalling. On one large system it seems almost impossible to ascertain from motormen or bus operators anything regarding connections or running time of lines other than their own. There is utter indifference in replying to queries; yet this system advertises how well it serves and the number of lines it operates. It publishes a map showing connections, but there is never a word about running time or layovers. Its bus operators are, in general, ignorant of cross streets. In contrast another system stands out as a particularly bright example of what a transportation company should be. To learn how well the men were informed I asked some of them for information that they might well be excused from knowing, but they directed me quickly and cheerfully and correctly. There was not a failure anywhere.

We can well realize the discomforts often endured by car operators; the annoyances created by ill-tempered

Digitized by Google

and ill-bred travelers, bad weather crowding that causes the breakdown of schedules, and many other things the casual passenger does not notice and would not consider if he knew. Some failures are expected by the general run of passengers and are forgiven and forgotten except by the one who thinks he may prove a claim. So we will overlook these deficiencies (but reserve the complaint regarding misdirection).

If more railway executives had had experience in on-the-road selling, it would be very helpful to them; if these officials met with salesmen, it would open their eyes to many needful things. Unfortunately, they are not buyers, but are supposed to be sellers of certain merchandise—car rides.

No salesman can be successful who simply expects buyers because the goods are exposed for sale. The public carrier must sell his transportation; there must be a managing salesman to instruct the salesmen, whether they be motormen, conductors, bus operators or ticket sellers. Every employee is a potential salesman; the personnel manager should know more than how to hire and fire.

If you have something worth selling, tell the public; but do not get the idea that a thing once told is not worth repetition. Remember the many really good things that have gone by the board because something else has been better advertised. Why, even Ford cars are advertised now.

LINSON H. DE VOE.

Make the Interurbans Railroad-Minded!

SOUTH MANCHESTER, CONN., Sept. 30, 1929.

To the Editor:

It doesn't pay an interurban railway to look like a street car line, if one can judge by the results that a number of progressive main-line interurbans have obtained. Evidently the abolition of street railway methods, equipment and appearance have been worth their while on these properties.

There is a reason for this. The interurban of today competes with fast steam trains, buses and automobiles, and the airplane. The public no longer is content to drag along on an outgrown street railway. What it wants is high-speed electric train service comparable to that furnished on the modern electrified steam road. If the interurban cars are dressed up like street cars, with awkward fenders, horse-car gongs, and blue-uniformed motormen, the public will at once brand the line as non-progressive, and will not take it seriously.

This does not mean that the interurbans should not give local service, nor that they should not be operated in conjunction with city lines. A sharp distinction should, however, be drawn between the city and interurban divisions and the personnel of each kept separate.

From an experience of twenty years with the interurbans, it does not seem good judgment to me, particularly from the standpoint of safety, to put a trainman on a street car one day and on an interurban the next.

I believe the greatest menace to our heavy interurban lines is that their officials are slow, in some instances, to become railroad-minded. No automobile dealer could sell a car dressed up in 1908 appliances, and the same is true of the interurbans. If the public is referring to the line as a street railway, then it is not receiving, and probably is not entitled to, the respect of the public. There is something wrong, for it is not railroading.

WILLIAM H. SNOW.

Convention Number a Syllabus on Fundamentals

THE NEW YORK, NEW HAVEN & HARTFORD RAILROAD

NEW HAVEN, CONN., Sept. 26, 1929.

To the Editors:

Your Annual Convention Number is a most creditable issue and certainly does get down to fundamentals as you intended. It is indeed a syllabus of information on the present state of the art, and deserves the place it will have in our libraries as a very valuable reference book.

C. E. SMITH,
Vice-President.

* * *

BOSTON ELEVATED RAILWAY

BOSTON, MASS., Sept. 20, 1929.

To the Editors:

Congratulations on the fine convention issue. From long experience I know what a job it is to get up each year a special issue of this sort, with sufficient originality to make it outstanding and at the same time cover the fundamentals of the business up to date. You have made excellent use of the material.

H. H. NORRIS,
Educational Advisor.

Maintenance Award an Incentive to Better Performance

SAN DIEGO ELECTRIC RAILWAY
SAN DIEGO & CORONADO FERRY

SAN DIEGO, CAL., Oct. 11, 1929.

To the Editors:

We greatly appreciate the certificate of merit awarded to the San Diego Electric Railway maintenance department for proficiency along the lines of mechanical performance. We agree with you that it will be quite an incentive to the department to continue its work, and even to excel past performances.

This is certainly one of the many phases of operation of the association and ELECTRIC RAILWAY JOURNAL that is a benefit to the industry as a whole, and we wish to give our whole-hearted indorsement to such activities.

S. E. MASON,
General Manager.

Convention Report Number a Complete Record

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

NEW YORK, N. Y., Oct. 14, 1929.

To the Editors:

After the convention I had an opportunity to review rather carefully the Report Number of ELECTRIC RAILWAY JOURNAL covering the convention papers and discussions. In view of the tremendous number of words used in the discussions and the length of the numerous papers, I feel that the JOURNAL staff has done a very fine job in picking out the high spots and worth-while references, and in giving it to the industry as a whole.

In a word, anyone reviewing the report number can get, in a very short time, a clear picture of everything of importance that took place at the convention.

M. B. LAMBERT,
Transportation Sales Manager.

New Maintenance

Individual Cash Prize of $100 Offered for Best Maintenance Idea of the Year

Twelve Cash Prizes to be Distributed Among Maintenance Men in Various Departments

Handsome trophy will be presented to the company making the best showing

DURING the coming year, ELECTRIC RAILWAY JOURNAL Maintenance Contest, arranged in co-operation with the American Electric Railway Engineering Association, will continue along substantially the same lines as in the past. Quarterly prizes of $25 will be given for the best items submitted in each of four departments. The best maintenance idea submitted during the entire contest period will receive an award of $100. To the company which makes the best showing in the contest, a handsome trophy will be presented.

In addition to the individual prizes and the company award, a special certificate of merit will be presented to each department making the best individual showing upon the same general conditions as for the company award.

As in the previous contest, the purpose is to arouse interest among maintenance men in the development and adoption of improved methods for performing routine work, or new methods or fixtures that save labor, time and money in maintenance on a transportation property.

All entries are to be made in the form of short articles describing briefly methods or devices that improve maintenance practice. These will be judged primarily on the value of the idea presented and its adaptability to the maintenance work of transportation companies.

The form of presentation will be judged only as to the clearness with which the method or device is described and illustrated, and the extent to which information is given which would be needed by other properties interested in using the idea.

GENERAL INSTRUCTIONS

Write on one side of the paper only. Have your article typed if possible, but manuscript written long hand will be accepted. Write the article as though you were writing a letter to another maintenance man giving him your experience with a new method or device. "Fine writing" is not necessary. Merely give the facts and a description of the device or method. Whenever possible include data on cost savings effected.

Manuscript should be marked "Maintenance Competition." Any number of items may be sent in the same envelope.

Men employed in the electric railway field

Digitized by Google

tenance Contest *Begins*

in foreign countries also are invited to submit their maintenance articles in the contest. Articles may be submitted in the native language of the writer, and ELECTRIC RAILWAY JOURNAL will have them translated into English.

Rules of the Contest

1. The contest will be judged and the prizes awarded by a committee of the American Electric Railway Engineering Association consisting of one representative of the standing committee on way and structures, A.E.R.E.A.; one representative of the standing committee on rolling stock, A.E.R.E.A.; one representative of the standing committee on power A.E.R.E.A.; the general secretary American Electric Railway Association, and the managing editor ELECTRIC RAILWAY JOURNAL. All decisions of the judges in interpreting the conditions of the contest and in making awards will be final.

2. Any employee or official of an operating electric railway or bus company may compete for the prizes.

3. Each contestant may submit any number of items he desires, each of which will be judged separately. An individual may win several of the prizes.

4. The author does not necessarily have to be the originator of the idea, but it must be adopted and be in use on the property with which he is connected. The idea submitted may have originated on another property or may have been furnished by a manufacturer. No device or method, a description of which, to the knowledge of the contestant or the judges, has been previously published, will be eligible for this competition.

5. The competition is not limited to those who originated or developed the idea or apparatus described. Any employee, *with* the *approval* of the department head concerned, may submit a maintenance practice or device used on his property. More than one article covering the same device or method will not be accepted, however.

6. Where the management of a railway has a practice of requiring approval of articles sent out for publication, such approval *must accompany* the manuscript. If written approval does *not* accompany the manuscript it will be assumed that such approval is *unnecessary*.

7. An article may be submitted by several persons or by a department, and need not be written by the person in whose name it is submitted. The prize will be awarded to the individual or department whose name appears on the manuscript, and may be distributed among the winners on any basis determined upon by them. Should there be a tie for any prize the full amount will be awarded for each of the articles involved in the tie.

8. Articles may describe any maintenance practice or device used by any department of a railway, such as the maintenance of rolling stock, buses, shop equipment or methods and equipment for overhead line repairs, power distribution and power generation devices, signal work, track and way maintenance, etc. Unless manuscript submitted is marked to indicate the department to which it is to be credited, the judges will determine the classification under the following divisions: (1) rolling stock and shops; (2) way and structures; (3) electrical and line; (4) buses and garage.

9. Articles submitted for these prizes should be *preferably* 100 to 200 words in length and should be accompanied by *one* illustration. Brevity consistent with a proper presentation of necessary information will be given weight in judging articles. In *no* event should they be longer than 400 words with *not more* than *two* illustrations. Articles will be published as promptly as space permits.

10. In rating the various articles the committee will consider the primary value of the method or device as of highest importance. The committee will also consider its practicability, the advantages and economies that are set forth and the clearness and completeness with which the idea is presented.

11. The original manuscript and illustrations will be turned over to the committee of judges for making all awards.

12. Any material submitted in the contest may be published at any time after its receipt.

13. All articles should be addressed to the contest editor of ELECTRIC RAILWAY JOURNAL, 10th Avenue at 36th Street, New York City. Items to be eligible for the first group of department prizes must bear a postmark not later than midnight, Jan. 31, 1930; for the second group not later than April 30, 1930; for the third group not later than July 31, 1930. All material bearing a postmark not later than the last mentioned date, will be eligible for individual cash capital prize, company trophy award and departmental certificates of merit.

14. The announcement of winners of departmental prizes will be made in the issue of ELECTRIC RAILWAY JOURNAL in the month following the closing date for each group of departmental prizes. Winners of the company trophy, individual capital cash prize and departmental certificates of merit will be announced in the September, 1930, issue, and awards made, at a date to be announced later.

15. ELECTRIC RAILWAY JOURNAL shall have exclusive right to the publication of all material entered in this contest. All articles submitted will become the property of ELECTRIC RAILWAY JOURNAL and no manuscripts will be returned.

16. A minimum of $5 will be paid for each item published.

Additional copies of these rules and full details of the contest may be obtained upon application to ELECTRIC RAILWAY JOURNAL *or the American Electric Railway Association.*

Maintenance Contest Produces Valuable Results

From the report of the judges' committee presented at the general session of the Engineering Association, Atlantic City, N. J., Oct. 1.

IT IS needless to say that the American Electric Railway Association and the electric railway industry at large are greatly in the debt of the *Electric Railway Journal* for inauguration and financing of these contests. There is widespread evidence of their value in the results to date and it is the hope of those most interested that the contests may continue and reach higher levels of attainment.

Many Handy Maintenance Devices Developed by

Coupler Testing and Assembling Machine

By Terance Scullin
Superintendent of Buildings and Equipment

CONVENIENT equipment has been developed at the Harvard shops of the Cleveland Railway to test overhauled couplers and to facilitate assembling them. Previously there existed no good way of testing the couplers prior to putting them into service, nor any quick and efficient method of assembling them. If it was desired to try out the coupler before mounting it on a car, it was necessary to butt one against the wall and jack the other onto it, thus forcing them to engage. The draft springs had to be removed in the wheel press. This method was entirely too slow and cumbersome for frequent overhaul and it was necessary to find some quicker way of assembling and testing couplers.

The apparatus now used is built of angle iron frame of suitable dimensions to support the coupler to be tested. On each end of the frame is an 8-in. air cylinder, so piped that air can be admitted on either side of the piston. The air in each cylinder is controlled by a straight air-brake valve. One master coupler is always left mounted on the frame, and the coupler to be tested is put in place at the other end and air applied, forcing the couplers together. The couplers are unlocked, the air reversed, and they are then uncoupled. This operation is repeated several times in order to show up any defects in the coupler tongues or other parts. When assembling the draft spring, the coupler to receive the spring is placed in proper position and secured by fixing a strap or bar across its face to prevent longitudinal movement. The spring and tailpiece are then put in place and a sleeve installed of suitable size to slip over the tail-piece and up against the spring on one end and against the special push rod on the other. The air is applied, thus compressing the spring far enough to allow the key which locks the tailpiece in place to be inserted. This equipment is a great time saver and insures that perfect couplers leave the shop.

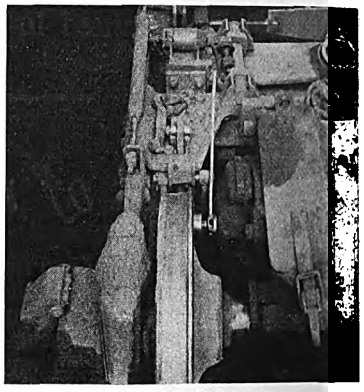
Jack for Installing Dust Caps

By E. H. Nobis
Assistant Foreman Mechanical Department

TO INSTALL dust caps securely on motors when mounted on the car truck it was found necessary at the Harvard shops of the Cleveland Railway to develop a special jack. On account of the small clearance between the commutator end of the motor housing and the car wheel it is difficult to install dust caps tightly. Previously, this was done by use of an ordinary hammer but it was found that many caps were loosening and dropping off. The new tool made is a small screw jack of proper size to slip in between the commutator housing and the wheel. One end is placed against the wheel and the other end, which is concave, is placed against the cap. By screwing up on the jack the dust cap is pressed into place as easily as though the motor were on the bench. A man can now apply a dust cap in about half the time that it formerly took. The cost of this jack was about $10.



Handy jack for placing dust cap on motor cases

* *

Molding Staining or Varnishing Machine

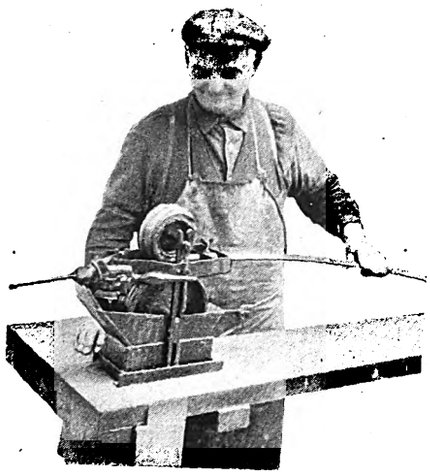
By R. C. Sohl
Engineer Mechanical Department

WOOD moldings are stained and varnished by a special machine developed for that purpose in the Cleveland Railway shops. Formerly it was the practice to saturate a sponge with the stain and pass the beading or molding through the sponge. This method was entirely too slow and expensive. It was difficult to keep the sponge filled with the liquid, which was absolutely necessary to insure uniform spreading of the material on the molding. Now the molding is simply passed between two wheels covered with $\frac{1}{4}$-in. felt and held in an 18-gage sheet metal frame. The lower wheel dips into the stain or varnish in the bottom of the container, and when the molding emerges from the rolls the stain or varnish is thoroughly brushed in by two ordinary paint brushes which are

Digitized by Google

Practices and Devices

Cleveland Railway



This machine stains or varnishes moldings cheaply and rapidly

fastened in place by means of small brackets. These brushes also wipe off all excessive material which drips back into the container, thus conserving it. With this machine one man can turn out as much work in a day as two men formerly could, using the old method. One of these machines can be made for approximately $10.

* *

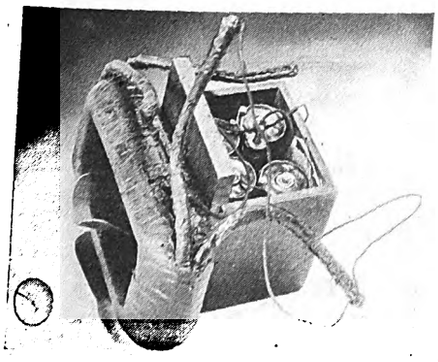
Field Polarity Testing Device

By CHRIST REINKER
General Foreman Mechanical Department

AT THE Harvard shops of the Cleveland Railway the field polarity of motors is tested by means of ordinary dry cell batteries and a compass. When new fields are put in electric motors the main pole and commutating pole fields are tested to ascertain if the polarity of each field is correct. Previous practice was to use current from the trolley wire by means of a special trolley pole and suitable resistance. This method was too slow. Moreover, when the current was interrupted quite an arc was caused when using 550 volts. By using batteries this danger is eliminated, as is also the danger of a severe shock.

The batteries are placed in a box in the center of which is mounted a wood core, and around this core is wound resistance wire of about 2 ohms. A current of 3 amp. flows through the fields, which is enough to overcome any residual magnetism in field poles or motor frame and does not reverse the compass. A sheet iron yoke, made of 14-gage iron, is mounted on the back of the box for testing single fields when out of the motor.

The lower half of the field coil is placed in this yoke and a compass held at the ends of the field.



Cleveland Railway tests the polarity of new fields with this low voltage test set

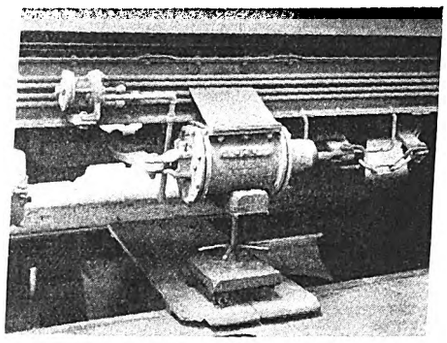
* *

Brake Cylinder and Air Tank Removing Jack

By M. J. LEARY
Assistant Superintendent of Buildings and Equipment

A HANDY device for lifting into place and removing brake cylinders and air tanks has been developed in the shops of the Cleveland Railway. Previously, ordinary double-acting jacks were used and sometimes it was even necessary to block up under the cylinder or tank and slide it out sideways after it was loosened from its base. These methods were slow and dangerous. The new hoist consists simply of a 2x12-in. plank with four castors and a screw jack in the center upon which rests a suitable block hollowed out on the top to the proper contour to allow the cylinder to rest with no danger of rolling off.

The hoist is rolled into place and raised until the upper block securely holds the cylinder to be removed. Then the nuts on the cylinder bolts are taken off and the jack lowered and rolled to where the cylinder has to be taken. The reverse is done when installation is made. This work can be done in about half the time previously taken and with a greater degree of safety.



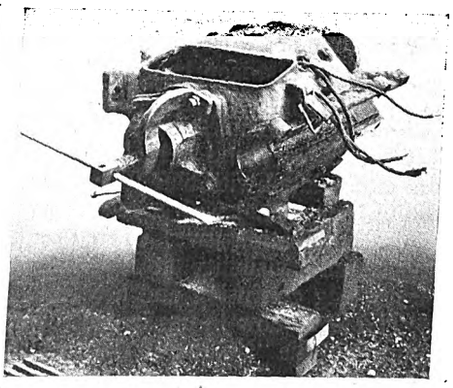
Jack facilitates the removal or mounting of brake cylinders of air tanks

* *

Yoke for Removing Armature Bearing Housings

By R. DUMKE
Foreman Mechanical Department

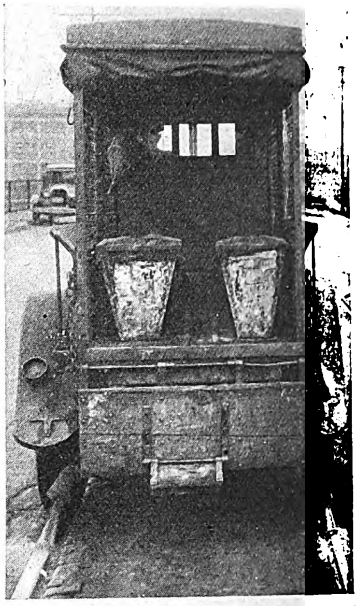
BY MEANS of a special yoke made at the Harvard shops of the Cleveland Railway armature housings on box-frame motors are readily removed. Formerly, the motor was placed on a stand and set-screws applied to push off the housings. This method was slow and considerable trouble was experienced from stripping the threads on the motor case or breaking the screws or bolts. Sometimes the housing would be forced out too far, allowing the armature to fall on the pole pieces and do considerable damage. With the new device this trouble is eliminated. Where it took one man twenty minutes to remove both housings the old way, the same man can do the



Apparatus for removing armature bearing housings which greatly facilitates this work and saves much time

Digitized by Google

work now in five minutes. The present practice is to remove three of the four cap screws on the pinion end housing and loosen the fourth about half its length. The dust cap on the commutator end housing is then taken off and also the two capscrews nearest the setscrew holes in the housing. This permits the yoke to be applied. The yoke is then fastened in place by two ¾x2-in. capscrews. Pressure is applied on the armature shaft by turning the screw of the yoke device against it, forcing the pinion end housing out the distance required. The remaining two bolts on the commutator end housing are then removed and by continuing the pressure on the armature shaft this housing is likewise forced off.



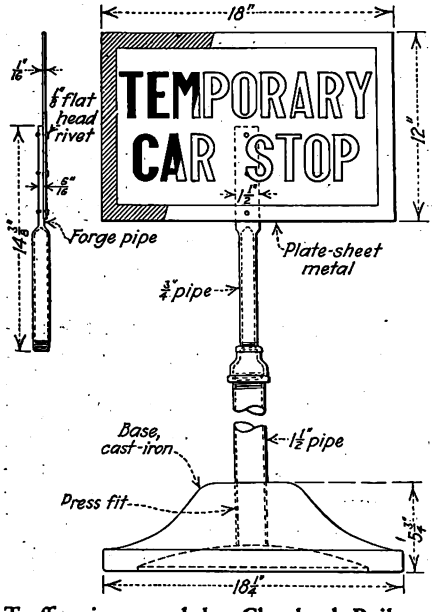
A ¾-ton delivery truck used by the Cleveland Railway for sanding track on steep grades

NEW IDEAS IN TRACK WORK

Traffic Signs Used During Track Reconstruction

By A. B. COPELAND
Superintendent of Construction Way Department

PLACING traffic signs to direct and warn the driving public during periods of track construction is considered a matter of great importance by the Cleveland Railway. After careful consideration, the company has adopted signs patterned from those now in general use by the Cleveland Police Department. These signs are made entirely of metal, having a heavy cast-iron base that gives them the necessary stability. The weight of a complete sign is about 126 lb. They stand 5 ft. 8 in. high and are painted with blue letters on a white background with a red border. This combination gives them prominence and visibility at a distance, preventing confusion and accidents.



Traffic signs used by Cleveland Railway reduce danger of accident and assist the public

The signs now in use by this company are: the "No Road" sign, which is equipped with a reversible detour arrow and has red lantern brackets; the "Danger Warning" sign, equipped with red lantern brackets; and the "No Parking" sign. In addition to the traffic signs, this company uses also a "Temporary Car Stop" sign, mounted on a standard base, which can be placed at a point convenient for passengers to board cars when the regular car stop is inaccessible. In connection with this sign, another is placed on the pole which carries the regular stop sign, having an arrow on it, directing the passengers to the temporary car stop. This combination eliminates the necessity of placing a man at the regular car stop to direct the passengers.

* *

Rail Sanding Truck

By E. B. SPENZER
Way Department

SANDING track on long steep grades at Cleveland is done with the aid of a motor truck. Formerly this was done by a man with a sand can, but the hazard of walking in the center of the street and the increased cost of labor resulted in the development of the sanding truck, which is more efficient and not as costly as the old method. At the rear end of a ¾-ton truck were installed two large sand boxes, one on each side. On the bottom of each box is a sand trap of the same design as used on a street car. From each of these a tube extends down behind each wheel to within 3 in. of the rail. The flow of sand is controlled from the driver's seat by a lever similar to the emergency brake, which can be locked into position. The driver keeps the wheels of the truck on the rails, as he goes up and down the hill, and releases the sand at will. This truck has cut the cost of sanding these hills to a third and has proved satisfactory in every respect for six years.

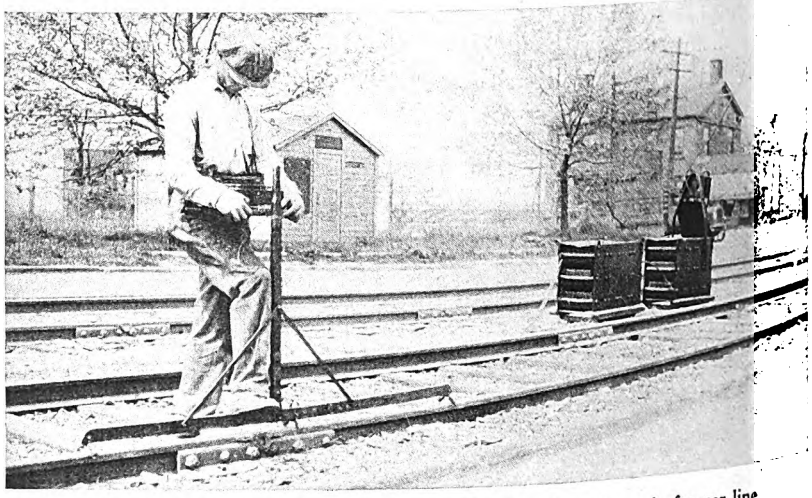
Artificial Load for Rail Joint Testing

By H. A. BROWN
Foreman Return Circuit Switch and Signal Division

FREQUENTLY, when using the ordinary type of portable rail joint testing meter at the end of a car line,



Testing rail joints by means of an artificial load at the end of a car line

Digitized by Google

or on a line which has little current flow in the rails, efficient joint testing becomes a difficult task, as it is practically impossible to obtain readings on the instrument. To overcome this difficulty the Cleveland Railway has designed an artificial load tester, which is connected between the trolley wire and rails, and gives the current flow necessary to furnish reliable rail joint data. The unit consists of two sections of heavy street car resistance grids in series. Each weighs 538 lb. Connection to the trolley wire is made through a G.E. 400-amp. railway type circuit breaker, which is mounted above one section of the unit, as shown in the accompanying illustration. The strength of current used is 100 amp.

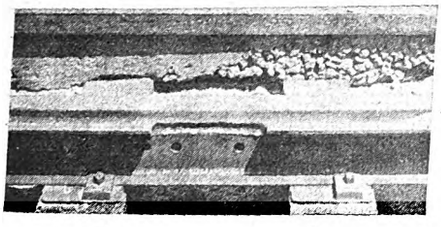
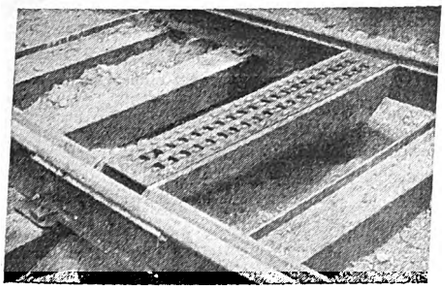
Reinforced Grooved Girder Rail for Track Drain Installation

By C. B. Bennett
Way Department

USE of the A.E.R.E.A. 122-lb. 7-in. grooved girder rail, adopted in 1928 as standard at Cleveland for track in paved streets, has led to a change in the design of the track



Reinforcement for grooved girder rail where track drains are installed



End-opening track drain used by Cleveland Railway

drain. This had an end opening to drain the water from the rail groove, making it necessary to cut away a section of the lip of the rail. The operation of cutting the lip consisted of two saw cuts at right angles to the gage and burning away the intervening section of the lip with an acetylene torch. During the first winter that this track was in service, a considerable number of breakages occurred through the rail at the points where the saw cuts had been made. Examination showed that where such breaks had occurred the saw cut had extended a very slight distance below the point where the acetylene torch had started, leaving a small nick in the rail. In order to avoid the possibility of a recurrence of this condition, the present practice is to install a pair of splice bars where such cuts are made, the center of the bars coinciding with the center of the track drain box. The inside bars have been machined down from $1\frac{1}{8}$ to $\frac{7}{8}$ in. in thickness, and $\frac{1}{4}$ in. machined off the top at an angle of about 45 deg. with the face of the splice bar to permit the placing of a welding rod back of the outside face of the splice bar. After these splice bars have been drawn up tight with bolts, they are seam-welded, top and bottom. The bolts are then removed except the two at the end. This permits the drain box to fit snugly between the two splice bars resting on the base of the rail. A further precaution which is being taken is to end the saw cut a sufficient distance away from the gage line of the rail to permit burning with a torch so as to form a small fillet in the corners of the opening that is left to receive the drain box. The total cost of reinforcing the rails in this manner is about $16 per drain. Since this practice has been followed no failures have been observed.

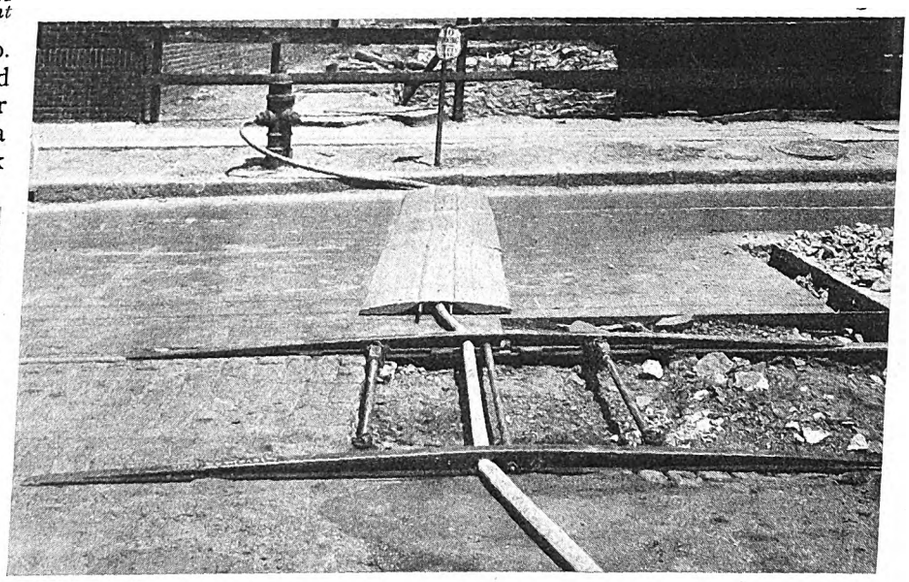
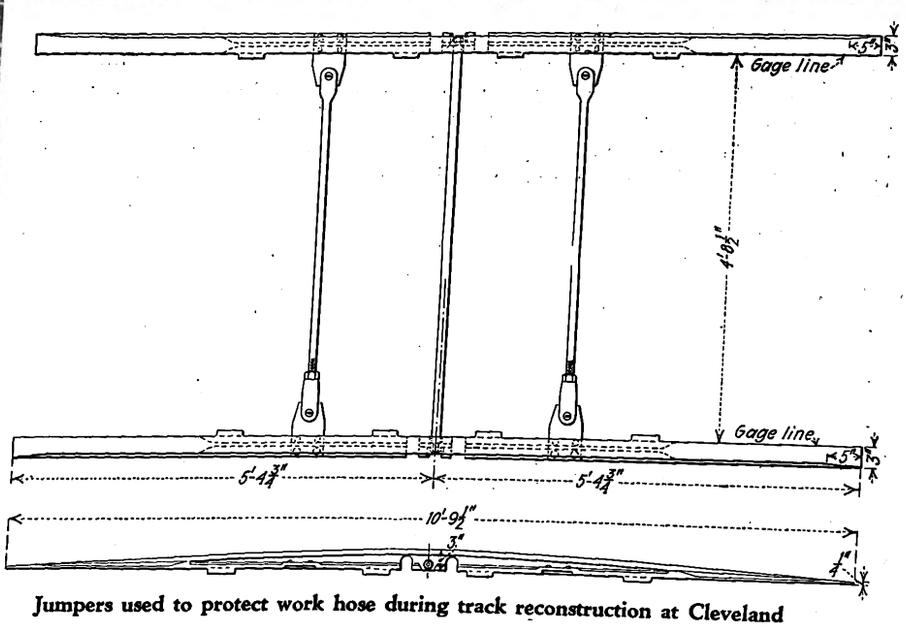
Jumpers Built for Work Hose

By F. E. Davidson
Way Department

WHEN mixing concrete for track jobs it is usually necessary to run a hose line from a hydrant on the curb across the roadway, and, in some cases, across the track in operation. At Cleveland this was formerly done by placing a plank on each





Jumpers used to protect work hose during track reconstruction at Cleveland

Digitized by Google

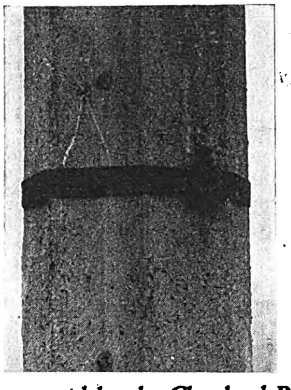
side of the hose in the roadway and throwing the hose over the trolley wire. This method was unsatisfactory and dangerous, as the planks get out of place and slow up vehicular traffic, while the hose over the wire may become wet and carry current. The Cleveland Railway is now using on all its large construction jobs a set of jumpers for work hose. The track hose jumper is made of solid cast manganese and lies on top of the rail. It is 10 ft. 9¼ in. long and weighs 400 lb. It has adjustable tie rods to fit a wide or narrow gage. The roadway hose jumper is made in sections 4, 5 or 6 ft. long, which can be bolted together to fit a road of any width. This jumper is made of oak, reinforced with an iron plate.

MAINTAINING OVERHEAD

Strapping Equipment to Trolley Poles

By H. A. Brown
Foreman Return Circuit Switch and Signal Division

AN EFFICIENT, neat and easy way of strapping conduit pipes, ground wire protecting strips and other pieces of equipment to trolley poles is used by the Cleveland Railway. A galvanized band or hoop



Hoop iron used by the Cleveland Railway to strap pipes or wires to trolley poles

iron measuring $\frac{1}{16}$ in. x 1 in., and a special malleable steel slotted key are utilized. The band iron is cut of sufficient length to circle the pole and the pipe to be strapped thereto, with about 3 in. excess allowed at each end. The slotted key, which is ½ in. in diameter with one end squared, is slipped over the protruding end of the band and is turned up tightly to the pole with a wrench fitting the square end of the key, designed especially for this purpose. It is not necessary to utilize any locking device to prevent the unwinding of the band iron. Pipes so installed will remain in close contact with the pole. The cost of the material is slight and a great saving in labor and material is effected due to the fact that it is not necessary to carry in stock a great number of shapes and sizes of forged pole straps.

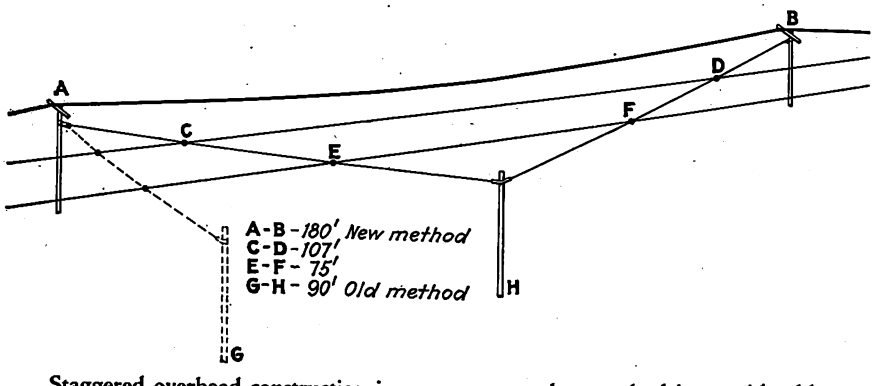
Staggered Location of Poles

By Angus G. Scott
Assistant Superintendent of Overhead Lines

ON LIGHT traffic lines on narrow streets the Cleveland Railway has saved considerable money by the use of staggered pole construction instead of the normal 90-ft. cross-span pole spacing. This staggered construction can be used with a maximum spacing of 180 ft. between poles on each side of the street, which will give trolley sections of approximately 107 ft. and 75 ft. on a street 50 ft. wide. This type of construction can be profitably installed with spacing varying from 120 ft. to 180 ft. between poles.

With this type of construction approximately 60 poles per mile can be eliminated, which represents a saving of about $3,000. By using the 120-ft. spacing, a saving of approximately $1,500 per mile can be effected.

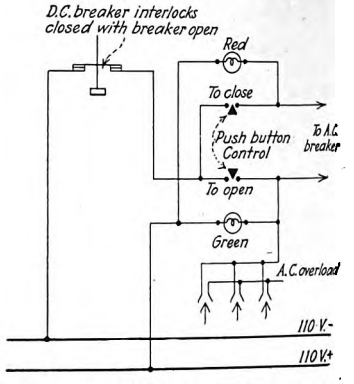


Staggered overhead construction in narrow streets has resulted in considerable savings for the Cleveland Railway

Interlocking Sequence Switching in Conversion Plants

By W. A. Masters
Assistant to Superintendent of Power Conversion

TO PREVENT substation tie-ups and damage caused by oversight on the part of attendants, the Cleveland Railway has found it desirable to make sequence switching as near fool-proof as possible. A method has been divised whereby the control circuits for the electrically-operated oil-



Hook-up of tell-tale switch in control circuits of A.C. supply to converter with hand operated carbon circuit-breaker

circuit-breakers, in the a.c. supply circuits to the converter, interlock with a tell-tale switch on the hand-operated carbon circuit-breaker in the outgoing d.c. supply circuits. The interlocking switch is such that it is impossible to open or close the high tension oil circuit-breaker unless the d.c. carbon circuit-breaker is open.

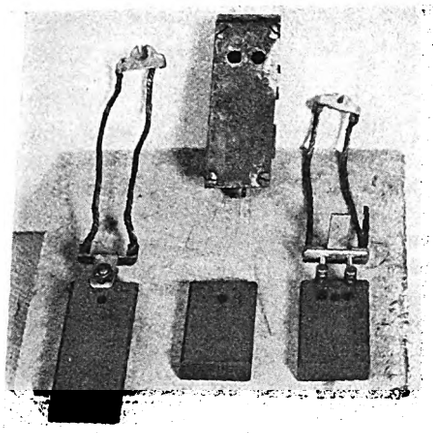
Reclaiming Worn Converter Brushes

By F. W. Braund
Superintendent of Power Conversion

SYNCHRONOUS converters purchased by the Cleveland Railway in 1912 are equipped with d.c. brush boxes on the commutator side to accommodate a carbon brush 1¾ in. wide, ½ in. thick and 3½ in. long. These brushes are of the detachable shunt type with but one bolt hole located centrally in the top portion of the brush. Due to the construction of the box, only 1 in. or approximately ⅓ of the material is available for wear, leaving some 2½ in. of brush stock to be discarded. Converters purchased in 1917 are equipped with d.c. brush boxes and take a brush 1¾ in. wide, ½ in. thick and 2½ in. in length. This brush equipment also is of the detachable shunt type but of different design, requiring two holes through the thick-

Digitized by Google



Worn brushes used on converters of one type are redrilled and can be used again on converters requiring a smaller size

ness of the brush and two through its length drilled to the thickness holes. This type is known as the screw and plug type of shunt and 1 in. of material is available for brush wear.

A jig has been made for redrilling the discarded 3½-in. brushes, worn to a length of 2½ in., so as to convert them into the new 1¾x½x2½ in. stock. The fifteen converters equipped with brushes 1¾x½x3½ in. make available more than enough brushes of ¾x½x2½ in. for the eight converters using the smaller size. The saving per year, with brushes costing approximately 60 cents a piece and with each converter equipped with 112 brushes, while eight such converters are in service, approximates $537.60.

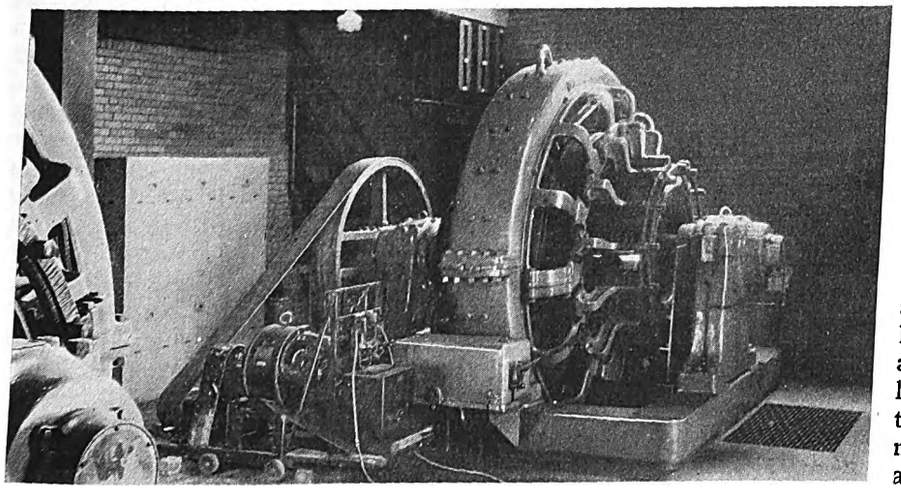
Turning Converter Armatures

By JOHN J. SCHULTIS
Maintenance Foreman

TO REDUCE the cost of turning commutators and slip rings on synchronous converters the electrical maintenance division of the Cleveland Railway has developed a compact apparatus consisting of a 600 volt motor and reducing gear mounted on a four-wheeled rubber-tired truck, a 5-ft. split wood pulley bored to fit the overhang of the converter armature shaft, and a screw jack and blocking to adjust the pulley center distance. The motor control is mounted on a panel carried by the truck and the connection is made to the main station bus. With this light portable apparatus two men can set up and turn a set of slip rings between the end of the morning peak load and the beginning of the evening peak. One man can be released for other work while the actual turning operation is being performed, and called again to help dismantle the rig when the job is finished.



Compact apparatus used by Cleveland Railway for turning converter armatures during overhauling

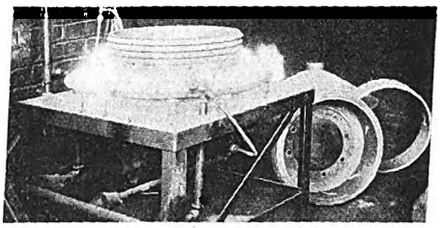
BUS AND GARAGE DEVICES

"Shrunk-In" Brake Drum Liners

By LEONARD S. ROSE
Superintendent Motor Coach Division

BRAKE drums of the modern motor coach represent a considerable expense to the operator if he finds it necessary to discard them as soon as they have become worn oversize. In order to solve this problem the Cleveland Railway has developed so-called "shrunk-in" drum liners. A cast liner is shrunk into an oversize drum and held in place as follows: The liner is turned 0.02 in. oversize, the drum heated and then dropped over the liner ring. The liner is held in place with six radial dowls, which are used because they prevent any vibration or strain caused by loosening. Liners used for this purpose are of the so-called "gun iron." This material is used since it is of a uniformly fine grained structure and will not chip, which often causes scoring of the liner.

Before installation the drum is set up in the lathe and a light trueing or smoothing cut is taken off the inner surface. This operation is necessary for the initial installation only. The liners are then turned to size, with the outer diameter 0.02 in. larger than the drum and the inner diameter under the nominal 16½ in. finished size, to permit of a light trueing up on the grinder or lathe. The liner itself is about ⅜ in. thick when finished to size. The drum is then heated in a small hooded furnace with a circular gas burner directing a flame on the outer surface, until it will readily drop over the prepared liner. If the liner be placed on a clean sheet-iron plate next to the heater it is merely necessary to drop the drum on the liner at this time in order to secure satisfactory alignment. When cool, six radial dowel holes are drilled through the drum and about 1/16 in. into the liner. Dowels, of ⅜ in. gas pipe, are then inserted. A drive fit is used and the pipe brazed both to the liner and to the drum. The final operation consists in mounting on an arbor and trueing up on the grinder or lathe.



Heating brake drum preparatory to inserting rim liner

When this drum liner has been worn sufficiently oversize so that it will no longer pay to regrind it, the dowels are drilled out and a narrow slot is chiseled through the gun-iron liner to the steel drum. It is then a simple matter to remove the old liner. The chief advantages of this type of installation are that it permits us to continue to keep in service all of the old steel drums originally equipped with removable two- or three-piece liners. The three-piece

Digitized by Google

liner was found to be unsatisfactory for the service because of its severe brake action and abuse of tires. Another advantage is that we are enabled to operate newer and more popular forms of "bolt-on" brake lining against a one-piece braking surface, thereby increasing their life considerably. Finally, it gives us a more economical method of obtaining new braking surfaces than by buying new drums. This is particularly important when one is considering the value of using the bolt-on type of shoe lining, since the mileage of this type of lining against a three-piece drum liner is often very disappointing in city service.

The time required to make and install a drum liner is approximately eight hours. The material cost is about $5 each. When considered against a comparable cost of $26 for a similar new drum it will be seen that this method is more economical. From the standpoint of results obtained we have been unable to detect any way in which our lined drums are not at least equal to cast drums. We believe that if these liners are properly installed there is less drum warpage than with solid drums.

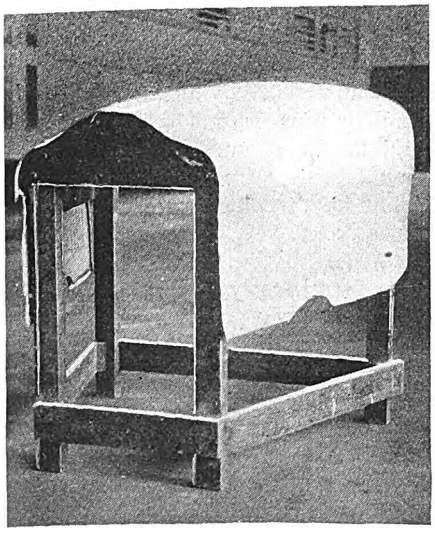
Hood Mounting Fixture

By JACK KEHOE
Foreman St. Clair Overhaul Garage

IN THE main overhaul garage of the Cleveland Railway a handy jig is used for preparing repaired hoods for mounting. The front end is cut to the shape of the coach radiator, while the rear end is of the same profile as the cowl, and at the proper height with relation to the radiator. When the hood comes from the sheet metal shop it is from 1 to 3 in. too long, it has spot-welding marks, requires the mounting of fasteners and is generally unready for immediate installation. It is convenient therefore, to mount the repaired hood on this jig in order to do all of the hand finishing necessary to fit each hood to its individual coach. This includes squaring up or shaping the ends and trimming them to the proper length, grinding or filing down the rough edges, hammering out any dents and in general preparing the hood for installation on the coach.



Jig used in the overhaul garage of the Cleveland Railway for finishing repaired bus hoods

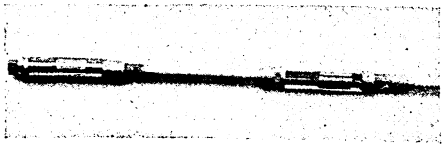
Brake Cam Line Reamer

By ROY STEVENS
Assistant Superintendent Maintenance

DIFFICULTY in reaming the bushings of the brake camshafts on coaches equipped with air brakes has led the Cleveland Railway to develop a special tool for this purpose. In this type of brake rigging the two shaft bushings are separated about 13 in., the outer one being in the brakeshoe spider and the other being in a bracket belted to the rear axle, near the air-brake cylinder. The bushings have the same inside diameter and must be in alignment. An attempt to ream these two bushings separately usually results in misalignments, making it necessary to ream oversize in order to get the shaft in place. The advantage of a reamed fit is lost and bushing life is materially shortened. At the request of the company a reamer manufacturer designed a double expansion reamer on one shaft, the two units being spaced the distance between the two cam bushings, as shown in the illustration. This permits placing the reamer in position by reducing the diameter of the "inside" reamer, and slipping it through the outside bushing simultaneously. This tool cost approximately twice as much as regular reamers of the same size. From a comparison of the quality of the work done, however, and the shorter time required to do the job, it is worth considerably more, and its use has become standard practice.



Double expansion reamer for brake camshaft bushings

Hose Jumpers for Buses

By LEONARD S. ROSE
Assistant Superintendent Motor Coach Department

FOR use on city coach lines special fire hose jumpers have been designed and built by the Cleveland Railway. These have been made necessary since a number of important routes traverse streets from which no detour can be made in case of fire and where a fire of any magnitude would result in a suspension of coach service. These jumpers are made up sectionally so that they can be extended in either direction to take care of any number of traffic lanes or any number of hose lines. Each unit is 6 ft. wide, three units being required to take care of double line of traffic. As may be seen from the accompanying illustration, individual units of this length conform to the crown of the road, and are short enough to be easily handled under the most adverse conditions. A jumper unit consists of two "risers" as a minimum and as many spacers as are necessary to cross the required number of hose lines. Individual pieces are assembled by pins which are automatically held in place when the hose is in position. When consideration is given to the fact that one fire hose, crossing the street merely as a precautionary measure, may hold up an important line for a number of hours, it may be seen that the value of these jumpers in maintaining the good will of the public may be very great.

New Products for the Railways' Use

The new Hyman fare register is designed to accommodate three denominations of coins—nickels, dimes and quarters

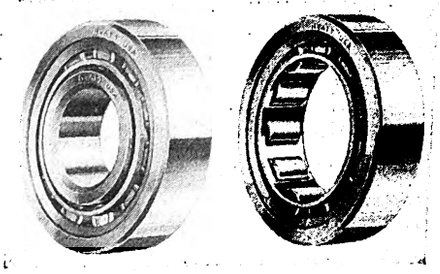
Mechanical Coin Fare Register

A REGISTER, designed to take three different denominations of coin, and to provide the operator with a particularly good view of the coin inserted, has been brought out by the Hyman Register Company. Two small electric bulbs are installed for night use, and an individual sounding bell is attached to each of the three receptacles in order that the operator may know what denomination coin has been inserted. After passing through the counter the coin drops to a plate, where it is clearly visible to both the passenger and the operator before the latter trips the plate which releases the coin and drops it to the bottom of the register. This is constructed somewhat after the manner of a change holder, so that change of quarters, nickels or dimes can be taken out easily by the operator.

The register is mounted on a regulation stand near the operator. It is mechanically operated throughout and does not rely on any power other than gravity to operate. The electric bulbs in the registers are operated separately from the battery on the bus and are used for lighting purposes only; therefore, the burning out of one or two of these does not hinder the operation of the register in any way.

Single-Row Radial Bearing Has Large Carrying Capacity

TO SATISFY an increasing demand for a roller bearing interchangeable with standard S.A.E. single-row ball bearings but having greater load capacity, the Hyatt Roller Bearing Company of Newark, N. J., is now manufacturing single-row radial bearings. This new type, made up of solid rollers, is not intended to replace the standard Hyatt roller bearing, which uses spirally wound rollers, but is offered as a supplement to it for use where space limitations exist, and for loads beyond the capacity of ball bearings to sustain. The design employed is one in which the rollers are permanently retained within the outer race by heat-treated end rings. The inner race is separable. A separator, floating on the rollers, spaces the rollers properly. The rollers and races of this bearing are made of a special analysis chrome nickel alloy steel, and the end rings are of vanadium steel to minimize wear by the ends of the rollers. The roller separator is so made that the pockets are parallel and equally spaced, thus assuring uniform load distribution on the rollers. The bore, outside diameter and width of Hyatt single-row radial bearings correspond to standard S.A.E. metric dimensions. They are therefore interchangeable with all single-row ball bearings of equivalent size, providing greater load capacity within the same space and increasing the efficient life of the installation.



Single-row Hyatt radial bearing assembled with the inner race in position and, at right, with the inner race removed to show roller construction

Power Amplifier for Station Announcements

APPARATUS manufactured by the Radio Receptor Company, Inc., of New York City is designed to amplify the sound of the human voice without distortion and with a volume that can rise above noise backgrounds caused by people and machines.

This may be used in conjunction with a microphone pick-up, or with a special record used on a phonograph or similar instrument. For moderate conditions an amplifier known as the "Powerizer" PXP-245 is used. This "Powerizer" has two 245 power tubes in push-pull arrangement, and amplifies the signal sufficiently to be carried by wires to all parts of a terminal or waiting room. If a relatively wide area is to be covered and large volume is necessary, the "Powerizer" PXP-250 may be used at these distant points, working in conjunction with PXP-171 as the voltage amplifier. The PXP-250 employs the 250 power tubes as well as two 281 rectifiers in one unit, and a 227 and two 1 1-A tubes for the other unit. It is capable of a total undistorted output of 15 watts, and may furnish as many as twelve loud speakers, to be used either in large halls or out of doors.

Train announcements can be easily made with this power amplifier, together with a small microphone as shown in the accompanying illustration

NEWS *of the Industry*

Baltimore Pact Removes Bar to Pennsylvania Electrification

Announcement was made on Oct. 21 by the Pennsylvania Railroad that negotiations which have just been concluded by the company with the city of Baltimore now open the way for complete electrification of the Pennsylvania Railroad from New York to Washington.

The new agreement has been in negotiation for several years. It covers extensive station platform and track improvements in and through Baltimore and the construction of two new double-track tunnels in the city limits, which will enable the company to extend the electrification of its lines from New York to Wilmington, Del., to Washington and the Washington Terminal area for both passengers and freight. Actual work on the Baltimore improvements will be undertaken by the company immediately.

Between five and six years are allowed in the agreement for completion of the tunnel work, new station, freight warehouses, grade crossings and electrification. It is anticipated, the company says, that before the expiration of that period the electrification from New York to Wilmington will have been completed.

Hearing on Intrastate Rates on Nov. 12

An investigation to determine whether the intrastate rates of the Wheeling Traction Company in Ohio discriminate against interstate traffic was ordered by the Interstate Commerce Commission on Oct. 22. The commission's action was taken on a petition filed by the company representing that, because of franchise ordinances and regulations imposed by the state and several municipalities, it is unable to increase its rates on intrastate traffic to the basis in effect on interstate traffic, as published in the tariff I.C.C. No. 21. This proceeding has been assigned by the commission for hearing on Nov. 12, at Steubenville, Ohio, before Examiner Maidens. The commission's order instituting the investigation has been served upon the Ohio Public Utilities Commission, the Mayors of Martin's Ferry, Bridgeport, Bellaire, the village of Shadyside, and the Board of County Commissioners of Belmont County, Ohio.

The order provides that an investigation be instituted "to determine the reasonableness of petitioner's interstate rates, fares and charges as published in said tariff I.C.C. No. 21 and whether the rates, fares and charges required by authority of the state of Ohio to be maintained by said petitioner cause or will cause any undue or unreasonable advantage, preference or prejudice as between persons or localities in intrastate commerce on the one hand and interstate or foreign commerce on the other hand, or any undue, unreasonable or unjust discrimination against interstate or foreign commerce; and to determine what rates, fares and charges, if any, or what maximum or minimum rates, fares or charges shall be prescribed to be charged by the petitioner on its lines in order to remove such advantage, preference, prejudice or discrimination, if any, as may be found to exist."

Action on School Fare for Minneapolis Postponed

The city of Minneapolis, Minn., may not press the matter of a special 5-cent fare rate for school children, such as is effective in Duluth, Minn., under a compromise arrangement. The attorney general has ruled that the Railroad & Warehouse Commission may grant such a fare legally under the Brooks-Coleman act, which placed rate-making powers in the hands of the commission. However, at a Council committee meeting on Oct. 18 consideration of the matter was postponed until the return of the Mayor, who asked the special rate. T. J. McGill, general manager of the Twin City Rapid Transit Company, believes the special rate would be useful to a comparatively few students. In Duluth, he says, only 1,500 out of 26,000 pupils use the privilege, and a partial check of one high school indicated that 100 out of 1,500 rode the street cars. The reduced fare for school children in Duluth was the result of negotiations in which the company there secured other concessions in return for granting this privilege.

New Agreement in Des Moines

Wage Contract Revised So As to Permit Use of One-Man Cars. Other Changes Made

AFTER successfully waging a five-year battle against the institution of one-man car service in Des Moines, Iowa, members of Local 441, Amalgamated Association, on Oct. 18 accepted a new working agreement which permits the Des Moines Railway to operate one-man cars whenever such a move is deemed advisable. Concessions from the company include recognition of the union until 1940, a wage increase, old age pensions, group life insurance and other favorable features.

The new contract contains the following major provisions:

1. All union employees of the company are to receive an increase of 1 cent an hour each year for the next three years. The first increase is effective on Nov. 1, this year. The total of 3 cents will boost the maximum for trainmen from 59 to 62 cents an hour.

2. The union agrees to accept a flat increase of 5 cents an hour additional if and when the company institutes one-man cars. It was this clause which aroused the ire of the union members against the two former proposals made by the present owners.

3. The company agrees to recognize the union until Nov. 1, 1940, and to treat with union representatives in all matters affecting the company and members of the union.

4. The company agrees to set aside $1,500 a month or $18,000 a year for a pension fund for employees. Any union employee who has served twenty years continuously and has reached the age of 65 years is eligible for a pension of $58 a month.

5. The company agrees to pay $58 a month to any union employee totally disabled in service, payments to continue during period of disability.

6. The company agrees to carry group life insurance which will pay beneficiaries of each employee $1,000 at his death.

7. Employees are to receive time and a half for all time over nine hours. Men on tripper runs are to receive a minimum of four hours pay every time they take out a car.

8. The company agrees to check off all dues, fees and assessments payable to the union. This was one of the "bones of contention" between the old company and the union.

9. Employees called to the claim department to report on accidents, etc., are to receive pay for time actually spent and one hour additional if called from their homes.

10. Both sides agree to arbitrate at the expiration of the wage agreement in 1932 in case they cannot arrive at terms for a new wage contract.

The new contract, proposed by Walter J. Cummings, president of the company, takes the place of the famous two-man car contract signed in 1915 by the Des Moines City Railway and the union. The 1915 agreement stipulated that there should be a motorman and a conductor on each car and was to be in force until 1940.

This agreement became legally void when Mr. Cummings and his associates purchased the Des Moines railway at the receivership sale on June 22, this year. At that time Mr. Cummings elected to buy the assets of the company "without the contract" as permitted in the order signed by Federal

Supreme Court to Test Ruling on 5-Cent Rate

THE Supreme Court of the United States on Oct. 21 granted a writ of certiorari in the case of Georgia Power Company vs. City of Decatur, No. 363, and will review the decree of the Supreme Court of Georgia, affirming the decree of the Superior Court of Dekalb County, Ga., adjudging that the company be perpetually compelled to operate its railway within the city at a 5-cent fare. The case involves an attempt on the part of the Georgia Power Company to surrender its franchise to the city after it had been denied permission to increase its existing rate of fare, which it contended was confiscatory.

Digitized by Google

Judge Martin J. Wade. Members of the union, however, refused to concede that the contract was not binding on the purchaser of the property and they turned down the first and second agreements proposed by President Cummings because of the clause which would have let down the bars to one-man car operation.

It should be pointed out that none of the three proposals, the last of which was accepted by the union, provided directly for one-man cars, but merely stated that the company would pay a flat increase of 5 cents an hour if the change were made.

The acceptance of the new agreement writes finis to a contest begun in 1925 when the Des Moines City Railway asked the Polk County District Court to set aside the two-man car contract. The company contended that under a service-at-cost franchise any contract which prevented it from instituting more economical operation was against public policy. The company told the court that a saving of nearly $200,000 annually in trainmen's wages could be effected by the institution of one-man cars, and that the saving would probably result in reduced fares. The court held that one party to a contract cannot plead public policy in an attempt to break that contract. The Iowa Supreme Court held likewise in a ruling on the appeal taken by the company.

Periodical strike votes followed the legal battle and the union and the company were at swords' points until the property was acquired by the present owners.

Negotiations which began between President Cummings and union officials shortly after Mr. Cummings acquired the property were marked by good will on both sides, and the peaceable settlement of the trouble was good news to Des Moines.

The $1.25 weekly pass, which has proved so popular, will be continued and all rolling stock except the ten new cars put into operation recently will be replaced by faster and more modern cars.

Committee Reports Against Omaha Bridge Purchase

Interest in the "free bridge" question has been aroused anew in Omaha, Neb., and Council Bluffs, Iowa, by the presentation of the report of the joint Omaha and Council Bluffs bridge committee. In brief, the report rejected the price of $4,155,296 placed upon the bridge by the Omaha & Council Bluffs Street Railway, the present owners of the bridge; recommended the construction of two new bridges unless terms considered more reasonable can be obtained from the railway; recommended the submission of revenue bond issues totaling $4,150,000 for the building of the two new bridges to the electors, and the securing of proper federal legislation preliminary to construction of the new bridges.

The recommendations of the committee will be submitted to the City Councils of the two cities, and the entire matter may then be submitted to the voters of the two cities.

The report of the committee stated: "If the existing bridge at Douglas Street (the one now owned by the railway and operated as a toll bridge) can be acquired at a price reasonably near the estimated cost of a new bridge of the arch span type, we submit that this is the most desirable method of obtaining a free bridge at the earliest possible date."

J. N. Shannahan, president of the railway, insists upon a price of $4,155,296, an amount which represents a sacrifice of more than $1,000,000 on the part of the company. The report of the committee prohibits a purchase price above $2,750,000, the estimated cost of a new bridge.

The only possibility of a compromise seems to lie in the direction of the adoption of the plan submitted by an Omaha City Commissioner, whereby the company would collect the tolls for a period of five years after which the city would secure title to the bridge. In order for this plan to be at all satisfactory to the company, however, the length of time for the collecting of tolls would have to be lengthened to 6½ years.

Attractive Program of Papers for Iowa Meeting

Announcement has been made of the program of papers to be presented at the annual convention of the operators' section of the Iowa Electric Railway Association at Waterloo, Iowa, on Nov. 7 and 8. Convention headquarters will be at the President Hotel. Following the address of welcome by the Mayor and the response by John Sutherland, Davenport, past chairman of the association, the morning of Nov. 7 will be devoted to the following order of business:

"The Car Builder's Contribution to Economic and Safe Electric Railway Operation," by F. L. Markham, sales manager American Car Company, St. Louis, Mo.

"Rehabilitation Problems of Omaha & Council Bluffs Street Railway," by C. D. Porter, vice-president and general manager Omaha & Council Bluffs Street Railway, Omaha, Neb.

"Practices in Maintaining Power Distribution System," by S. J. Fairbanks, electrical engineer Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa.

Discussion.

Announcements and appointments of committees.

In the afternoon the paper, "Electrification and Operation of Illinois Central Terminals in Chicago," will be presented by W. M. Vandersluis, electrical engineer Illinois Central Railroad, Chicago, Ill.

Another paper of the afternoon will be:

"Salient Features of Operation and Maintenance of Motor Coaches of Chicago Motor Coach Company," by E. Watton, superintendent of equipment Chicago Motor Coach Company, Chicago, Ill.

John Sutherland, master mechanic Tri-City Railway, Rock Island, Ill., will then present "A Talk with Our Foremen."

On the morning of Nov. 8 there will be two papers:

"Urban Transportation by Street Car and Bus—Experience in Maintenance and Operation of Both," by A. H. Smith, superintendent transportation Interstate Power Company, Dubuque, Iowa, and "Substitution of Buses for Street Cars," by Charles Munson, manager Iowa Railway & Light Corporation, Marshalltown, Iowa.

In the afternoon there will be a trip over the Waterloo terminals of the Waterloo, Cedar Falls & Northern Railway.

The convention banquet will be held on the evening of Nov. 7 at the Hotel President at 6 o'clock.

A Strong Arraignment of New Orleans Strikers

"The senseless animosity of a few communists prolonged the fight between the New Orleans Public Service and the union and resulted in defeat of the cause of unionism in New Orleans," Rev. Father Peter M. H. Wynhoven, head of Catholic charities in that city, told members of the Federation of Catholic Societies of Louisiana at their meeting there.

Father Wynhoven was at one time mentioned as a possible arbitrator between the company and the men and was a member of the Commission Council's committee of seven prominent citizens who sought to end the strike two months ago. He said:

"Communism is the fire by which the carmen 'cooked their own goose.' Property was destroyed, arson committed, people wounded, men killed—by whom and for what? Not by the rank and file of the carmen, for most of them are good, law-abiding citizens. It was by their so-called 'leaders' who were so filled with the violent, unreasonable, brainless spirit of communism that they brought about the carmen's defeat.

"Can you imagine for a minute that the vast majority of these conductors and motormen, as you know them, would place bombs under our street cars? It was the communists who wished to destroy capital, but who also are equally against the cause of the laboring man.

"It would be well for the heads of the American Federation of Labor to climb into the watchtower and keep vigil night and day for these symptoms. If they do not, this unreasoning spirit will eat into the very foundation beams of our national structure. There is nothing more unnatural and unreasonable than the hostility sought to be engendered between labor and capital.

"If ever harmony, a spirit of co-operation and unity of purpose should exist, they are certainly called for by the relations of these two classes. Employees cannot flourish unless the company for which they work is making money, and the employer cannot exist unless his workers are satisfied and happy.

"No material laws can correct the difficulties set up between capital and labor: Morality is needed—a morality that cannot be instilled by the materialism with which the atmosphere is charged in these modern times. Catholic men and women have a mission, a sacred obligation—to exert an influence for settling difficulties such as the present one in New Orleans."

90,707 Miles to the Accident in Portland, Ore.

The transportation division of the Portland Electric Power Company, Portland, Ore., has made the best record in its history on its street cars and buses in reducing preventible accidents. The total number of miles operated during August was 1,288,143, with only nineteen accidents classed as "preventible."

The new mark is nearly 35 per cent above the July record, which was the highest up to that time. The company has now advanced its "bogie" for its campaign to 65,000 miles. The star performance in August of the five transportation divisions indicated an average of 90,707 miles to an accident.

No Parking Being Enforced in Chicago Loop

Although the Illinois Supreme Court has held the original ordinance prohibiting parking in the Chicago Loop area invalid, city officials are promising that the no-parking rule will continue in force.

The ordinance declared void by the court was superseded last March by another which cured the defect found by the court in the original act. It is contended that because of this fact the court's decision is of no effect, but the city corporation counsel has not yet ruled on this point. In the meantime the ordinance is being enforced without interruption and steps are being taken to ask for a rehearing.

Public sentiment is outspokenly against a return to the chaos of Loop streets prior to the adoption of the parking prohibition.

The decision of the court was based on the fact that the original ordinance, attacked by Arthur Haggenjos, a Chicago attorney, did not allow a reasonable use of automobiles in the Loop, since it prohibited "standing" for any purpose.

The new ordinance, enacted in March, permits private automobiles to stop for not to exceed three minutes for loading and unloading and allows service vehicles half an hour for the transaction of necessary business. This is the ordinance which has been enforced since that time and it is believed that its terms are not in conflict with the court's decision.

City's Expert Recommends Fare Increase

Harry R. Allensworth, who has been inspecting the books of the Columbus Railway, Power & Light Company, Columbus, Ohio, for the city, says in his report that the company should be granted an increase in fares. The company now gets 5 cents for ticket fares and 6 cents for cash fares. When the company sometime ago opened negotiations with the City Council for a new franchise it asked a 7-cent ticket rate, with 10 cents for cash fares.

Mr. Allensworth favors the sale of four tickets for 25 cents with the cash fare at 8 cents if the railway service is to be continued as at present. He would, however, allow the company to sell five tickets for 35 cents, with an 8-cent cash fare if the service is to be improved by extensions, rerouting, better equipment and if a higher wage is paid car crews. The report has been turned over to Fred P. Zimpfer, chairman of the public utilities committee of the Council.

Benjamin W. Marr, president and general manager of the Columbus Railway, Power & Light Company, declined to comment on the report other than to say that it appeared to be fair and satisfactory.

Parking in Memphis

The question of parking in Memphis, Tenn., remains open to solution by engineers and the City Commission, it was learned, when visits of two consulting engineers to the city brought Memphis traffic problems into widespread discussion. The Mayor said:

"The city has no intention to divert street cars from Main Street. Merchants have built their stores around the present car system, and have a right to expect it to remain. We are considering the rerouting of some car lines, especially the Lamar line, but we have not gone so far as to prepare any definite plans."

It has been suggested that all parking on Main Street be prohibited during business hours.

The two visiting engineers are Harland Bartholomew, St. Louis, consulting engineer of the planning commission, and Ross W. Harris of Madison, Wis., who has been retained by the city to make traffic recommendations.

$8,632,000 Grade Elimination at Chicago

Depression of the South Chicago suburban branch of the Illinois Central Railroad tracks would cost approximately $8,632,000, according to estimates presented by the railroad officials to the track elevation committee of the Chicago City Council.

The South Shore Chamber of Commerce, of Chicago, last year started a campaign to obtain track depression. Morgan L. Fitch, chairman of the track depression committee of that organization has stated that he believes the railroad favors it as much as do South Shore residents. Public hearings will soon be held to permit these residents to express opinions on the proposed ordinance.

The railroad officials suggested that the payment should be apportioned as follows: $2,173,000 by South Shore property owners, $1,075,000 by the city of Chicago, and $4,584,000 by the railroad.

Los Angeles Case Argued

City and Company Have Inning Before U. S. Supreme Court in Proceeding Involving 5-Cent Fare

THE plea of the city of Los Angeles for a straight 5-cent fare on the street cars of that city was presented to the Supreme Court of the United States on Oct. 22, when were heard oral arguments in the case of Railroad Commission of the State of California and city of Los Angeles vs. the Los Angeles Railway.

Arthur T. George, for the commission, opened the argument. He said the case was on a direct appeal from the decree of the District Court for the Southern District of California, which held invalid an order entered by the commission refusing to allow the railway to raise its fare from a straight 5-cent fare to a rate of 7 cents with four tokens for 25 cents.

The commission set the rate base at $42,000,000, and thereafter declared that the rate of return for the five years ended Dec. 31, 1926, had been 7.1 per cent, but that the rate of return for the past year had only been 4.9 per cent. The lower rate, Mr. George declared, the commission found to be due to failure to take advantage of numerous economies.

The railway appealed from the commission's order to the district court asking for an injunction to prevent the enforcement of the commission's order. At this time the city was allowed to intervene. Answers were filed to the railway's bill declaring that the corporation was operating under franchises granted by the city and county of Los Angeles calling for a fixed fare of 5 cents. Mr. George said:

"It is our contention that these franchises constituted contracts binding upon the railway and that the federal court was without jurisdiction to grant the relief sought."

The three-judge court issued the permanent injunction on the ground that the order of the commission deprived the railway of its property without due process of law.

Frederick Von Schrader took up the argument at this point for the commission and declared that the commission's argument is based on the ground that the franchises mentioned were binding contracts. He said:

"If any of our franchises are held to be contracts as we contend, then the lower court was without jurisdiction to change the rates by judicial action. Our adversaries will contend that the city did not have the power to contract with respect to the regulation of rates, but under the constitution and laws of California it has been held that the city did have that power. By decided cases of this and other courts, it has been held that where a valid contract fixing rates has been entered into between a city and a public utility there is no confiscation."

A total of 102 franchises has been granted to the railway, Mr. Von Schrader continued, 73 of which provide in substance that the grantee of the franchise shall have the right to charge 5 cents and no more as fare for any distance over the road, while eighteen of them provide that the carrier shall not exact a fare in excess of 5 cents except upon a showing before a competent authority having jurisdiction over rates of fare, that such greater fare is justified. He said:

"It is conceded by all the parties involved in this litigation that the commission is vested with power to change the rates fixed in the various franchises and we contend that until the commission issues an order changing the rates, the rate named in the franchises must continue in force."

The railway can seek no relief in the courts, Mr. Von Schrader pointed out, unless it secures a change of the franchise rates by order of the state commission.

Woodward M. Taylor for the railway, after reciting the facts of the case, told the court that the corporation's chief argument was that the franchises did not amount to contracts. Mr. Taylor then took up the various franchises issued by the city and county and added that the city has never passessed the power to fix public utility rates by contract. He said:

"The grant of authority to contract away the police power must be in definite terms, and there is no such grant in either the civil code of California or the franchise acts or the city charters."

Under the constitution of the state the legislature cannot fix public utility rates by contract, Mr. Taylor added, nor delegate the power to a city so to do. Therefore, Mr. Taylor continued, where conditions are inserted in a franchise which a city has no right to impose, they are negatory.

Not one single witness for any party to the proceedings before the commission testified other than the fact that under the 5-cent fare the company's system was earning a return of less than 5 per cent on any theory of valuation. Mr. Taylor said:

"In conclusion, we reiterate that under the decisions of neither the Supreme Court of California nor of this court nor the pertinent provisions of the California code, franchise acts or the city charters, is there a grant of the right to the city to contract regarding the regulation of rates, either expressly or impliedly."

Fare Hearings Resumed in Milwaukee

The Wisconsin Railroad Commission reopened on Oct. 15 and 16 fare hearings postponed in March to enable the interested parties to gather data desired by the commission and to permit the Milwaukee Electric Railway & Light Company to offer a definite fare plan. While there seems little disposition to deny that the company is entitled to an increase that will make the transportation department self-sustaining, there is discord among the municipalities involved.

The matter was brought to a head by the action of North Milwaukee in declaring for annexation to the city of Milwaukee in 1928. A strong factor in favor of this action by the electors was the expectation that they would automatically receive the city fares—now 7 cents cash and 6¼ cents by ticket (eight for 50 cents). The fares to North Milwaukee residents, however, include two zones at 3 cents each cash or 2 cents by ticket. It is the declared policy of the city to seek "one fare for one city" regardless of the extent of future annexations.

Certain of the wealthier suburbs opposed to annexation fear that if the annexed districts should receive a fare uniform with that of the city, the independent communities would have to bear an undue share of the metropolitan transportation cost.

The company is not taking sides in this matter, but is concerned solely with securing revenues that will produce the allowed rate of return on its transportation investment. In fact, it has offered to rebate in lower kilowatt-hour power rates any increases it may obtain from transportation.

The hearings opened with presentation of the city's case by Clifton Williams, special counsel. Various witnesses, including Mayor Hoan, contended that any fares adopted should be uniform for all of the city as a political unit, and that suburbs which refused to be annexed should be made to share a greater part of the expense of conducting transportation.

Among the witnesses for the company were: Ralph E. Moody, executive assistant, who presented the proposed schedule of 10 cents cash, six tickets for 50 cents and $1 weekly pass; Walter Jackson, fare specialist, who discussed the merits of the plan and the bases for the revenue and riding estimates; and R. H. Pinkley, assistant general manager, who, with Mr. Moody, discussed the rate base, allocations of revenues and expenses, etc.

On the plea of the non-annexationist suburbs that they needed more time to prepare, the commission granted a postponement to Nov. 11.

Promising Business Ahead for Evansville Lines

The Evansville & Ohio Valley Railway and the Evansville, Suburban & Newburgh Railway, Evansville, Ind., report that many of the large coal mines along their lines are getting ready to start on a better schedule. The Evansville & Ohio Valley Railway, as well as the Evansville, Suburban & Newburgh Railway, both own a large number of coal cars and other equipment, especially designed for handling business of this kind. At times these companies deliver as high as 40 and 50 cars of coal a day into the yards at Evansville.

During the past summer the Evansville & Ohio Valley Railway has greatly increased its passenger business by offering week-end excursion rates. This has enabled people in Evansville to spend the week-ends with relatives and friends at points along the line, and at a nominal charge. In addition to operating the railway from Evansville to Grandview, Ind., the company maintains a regular bus service between Evansville and Mount Vernon, Ind., and Henderson, Ky. The company also operates buses from Grandview to Cannelton, Ind., and to Owensboro, Ky.

COMING MEETINGS

Nov. 1—Metropolitan Section, American Electric Railway Association, New York.

Nov. 4—Transportation Group, American Institute Electrical Engineers, New York.

Nov. 6-7—Association of Electric Railway Equipment Men, Middle Atlantic States, Richmond, Va.

Nov. 7-8—Iowa Electric Railway Association, Operators Section, annual convention, President Hotel, Waterloo, Iowa.

Nov. 21-22—Public Utilities Association of Virginia, annual meeting, Chamberlain-Vanderbilt Hotel, Old Point Comfort, Va.

Dec. 2-7—National Exposition of Power and Mechanical Engineering (National Power Show), Grand Central Palace, New York City.

Jan. 23-24, 1930—Central Electric Railway Association, Statler Hotel, Cleveland, Ohio.

Jan. 27-29—Electric Railway Association of Equipment Men, Southern Properties, Birmingham, Ala.

Late News Briefs

Columbus, Ohio—In a speech for the Republican candidates for the Council, Dr. Howard Miller said he favors two crosstown railway lines, connecting North High Street and Cleveland Avenue. Benjamin W. Marr, president of the Columbus Railway, Power & Light Company, stated his company had considered only one of the two routes.

Baltimore, Md.—Sixty-four thousand words of argument for and against a 10-cent fare on the lines of the United Railways & Electric Company have been laid before the United States Supreme Court as the last step before the court hears the fare case later this month.

Richmond, Va.—A gold-colored street car of the one-man type, placed in service on its different routes by the Virginia Electric & Power Company in connection with the golden jubilee of light, attracted wide attention as it passed through the streets. The car, which took no passengers, carried a display of posters and replicas of the original Edison incandescent lamp. In addition to the illumination of Broad Street in gold from Twelfth to Jefferson Streets, arrangements were completed for a similar illumination on Hull Street during the period of Light's Golden Jubilee.

Chicago, Ill.—Twenty-five railway grade crossings along the Chicago & Northwestern steam railway and the Chicago, North Shore & Milwaukee electric railway in villages north of Chicago are to be eliminated immediately. The financing of the project will probably be undertaken jointly by the villages and the railroads. A bill passed by the last Legislature permits cities, towns and villages under 15,000 population to float bonds for grade separations. Several of these crossings are used daily by school children, a number of them carry much of the north and south traffic to and from Chicago, and virtually all of them are heavily traveled.

Lynchburg, Va.—Plans for a new carhouse, to be located at Thirteenth and Kemper Streets, will be submitted to the City Council on Oct. 28 for approval, following which the Lynchburg Traction & Light Company will erect modern buildings. The present carhouse site in Main Street has been sold for a theater. Removal of the carhouse from Main Street will mean the removal of a number of special tracks from Main Street and the substitution of a double track in that street from Sixth to Fifth Streets.

Boston, Mass.—James M. Curley, speaking in Dorchester, urged the removal of members of the Utilities Commission and said that if elected Mayor, he would work for making the commission an elective body. Rival candidate Mansfield said Curley's monuments are garages and gas stations in residential districts and declared he thought Mr. Curley is spending $500,000 in the campaign.

Richmond, Va.—Consideration of an appeal filed by the Piedmont & Northern Railway against the government, involving the company's proposal for extension of its lines in North and South Carolina, in all probability will not be given by the United States Supreme Court until December. The court first will consider the jurisdictional statements filed in other cases by parties seeking a hearing of an appeal similar to that of the Piedmont & Northern Railway. If the court approves these jurisdiction statements, which do not involve the merits of the contentions of opposing parties, it will then in all probability follow its customary procedure and set a tentative date for a hearing. On the final outcome depends the expenditure of between $15,000,000 and $20,000,000.

Indianapolis, Ind.—A new schedule for the livestock trains operated twice weekly between Indianapolis and Scottsburg, Ind., by the Interstate Public Service Company has started. The new schedule does not change the days of the week upon which the trips occur, but

Mule Car in Texas Round Up

OLD No. 1 mule car, which provided a de luxe mode of travel between El Paso, Tex., and Juarez, Mexico, in the early eighties, was featured in a pioneer parade which opened the Southwest Range Stock Show and Round Up held in El Paso during the last week of September. J. E. Lawless, master mechanic, El Paso Electric Company, was instrumental in having the old car entered in the parade. Mr. Lawless said that, like the covered wagon and the Concord coach, the old mule car is inseparably connected with El Paso's early history, a history typical of the spirit of the Old West.

Digitized by Google

later loading hours benefit the shippers. Under the new schedule trains depart from Scottsburg for Indianapolis at 1 p.m. on Mondays and Thursdays. They arrive at Indianapolis in time to allow a feeding for the stock and a rest before selling. The trains carry livestock shipments in less than carload lots. Indiana farmers are loud in their praises of the company for this arrangement.

Sandusky, Ohio — The Ohio State Public Utilities Commission has directed the Lake Shore Electric Railway to erect automatic flasher signals at all grade crossings in Huron, Sandusky, Ottawa and Erie Counties within a year.

Louisville, Ky.—Judge Dawson's decision in the Louisville Railway fare case was incorrectly reported in ELECTRIC RAILWAY JOURNAL NEWS for Oct. 12, page 168, under the caption "Ten-Cent Fare Allowed in Louisville." The court stated its belief that an 8 per cent return was fair and reasonable. The misquotation in the JOURNAL was to the effect that Judge Dawson "believed an 8-cent fare was fair." A typographical error led to the critical misquotation.

Cleveland, Ohio — Peter Witt, independent in politics and former street railway commissioner, at the annual town meeting in the public hall, laid all land graft at City Manager William R. Hopkins' door, accused Van Sweringen of controlling the Cleveland Railway in the interests of the rapid transit system and real estate developments, and criticized President Hoover for the military parade with which he greeted Ramsay MacDonald, the "world's greatest pacifist."

Richmond, Va.—Installation of one-man safety cars by the Lynchburg Traction & Light Company will mean a new rule prohibiting smoking in the front vestibule of the cars. Passengers have been allowed to smoke on the pay-as-you-enter type of cars, in use for about two decades. The entire system is expected to be equipped with the new cars within a month.

Detroit, Mich.—The Department of Street Railways prepared fitting ceremonies to attend the opening of railway service between Detroit and the western section of Dearborn. An elaborate program in which all civic and official organizations participated was staged at Michigan Avenue and Mason Street, the western terminal of the new line. Scheduled service to this section of Dearborn, which is served only by the Detroit Motor Bus Company at present has now been fully started. Cars will operate on a twenty-minute schedule. The cars will use the rails formerly employed by the Detroit, Jackson & Chicago Railway, which discontinued service to Ann Arbor and Jackson a month ago. The municipal railway has been using these rails for the past year as far west as Schaefer Road in the eastern section of Dearborn, which was formerly Fordson, to serve employees of the River Rouge plant of the Ford Motor Company.

Denver, Col.—Valverde, a subdivision in the southwestern part of the city, has suggested to President Robertson of the Denver Tramway that he place buses in operation to connect with the Broadway tram cars at Alameda Avenue and the Barnum line at West Bayard and Hazel Court. Mr. Robertson is believed to regard the suggestion as one which has real merit.

Montreal, Que.—Problems regarding the needs of the South Shore communities in the matter of transportation were discussed at a recent conference at which the Montreal Tramways, the Provincial Transport Company, and the South Shore Transportation Commission, were represented. The entire question of the feasibility and advisability of bus or combined bus and electric rail transportation for the communities concerned was discussed, and it was decided that there should be a further conference of the same representatives, together with the Montreal Harbor Commission, and the Canadian National Railways.

Evansville, Ind. — The Evansville & Ohio Valley Railway has awarded a contract for the erection of a modern frame garage on company property on East Fourth Street, Mount Vernon, site of the present carhouse. The new structure will be on the alley south of the present building.

Foreign News

Traffic on Paris Subway Bus and Street Car Lines Increases

During the last fiscal year the surface transportation lines of Paris carried 1,073,562,531 passengers, averaging 2,933,230 per day. The total number carried showed an excess over the previous year of 56,102,231, or a daily increase of 153,285 passengers.

Buses carried 342,868,520 passengers per year, the street cars 725,563,463, and the river boats on the Seine 5,130,348 passengers.

Total receipts reached the figure of 661,574,950 francs, or 38,608,142 francs more than the previous year.

Merger of Paris Underground Railway

The two individual operating companies of the Paris underground system, the Compagnie Métropolitaine and the Compagnie Nord-Sud, which have heretofore operated as separate units with transfer facilities, have been merged into a single company.

The Nord-Sud Company receives 106,877 fully paid Métropolitaine shares of 250 francs each, to be apportioned to its shareholders at the rate of two shares for five Nord-Sud shares.

The fusion of the two companies is to become effective on Jan. 1, 1930. The Nord-Sud produced a net profit of 5,672,536 francs last year.

Piccadilly Circus Old Station Closed—Midland Gets New Cars

Traffic at the new Piccadilly Circus Station of the London Underground, which opened in December last, is now at the rate of 33,000,000 passengers annually and is still growing. The figures for the first six months show an increase of over 2,000,000 passengers and 5,000,000 have used the slot ticket machines, of which there are 35. Meanwhile, the old Piccadilly Circus Station has closed to traffic. This was on July 26. In consequence the new station now supports the full load of traffic at this busy interchange point. The old station with its eight lifts has been in service since December, 1907.

An order for 30 40-ton (long ton) side-discharging freight cars has been placed by the London, Midland & Scottish Railway for use in connection with its electrified line. The cars have been designed for the experimental conveyance of coal in bulk between certain collieries and the railway's power station at Stonebridge Park, which supplies current for the Watford electrified lines. A train of twelve of these cars, which have a capacity of 1,794 cu.ft., and are self-discharging, can be emptied and cleared in about 30 minutes. The cars will be 32 ft. long, 8 ft. 11 in. wide, and 10 ft. 9 in. high. When they are empty they will weigh more than 22 tons.

Electrification of Great Britain's Trunk System Ahead

That the government plans to electrify the whole trunk railway system throughout Great Britain as a means of relieving unemployment is suggested by an announcement on Sept. 7 that a committee, of which Lord Weir of Eastwood is chairman, has been appointed to report on the possibilities of the scheme. Lord Weir presided over the committee whose report led to the establishment of the British Central Electricity Board. He will be associated in the present inquiries with Sir Ralph Wedgewood and Sir William McLintock, who has advised the government in many matters connected with electrical undertakings. In London it is said that Mr. Thomas wants Sir Henry Thornton to come to England as railway adviser of the government. Sir Henry is now president of the Canadian National Railways.

Simplon Work Satisfactory

The Simplon Tunnel probably will be fully electrified by next May. The Swiss are working on this project on their side of the border and are said to be making satisfactory progress. The present line had to be lowered as much as 40 cm. in some places to permit running the load wire overhead. To prevent the danger of induction, all telegraph and telephone lines were encased in a cable and run along the track underground. The completion of this electrification will provide for quicker service over the line and the elimination of the stop at Iselle to change locomotives.

Bombay, India — The American & Foreign Power Company is understood to have paid about $1,400,000 for its 50 per cent interest in Tata & Sons, Ltd., which manages the Tata hydro-electric power companies that supply the bulk of power to the Bombay Lighting & Tramways Company and to the Great India Peninsula Railroad and the Bombay Baroda Central India Railroad.

Recent Bus Developments

Fifteen New Buses for Richmond

Fifteen new Twin Coaches are now being placed in operation in Richmond, Va., by the Virginia Electric & Power Company. Concurrent with their installation a new system of transfers for use of passengers transferring from street cars to buses has been devised for immediate use. Passengers on street cars who also desire to take a bus will ask for a bus transfer in the future, and pay an extra cent on boarding the bus, as at present. The terms under which transfers will be issued from street car to street car will remain the same.

The new Twin Coaches will increase the number of vehicles of this kind in Richmond to twenty. They will arrive one or two a day until the full complement has been received.

In addition to the fleet of fifteen for Richmond, ten buses of the same type have been purchased for use in Norfolk by the Virginia Electric & Power Company. Delivery of this lot has already commenced.

Five Additional Buses in Service in Knoxville

The five new 23-passenger buses purchased by the Knoxville Power & Light Company, Knoxville, Tenn., have been placed in service over four routes supplementary to the present street car service. The extra machines will be used in case of emergency and during the rush hours. Work on streets over which the North Lonsdale route was to operate delayed beginning of service in that section. This route connects with the Lincoln Park car line and continues out Central and thence out Texas Avenue, a round trip of 3.8 miles.

The Beaumont bus route connects with the Lonsdale street car at both ends of the bus line, Alexander Park and Clinton Pike. The bus takes the shorter and more direct route.

The other two lines operate on Sevierville Pike from the intersection of the Island Home and Sevierville Pikes to the city limits, and on Washington Pike.

No additional fare is charged for travel in the buses. Weekly passes, car tokens costing 30 cents for five, or the cash fare of 10 cents, may be paid. Transfers from street cars to buses or from buses to street cars are honored.

Co-Operation of Interstate Operators Sought in Washington

In an effort to relieve congestion in the business section, the District of Columbia Public Utilities Commission sounded out representatives of the interstate bus lines operating out of Washington, at an informal conference last week, on the degree of co-operation which they are willing to extend in changing their present routes through the city, so as to minimize interference with the city's traffic.

The bus operators and their representatives were also asked to consider the establishment of one or two central bus terminals in place of the many small waiting rooms now maintained. The commission's purpose was to acquaint the bus lines with the situation as it exists in the hope that by co-operation, steps to bring about an improvement can be worked out. There was no reference to the commission's power, or intention if it has the power, to compel rerouting.

California's Regulatory Bus Requirements Under Review

Of interest to the operators of stage lines, and particularly so to railway operators with bus lines, is the preparation by the California Railroad Commission of a proposed set of rules and regulations governing the operation of automobile equipment by all certificated carriers.

Under the Auto Stage and Transportation Act the commission has had jurisdiction over stage lines since May 10, 1917, but it was not until 1927 that, through amendments to the Public Utilities Act, stage and bus operations were made full-fledged public utilities in California. It at once became apparent that previous regulations of stage operations under the auto stage and transportation act were in need of revision, particularly with regard to urban bus operations of the electric railways.

The matter has been set for hearing some time after Sept. 16, 1929, and a general order will be issued by the commission making the regulations formally effective.

Several items in the proposed regulations cause concern among railway operators. Among these is the proposed regulation prohibiting the collection of fares, making of change, etc., by operators of buses while the vehicle is in motion. It is feared that this will tend to slow up schedules on urban lines. No standees are permitted except in vehicles with head room in excess of 6 ft. 4 in., which is greater than all standard equipment at this time. Hours of labor by bus operators are limited to ten hours in any 24-hour period, with a twelve-hour spread. This would require the adjustment of many street railway schedules. Many mechanical requirements also are contemplated, such as heating of buses in cold weather, specified types of mechanical brakes, etc.

Rochester, N. Y.—In the wholesale changes made by the New York State Railways recently in its bus lines here, interurban bus lines to Hornell, Holcomb and Sodus Bay remain the same, except that Sodus Bay buses now operate from the bus terminal at South and Broad out South Avenue to Monroe Avenue, Chestnut, East Avenue to Culver Road, Empire Boulevard and thence to Float Bridge and on to Sodus, paralleling the route of the abandoned Rochester and Sodus Bay electric line. Sodus Bay buses, instead of turning north at Wallington, as the street cars did, go on through to Alton, thence to Sodus Point by way of the new concrete highway.

Springfield, Mass.—That the Springfield Street Railway is fully alert to the opportunities for merchandising its service is instanced by a plea to its employees, in part as follows: "Now that the World's Series for 1929 is a thing of the past, reminding you that the summer months are about gone, churches, societies and lodges have started fall and winter activities. It is to your advantage to endeavor to secure whatever special party business you can either by speaking to the chairman of the committee in charge of such activities if you are personally acquainted with him or her, or through some friend of yours. Football trips are now in order and soon basketball trips and hockey trips will be. There is a big field to work on, boys, and we are sure you can help us bolster up our special motor coach business."

Baltimore, Md. — Coincident with another bus accident on Washington Boulevard, in which two persons were injured when the vehicle hit a telegraph pole, the Public Service Commission announced that inspection of buses operated by nine companies throughout Maryland revealed that they are in faulty operating condition and did not comply with commission rules.

Greensboro, N. C.—The proposal to substitute buses for the present railway service on North Elm Street, between Church Street and Irving Park, took definite form at a conference of a special committee from the City Council, officials of the North Carolina Public Service Company, City Manager P. C. Painter and other interested parties. A route for the buses has been worked out which will be submitted in a written report of the committee to the Council.

Atlanta, Ga.—To meet the increasing need of reliable transportation in the fast-growing northeast section of the city and to furnish transportation to the new Morningside school, the Georgia Power Company has extended both the Virginia Avenue and the Morningside coach routes and increased the service on both lines.

North Adams, Mass.—The Berkshire Street Railway has petitioned for two new bus lines in North Adams. One line is to operate over Marshall and Houghton Streets to the Clarksburg line and the other over Eagle and North Eagle Streets with a trip to the North Adams Hospital. The company plans to maintain the trolley terminal at the Boston Store on Main Street. A single bus could be used for either run on a fifteen-minute headway. At the time time the City Taxi Service, Inc., has petitioned for authority to operate bus lines on East Quincy Street, Park Avenue and through the eastern section with a route covering Veazie Street and also streets in the northern section.

Richmond, Va.—An ordinance permitting removal by the Virginia Electric & Power Company of its street car tracks from portions of Laburnum and Chamberlayne Avenues and Hermitage Road, and the substitution of bus service has been approved by Mayor Bright, following its passage by both branches of the City Council.

Summit, N. J.—It is expected that the new Summit garage of Public Service Co-ordinated Transport will be ready about Nov. 1. The structure will be of cement block, with stucco veneer, steel trusses and concrete floor. It will house about sixty buses. There will also be an up-to-date repair shop and boiler room. Offices for executives of the Morris division and a room for operators will be located in the building.

Financial and Corporate

Debt Scaled Down

Fixed Interest Payments of Indiana Interurban to Be Cut $118,526 a Year Under Reorganization

A PLAN for the reorganization of the Chicago, South Bend & Northern Indiana Railway has been prepared and adopted by the bondholders' protective committee, constituted under the deposit agreement dated July 21, 1927, for the first mortgage 5 per cent 30-year gold bonds of the Chicago, South Bend & Northern Indiana Railway, the La Porte & Michigan City Traction Company 5 per cent 25-year first mortgage gold bonds and the Northern Indiana Railway first consolidated mortgage 5 per cent gold bonds. It is intended by the reorganization to accomplish:

1. Termination of the receivership as soon as the reorganization can be consummated.
2. Recapitalization of the railway system on a conservative basis as between bonds and stocks.
3. Reduction of funded debts from $4,415,000 to $1,959,000 and adjustment of $598,000 arrears of interest, a total reduction of debt in the amount of $3,054,000.
4. Reduction of annual interest charges from $220,750 to $102,214 on the funded debt outstanding on consummation of the reorganization.
5. Creation of a new mortgage, subject only to $426,000 of underlying bonds outstanding, to provide, among other things, for refunding such underlying bonds, at their extended maturity, and for new capital requirements from time to time.
6. Provision of approximately $100,000 of new money by bondholders or underwriters for the purpose of the new company and of effecting the reorganization.

The following underlying bonds, now outstanding, on which interest is not in default, are to be extended in the reorganization for six years at 6 per cent per annum on payment to the respective holders thereof of $10 with respect to each $1,000 bond:

Indiana Railway's first mortgage 5's due 1930, to be extended to 1936	$588,000
La Porte & Michigan City Traction Company 5's	$312,000
Chicago, South Bend & Northern Indiana Railway first mortgage 5's	$3,089,000

The plan contemplates the foreclosure only of certain mortgages.

The properties of the Chicago, South Bend & Northern Indiana Railway have been in the hands of Raymond R. Smith as receiver since July 9, 1927. The properties of the Southern Michigan Railway have been in the hands of Raymond R. Smith and L. V. Bower as receivers since April 25, 1928.

The Chicago, South Bend & Northern Indiana Railway owns and operates lines of interurban railway extending from South Bend to Mishawaka, Elkhart, Goshen, La Porte and Michigan City, and railway lines in the cities of South Bend, Mishawaka, Elkhart and Michigan City, a total of 125 miles. The company was incorporated Feb. 1, 1907, acquiring by purchase all of the railway properties and franchises of the Northern Indiana Railway, successor of the Indiana Railway, with which the La Porte & Michigan City Traction Company had previously been consolidated, and assuming the funded debt of these companies. The Southern Michigan Railway owns and operates an interurban line between South Bend, Ind., and St. Joseph, Mich., with 35 miles of track. The lines of the Southern Michigan Railway prior to receivership were operated by the Chicago, South Bend & Northern Indiana Railway pursuant to trackage agreement.

Albany-Hudson Line Would Liquidate

Abandonment by the Eastern New York Utilities Corporation of its street and interurban line between Hudson and Rensselaer, N. Y., is sought in an application filed on Oct. 18 with the Interstate Commerce Commission. The line is approximately 35 miles long between terminals and carries both passengers and freight. The company operates passenger service into Albany over the tracks of the United Traction Company.

The company proposes to liquidate. The line is not in receivership but it sustained a deficit in operating income of $51,173 in the first eight months of 1929 and of $62,098 in 1928. Continued operation would subject the line to heavy expense for improvements. The reduction in traffic is ascribed to private automobile and bus competition and to improvement of the state highway which parallels the line.

The corporate predecessors of the present company were the Albany Southern Railroad, the Albany & Hudson Railroad, and the Albany & Hudson Railway & Power Company. Service over the road was begun in 1900. A hearing is desired on the application to abandon operation of the line, in the event that the commission decides that it has jurisdiction.

Westerville, Ohio—The Village Council has approved the discontinuance of railway service between Westerville and Columbus. The Columbus Railway, Power & Light Company, which furnished the service, asked the Public Utility Commission for a discontinuance several weeks ago. The request of the company for control of bus service between the village and Columbus was rejected. The Buckeye Stages proposes to furnish hourly service during the day, and 30-minute service in the mornings and evenings.

Philadelphia, Pa. — The Philadelphia Rapid Transit Company spent $322,829 in a futile fight for control of the Philadelphia Electric Company, in battle against the Conowingo Dam project and in other power activities, and then charged the expenditures to "road and equipment," Dr. Milo R. Maltbie declares in a report submitted to City Comptroller Hadley.

Springfield, Ohio — The property of the Indiana, Columbus & Eastern Traction Company is to be offered at a receiver's sale in Springfield on Nov. 12, according to an announcement by the law firm of Martin & Corry on Oct. 23. J. Harvey McClure, Dayton, is receiver. A bid already made on the property by the Cincinnati, Hamilton & Dayton Railway of Dayton is expected to be accepted. The sale is a technical move to complete the transfer of the lines to the Cincinnati, Hamilton & Dayton Railway, now operating through service from Cincinnati to Columbus and Toledo.

Book Reviews

Oxy-Acetylene Welder's Handbook

By M. S. Hendricks. Published by the Acetylene Journal Publishing Company, Chicago, Ill. 208 pages, 4½x6½, 102 illustrations, flexible binding. Price $3.

Here is a working manual of instructions for oxy-acetylene welders which covers the fundamentals of oxy-acetylene welding in a clear and helpful manner. The important operating factors involved in welding are discussed principally from the standpoint of welding on steel. However, the book has complete information regarding the correct technique for welding other ordinary metals, such as cast iron, aluminum, copper, brass, bronze, nickel, monel metal and alloy steels. The subject of the design of welds is discussed in detail and well-illustrated. The conclusion of the chapter on testing welds is a discussion of the factors involved in a complete welding operation, included as a guide to the welder or supervisor in setting up a standard of good practice or in checking up a welding operation to make sure that no detail of good procedure or organization of the work has been neglected.

The Financial Post Year Book of Canadian Business

Published by Canadian *Financial Post*, Toronto, Ont.,—200 pages—price $2.

Here is a well-chosen array of Canadian business facts and figures which will serve as a ready reference guide to Canadian business. There are chapters on insurance, trust and loan company, taxation in Canada, trading with foreign countries and surveys of industries.

Universal Directory of Railway Officials. Published by the Directory Publishing Company, Ltd., London. 8⅝ in. x 5½ in. x 1 in. Price 20s. net.

The 35th annual edition of the Universal Directory of Railway Officials has now been issued. It has been compiled chiefly from official sources, under the direction of the editor of *The Railway Gazette*.

The Directory is divided into eleven sections arranged as follows: Official, Great Britain, Ireland, Europe, Asia, Africa, Australasia, North America, Central America, Mexico and West Indies, South America, and Personal Index of Railway Officials.

Many engineering firms doing business with railways use the Universal Directory of Railway Officials in connection with correspondence as a ready means of finding the right railway and the right officer at the right moment.

Capital Stock Without Par Value

By John R. Wildman, of Haskins & Sells and Welden Powel; published by A. W. Shaw Company, Chicago; 546 pages; price, net $5.

Writing from wide study of the actual application and practical operation of the varying statutes in some 40 states, the authors of this work have aimed throughout to clarify the conflicting concepts of no-par shares and to square them up with the accepted principles of accounting and sound business management. They describe specifically and definitely the pivotal points to consider in originally issuing no-par stock; determination of capital value, effect on capital account, marketing no-par shares, and so on, to mention but a few. How to handle stock subscriptions, donated stock, the results of acquiring own stock and the relation of no-par stock to surplus are plainly told.

Frontiers of Trade

By Dr. Julius Klein, now Assistant Secretary of Commerce, with a foreword by Herbert Hoover—The Century Company; 328 pages; price $2.50.

In this book on the development of American trade and commerce Dr. Klein points out the revolutionary changes which have taken place during the present decade—"practices, methods and ideals, all of which were once 'normal,' but which today are the most useless relics of antiquity," the result of "advancing machine technique, of superorganization and management, engineering and equipment efficiency." Dr. Klein expresses the feeling that while the European international cartels have not been so successful as had been hoped, yet "there can be no question that the cartel is at least a moderate improvement over its possible alternative, ruthless competition, especially with reference to intra-European trade."

Economic changes since the war are set forth and conclusions drawn that a "return to pre-war normalcy is but idle chatter." "Entirely new methods, new conditions and new results" have been attained which make "utterly impossible any reversion to the industrial medievalism of pre-war years."

The author then turns to a contemplation of the prevailing obstacles to international trade and the efforts being made to remove them. He discusses trade barriers with their vexations and oftentimes irritating classifications; raw material control by foreign nations; the outlook for agricultural products in Europe; and American investments abroad.

Methods of Compiling Statistics of Railway Accidents

Published by the World Peace Foundation, 40 Mount Vernon Street, Boston, Mass. Price 50 cents.

In an effort to establish identical criteria to be applied in compiling uniform and comparable railway accident statistics throughout the world, the International Labor Office has just published a report based on existing systems in 21 countries. Underlying principles of classification, the experts find, are much the same in most countries, but specific groups do not coincide sufficiently to allow a satisfactory comparison. After a thorough analysis of methods used, the authors of the report have embodied their main criteria in a comprehensive classification scheme, based on fundamental principles already employed in the countries studied. The report as a whole is confined to the industrial risks of railway employees only, and deals specifically with the problem of eliminating incomparability. The main sources of variations appear to lie in the methods of defining reportable accidents and casualties, of demarcating industrial railway risk, of calculating exposure, and of making classifications by causes.

Music in Industry

By Kenneth S. Clark; 384 pages; published by the National Bureau for the Advancement of Music; price, $3.

Testimony is included in Mr. Clark's volume which presents a study of the type and extent of various uses of music in industry—the results of a survey made by the National Bureau for the Advancement of Music. Statistics presented in the book explain that musical activities are carried on in 679 industrial or commercial establishments in the United States. From the plants represented there are recorded a total of 267 bands, 182 orchestras, and 176 choruses—besides 133 plants where there is group singing and 273 which provide musical instruments for their employees.

Railroads lead the procession as to the number of operations from which musical activities are reported with a total of 115. Electric companies report 38, and street railways 15.

In discussing the benefits of music in industry, the author presents testimony from employers declaring that it has been found to increase production, provide a common meeting ground for executives and the working force, improve the morale of workers, cut down labor turnover, counteract the monotony and fatigue of the job and act as good-will advertising.

In the chapter entitled, "What Experience Has Taught," the author presents an interesting discussion of the power of music to lessen fatigue.

German Railroad Calendar

Published by the Publicity Department of the German Railway System, Berlin.

This calendar, in which three pages are devoted to each week, is issued primarily to advertise the service given by the German railways. There are one or more illustrations on each page, principally views of picturesque points along the lines, but considerable technical data are also included.

Several pictures are published showing views along electrically-equipped lines. These are supplemented with statistics of the length of lines equipped. Thus, at the end of 1928, of the 5,300 km. of railway lines in Germany, 1,554 km. or 2.92 per cent, had been equipped with electric power. Of this mileage, 1,287 km. were long-distance lines and 267 km. were city and suburban lines. The latter included the suburban system of Berlin. This percentage of electrically-equipped lines compared with 2.06 per cent in England, 2.29 per cent in France, 6.60 per cent in Italy, 8.66 per cent in Austria, 7.52 per cent in Sweden, and 0.71 per cent in the United States. The views also include a series of maps of different portions of the railway system, showing by the width of lines the daily traffic carried over each route.

A view is given of the first train over the Berlin Suburban System, which was put in operation on June 9 of last year. The electrical trains on this system are made up of one, two, three or four units, each unit consisting of a motor car with four motors and a trailer. At the end of 1928 the equipment consisted of 345 such units. The material used in car body construction is silicon steel, making the car, it is said, the lightest rapid transit car in the world for its carrying capacity.

Personal Items

World Honors Thomas A. Edison

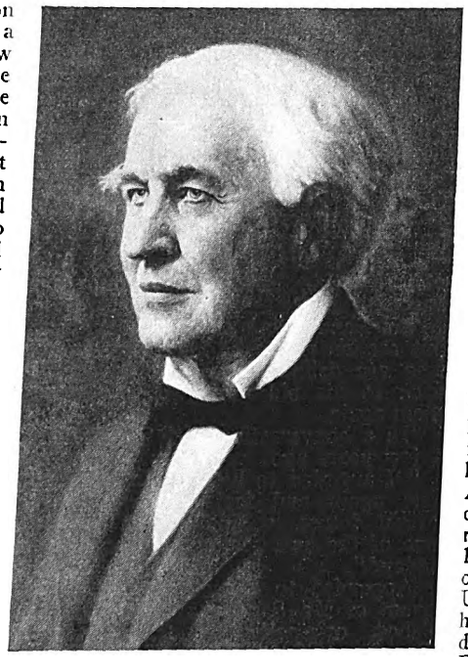
Wizard of Menlo Park Re-enacts Birth of Incandescent Lamp Amidst Surrounding of 1879 Re-created by Henry Ford While President Hoover and Leaders of Industry Stand By

THE hands of time were set back on Oct. 21 in Dearborn, Mich., that a venerable old gentleman might renew the scenes of his youth and receive the homage of mankind. It was the dramatic climax of Light's Golden Jubilee, when, in the presence of a distinguished gathering of men prominent in all walks of life, Thomas Alva Edison returned to his shop, his laboratory and his boarding house of 1879 in Menlo Park, New Jersey, now transplanted and restored as the shrine of his genius by his friend Henry Ford.

In this little village, now called Greenfield, which will become part of the laboratory of the Edison Institute of Technology, there gathered that day 500 guests of Mr. Ford, come to pay tribute to the grand old man of electricity on this the 50th anniversary of the invention of the first commercially practical electric incandescent lamp. In addition to the leaders of the electrical industry there were men eminent in science, art and education—a brilliant gathering of notable Americans.

Mr. Ford's house guests, including Mr. Edison, puffed in on the old Grand Trunk train. They were met and driven about the village in old-time horse-drawn carriages in the manner of 1879. The day of tribute to the giver of the light closed with a ceremony that will never be forgotten by any who were privileged to be present. On the lower floor of "Independence Hall" (an enlarged reproduction of Independence Hall in Philadelphia), which is to form the central museum of the Edison Institute, the guests of Mr. Ford sat down to dinner. At 7:30 p.m., Mr. Edison, President Hoover, Mr. Ford, Owen D. Young and a small party left the hall and drove to the laboratory building and there re-enacted the lighting of the lamp. At the conclusion of the re-enactment of the historic scene the party returned to Independence Hall, where Owen D. Young, acting as toastmaster, introduced W. S. Barstow, president of the Edison Pioneers; Mr. Ford, Mr. Edison and Albert Einstein (over the radio from Germany) for short addresses.

Next in importance to the celebration at Dearborn was that at Menlo Park, N. J., birthplace of the incandescent lamp and hence of the electrical industry. Here assembled about fourteen of the Edison Pioneers who had been unable to make the trip to Dearborn, as well as two sons and a daughter of Mr. Edison. The main event was the illumination of a cluster of 800 individual lamps mounted on a 100-ft. tower so as to form a lighting unit 18 ft. high, with a smaller lamp at the foot of the tower—a reproduction of the original Edison lamp—which is to burn perpetually.



Thomas A. Edison

This installation was made by the Edison Lamp Works. The lights came on when Mr. Edison touched a button at Dearborn. Former Governor George Silzer made an address, and the Dearborn program came through the loud speakers.

J. B. Hayes Returns to Nova Scotia

J. B. Hayes has resigned as manager of the Norfolk division of the Virginia Electric & Power Company, to become connected with the Nova Scotia Light & Power Company, Halifax, Nova Scotia. Thus it is back to the old home town for "Bert" J. Hayes, who has been seeing America first with Stone & Webster, Inc. In that noted organization Mr. Hayes had progressed rapidly to the job of superintendent of transportation at Norfolk, Va. Undoubtedly, greater things were in store for him, but the pull of home overcame the lure of years of pleasant association and future promotions.

Mr. Hayes is returning to Halifax as "the boy who made good"—so good, in fact, that he goes back to his own people as general manager of the Nova Scotia Light & Power Company. To this position he brings much more than the advantages of nativity in conducting a public service. Mr. Hayes' mind is essentially that of the student and analyst.

On taking over a given job, he has never been content to accept the old routine for granted. "Why?" is the favorite word in his lexicon. Whether he was checking up a budget for every department of a large organization or analyzing the travel habits of street railway and bus patrons, the spirit of thoroughness was always there. In his new work, Mr. Hayes will have greater opportunities to put this faculty to work.

Mr. Hayes formerly was assistant to the president of the company in Virginia, and during his occupancy of that office was located at Richmond.

Wendell W. Willkie Joins New York Law Firm

Wendell W. Willkie, connected with the Northern Ohio Power & Light Company, Akron, Ohio, as general counsel, has become associated with John C. Weadock and Bernard F. Weadock under the name of Weadock & Willkie, with offices in the Chase National Bank Building, New York City. Mr. Willkie was one of the speakers before the American Electric Railway Association at the session at Atlantic City, on the morning of Sept. 30.

Mr. Willkie was born in Elwood, Ind., on Feb. 18, 1891. His boyhood was spent there, and he was graduated from the Elwood High School in 1909. His father, Judge H. F. Willkie, practiced law in Elwood for more than 40 years, and early in life the son began the study of law in his father's office. After finishing high school he spent one year at Culver Military Academy. He then took the arts and law courses in the State University of Indiana, receiving his A.B. in 1912 and LL.B. in 1915. Between these two courses he spent one year in the arts course at Oberlin. Upon being graduated from the law course he was admitted to the bar in Ohio, Indiana and New York. He is a member of Beta Theta Pi, Phi Delta Phi fraternities. He continued as his father's law partner in Elwood until April, 1917, when he enlisted in the World War service. He was commissioned an officer in the field artillery and saw service in France. He was mustered out of Camp Sherman on March 1, 1919. He went to Akron a month later and became a member of the staff of the legal department of the Firestone Tire & Rubber Company. On Jan. 1, 1921, he became a member of the firm of Mather, Nesbitt & Willkie.

Mr. Willkie has specialized in corporation law, representing among others the Northern Ohio Power & Light Company and the Erie Railroad. His association with John C. and Bernard F. Weadock, under the name of Weadock & Willkie in New York City dates from Oct. 1.

C. W. Reeve Managing Director of A.E.C.

C. W. Reeve, who has been acting as assistant to the chairman of the Associated Equipment Company, London, England, has been elected to the board and appointed managing director of the company.

Mr. Reeve joined A.E.C. as works accountant in March, 1915. The following year he became accountant and two years later, joint manager. His next appointment was that of chief purchasing and stores superintendent for the underground group of companies. This position he held from 1924 to 1928.

Mr. Reeve was a member of the coun-

Digitized by Google

cil of the Motor Transport Association from 1920 to 1923, and was president of that body in 1922 and 1923. He was on the council of the Society of Motor Manufacturers and Traders from 1920 to 1924.

In his earlier business life, he saw service with the Premier Gas Engine Company at Sandiacre, Derbyshire, and was for three years with the British Westinghouse Company at Trafford Park, Manchester. In 1913 he joined John Wright & Eagle Range, Ltd., of Aston, Birmingham, and remained there until 1915, when he joined the A.E.C., then at Walthamstow.

F. C. Chambers With Cedar Rapids Property

F. C. Chambers, president of the Des Moines City Railway, Des Moines, Iowa, from 1921 until the receivership sale of the property in June of this year, has been appointed general manager of the Iowa Railway & Light Corporation with headquarters at Cedar Rapids, Iowa.

As noted in the JOURNAL NEWS of Oct. 12, Mr. Chambers will have charge of the

F. C. Chambers

operation of all of the properties of the corporation, which serves approximately 200 cities and towns of Iowa. It supplies electricity, gas and steam heat. The organization also operates more than 800 miles of bus lines in eastern Iowa, and 43 miles of interurban railway. It serves a constituency of about 300,000 people.

In the rehabilitation of the physical property of the Des Moines City Railway following the granting of the 1915 franchise, Mr. Chambers's efforts played an important part. It was the reputation that he made here and in his later work that led to his advancement to the post of operating head in 1922. Mr. Chambers has ever been alert to keep abreast of the latest engineering practices. He was one of the very first, for instance, to see the possibilities of the automatic substation. It was largely the early record of performance of the Des Moines installation that helped the quick spread of the automatic substation idea.

Mr. Chambers entered the electric railway field in 1896, in power house work for the Adrian Light, Heat & Power Company, Adrian, Mich. In 1901 he went to Rome, N. Y., as chief engineer for the Rome Gas & Electric Company. He left Rome in 1905 to become electrical engineer for the East St. Louis & Suburban Railway. From 1908 to 1911 his position was superintendent of power for the Springfield (Ill.) Consolidated Railway. In 1911 Mr. Chambers went to Chicago, where he became superintendent for the County Traction Company, now known as the Chicago & West Towns Railway. He remained with the company until 1913, when he went to Des Moines.

H. L. Sanders Honored in His Home Community

Henry L. Sanders, former president of the Cincinnati Car Company, was the subject of the following item in the Beaufort, S. C., *Gazette*, of Oct. 10:

"Henry L. Sanders, who spent his boyhood days in Beaufort, resigned his position as president of the Cincinnati Car Corporation on Sept. 25, after being in active service for the past 25 years, and returned to his old home where he will spend the rest of his life on his large plantation at Chisolm.

"Mr. Sanders began his career as pay clerk at the Naval Station at Parris Island, and after going to Cincinnati he rose to the top in bounds and leaps. He was considered one of the outstanding financial heads in the country, and was held in the highest esteem by all who knew him in a business and social way.

"Mr. Sanders is a large land owner in this section where he has many friends who are delighted to have him come back to his old home to live among them again.

"In a conversation Mr. Sanders said a few years ago:

" 'I am glad to be back in old Beaufort again and feel that we have a bright future in this section, as it is one of the best sections of the country today.' "

Appended to the story was the account of Mr. Sanders's retirement published originally in the Cincinnati *Enquirer* of Sept. 26.

M. B. Bracken Claim Agent in St. Louis

M. B. Bracken has been appointed claim agent of the St. Louis Public Service Company, St. Louis, Mo., to succeed Charles B. Hardin, resigned. Mr. Bracken has been connected with the claim department of the St. Louis company and its predecessors since 1897, in which year he was graduated from St. Louis University. Thus he has seen service in all branches of claims work with the St. Louis Transit Company, the United Railways and the St. Louis Public Service Company. When Mr. Hardin was made general claim agent, Mr. Bracken was made assistant general claim agent. He was admitted to the bar in St. Louis in 1905.

Ross F. Hayes, who during the past five years has been engaged as manufacturers' agent, railroad supplies, at New York, has become connected with the Adams & Westlake Company as representative in charge of eastern sales of Rex car specialties. Mr. Hayes was formerly for many years with the Curtain Supply Company as eastern manager at New York, and later as general sales manager at Chicago. The Curtain Supply Company was consolidated about two years ago with the Adams & Westlake Company at its eastern office, 50 Church Street, New York.

C. H. Forsgard a Factor in Toledo Rehabilitation

Charles H. Forsgard, who was made acting general manager of the Community Traction Company, Toledo, Ohio, following the recent resignation of J. Frank Johnson as vice-president and general manager, came to Toledo two years ago as general superintendent. In that post he has played an increasingly important part in the work of rehabilitating the company, following the revision of the terms of the Milner service-at-cost grant under which the company operates.

Mr. Forsgard's experience has been wide. He joined the Houston Light & Power Company, Houston, Tex., in 1915 and later had charge of ice and power plant operations for an operating company. In 1918 he became associated with Westinghouse, Church, Kerr & Company, in the operation of electric and railway services in Colorado. The company in Colorado subsequently was taken over by Henry L. Doherty & Company in 1921 and for the last eight years Mr. Forsgard has been associated with Doherty enterprises. He was in railway work at Durham, N. C., before he went to Toledo two years ago.

Mr. Johnson plans to enter another field

C. H. Forsgard

of utility work in the Southwest. He has been with the Doherty organization ever since he came to Toledo from the University of Wisconsin as junior engineer in 1916. He was transferred to Durham, N. C., and also served as superintendent of railways on Doherty properties at Bartlesville, Okla. In 1920 he returned to Toledo as general manager of the Toledo & Western Railway, resigning as a co-receiver of the road to become vice-president and general superintendent of the Community Traction Company in 1923. Two years later when B. C. Adams, who had been vice-president and general manager of the Toledo Edison Company, left Toledo, Mr. Johnson was made manager.

George H. Clifford Heads Stone & Webster Service Corporation

George H. Clifford has been elected to succeed Harry H. Hunt as president of the Stone & Webster Service Corporation, Boston, Mass. Mr. Clifford is well fitted by experience and natural ability for the responsibilities of his new position. He has been with the Stone & Webster organization 28 years, having initially been employed by the Northern Texas Traction

Digitized by Google

Company at Fort Worth, Tex., in 1901. In less than ten years he worked up through the ranks to the position of manager of that company. Further recognition of his ability came some five years later when he was appointed district manager of the Stone & Webster properties in the Southwest. In 1927 he was brought into the Boston office to take over the duties of division manager of that district and of the Virginia Electric & Power Company properties, a position he has held up to the present time.

F. Carter Womack at Norfolk

F. Carter Womack, engineer of maintenance of way of the Virginia Electric & Power Company, Richmond division, has been promoted to the position of manager of railways, Norfolk division, succeeding J. B. Hayes, who has accepted a position with the Nova Scotia Light & Power Company, Halifax, Nova Scotia, Canada.

Mr. Womack entered the service of the company at Richmond as a water boy in 1910. He won rapid promotion in the engineering department and when the Stone & Webster interests formed the Virginia Electric & Power Company he was appointed to the position from which he has just been promoted.

F. Carter Womack

R. W. Woodruff White Head

Robert W. Woodruff, president of the Coca Cola Company, has been elected president of the White Motor Company to succeed the late Walter C. White. Mr. Woodruff has been a director of the White Company and a member of its executive committee for several years. His connection with the company really dates back seventeen years to the beginning of his business career. Prior to his accession to the presidency of the Coca Cola Company he devoted his entire time to White affairs, serving successively as a salesman, manager of the Atlanta branch, vice-president of the eastern region and vice-president and general manager in charge of sales.

Mr. Woodruff was the author of the regional organization plan under which sales activities of the White Company now are conducted and, in his various capacities, has acquired a thorough knowledge of every phase of the truck and bus industry. Although he has just reached his fortieth year, his business acumen has won him world-wide recognition. Mr. Woodruff will continue as president of the Coca Cola Company. In assuming his new office, Mr. Woodruff said:

Robert W. Woodruff

"At this time the White Motor Company, as a result of Mr. White's able leadership, is enjoying prosperity. Its latest financial statement, covering the first six months of the current year, showed that current assets were in the ratio of more than eight to one to its current liabilities. The situation, as we enter the final quarter of the year, is pre-eminently satisfactory. Our production and sales for the first nine months of this year considerably exceeded those of the corresponding period of 1928. The trend has been constantly upward."

The board of directors also elected the following vice-presidents: Saunders Jones, vice-president and assistant to the president; George H. Kelly, vice-president and treasurer; H. D. Church, vice-president in charge of engineering; George W. Smith, Jr., vice-president in charge of production. T. R. Dahl remains as secretary.

Charles B. Hardin Leaves St. Louis Public Service

Charles B. Hardin, who, as noted in the ELECTRIC RAILWAY JOURNAL NEWS for Sept. 28, resigned as general claim agent for the St. Louis Public Service Company, St. Louis, Mo., occupied that position with the present company and its predecessors since 1905. He became connected with St. Louis street railways in 1901 as assistant general claim agent under W. P. Palmer, whom he succeeded when the latter resigned in 1905. During his administration he disbursed more than $20,000,000 in claims entered against the present and previous companies. Mr. Hardin has also been active in safety work in St. Louis. He served as president of the St. Louis Safety Council for one term in 1919 and 1920. He has served the claim agent's division of both the American Electric Railway Association and the Midwest Electric Railway Association as president.

Mr. Hardin was born in Renick, Mo., in 1869. He was graduated from the Moberly, Mo., High School in 1886, and shortly thereafter went into the railway postal service on the Missouri, Kansas & Texas Railroad. He left the postal service in 1889 and entered the employ of the Wabash Railroad as timekeeper. He held this place until 1891, when he was made assistant claim agent for the Western division of that road. He was with the Wabash in this capacity until 1901, when he resigned to accept the appointment as assistant general claim agent for the United Railways.

J. R. Stauffer on Journal Staff

West Point Man With Background of Practical Railway and Bus Experience Becomes Assistant Editor

Joseph R. Stauffer, Montclair, N. J., has joined the editorial staff of the ELECTRIC RAILWAY JOURNAL. He assumes his editorial work after three years with Public Service Co-ordinated Transport in New Jersey, the service of which he entered in 1926 as a cadet. He was at first assigned to the Essex division and as part of his duties in the manager's office spent approximately six months in directing the operation of special and chartered car and bus service.

He was next transferred to the general operating department. There he went through the various departments of instruction, including car and bus operation, maintenance, time tables and road operation. Upon the completion of this period of apprenticeship he was made a supervisor and placed in charge of the Montclair district, having under his direct supervision all trolley car and bus operations between Paterson, Montclair and Newark, together with an interstate line between Montclair and New York City.

Here, indeed, was an important assignment for a man so young, but Mr. Stauffer brought to the work not only the knowledge he had gained in his period of apprenticeship, but a keen realization of the needs of the territory served as a result of his personal familiarity with it. In addition, he had the background of dealing with others that is a part of the training given by the United States Military Academy at West Point, from which he was graduated in 1920. His work with Public Service, however, does not represent the sum total of his business experience, for before joining the New Jersey organization he had been assistant general manager of the United States Ozone Company in Scottsdale, Pa., manufacturers of water-purifying and air-conditioning equipment. Later he had charge of that company's sales office in Philadelphia. He left the army to accept the assistant managership of this company.

Supplementing his formal scholastic training at the West Point Acadamy, Mr. Stauffer attended the army cavalry school at Fort Riley, Kan. West Point is nothing if not meticulous about implanting in its men due regard for detail, training highly helpful in the posts Mr. Stauffer has filled previously in the transportation and business world and an important asset to the editor engaged in technical journalism.

J. R. Stauffer

Obituary

Bert W. Arnold

Assistant to Vice-President of North Shore Dead Following Protracted Illness —An Able Executive

Bert W. Arnold, assistant to the vice-president of the Chicago, North Shore & Milwaukee Railroad, died on Oct. 20 following an illness of several months.

Bert Arnold was called to the post of manager of the motor coach department of the Chicago, North Shore & Milwaukee Railroad on Jan. 1, 1924. In that post he had headquarters at Milwaukee and reported to C. E. Thompson, assistant to the president. He had charge of the operation of the motor coach lines of the company and of the expansion of this service, but three years later he was made assistant general manager, a post in which the scope of his work was broadened greatly. His

Bert W. Arnold

appointment as assistant to the vice-president in charge of the transportation activities of the company dated from October, 1925.

To the railway men in the Wisconsin territory Bert Arnold was familiarly known as the wizard of Oshkosh. He was formerly manager of railways of the Eastern Wisconsin Electric Company, with jurisdiction over the local properties in Oshkosh, Fond du Lac and Sheboygan and the interurban line between Neenah and Oshkosh. It may sound like overdoing the thing to say that Mr. Arnold knew everybody and everything in the territory in which that company operated, but the statement is substantially true.

It was in 1917 that Mr. Arnold went to Oshkosh. At that time public relations were anything but good and the physical property of the company was somewhat below par. All this Mr. Arnold corrected. As for co-operation—even the independent bus men used the railway station as a terminal at his suggestion. He demanded a square deal at the hands of the local papers and he got it. It was Bert Arnold who in 1922 put across in magnificent shape the first separate convention of electric railway men in Wisconsin.

Mr. Arnold brought to the positions at Oshkosh and Milwaukee a background of wide experience in railway work. He entered the field in 1899 with the Wheeling & Lake Erie Railway. Next he was dispatcher of the Lake Shore Electric Railway, Cleveland, Ohio, and chief dispatcher of the Muncie, Hartford & Fort Wayne Railway, Muncie, Ind. In 1907 he became superintendent of the southern division of the Illinois Traction System. From his headquarters with that company at Springfield he was transferred to Decatur as superintendent of all lines entering that city and later was made chief clerk to the general superintendent of the system. In 1910 he was made superintendent of transportation of the Chicago, Ottawa & Peoria Railway. In 1917 he joined the Eastern Wisconsin Electric Company.

L. C. Lemon

L. C. Lemon, president and manager of the Muscatine Coach Lines, Muscatine, Iowa, is dead. With Dr. A. R. Menary, Cedar Rapids, a close friend of his since they were roommates while in college, he incorporated the Muscatine Coach Lines, which received a city franchise for operation in Muscatine early this year, and started operations March 18, following the expiration of the railway franchise held by the United Light & Power Company. Most of the preliminary arrangements for the start of the local coach service were handled by Mr. Lemon, and it was under his direction that the routes were outlined and all preliminary surveys made, before the Council was asked for the franchise.

Following his discharge from the army he became associated with the United Light & Power Company at Davenport, where for nine years preceding his work at Muscatine he was assistant general manager of the Tri-City Railway and of the Clinton, Davenport & Muscatine Railway. He also handled transportation matters for the company in an engineering capacity on other properties. He resigned from the property at Davenport following the incorporation of the Muscatine Coach Lines, and with his family he moved to Muscatine early this spring.

M. L. Harry

Merrill L. Harry, general manager of the Central Illinois properties of the Illinois Power & Light Corporation with headquarters at Decatur, Ill., was fatally injured in an auto accident on Oct. 11. He was 51 years old. For a quarter of a century he had been identified with utility interests in the Decatur district, having supervision of more than 200 miles of electric railway between Decatur and Springfield in the years the utilities in that area were controlled by the McKinley interests.

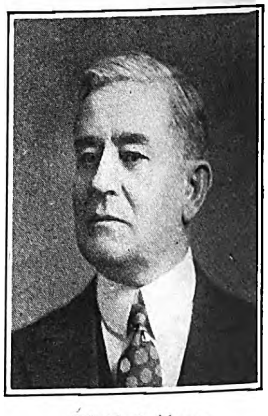
Mr. Harry was born in Bay City, Mich. His father established an electric light plant there and later a railway system. Here the son obtained his first experience in utility management. He became associated later with the McKinley interests at Danville. When the McKinley interests expanded into the railway field he was made manager of the Decatur lines. This was on Jan. 1, 1904. He had since been prominently identified with utilities in the central section of the state. As power and light development assumed growing importance he directed those properties, and six years ago when the Illinois Power & Light Corporation took over the McKinley interests, he was made Decatur division manager. Subsequently he became general manager in charge of the properties in Peoria, Champaign-Urbana, Decatur, Bloomington and Danville as well as those in the smaller communities in the territory.

Walter E. Robinson

Walter E. Robinson, claim agent of the Cincinnati Street Railway, Cincinnati, Ohio, died on Sept. 14, as the result of complications arising from a severe case of la grippe contracted several weeks before.

Possessed of a legal mind of unusual ability, Mr. Robinson was regarded as one of the best authorities in the country on the handling of railway claims. In conducting the affairs of his department he established for himself an enviable reputation for square dealing that commanded the respect of all his colleagues and the members of the Cincinnati bar.

Mr. Robinson was a pioneer in the electric railway industry in Ohio and secured many of the rights-of-way of the "Appleyard Lines," the first of the interurban electric railways in the state. At one time he was Mayor of New Carlisle, Ohio, following which he went to Cincinnati in



W. E. Robinson

1908 to take up duties as claim agent for the Cincinnati Traction Company. When the Cincinnati Street Railway took over the property in 1925 Mr. Robinson continued with the same duties.

He was first vice-president of the American Electric Railway Claim Association, a position which he held until about ten days before his death when he resigned on account of ill health. Mr. Robinson was born in Atglen, Pa., on March 4, 1870.

F. M. Mills

F. M. Mills, head of the local transportation system at Sioux Falls, S. D., died there on Oct. 20. He was a newspaper publisher for many years, and at the age of 77 organized the Sioux City lines. He was 91 years old when he made up his mind to supplement his railway system with bus service.

Mr. Mills was born at Ladoga, Ind., April 4, 1831, and was graduated from Wabash College. He established a printing plant at Des Moines in 1854, and later started the *State Register* and *Iowa Homestead,* still in existence. He was state printer for years, and helped establish the Northwestern Associated Press. He was also the author of two books. He later published a newspaper at Springfield, Ill., and subsequently helped to establish railway systems at Benton Harbor and St. Joseph, Mich., before going to Sioux Falls.

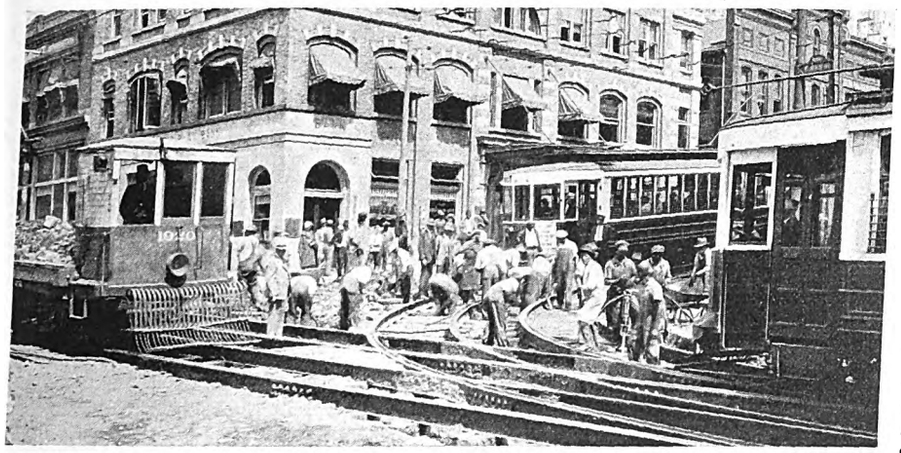
Industry Market and Trade News

Extensive Repaving in Richmond, Va.

Paving Main Street, one of the heavy traffic arteries of Richmond, has been keeping the maintenance of way department of the Virginia Electric & Power Company busy with an extensive project of track reconstruction which includes the installation of 4,800 ft. of new 122-4 A.E.R.E.A. rail, in addition to tie renewals, surfacing, and realignment of double track.



Major track repairs in progress at Eighth and Main Streets, Richmond, Va. Curves are being redesigned so as to permit double truck equipment to pass

The Main Street project, which will be completed late in the fall months, involves one of the busiest streets of the financial and wholesale districts. In order to avoid any delay in schedules and to keep vehicular traffic moving, the company is working night and day shifts. At present only one track and the dummy have been opened up, thus allowing free passage for a one-way traffic load. High-power lights have been strung from Fifth to Fifteenth Streets in order to facilitate night work. The portion of Main street under rehabilitation is for the most part on grades of from 4 to 6 per cent, which complicates the work to a considerable degree. So far there has been no delay to schedules nor serious interference with vehicular traffic.

Contracts Let for New York's Subway Equipment

Final contracts necessary for the completion of the Eighth Avenue line of New York City's new subway system were awarded recently by the Board of Transportation. The total sum involved is $20,146,024, covering cars, motors and control equipment, installation and equipment of six substations and the installation of a block signal and switching system on the portion of the route between Fulton Street and 215th Street.

The 300 cars will be built by the American Car & Foundry Company at a cost of $9,145,000. Six hundred and ten motors, together with necessary control equipment, will be supplied by the Westinghouse Electric & Manufacturing Company on a bid of $2,659,100, and substation equipment will be provided by the General Electric Company for $2,743,174. The contract for the switching and signal equipment, including installation, is divided equally between the Union Switch & Signal Company and the General Railway Signal Company, the total cost being $5,598,750. The first named company is to handle the five sections from 103rd Street to the Harlem River, including the shops and yards at 207th Street, while the General Railway Signal Company will do the necessary work between Fulton Street and 103rd Street. While no definite date has been set for the completion of the work it is expected that the line can be opened for service at some time during the latter part of 1931.

Record Order for Car Heaters

Consolidated Car Heating Company heaters have been ordered by the Delaware, Lackawanna & Western Railroad for its 282 new cars. Each car will be equipped with 40 heaters, operating on 3,000 volts. The total number of units required, 11,280, is said to be the largest order ever placed for car heaters.

General Electric Sales Increase

General Electric Company sales billed during the first nine months of 1929, announced by President Gerard Swope, amounted to $301,812,808.55, compared with $242,676,762.07 for the corresponding period last year, an increase of 24 per cent. Profit available for dividends on common stock for the first nine months of 1929 was $47,965,831.71.

Twenty Cars for Lynchburg, Va.

Twenty master unit motor cars of the one-man, double end, double truck type, seating 41 passengers, have been ordered for city service by the Lynchburg Traction & Light Company, Lynchburg, Va. The cars will be built by the J. G. Brill Company, Philadelphia, and are to be delivered in November.

Bus Exhibit at Convention Productive of Inquiries

Although it may be a number of months before the effect of the Atlantic City convention will become manifest in orders of any considerable proportions, bus manufacturers already report renewed interest accompanied by many inquiries. Meanwhile normal flow of orders continues.

The United Railways & Electric Company, of Baltimore, has ordered seven White model 65 19-passenger buses, while the United Electric Railways recently received five model 54 six-cylinder buses from the same manufacturer. Other White deliveries to electric railways include five buses of the 50B type to the Middlesex & Boston Street Railway, and one 54A type to the Boston Elevated.

Ten coaches seating 41 passengers each have been ordered by the Pacific Electric Company, Los Angeles, for service on its Huntington Park-Long Beach and Girard-Ventura suburban lines. The buses, which are of the "twin coach" type, will be supplied by the Fageol Motors Company of California. A substantial order was that of the Virginia Electric & Power Company, Richmond, which has added to its already extensive fleet 25 urban type coaches seating 40 passengers each, of which fifteen will go into service in Richmond and ten in Norfolk. The buses are supplied by the Twin Coach Corporation, of Kent, Ohio. Other recent Twin Coach deliveries of this general type include ten to the Youngstown Municipal Railway, ten to the Peoples Transport Company, Muskegon, Mich., three to the Aronomink Transportation Company, Philadelphia, and five to the New Haven & Shore Line Railway, New London, Conn. The United Electric Railways of Providence has taken six Twin Coaches of the suburban express type, while the Groton & Stonington Traction Company has taken one parlor coach.

Other recent deliveries of large-capacity buses include eight 40-passenger metropolitan type coaches to the Eastern Massachusetts Street Railway, one 33-passenger street car type coach to the Brooklyn & Queens Transit Corporation, and five 33-passenger coaches to the Citizens' Transit Company, of Oil City, Pa., all supplied by the American Car & Foundry Motor Company. This same company has delivered four 29-passenger parlor coaches to the Eastern Michigan Motor buses.

The Mack International Motor Truck Corporation reports the delivery of nine model AB 25-passenger city type buses to the Connecticut Company, of New Haven, and two buses of similar type to the Interstate Power Company, of Dubuque, Iowa. The Hamburg Railway Company, of Hamburg, N. Y., and the Union Transportation Company, of Tulsa, Okla., have also recently accepted delivery of two model BK Mack buses of the city type. The Twin City Rapid Transit Company, Minneapolis, Minn., has ordered four buses from the Wills Motor Company, two Whites, two Macks, and three buses with gas-electric drive from General Motors.

The following deliveries are reported by the General Motors Truck Company: Four type W observation buses to the Berkshire Street Railway, Pittsfield, Mass.; three type W city service buses to the Capital Traction Company, Washington,

D. C.; four type W city service buses to the St. Joseph Railway, Light, Heat & Power Company; three type W buses to the Illinois Power & Light Corporation for city service in Galesburg, Ill.; a type W parlor coach to the Oklahoma Railway Company, of Oklahoma City; two type W parlor coaches to the Fifth Avenue Coach Company, New York; five type W city service buses to the Interstate Transit Lines, Omaha, Neb.; one type W city service bus to the Mississippi Valley Electric Company of Iowa City, Iowa; five type W city service buses to the Knoxville Power & Light Company; and one type Y parlor coach to the Washington Rapid Transit Company of Washington, D. C.

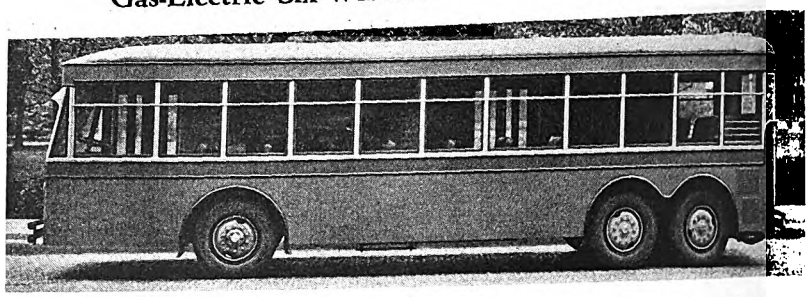
Four 20-passenger Reo buses, which are mounted with Fitzjohn bodies, have recently been delivered to the Georgia Power Company, of Atlanta.

Westinghouse Receives Street Railway Orders Totaling $3,500,000

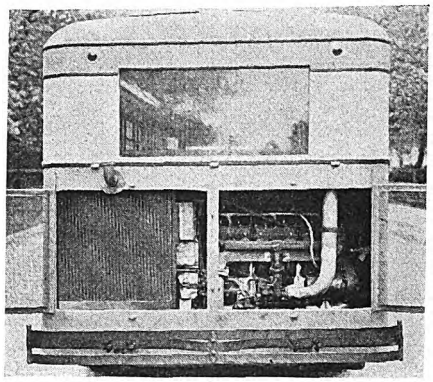
Improving conditions in the electric street railway industry are indicated by the fact that the Westinghouse Electric & Manufacturing Company has received orders for street car motors and controls totaling $3,500,000 during the past few weeks.

These orders include equipment for 100 cars for the Cleveland (Ohio) Railway; 100 for the Brooklyn (N. Y.) & Queens Transit Corporation; 60 for the Chicago (Ill.) Surface Lines; 50 for Montreal (Quebec) Tramways; 25 for the Chicago (Ill.), North Shore & Milwaukee Railroad; 10 for the Cincinnati (Ohio), Hamilton & Dayton Railroad; 12 for the Allegheny (Pa.) Valley Street Railway; 13 for the Youngstown (Ohio) Municipal Railway; 20 for the Lynchburg (Va.) Traction & Light Company; 15 for the Scranton (Pa.) Railway; 10 for the Lake Shore (Ohio) Electric Railway.

Gas-Electric Six-Wheel Bus Announced by St. Louis



This six-wheel gas-electric bus of the St. Louis Car Company is now in production. It seats 40 passengers and has its power plant mounted under the rear seat



The protecting screen is opened to show the method of housing the power plant at rear of the bus

Electric service braking, individual drive from electric motor to each of the four rear wheels, and discharge of exhaust gases at roof, are some of the features of the 40-passenger gas-electric coach recently produced by the St. Louis Car Company, St. Louis, Mo. As indicated in the accompanying illustrations, the vehicle has a street car type body, with entrance at right of the driver and exit at the center. Both doors are air-controlled, and the one at the center is equipped with a treadle-opening device. The vehicle is 32 ft. 4¾ in. over the bumpers, 8 ft. wide over the aluminum side panels and has 6 ft. 10 in. headroom at the front. This headroom is reduced to 6 ft. 2 in. back of the exit door where the floor is on a higher level. The wheelbase is 210 in. from front axle to center of rear truck.

The power unit, consisting of Waukesha six-cylinder 4¾x5½ engine coupled to General Electric No. DT-1132 generator, is mounted under the full-width rear seat. The engine exhausts through a stack in the right-hand corner of the body to the roof. Air for carburetion is drawn in from the roof through a passage in the other rear corner.

Ease of control is provided for by an arrangement consisting of a pedal connected to the engine throttle with two other pedals for braking. One of these works a controller which changes the motors into an electric brake, generating energy dissipated in grids mounted under the body. By its use the vehicle is slowed up to about 3 m.p.h., and is then brought to a full stop by the application of the other brake pedal, which through an equalizing lever actuates a pair of disk brakes located in each of the rear axles, between the armatures of the GE-1131 electric motors. A hand lever is also connected to the disk brakes, for use in parking. Starter button, ignition and lighting switches and door control buttons, are all mounted on a small board on the side of the body.

The drive unit is literally built into the rear axles, since the cases of the motors form part of the two axle housings. That is, there are two electric motors in each of the two rear axles. From each motor a 12 to 1 gear reduction, made up of one set of helical and one set of spur gears, carries the power to the four wheels of the rear truck. All six tires are 36x8 high-pressure pneumatic. The complete rear truck, including the four electric motors, springs and torque system, may be detached by loosening four bolts and then rolled out from under the frame. Similarly, it is possible to disconnect any one of the electric motors, electrically and mechanically, so the vehicle can complete its run without danger to the other motors.

Chassis and body are of the integral type with side sills continuous from front to rear except at door openings. The pressed steel posts are riveted to side sills and top plates. Cross sills and outriggers are also of pressed steel.

Westinghouse Electric & Manufacturing Company recently purchased in Newark, N. J., a 22-acre site for a new warehouse, shop and station to serve the entire northern New Jersey industrial area.

ELECTRIC RAILWAY MATERIAL PRICES—OCTOBER 26, 1929

Metals—New York

Copper, electrolytic, delivered, cents per lb.	18.00
Lead, cents per lb.	6.9
Nickel, cents per lb., ingot	35.00
Zinc, cents per lb.	7.05
Tin, Straits, cents per lb.	41.875
Aluminum, 98 to 99 per cent, cents per lb.	24.30
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	43.00
General service	31.50

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	$4.80
Somerset mine run, f.o.b. mines, net ton	1.90
Pittsburgh mine run, Pittsburgh, net ton	1.80
Franklin, Ill., screenings, Chicago	3.40
Central, Ill., screenings, Chicago	2.30
Kansas crushed mine run	2.50

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive ⅝ in. and larger, cents per lb.	2.80
Tie plates (flat type), cents per lb.	2.15
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.95
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	$2.50
Sheet iron (24 gage), cents per lb.	2.75
Sheet iron, galvanized (24 gage), cents per lb.	3.55
Galvanized barbed wire, cents per lb.	3.15
Galvanized wire, ordinary, cents per lb.	3.10

Waste—New York

Waste, wool, cents per lb.	13.00
Waste, cotton (100 lb. bale), cents per lb.:	
White	12.5
Colored	9.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	16.1
White lead in oil (100 lb. keg), cents per lb.	13.2
Turpentine (bbl. lots), per gal.	$0.61
Putty, 100 lb. tins, cents per lb.	5.725

Wire—New York

Copper wire, cents per lb.	19.875
Rubber-covered wire, No. 14, per 1,000 ft.	6.85
Weatherproof wire base, cents per lb.	20.875

Paving Materials

Paving stone, granite, 5 in., f.o.b.: New York—Grade 1, per thousand	$150.
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd., delivered	3.25
Cement, Chicago, in carload lots, without bags, f.o.b.	1.85
Gravel, ¾-in., cu.yd., delivered	3.25
Sand, cu.yd., delivered	2.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	14.5
Light copper, cents per lb.	12.5
Heavy yellow brass, cents per lb.	8.125
Zinc, old scrap, cents per lb.	3.15
Lead, cents per lb. (heavy)	4.75
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	14.25
Rails (short), Chicago, gross ton	18.00
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.25

Electric Railway Journal

Consolidation of
Street Railway Journal and Electric Railway Review
A McGraw-Hill Publication—Established 1884

JOHN A. MILLER, JR., *Managing Editor*

Volume 73 New York, December, 1929 *Number 22*

Economic Readjustment Unlikely to Affect Electric Railways Seriously

EXPERIENCE, it has been said, is the name by which men call their mistakes. Of late the American public has been listening to a lot of modern ballyhoo artists who carried people off their feet with false economic doctrines which ignored history. "Bigger and better business" is sound doctrine when applied with reason, but it is unsound when its proponents deplete their savings, borrow on their life insurance and mortgage their building and loan accounts to gamble on future security values. This lesson has been learned as a result of the recent stock market crash, but the experience has been costly.

The future will be what we ourselves make it. The great gamble in securities bore no relation to production and consumption, nor to the earning power of industry. Fundamentally, business conditions are sound. No physical values were destroyed in the collapse of security values. Industry is not seriously over-expanded. The general credit situation is good. Short-term money is plentiful at low rates, but long-term loans may be expected to ease only in proportion to the extent that saving replaces speculation. All this is distinctly favorable to business progress.

In the White House sits a man familiar with crises. He is not emotional. He has had his ear to the ground. Apparently he is prepared. He knows that construction work by government is a stabilizing factor and he has a program ready which will take up part of any slack. Already he has undertaken conferences with business leaders looking toward the stimulation of industrial activity. This is of vital importance, because public works can have only a limited effect upon the situation.

Responsibility for maintaining prosperity rests ultimately on private business. If common sense is used, business and industry will escape a recession such as the stock market experienced. From high Washington authority it is learned that there has been no note of pessimism. Legitimate projects are going forward, and those who have attended the President's conferences entertain no fear for the economic stability of the country.

So far as the electric railway industry itself is concerned no reason exists for apprehension. Such economic readjustment as may be in prospect is not likely to affect it seriously. In general the transportation business is a necessity business. It is, of course, not immune to economic change, but it is less harmfully affected than many others. Even in the pronounced business recession of 1921 riding declined only 4 to 5 per cent. There is no reason to believe that any such recession will occur now. Curtailed purchasing power may be expected to be concentrated in the comparatively small section of business that concerns itself with the production of luxuries. The electric railways can look forward to the coming year with unshaken confidence. For the great mass of the people public transportation will continue to be a vital necessity.

Vital Factors Ignored in New York Substitution Proposal

REAL hope of improving transportation in New York City lies only in wise co-operation of facilities. Advocates of wholesale substitution of buses in place of street cars delude themselves in thinking that this will solve the problem of surface transportation. More buses are urgently needed. Of that there can be no doubt. On certain routes the replacement of rail service by bus service would be advantageous. On many routes, however, the most efficient and economical means of providing transportation service is by electric rail cars.

Recommendations recently made by the Merchants Association favor the gradual substitution of buses operated by the existing companies on all street railway routes in Manhattan when existing equipment requires replacement. While these recommendations are moderate compared with many other recent utterances on this subject, they evade certain fundamental facts. These facts merit far more consideration than they have ever received.

No justification exists for the theory that wholesale substitution of buses in place of cars will relieve street traffic congestion. To carry the same number of passengers many more buses than cars would be required. The operation of these hundreds of additional vehicles on the streets would tend to increase rather than decrease congestion. Moreover, no improvement in speed could be expected, as speed in congested districts is determined by traffic conditions rather than by the type of vehicle. Relief of congestion can be obtained only by the establishment of an efficient system of traffic regulation and control—now sadly lacking in New York.

The underlying difficulty in the present transportation situation in New York City is financial. Up-to-date service cannot be furnished today for the same fare that sufficed twenty years ago. Elsewhere throughout the country this fact has been recognized, and the transportation agencies have been granted increased fares to meet their increased costs. So long as New York clings tenaciously to its 5-cent flat fare it cannot expect high-grade, modern transportation, either by car or bus. Operating costs for buses certainly would be no less than for street cars, and a starved bus system would be no improvement over a starved electric railway system. Only with an adequate fare can the country's largest

Digitized by Google

city expect to have adequate transportation. Until this basic economic fact is squarely faced, no real solution of the problem is possible.

Safety Work Begins at Home

MENTION of the word "safety" to the average electric railway operator brings to mind thoughts of boarding and alighting accidents, automobile collisions, falls in cars, and other similar mishaps which are likely to result in claims being made by passengers or drivers of other vehicles against the company for personal injuries or property damage. Thanks to intensive study of this matter, greater care in the selection of trainmen, better methods of construction, and improvements in equipment, gratifying progress has been made by the industry in recent years in reducing the number of such accidents.

Sometimes it appears, however, that in the effort to prevent accidents in which the public is involved, the need is overlooked for preventing accidents to the company's own employees. A considerable number of instances could be cited where safety placards are prominently displayed in the cars of an electric railway, while serious accident hazards existing in the company's carhouses and shops go apparently unheeded. This is the more regrettable because it is entirely unnecessary. Compared with the unavoidable hazards which exist in many industrial plants, those in electric railway carhouses and shops are of a minor nature. Most of them could be eliminated easily and at small cost.

Probably the most frequent hazard is that resulting from the common practice of leaving heavy objects where passing workmen are likely to stumble over them. Unguarded belts, driving shafts and cutting tools constitute another hazard frequently encountered. Holes of one sort or another into which an unobservant person might easily fall are still another source of danger. Many other minor mechanical hazards of this nature might be mentioned. Because they are potentially far more serious, electrical hazards, as a rule, have been reduced to a minimum. The cost of similar elimination of the mechanical hazards would be comparatively slight and would undoubtedly prove to be a profitable investment.

On the Trail of the Parking Rule Violator

INCREASING sentiment for the restriction of parking is evident in activity all over the country directed toward the more rigid enforcement of existing ordinances and further limitation of the storage of vehicles on the street. More and more it is being recognized that those who persist in parking for long intervals on busy streets cause inestimable delay to the many, while themselves enjoying only a negligible benefit. It is being realized, too, that limiting parking, particularly during rush hours, is absolutely essential to assure the smooth flow of traffic through important arteries.

Handicapped by the necessity of overcoming the inertia which attends any long-established custom, the advocates of limited parking until recently made slow progress in convincing city officials and the public of the economic soundness of restricting street storage of vehicles. Now, however, it is generally agreed that stringent regulation is essential to the welfare of the community. Many cities within the past two years have investigated their traffic problems and sought to find means of securing relief. Recommendations were included in the report of practically every investigation that the abuse of parking privileges should be curbed and stricter regulations enacted. From this have come more effective ordinances and more rigid enforcement.

One of the most successful recent drives against illegal parking was made in Detroit. In 1927 a traffic survey revealed that many automobile users were parking for excessive periods on limited streets while others were parking regularly on streets where all parking was forbidden. Requests by several merchants' associations prompted the City Council to undertake a 30-day trial of rigid enforcement of the existing parking regulations. So pleased were these associations with the results of the experiment that the drive was extended for an additional 30 days. Elsewhere in this issue is a detailed account of the experiment and its results.

As was expected, some of the victims of the tow cars employed by the police in the Detroit campaign protested against the removal of their automobiles from the streets. The general public, however, voiced its emphatic approval. It is of particular significance that a group similar to those which most violently opposed restricted parking in New York and other cities—the merchants—requested the enforcement in Detroit and commended the work of the Police Department in conducting the drive. But all concerned with the movement of traffic, the electric railway, drivers of private automobiles, taxicab companies, trucking interests, industrial plants and store owners, were benefited through the ability of all types of vehicles to travel faster and more safely through the formerly congested areas.

Large Buses Increasing in Popularity

STUDY of the new buses developed in the past year indicates several distinct trends in design. Perhaps the most outstanding is the increase in the number of large capacity, single-deck types. A number of large buses have been on the market for more than two years, but the past year saw the addition of others. That this trend is likely to continue is indicated by the recent announcement of a 50-passenger bus and a 72-passenger vehicle. Only slightly less pronounced is the trend toward buses ranging in capacity from 12 to 21 passengers. This size seems to be well suited for de luxe suburban and feeder service and is being widely accepted. In going to these two extremes, the medium-sized bus has been somewhat neglected. Less activity was shown in this field in the past year than in former years. Operators seem to be of the opinion that the medium-sized bus is too small for mass transportation and too large for feeder and suburban service.

Manufacturers are bending their efforts in body design toward securing greater strength with less weight. Aluminum and its alloys are being used more extensively with the result that substantial reductions in weight have been effected. For example, in the design of a double seat using aluminum the total weight has been reduced 50 lb. Manufacturers also are attempting to secure more room in the newer designs. Full headroom over the aisles is allowed in almost all buses, and baggage racks over the seats are being designed to cause less interference with rising passengers. More knee room is being provided in the spacing and design of seats, and one company is offsetting the seat backs to give more hip-room

Digitized by Google

in the aisles while retaining the full seat width. Better ventilation and heating are being secured also in many of the newer buses. More roof ventilators are being added and one manufacturer has developed an ejector ventilation system which seems to be effective. Extensive experimentation with hot water and steam heating systems suggests a trend away from exhaust heater systems in which the pipes pass through the body. Another trend is the more extensive use of bumpers and heavy fenders to protect the bus body better.

No radical changes in chassis design have appeared in the past year, but there seems to be a disposition to strengthen the construction to take care of the heavier engines being adopted. The use of heavier engines also has brought forth more rugged transmissions, drive assemblies and other mechanical parts. Four engines with a rating of 150 hp. or more are now available for use in buses. This trend is paralleling the increasing popularity of the large bus and is the result of a demand for more powerful engines not only to serve the larger vehicles adequately but also to give greater flexibility to the smaller vehicles in present-day traffic. Better cooling is being secured in some of the newer engines by the use of systems which give a more uniform control of jacket temperature.

All of the developments of the year, along with many projected ones for the future, promise to keep the product of the bus manufacturer in step with the demands of the operators for a better vehicle.

Growing Demands of Vehicular Traffic Complicate the Paving Problem

ONLY a generation ago people traveled everywhere in clouds of dust. In those days the horse was the principal source of power for both public and private transportation vehicles. The problem of street paving presented no difficulties. Many streets were not paved at all and others were paved in only the most elementary manner. Since then, the development of the gasoline-propelled automobile and the electric rail car have entirely altered the situation. Elimination of the horse as a source of power for street cars years ago removed the justification for making the railways pay for paving installation. At the same time the growth of automotive transportation has made the paving problem far more complex than it used to be. Despite the unreasonableness of requiring the electric railways to pave the track area, the obligation to do so exists in most communities and the resulting problems must be solved by way engineers. In fact, it is no exaggeration to say that the degree of success attained in this respect has a decided effect upon the public relations of the company.

Vehicular demands have kept steadily ahead of paving construction during these years of development. Many materials have been used and discarded as inadequate. Consequently, re-paving has had to be done at frequent intervals and at great cost. Today it is necessary to provide a pavement having strength sufficient to carry extremely heavy loads and having a surface smooth enough to permit comfortable travel at high speed. Municipalities are more particular now than in the past concerning the type of paving used in the track area. A survey of the situation on some 30 electric railway systems, published elsewhere in this issue, shows a widespread demand by city authorities for a uniform paving surface from curb to curb. Where the material specified differs from that which is deemed most suitable for use in the track area, a filler or surfacing may be employed to give the appearance of this uniformity, and this is likely to add to the cost of track paving. Practically everywhere the railways are being required to put down far more expensive pavement than was contemplated when their franchises originally were granted. Moreover, it requires no prophet to foresee that vehicular demands in the future will require still heavier and more expensive paving. Certainly this situation constitutes one of the strongest possible arguments for placing the burden of paving charges where it belongs—on the general taxpayer rather than on the car rider.

Benefit Assessment Plan Proves Its Value in San Francisco

FINANCING of rapid transit construction in whole or in part by assessments on the benefited property, while frequently suggested, is usually looked on as a rather theoretical proposition. Yet seldom is it realized that there exists in San Francisco a clear-cut example of the effectiveness of this method of paying for such improvements. There a large section of territory in the city, not more than 4 miles from the center of business activity along Market Street, was for years a barren waste through lack of adequate transit facilities. This situation came about through the peculiar topography, a series of hills separating the district from the business section by an almost insurmountable barrier. It was only when this ridge was pierced by a tunnel and street railway service established that development began.

That the opening up of this large tract was undertaken, was due to the foresight of the city engineer and the courage of the owners of the tract in agreeing to an assessment of the property itself in order to build the rapid transit line. A total of $4,000,000 was thus obtained to pay the entire cost of the improvement. Hence it has not become a burden on the city as operator of the railway system, and car service can be furnished at no greater cost than over a normal surface line of equal length. The property owners and the city itself have profited enormously, the one through enhanced values and the other through correspondingly greater tax assessments.

The assessments for construction of the tunnel were by no means small, and represented a proportionally large increment of the value at that time, perhaps a quarter of the total. The increases in value that have come since the tunnel was built, however, have been so large that they dwarf the assessments to virtual nothingness. In the fourteen-year period between the two tax assessments quoted in the article by Mr. O'Shaughnessy in this issue the increase in the value of the land and improvements has averaged fourteen times the cost of the land just before the tunnel project was broached, or an amount equal to the pre-tunnel price has been added each year. The land itself is worth more than five times as much as it was at the earlier period.

While the Twin Peaks Tunnel is but one of many instances where property values have increased enormously through rapid transit, it is perhaps the only one of any magnitude where the property owners affected have paid the cost and then reaped the benefit. As such it is an object lesson worth the attention of city planners who are seeking to add to the productive area through major improvements.

Westwood Park in 1917. This picture, taken along Miramar Avenue, shows that the entire district was only a thicket of gum trees. The area included appears in the picture in the middle distance. The boulevard was being built in anticipation of transit facilities. This and the companion picture were taken from a point about 8,000 ft. south of the west portal of the Twin Peaks Tunnel

Results Justify Assessment

Construction of the Twin Peaks Tunnel has opened up a large residential area near the business district of San Francisco which could not be reached readily by any other means. The benefited property owners, who paid the entire cost through special assessments, have seen their holdings increase in value up to fourteen times the original price of the land in fourteen years

DUE to the construction of the Twin Peaks Tunnel a new residential area has been added to the city of San Francisco, with homes and beautiful curved streets, and populated with a very desirable class of inhabitants. It has increased the tax assessments of a large section of the city to fourteen times what they were before the tunnel was built, and has increased the market value of the properties still more. Furthermore, it was paid for by the property owners most greatly benefited. This was accomplished through the levying of special assessments, so that the city at large and the car riders have only borne the cost indirectly, if at all.

Construction of the Tunnel Opened Up an Inaccessible Region

The tunnel pierces the high ridge which separates the more densely populated and older settled portions of San Francisco from the large and comparatively level region lying west of this ridge and constituting the watershed of Lake Merced. Without the construction of such a tunnel the inhabitants of these outlying districts could not reach the city by means of street cars except over a circuitous route involving considerable delay. Previous to its opening, access to the city was confined to such detour car lines, and to travel by vehicle and on foot over steep hills. Accordingly the territory was scarcely developed at all, and the property had a value very low for land in such close proximity to the center of San Francisco.

Since the reason for the construction of this tunnel and the operation of street car lines through it was that it provided a ready means of access from a potential residential district to the business section of the city, the resulting benefit to the property affected was plainly apparent. Accordingly, funds for the construction of the tunnel were obtained by an assessment levied by the city covering lands near the two ends of the tunnel.

The Twin Peaks Tunnel was constructed by the city and county of San Francisco under authority granted under Chap. VIII, Art. VI, of the San Francisco charter, and under the procedure provided by an ordinance passed by the Board of Supervisors of San Francisco, pursuant to authority given in the chapter mentioned, on Oct. 20, 1913. The tunnel ordinance was especially drafted for the purpose of carrying through

Westwood Park in 1927. In the ten years since the opening of the tunnel the entire district has been built up as a high-grade residential section. The development has been a direct result of the transit facilities made available by the tunnel. The older houses in the foreground were partly built before the tunnel was built, but many have been replaced

the work, and a special counsellor was retained by interested property owners to assist the city officers in its legal consummation. The enabling ordinance empowered the Board of Public Works to acquire for the city, by purchase and condemnation, any and all land or easements therein or any property necessary or convenient for such tunnel, and to raise money for such acquisition by means of an assessment on private property, as well as to adopt ordinances providing the procedure to that end. The ordinance provided for the acquisition of property for the tunnel and for the construction of the tunnel itself, and to allow such consolidation of the two purposes in a single proceeding. The proceedings included the acquisition at a cost of $514,935 of a strip of land about 90 ft. wide and 1,900 ft. long at the easterly end of the tunnel and the end of Market Street, the main business artery of the city.

The tunnel design was based on a previous study of the main transportation problems of San Francisco made in 1911 by Bion J. Arnold of Chicago. The original idea was to extend the tunnel a mile further down toward the business district to the intersection of Valencia and Market Streets, which would have involved the expenditure of $3,000,000 additional to the amount finally decided on, or a total of $7,000,000. The writer, from previous experience with San Francisco assessment problems, knew that it would be impossible to collect this additional amount from the taxpayers. The shorter $4,000,000 tunnel was therefore decided on.

Entire Cost Raised by Assessment

The total area inside the assessment district included 4,981.7 acres. Of this the west portion comprised 4,280.7 acres, with a maximum assessment of 3½ cents per square foot near the tunnel portal, receding to ⅛ cent per square foot 3 miles away. The total was $2,996,250, and the average rate of assessment was $700 per acre. The east portion, in the built-up section of the city, with improvements already made, consisted of 701 acres, on which the total assessment was $998,750, ranging in amount from the densest, at 3½ cents per square foot, to the lightest and most remote, at ⅛ cent per square foot. The average of the assessments at this end was $1,424 per acre. The distribution of the assessments in the areas at the two ends of the tunnel is shown in the assessment map on page 1096.

No assessment of this kind can be conceived of as being made without surmounting obstacles, and the Twin Peaks project had its quota. The several assessments were made by the city engineer's department under the direc-

Table I—Assessed Values of Property Adjacent to West Portal

Assessments of land and improvements before and after construction of the Twin Peaks Tunnel, by sections

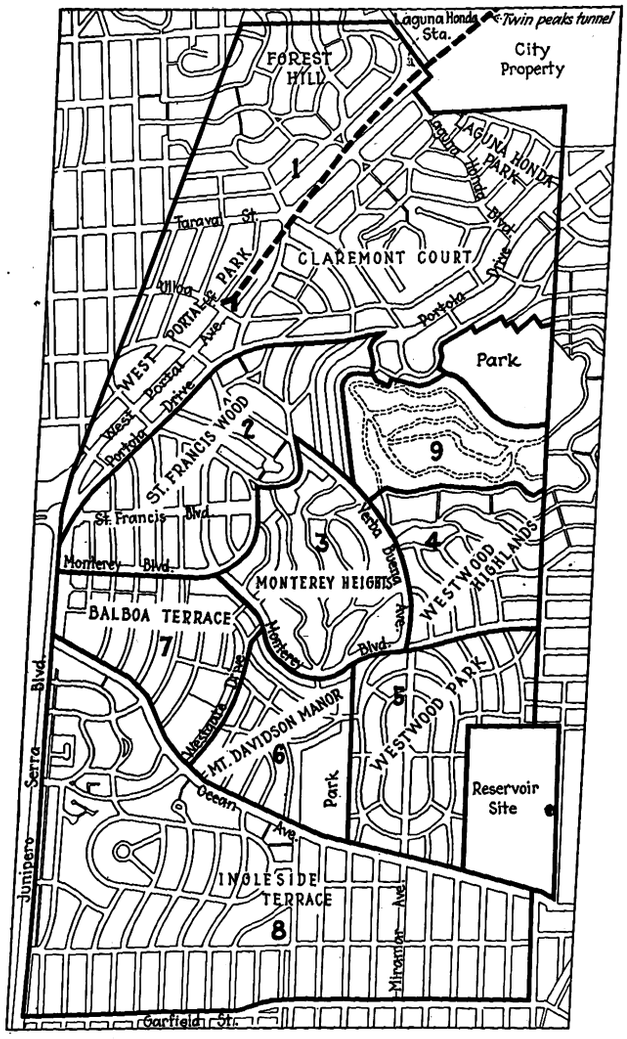
Ref. No.	Section	1928 Assessment Roll Land	1928 Assessment Roll Improvements	1912 Assessment Roll Land	1912 Assessment Roll Improvements
1	Forest Hill, West Portal Park, Claremont Court and Laguna Honda Park	$1,628,920	$3,274,710	$220,000	.....
2	St. Francis Wood	827,550	1,603,680	149,000	.....
3	Monterey Heights	503,430	505,100	53,000	.....
4	Westwood Highlands	263,180	584,900	41,600	.....
5	Westwood Park	638,770	1,206,250	166,500	.....
6	Mount Davidson Manor	432,830	200,910	78,000	.....
7	Balboa Terrace	538,130	586,950	102,000	.....
8	Ingleside Terrace	1,797,810	3,195,150	420,000	$32,500
9	Acreage	210,540	25,400	46,000	.....
		$6,841,160	$11,183,050	$1,276,100	$32,500

increased an average of 436 per cent, or, in other words, it was worth 5.36 times as much as it was in 1912 before the tunnel was begun. The total market value of land and improvements went up from $3,287,750 in 1912 to $50,652,050 in 1928, or it was worth 15.41 times as much as the original unimproved property before it was served with rapid transit.

One significant instance may be cited of the increase in property values due to the changed conditions incident to the provision of first-class transportation by the Municipal Railway lines. The Westwood Park tract was a sand waste with gum trees when the tunnel was built. Its appearance may be seen from the reproduction of a photograph taken in 1917, about the time that the tunnel was completed, but before car service was begun. The parked street in the middle distance is Miramar Avenue, which was in process of construction in anticipation of the development. The few houses in the foreground were not in the district under consideration. They were of comparatively inexpensive construction, and most of them have been replaced. In 1916 the 92 acres of this tract were assessed at $164,150. In 1921 the assessment of real estate had increased to $340,000, showing a growth in value of this one tract of $175,850. The improvements made in the meantime had a valuation of $538,000. The total increase for land and improvements is thus $713,850, or $7,760 per acre. The tunnel assessment on this land was $544.50 per acre.

Pastures Turned Into Residence Lots at a 10 to 1 Increase

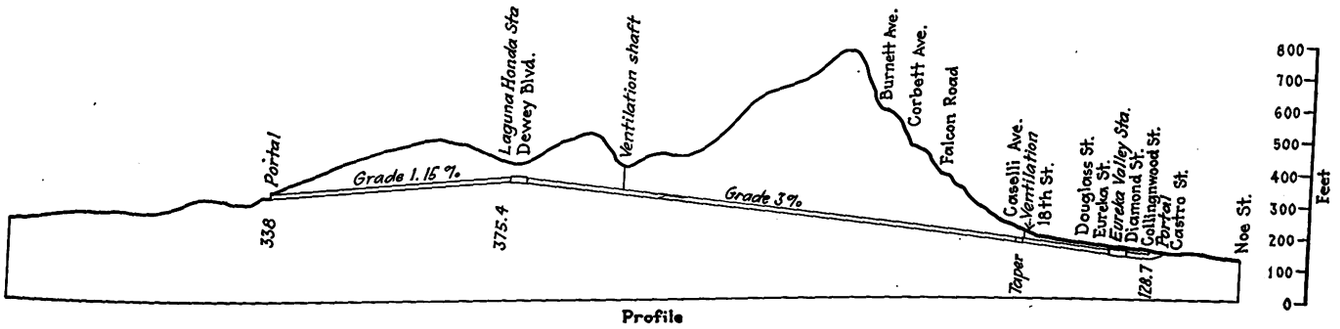
When the tunnel was built there was nothing in the first block south of the west portal but a potato garden and land valued at $10 per front foot. Since then land has enhanced in the first block immediately near the west portal to $500 a front foot, as the place has become a business center. The general level of prices now would measure up to perhaps $11 per front foot, where before the tunnel was built it was not worth more than a tenth of that amount.



A part of the assessment area adjacent to the west portal of the Twin Peaks Tunnel. The assessed values for land and improvements in 1928 are shown in comparison with 1912 in Table I

On Nov. 2, 1914, the city entered into a contract for the construction of the tunnel with R. C. Storrie & Company, at an estimated price of $3,372,000. This was increased by extras and incidentals to $3,947,856.70. The work was completed within schedule time, construction work being begun Nov. 30, 1914, and completed July 14, 1917.

Considerable attention was given to the terminal arrangements, so that future rapid transit lines could be extended therefrom. At the eastern end the tracks are depressed to the grade of a future subway down Market Street. At the westerly terminal an interurban 3 per cent transit grade has been constructed for a distance of



The profile of the Twin Peaks Tunnel shows the character of the barrier between the business district and the residential section that has been pierced

West Portal Avenue, non-existent before the tunnel was built, has become a high-class business district. This picture, taken in September, 1929, is looking toward the tunnel entrance from Vicente Street, about 500 ft. farther away than in the 1927 view

practically 2 miles southerly to the county line of San Mateo County, so that in the future interurban service may be handled through the tunnel. The grades are less than one-half the steepest grades in the New York subways, and the curves of 1,000-ft. radius are about four times their length. So all features of the construction were designed for the highest grade of future rapid transit.

The general plan and profile of the tunnel are shown in the illustrations. The length of the tunnel is 11,750 ft. It lies between an extension of Market Street at the intersection of Seventeenth and Castro Streets and the intersection of West Portal Avenue and Ulloa Street. There are two subway stations in the tunnel, one near the easterly end in Eureka Valley and the other at the Laguna Honda, at the summit of the tunnel and 8,500 ft. from the easterly portal. Each station is 300 ft. long, capable of accommodating an interurban train. The Laguna Honda station is 65 ft. below the surface, and the tracks are reached by stairways and elevator from the station building above. The site of the station is a narrow valley, the foundation for which was excavated by the open cut method, the opening being afterwards filled by spoil from the tunnel.

Table II—Market Values of Land and Improvements by Sections of Twin Peaks Tunnel Assessment District Adjacent to the West Portal, Previous To and After Construction of Tunnel

District	Market Values in 1928, After Construction			Market Values in 1912, Before Construction			Increase in Value, Per Cent	
	Land	Improvements	Total	Land	Improvements	Total	Land	Total
1	$4,072,300	$9,824,130	$13,896,430	$550,000	.....	$550,000	640	2,427

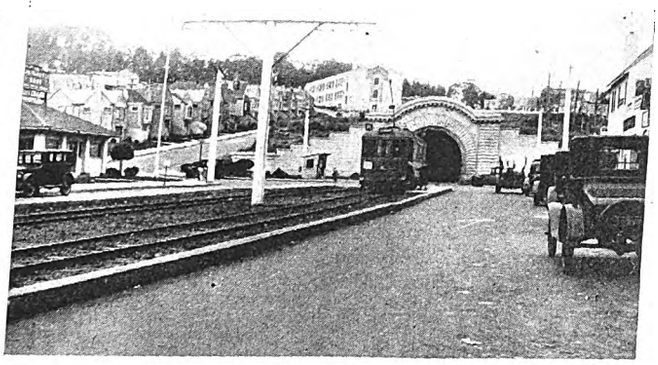
Table III—Materials Used in Constructing Twin Peaks Tunnel

Quantity of excavation, cubic yards	530,000
Cement used, barrels	120,323
Sand used, cubic yards	39,458
Gravel used, cubic yards	94,245
Reinforcing steel, tons	2,850
Timber, thousands of feet	11,000
Hydrated lime, tons	1,534

The tunnel is all lined with concrete of a $1:2\frac{1}{4}:5\frac{1}{2}$ mixture, with the addition of 8 lb. of hydrated lime to every 100 lb. of cement. The center of the mass of the mountain penetrated by the tunnel for a length of nearly 4,000 ft. was found to be of hard crystalline serpentine, which did not require the construction of any invert, did not need timbering, and is known as the hard rock portion of the tunnel. The distance was less than originally determined from the borings, but as the nature of the materials along the remainder of the tunnel was soft and inferior it demanded a concrete invert which exceeded in length the original estimates and hence increased the cost.

Ventilation is obtained by means of a duct chamber in the roof of the tunnel 15 ft. wide and 4 ft. high, with air ports all along its bottom slab, to be used as a ventilating chamber when the volume of business increases to an extent that the gas and foul air make increased ventilation a necessity. Up to the present time the natural draft has been sufficient. There is a shaft 13 ft. in diameter and 110 ft. high near Laguna Honda Valley on the peak of the grade, where ventilating apparatus may be installed in the future.

Some figures on the tunuel give an idea of the magnitude of the work and the quantities of materials involved. These statistics are given in Table III, above.

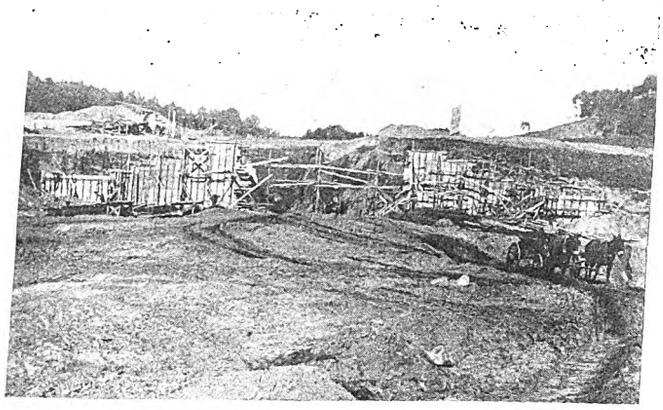


The west portal as it looked in 1927. This view was taken from approximately the same point as the 1915 picture. The intensive real estate development can be seen. The open track area has since been paved

Another view of the hill above the west portal. This also shows how completely the territory has been built up and a new residence district formed

In connection with the construction of the tunnel, parallel tracks of the municipal street railway lines were built along Market Street all the way to the ferries at its foot. The private railroad corporation serving the city contested the latter's right to construct and operate parallel tracks on Market Street, although the thoroughfare is 120 ft. wide. It was only after the case was argued in all the courts, ending by a decision from the Supreme Court of the United States on April 21, 1919, that the city's rights were definitely determined, and it was permanently granted permission to operate cars on the outer tracks.

Cars of the Municipal Railway commenced operating through the Twin Peaks Tunnel on June 1, 1918, from the Ferry along Market Street and to Sloat Boulevard. Extensions were made at both ends, and on April 12, 1919, the Taraval Street line was operated as far as 33rd Avenue. Since that time there has been a steady growth in the district west of Twin Peaks. The Municipal Railway system has been increasing its annual receipts



The site of the west portal of the Twin Peaks Tunnel at the beginning of construction work in 1915. The undeveloped character of the territory is apparent

constantly since its first installation in 1912. The actual returns for the year ending June 30, 1928, amounted to $3,477,665. Of this amount the zone feeding through the Twin Peaks Tunnel provided receipts of $691,024, which means that the yearly travel was 13,820,493 persons. The passenger business has expanded practically 300 per cent in the last ten years, and there is no doubt about its greater expansion in the future, so that as a railroad transportation asset the Twin Peaks Tunnel is of great value to the citizens of San Francisco.

Table IV indicates the growth in annual receipts of lines passing through the tunnel for the past ten years.

Table IV—Receipts of Twin Peaks Tunnel Lines, San Francisco Municipal Railway

Year Ended June 30	"K" Line	"L" Line	"M" Line	Total
1918	$38,994	.....	.....	$38,994
1919	249,239	$1,647	.....	250,886
1920	321,089	8,896	.....	329,986
1921	368,928	10,056	.....	378,984
1922	389,011	11,018	.....	400,030
1923	420,099	13,205	.....	433,304

The overhead structures for supporting the contact wire on the Lackawanna electrification were completed first at the Montclair station

Instruction Progresses with

By

J. G. MORGAN
Director of Personnel
Delaware, Lackawanna & Western Railroad

WITH rapid progress now being made by the Lackawanna Railroad in the change from steam to electric power, the officials of the company are directing their attention to the proper training of their supervisors and foremen. Under J. G. Morgan, director of personnel, assisted by the vocational division of the State Department of Public Instruction, an educational program consisting of selected group conferences was begun more than a year ago with the supervisory forces in the round houses, terminals and repair shops. The men in these conferences soon recognized the necessity for training in the electrical field if they were to direct intelligently the working forces which in the near future would be placed under their supervision. As a result, they requested special conferences and instruction. Consequently a short course in applied electricity was organized and carried through to a successful conclusion at the Paterson Vocational School, which is affiliated with the State Department of Public Instruction. This course included study of the effects of electricity, methods of generation, Ohm's law, direct current, direct-current motors, direct-current generators and motor control apparatus. Since the electrification of the road involves the utilization of direct current only, the instruction for this group was confined to that field alone.

Following the course just outlined, a more advanced series of conferences is being held during the present term by the state department under the joint supervision of the Paterson Vocational School, Jackson & Moreland, consulting engineers on the electrification, and the Lackawanna engineers, for the purpose of aiding the supervisors in dealing with technical problems of instruction and the specific problem of the Lackawanna electrification. There are also two other courses going on for the rank and file on the Morris & Essex division, and one for the foremen at Scranton is being organized and will be under way before the first of the year. Plans are also being made to outfit properly a class room with equipment parts and to have one of the multiple unit cars arrive as soon as possible so that both may be used for practical demonstration.

On every Tuesday evening, those supervisors who took the preliminary foreman leader conference course last year are meeting at the Paterson Vocational School for the study of the specific problem of electrification of the Lackawanna road. Arthur J. Manson's "Railroad Electrification and the Electric Locomotive" is used by this class as a textbook. The course covers a period of 35 weeks from Oct. 1, 1929, to May 27, 1930, with conferences and assignments as shown opposite.

A second group of supervisors is meeting each Thursday evening in the Terminal Concourse in Hoboken and is taking up the subject of "foreman conferences" under the instruction of John M. Fecher, supervisor of foreman training, State Department of Public Instruction. The outline for this particular course covers the stages through which a foreman's mind should pass in conducting a conference, namely, gathering the facts, selecting the facts, comparing and evaluating them, deciding and carrying out the decision. The supervisor is impressed with the idea that his job is a three-phase one; that besides being a supervisor he is also a manager and an instructor and that the formula for his qualifications should be:

$$E = M + T + I + J + Mo,$$

What Is Morale in Industry?

1. Honesty
2. Good character
3. Mental attitude
4. Fair judgment
5. Respect
6. Obedience
7. Loyalty
8. Good citizenship

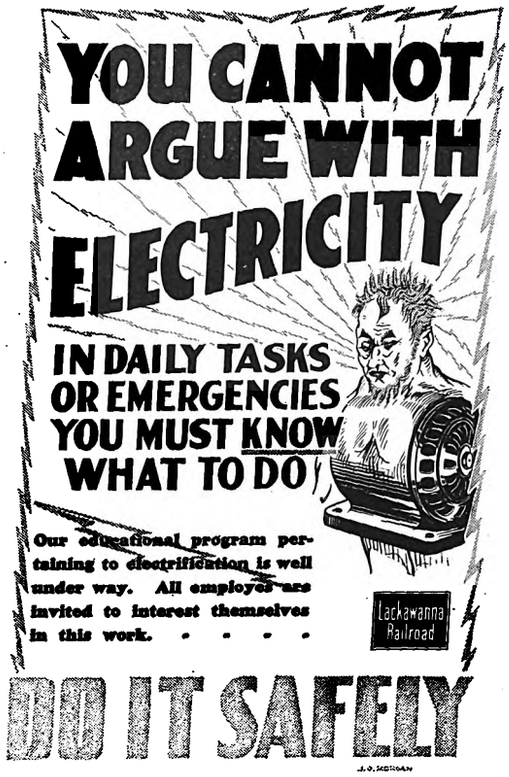
What Causes Poor Morale?

1. Setting a bad example
2. Poor supervision
3. Playing favorites
4. Lack of discipline
5. Improper instruction
6. Wrong attitude
7. Lack of co-operation
8. Lack of materal
9. Misunderstanding
10. Carelessness
11. Poor workmanship
12. Lack of character analysis
13. Bad disposition of foreman
14. Poor material
15. Poor working conditions
16. Unsanitary conditions
17. Poor tools
18. Lack of safety
19. Indifference
20. Home conditions
21. Ignorance
22. Disrespect

How Can You Improve the Morale in Your Department?

1. By setting a good example
2. By giving proper instructions.
3. By sympathizing with workers
4. By observing company rules
5. By co-operation with workers
6. By promotion whenever possible
7. By being fair
8. By a good disposition
9. By social activities on and off the job
10. By being broadminded

or, his equipment equals manipulation plus technical knowledge plus industrial planning plus judgment plus morale. This is known as the Allen Richards formula. Discussion of these subjects is then followed by instruction in the proper methods of teaching. This course covers a period of 35 weeks, after which the supervisors are ready to take up the practical electrification work and instruct the men under them. Mr. Manson's book is used as a reference rather than a text in this course.



This poster has been used to good advantage on the Lackawanna to emphasize to the men that they will be working with a new motive force

Construction

The first four conferences held by this group dealt with the question of morale and the tables shown above resulted from the discussion of that subject.

After summing up the discussion on poor morale, it was decided that the condition could be laid to either one of two reasons: (1) The worker is ignorant and does not know any better; (2) the worker knows better but refuses to carry out the things which would affect morale. It was decided that the latter was a mental condition and could probably be helped by the foreman.

Another interesting discussion in these first conferences dealt with the responsibilities of the foreman and how his job differed from that of the workers. It was

agreed that, in order to obtain production, a foreman must have men, trade knowledge, skill, machines and materials. In fact, while this formula outlined the job of the worker it was found equally applicable to the foreman, who, in addition, must be able to assume responsibility for production. The foreman's responsibilities were then listed in the order of their importance and each man was asked to evaluate the relative degree of supervision required by each item as compared to the degree of thought or worry he gave to it. These valuations were placed on a chart and two graphs constructed which tended to determine for the foreman himself whether or not he was applying his energy and thought to the most important phases of his work.

The third course is for the men of the rank and file and Kingsland shops, Hoboken engine house, Secaucus round-house and car department and the car department in Hoboken. Approximately 100 men are in this class which meets in the Hoboken Terminal each Friday evening under the direction of George Wall, chief electrician of the Lackawanna Railroad. The principles of morale and co-operation are being discussed in detail along the following lines: Morale as a mind builder; morale from the standpoint of the company's policies and of community betterment. Following this the class takes up elementary mathematical problems, how to take orders, how to carry out orders and how to co-operate with other departments. Each man is supplied with a list of parts that will be used in the electric multiple-unit car equipments and he is required to familiarize himself with the names of these parts.

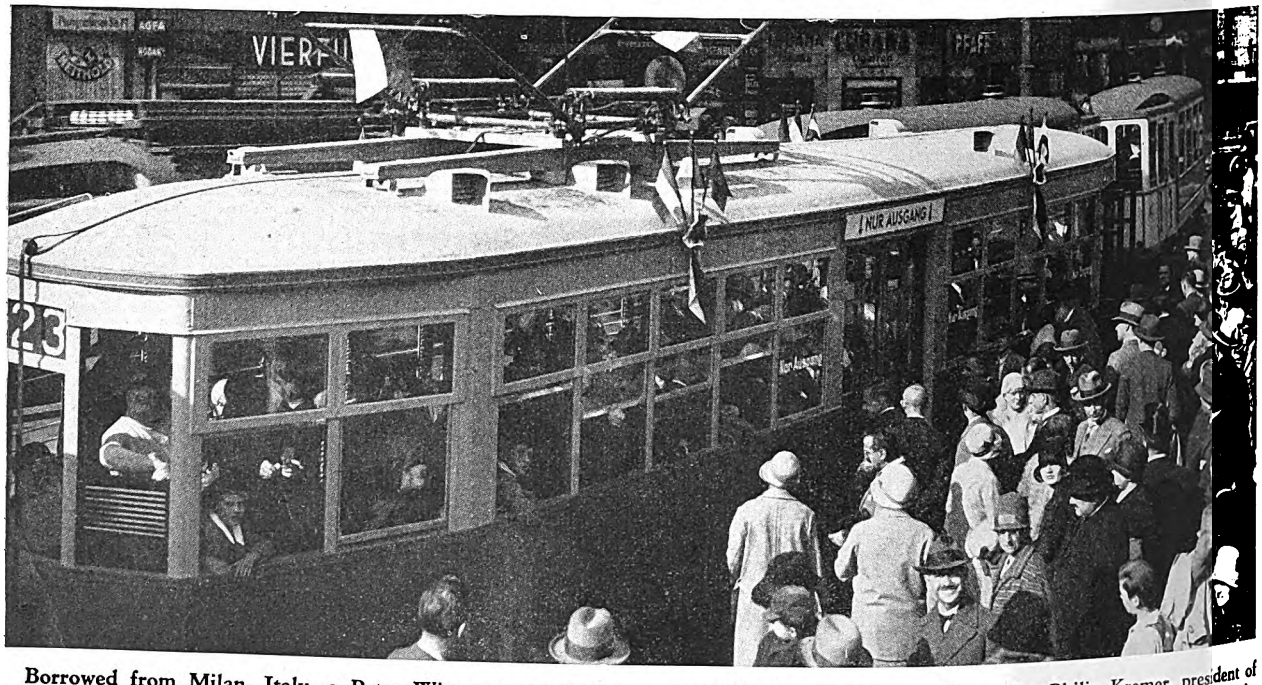
Supplementing the class-room work, this third class also meets at the Paterson Vocational School every Tuesday evening where a laboratory has been outfitted with the various parts of the equipment to be used and practical demonstration and instruction can be given.

In this course as well as in all others, the question of safety is being emphasized to a very great extent. With the new operation by electricity, new accident hazards will be met. One of the most important results of these conferences will be the establishment of proper safety practices. The poster reproduced with this article, emphasizing that "You Cannot Argue with Electricity" and that "in daily tasks or emergencies you must KNOW what to do," has appealed to the personnel of the road and has made them realize that instruction and practical training are necessary for their new work.

In addition to the program of education and instruction now in force, an outline of a new course for apprentice electricians has been proposed. There are 41 units of instruction planned in this course under four general heads: namely, shop assignment, shop mathematics, blueprint reading and general shop information. Under shop assignment, the apprentice who is to become eligible for a standard credit card for any of the nine units in this group must have diligently performed the assignments for approximately the duration of time indicated, and, through the co-operative efforts of the shop instructor, the foreman and the mechanics, must have been trained to a high standard of skill on the work. Similarly, the apprentice, to be granted a standard credit card for the shop mathematics unit of study, must understand the shop practices, including the necessary technical and production information underlying the unit, and be able to solve readily the practical shop calculations.

To qualify for credit in the blueprint unit, the apprentice shall have done a sufficient amount of work to enable him readily to transmit and understand all information given and received by him in the form of blueprints. Under the last heading of general shop information there are 29 units of study pertaining to technical and general practices of operation.

Pay-as-You-Pass Car Introduced in Germany



Borrowed from Milan, Italy, a Peter Witt type car is being tried in Frankfurt, Germany. On account of the multiple zone fare system in effect there, however, it has been found necessary to employ two conductors. Moreover, the dimensions of the car prohibit its use on many lines. Dr. Philip Kremer, president of the Frankfort City Railway, favors the use of large capacity units rather than motor cars and trailers, but believes this object can best be accomplished by means of articulated cars.

Transportation a Subject Discussed at the World Engineering Congress

WITH representatives of 26 countries in attendance, the World Engineering Congress, held in Tokio, Japan, was opened on Nov. 1 by Prince Chichibu. According to a cable dispatch from the representative of ELECTRIC RAILWAY JOURNAL, speakers from all nations stressed the part played by engineering in the advancement, welfare and economic progress of all countries, the value of the engineering profession being recognized in official circles now as never before. Progress in Japan is demonstrated by the development, in its 50 years as an industrial nation, of engineers whose work is recognized and commands respect in countries much older nationally.

This congress has become the greatest conference yet held for the exchange of engineering information on all phases of modern industry, covering past and future prospects under most varied conditions. Steam from volcanic heat and electric power generation by windmills are possibilities that were touched upon. The advantages of high voltage and superpower interchange were discussed, along with the hope for an international steam table and a standard form of power utilization statistics. Water storage for power, flood mitigation and irrigation were considered carefully in the light of American experience.

Among the papers presented by American delegates were several of special interest to transportation men. These included "Factors Governing the Use and Construction of Motor Trucks," by B. B. Bachman, of the Autocar Company; "Automatic Train Control," by C. E. Ellis, secretary of the committee on automatic train control of the A.R.A.; "Employment of the Less Volatile Fuels for Motor Coach Engines" and "Heavy-Duty Motor Coach Brake Design," both by G. A. Green, vice-president General Motors Truck Corporation; "Application of Motor Transport to the Movement of Freight and Passengers," by F. C. Horner, General Motors Corporation; "Economic and Operating Considerations in Railroad Electrification in the United States," by Prof. D. C. Jackson of the Massachusetts Institute of Technology; "American Developments in Diesel Engines," by L. H. Morrison, associate editor *Power;* "Rapid Transit Subways in New York City," by Robert Ridgway, consulting engineer New York Transit Construction Commission; "Transportation," by Major Mott Sawyer, superintendent Chicago, Milwaukee & St. Paul Railway; "Railway Engineering," by John F. Stevens, consulting engineer, New York; and "Improved Utilization of Railroad Equipment," by Roy V. Wright, managing editor *Railway Age.*

Discussing the subject of motor transport, Mr. Horner traced the use of the motor truck, first for the haulage of the food products necessary for life, and then for local and long-distance general hauling. A section followed on the use of this form of transportation by public utilities and municipalities. The co-ordination of railroad and highway transportation was discussed at some length, the topics covered including store-door delivery, railroad terminal trucking and a comparison of the volume of freight handled by the railroad and the motor truck. The author pointed out that the movement of freight by motor transport is still in its infancy and the biggest problem is the application of this new transportation tool to present-day requirements, intensive and comprehensive use of the motor truck in the short-haul areas of large cities and its co-ordination with the railroads.

On the subject of passenger transportation by motor vehicles, Mr. Horner presented a comprehensive picture of the present status of the motor coach in the United States. The growth of the bus industry was traced from its inception to the present time. The electric railway lines have not been slow in adopting this form of transportation, for more than 300 such companies in the United States and Canada are now operating approximately 10,700 motor coaches covering more than 20,000 route-miles in conjunction with their rail service, while some 50 additional companies have entirely replaced their electric car service, using more than 500 motor coaches for this purpose. The motor coaches operated by all these companies were operated an aggregate of 300,000,000 miles during 1928 and carried more than 1,000,000,000 passengers. The steam and electric railways are making money in two ways by using motor coaches: first, by reducing losses on unprofitable train service and, second, through actual increase of passenger revenue from motor coach lines acting as feeders and supplementary to long-distance rail service. The extent of city motor coach transportation was shown in tables, and examples of operating revenues and costs were given. The latter part of the paper was devoted to considerations of the causes of delays in service, taxation of motor trucks and motor coaches, and restrictions imposed for the protection of highways and their users.

Mr. Green discussed the various types of brakes which have been developed for motor coaches in view of the severe demands imposed on them by modern traffic. He gave the advantages and disadvantages of mechanical brakes, air brakes and hydraulic brakes. Metal-to-metal brakes and propeller shaft brakes also were considered. In conclusion, Mr. Green stated that it is his belief that the future heavy-duty motor coach braking systems will possess the following general characteristics: (1) Hydraulic operation, with either pressure or vacuum-type boosters; (2) a booster and master cylinder as an integral unit; (3) hydraulic brake-operating cylinders of the external type; (4) brake shoe design that provides for 100 per cent drum contact as nearly as possible, with uniform pressure around the entire interior circumference of the brake drum; (5) the molded types of brake linings; (6) propeller shaft brakes; (7) brakes on all wheels.

Speaking on the subject of motor trucks, Mr. Bachman predicted that the future probably will witness further increases in engine sizes and an increasing use of six-cylinder and possibly eight-cylinder engines to meet the need for greater average road speed without such an increase in maximum speed. Improvement in brakes and the use of four-wheel brakes naturally will follow this increase in speed. Greater protection for the operator, more comfortable seats, and easier operation of the steering gear and controls also will be demanded, together with better riding quality and smoother and quieter engines, transmission and rear axles.

Boston L Tempts Auto-Commuter by Clever Advertising

BEFORE planning its advertising campaign for this year the Boston Elevated Railway carefully studied the advertising of other companies all over the United States. Several cities, it was found, based their advertising copy on an appeal to the pocketbook of the prospect, pointing out how economical it was to use their service. However true that theory was, it opened the road to argument. Other cities took an aggressive point of view in their advertising campaigns, stressing the evils of parking, and claiming that thousands of street car riders were inconvenienced in order that a few people who traveled by motor might enjoy special privileges. Since the persons whom it is desired to influence are these same automobile riders, the result of such tactics may be to arouse antagonism rather than to win people over to the use of public transportation service. Hence, the Boston Elevated decided to base its advertising on suggested co-operation between automobile riders and the railway.

Throughout the campaign emphasis was placed continually upon the importance of keeping out of traffic. The subject matter of the copy was centered upon the many things that happen to a motorist who drives his car into the city. The remedy suggested was to park the auto near some rapid transit station and ride to and from the city in comfort and ease.

Among the many advantages offered the motorist in patronizing the "L," as stated in the advertising, were: Absence of all worry about getting suitable parking space in the city; absence of the risk of having his automobile damaged in a collision; elimination of tedious waiting in traffic jams, and the freedom from being tagged for infringement of one of the many and confusing traffic rules prevalent in the city.

To give the advertising force, specific mention was made of certain parking spaces along the rapid transit lines and the areas that they serve. For example, one read: "Do you live in Reading, Wakefield, Stoneham, Saugus, Melrose, Medford, Everett or Somerville? Leave your car in a convenient garage or parking space at Everett station or Sullivan Square and continue on to Boston via the Elevated."

The campaign included a series of eight advertisements that appeared during the months of July and August. Metropolitan and suburban newspapers were used, as well as one local financial newspaper and several foreign-language newspapers in which the advertiser's message had a local or specialized appeal. The ads were two columns wide and about 9¼ in. high.

In order to make the advertising campaign effective, only the points on the rapid transit lines were recommended for parking where open air parking spaces or garages were in existence. At most of the rapid transit stations recommended there were private parking spaces and garage facilities available. Near two stations the Elevated had leased for parking purposes land of its own to private interests who looked after the business of the auto parks. In these two areas the parking charge is 25 cents per car. In building new stations the company has in mind the necessity of adequate parking facilities even to the extent of providing for them as far as possible in the plans of the new stations themselves.

Tokio Adopts Western Traffic Control

Traffic signal on a busy street in Tokio

STOP and go traffic signals of a type similar to those widely used in this country recently have been introduced in Japan. An accompanying illustration shows a signal at Hibija Park Corner, Tokio. The control is manual. A warning bell tells when the signal is about to be changed from "go" to "stop." Directions are given in English as well as Japanese.

Use of the motor frame as the main member of the truck makes the assembly simple and reduces the number of parts materially

Integral Truck and Motor

Feature New Liverpool Car

In this radical design practically all unsprung weight except wheels and axles has been eliminated. The motor casing itself forms the main member of the truck, and the armature, mounted longitudinally, drives the two axles through spiral bevel gears mounted on quills

NOVEL construction of the trucks features a type of tram car designed by Percy Priestly, general manager of the Liverpool (England) Corporation Tramways. The design was worked out in conjunction with the English Electric Company and the car was built by the latter.

The object in view was to produce a car which would be suitable for present-day and future requirements of city passenger transport. This entailed considerably higher speeds than normal, but other desirable features were considered necessary, such as improved spring suspension, ease of riding, reduction of noise, low wheel loading and reduced cost of maintenance.

As no single truck was considered satisfactory for high speeds, combined with the rapid acceleration and retardation deemed essential, it was decided to develop a double-truck car, having as long a total wheelbase as possible to negotiate the curves encountered in Liverpool. To give the higher speeds the driving equipment employed consists of two DK-120 motors, each rated 60 hp. at 500 volts, an exceptionally high power for British practice. All four axles are drivers, so that the whole weight is available for adhesion, and maximum acceleration can be obtained.

The design of the motor and truck is entirely novel. The two have been developed as a single unit, so that the motor forms an integral part of the truck. The arrangement will be seen in the line drawings which are reproduced. The motor is mounted longitudinally, with its shaft in the same horizontal plane as the driving axles. A bevel pinion on each end of the armature shaft drives a spiral bevel gear mounted on a quill surrounding the axle. The quills are mounted on large roller bearings in cast-steel casings secured to the main frame of the motor, so that the gears always mesh correctly. Also, in order to maintain the correct relation to insure proper meshing of the gears, the motor armature is mounted on roller bearings. Since no wear takes place in the bearings, the correct pitch line will be maintained between pinion and gear, ensuring smooth and quiet operation.

At each end of the quill is a flexible drive for transmitting the power to the driving wheels. This flexible drive allows relative movement in all directions between the quill and the axle without setting up additional strains in the driving gear.

The truck, which really consists of the motor together with the two end casings, is supported on eight coil springs, which are mounted on cast-steel caps containing anti-friction bronze axle bearings. Hence the only unsprung weight in the entire assembly is that of the wheels, axles and axle bearings. This feature is most important when considering track maintenance, as the hammer effect on the rails has been minimized. Similarly, by distributing the weight of the car over four axles, the axle load is considerably less than in normal British practice, so that a track upon which this type of car is operated should have considerably longer life with less upkeep.

Lubrication is simple, as each casing at the end of the

The position of the various parts of the Liverpool Tramway car drive is shown clearly in the sectional drawings of the truck and motor

Principal Dimensions of Experimental Car, Liverpool Corporation Tramways

	Ft.	In.
Length over collision fenders	37	0
Length over body	28	0
End platforms	4	0
Distance between bogie centers	17	6
Bogie wheelbase	4	2
Overall height (rail to top of trolley plank)	10	5
Height, top of floor to under side of veneer ceiling	7	6
Height of doorway	6	0
Width over roof	7	2
Width over monitor roof	4	4½
Width between sills	6	6
Width of transverse seats	2	7½
Depth of transverse seats	1	4½
Distance between seats		11½
Width of aisle	1	2

motor forms an oil reservoir from which all the axle and motor bearings, flexible drive and gears, are lubricated. Thus, on the complete car there are four oiling points, compared with the 28 that would be necessary on a bogie car with four driving axles if built according to the standard design.

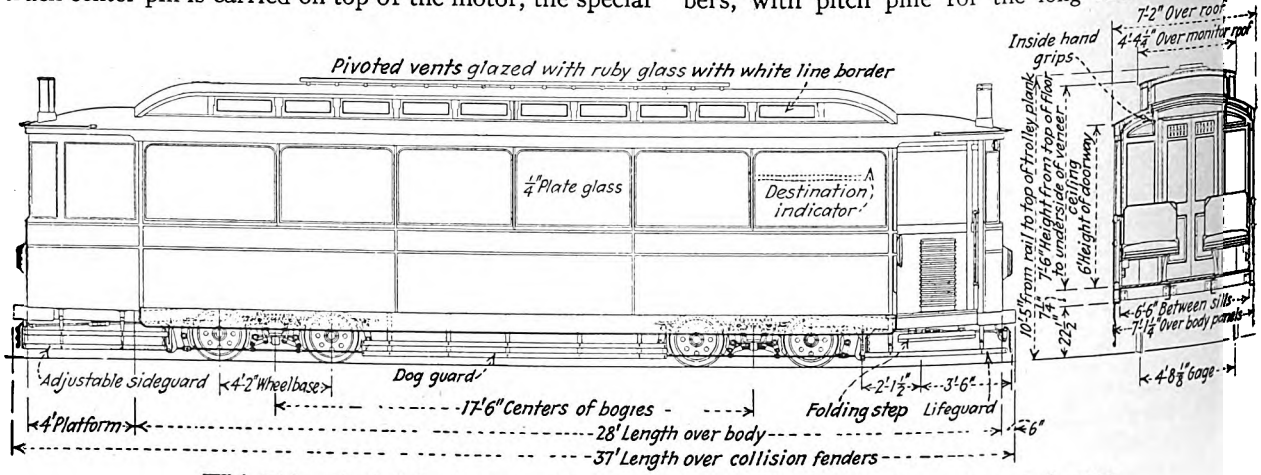
The springing consists of two large semi-elliptic springs placed in series, with two coil springs to carry the car body on the truck, while the truck itself is carried on the axles by eight coil springs. This combination of semi-elliptic and coil springs makes the car very comfortable and easy riding.

The driving wheel diameter is 24 in., and although the truck center pin is carried on top of the motor, the special design of the motor permits the low floor level of 28½ in. without sacrificing road clearance, which is a minimum of 4 in.

The control equipment also is special, being arranged for use with multiple-unit two-car trains. The controllers are of the English Electric Company drum type, so arranged that it is possible to drive each separate car or the two-car unit from either end. The only extra switch gear necessary is the change-over switch on each car, together with a three-way coupler. Line contactors have been incorporated so that when the power is shut off the whole of the break of current is taken on them, reducing considerably the wear and tear on the controller. The electric braking feature has been retained, although, in order to keep the control as simple as possible, the electric brake, which in Liverpool is used essentially for emergencies, is operative on the forward car only. For the same reason, the reverse position of the controller operates the motors on the leading car only.

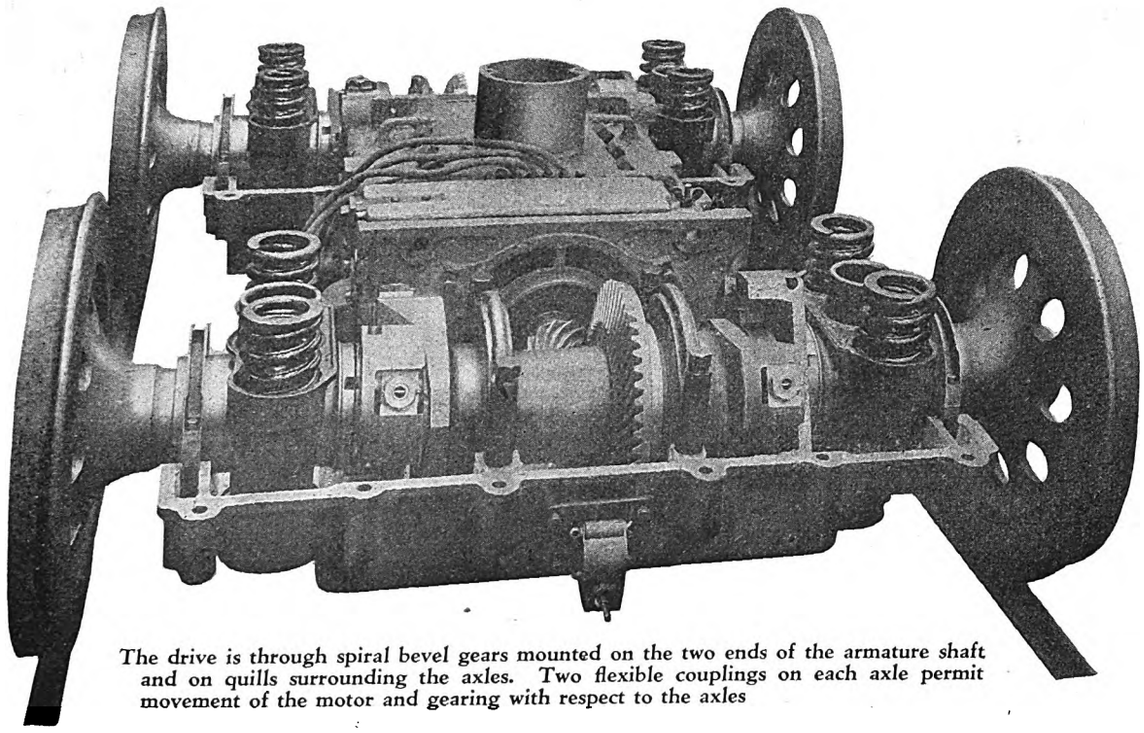
The auxiliary equipment is of standard English Electric Company type, including D form A circuit breakers and FR resistances. The trolley is made to the special design of the Liverpool Tramways Department.

The car body is designed as a de luxe type with cross seats, except for double side seats at the ends, similar to American practice. The seating capacity is 44. The main body framing consists of teak for all exposed members, with pitch pine for the long rails which are not



With 24-in. wheels it has been possible to obtain a low floor height without the use of ramps

Digitized by Google



The drive is through spiral bevel gears mounted on the two ends of the armature shaft and on quills surrounding the axles. Two flexible couplings on each axle permit movement of the motor and gearing with respect to the axles

exposed. The underframe is built up of mild steel sections with packings of oak for cross bars and pitch pine for sole bars, the whole being securely framed, together with the necessary knees and gussets. In addition to the substantial sole bar, a special adjustable truss rod attached to the pillars along the body and passing through the headstock has also been fitted.

The roof is of the monitor type, which is standard on the single-deck buses built by the Liverpool Tramways. The inside finish of the car is mahogany-stained and cellulose-lacquered in the natural grain, together with panels of the same material. The seats are special English Electric reversible tilting type, fitted with comfortably-sprung backs and cushions. They are upholstered in blue leather. The grab handles and furniture are covered with doverite, while instead of hand poles separate doverited hand grips are secured to the bottom monitor rail. The ceilings are of three-ply birdseye maple veneer, paneled out with mahogany moldings and ornamented with gilt lines.

Special attention has been paid to the lighting. Inside the saloon are thirteen lamps, four down each side and five down the center under the monitor roof. The fittings consist of large base holders with super-lux white glass shades and silvalux opal gas-filled lamps.

Hudson-Bowring lifeguards, Philipson side-guards, and destination signs of the standard Liverpool pattern are part of the equipment.

The accompanying table gives the principal dimensions.

The car body in the new Liverpool car is quite similar to American practice

Use of track area by vehicles of all kinds is an important factor in selection of paving materials

How Changing Traffic

Survey of specifications and materials used by more than 30 electric railways for paving in the track area shows trend toward development of certain standard designs

WITH vehicular loads constantly increasing in weight and railway loads decreasing, due to lighter car construction, the selection of the type of paving to be used in the track area cannot be based on the requirements of the railway alone but must be based on careful study of the demands to be made on the whole street surface. Despite the progress which has been made in securing relief from paving burdens, this subject remains a major problem with the electric railways. Standardization of paving materials and structure has occurred in recent years on many individual electric railways, despite some difficulties imposed by municipal ordinances and the wishes of abutting property owners. Practices on railways located in different cities, however, continue to vary widely, as shown by a survey just made by ELECTRIC RAILWAY JOURNAL covering more than 30 leading properties in the United States and Canada.

Few city railways serving heavily congested downtown areas as well as outlying residential districts have been able, or have deemed it advisable, to standardize on one type of paving construction. Numerous companies can boast of past experience with nearly every known paving material and a large number of them still have in use such surfaces as granite block, asphalt, concrete, brick and wood block. This experience has given each material a fair period of trial and permitted detailed observations of its adaptability to local conditions. As a result, most companies have adopted as standard not more than two methods of construction with two surface materials, which meet all their requirements.

Several railways have, for all practical purposes, standardized on one paving specification for the entire system, but the surface materials selected by the different systems vary widely. Way engineers, almost without exception, believe that the factors governing the selection of a paving material are: (1) cost, (2) durability, with due regard for the amount and kind of traffic using the area, (3) the facility with which the material lends itself to repairs by the company's own forces and (4) salvage value when ordinary repair or complete reconstruction becomes necessary. Yet to meet these requirements representative railways are using distinctly different surfaces.

Most companies are approaching a uniform practice by using fewer standard types of paving each year. A sturdy, hard surface construction, such as granite block, is favored on heavy duty streets and a lighter material, as asphalt, for outlying, lightly traveled districts. For example, the Boston Elevated Railway uses granite block for heavy traffic, asphalt or Warrenite for lighter work; the Twin City Rapid Transit Company has 962,000 sq.yd. of granite block, 106,900 sq.yd. of brick and 195,300 sq.yd. of concrete; the Pittsburgh Railways employs block stone, brick and asphalt with block stone stretchers. The Toronto Transportation Commission has some asphalt but attempts to standardize on granite block paving for both tangent and special trackwork.

Franchise obligations, municipal ordinances or gentlemen's agreements between company and city officials are important factors in the selection of paving specifications. In many cases the railway determines the type of paving

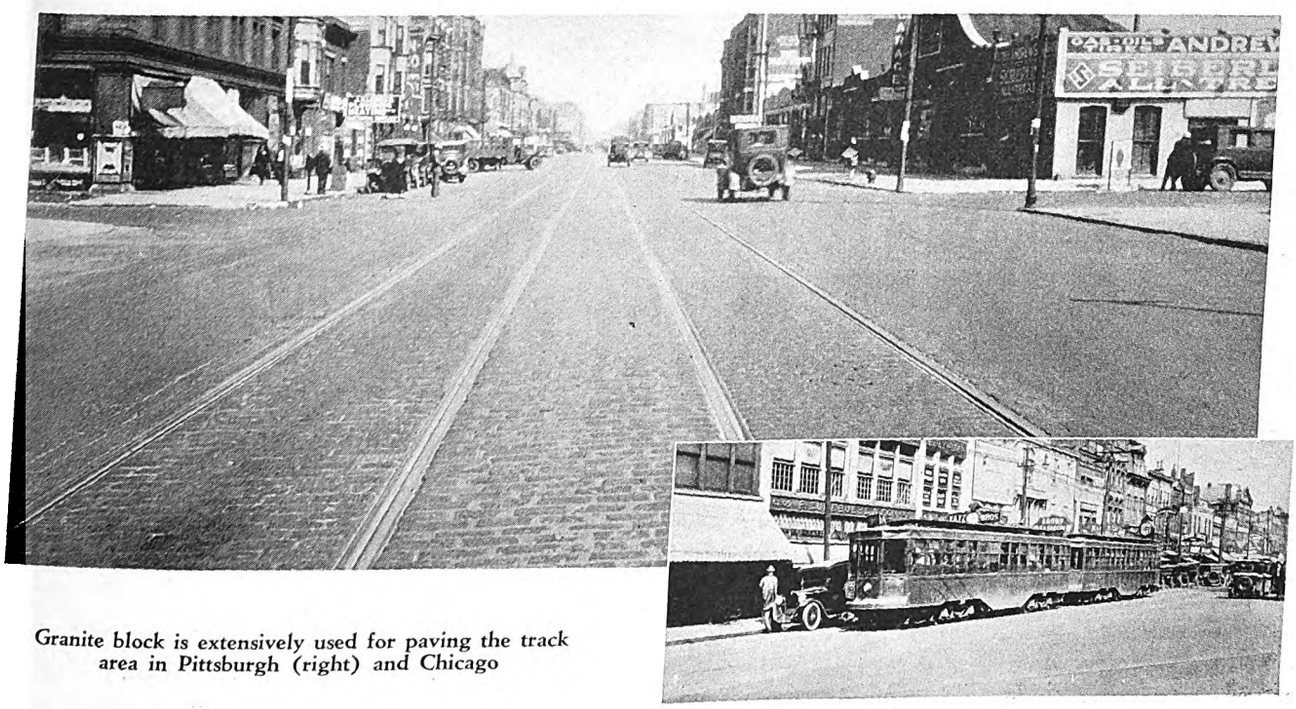
Digitized by Google

for the track area without following city specifications for the general street surface. In others the city insists on uniformity from curb to curb. Usually, however, as a result of years of co-operation with city officials, the railway and the city plan their construction together. The general tendency, in any event, is toward uniformity throughout a single property.

This does not mean, however, that the street and track areas are necessarily paved alike. In fact, maintenance engineers are almost unanimous in their belief that it is not necessary, and in many cases not desirable, to pave the track area with the same material used on the adjacent street. Ordinarily the railway paves and is solely responsible for the maintenance of the track area, the dimensions of which vary in different municipalities, but which in nearly every instance extends between parallel lines at some distance beyond the outer rails. The Connecticut Company is responsible for a strip 8 in. beyond the outside rail while the Capital Traction Company in Washington maintains to a point 24 in. beyond the rails. The average measurement in this respect is approximately 18 in. There are, however, a number of companies that use special paving between the rails only. In San Francisco, the city paves up to the outer rail but the Market Street Railway is required to maintain the paving between the rails and also 2 ft. on the outside of the outer rails. In Boston, special paving is used between the rails of each track only and in San Antonio the railway paves only between the rails but pays the city for a 2-ft. strip beyond that.

Granite block continues to head the list as the most widely used surface material in track paving. Over 76 per cent of the railways whose practices were surveyed in this study are using granite block in areas that are subjected to hard traffic conditions. Howard H. George, superintendent of way of the Cleveland Railway, summarizes his experiences with various paving materials as follows: "Granite block is by far the most satisfactory paving material for the track area, taking into consideration all of the factors involved. While it is higher in first cost than any of the others, it possesses wearing qualities which no other type of pavement has. It is not slippery in wet weather; it lends itself readily to maintenance repairs, and has a maximum salvage value." His experience with other materials has been that "concrete pavement has shown a tendency to crack badly and has a decided disadvantage in that it does not lend itself readily to economical repairs"; that "'brick does not always run uniform in texture and has but little salvage value"; that "asphalt, besides having no salvage value when repairs become necessary, requires a special plant for its production which the ordinary railway is not

Conditions *Affect* Paving Practices



Granite block is extensively used for paving the track area in Pittsburgh (right) and Chicago

Digitized by Google

Underground conduit construction complicates the paving problem in Washington, D. C.

justified in maintaining and, consequently, repair work must be done by outside agencies"; and that "wood block has proved unsatisfactory as it is difficult to keep down and is very slippery in wet weather."

The Toronto Transportation Commission has had past experience with both asphalt and granite block and as a result has adopted the latter material as standard paving for both tangent and special track work. Blocks 4 in. to 4½ in. wide, 7 in. to 10 in. long and 4½ in. to 5 in. deep are grouted in a mixture of one part cement to one part coarse sand, resting on a 1-in. cushion of one part cement to four parts sand. This cushion is laid on a base, approximately 6 in. in depth, of 1:3:6 concrete using a graded gravel for aggregate. W. A. MacRae, engineer of way for this system, believes that although the cost of this granite block construction is approximately twice that of asphalt pavement, the additional cost is justified by the durability of the blocks and their salvage value when rail renewals and repairs are necessary.

Other engineers testifying to the advantages of granite block surface are George T. Wilson of the Twin City Rapid Transit Company and Alfred Sweeney of the Androscoggin & Kennebec Railway, Lewiston, Me., while C. W. Wilson of the Pittsburgh Railways and S. Clay Baker of the East St. Louis & Suburban Railway advocate granite block or brick, the former for high rail and the latter for lower rail construction. In Pittsburgh, the standard practice is to use granite block with 9-in. rail and brick for 7-in. rail, both being laid on a 6-in. concrete base. The old objection of rough pavement where granite blocks were used has been overcome as the result of present skill in dressing the blocks and they can now be laid to a very smooth surface, while experience has proved that such a pavement properly constructed will require no maintenance during the life of the rail.

Equally definite in their views, although not so numerous, are the advocates of asphalt. They claim as factors in the selection of this material for the track area: low first cost, adaptability to all kinds of track construction, ability to withstand demands made upon it by general traffic, and the ease with which it is repaired

Paving Practices of the Toronto Transportation Commission

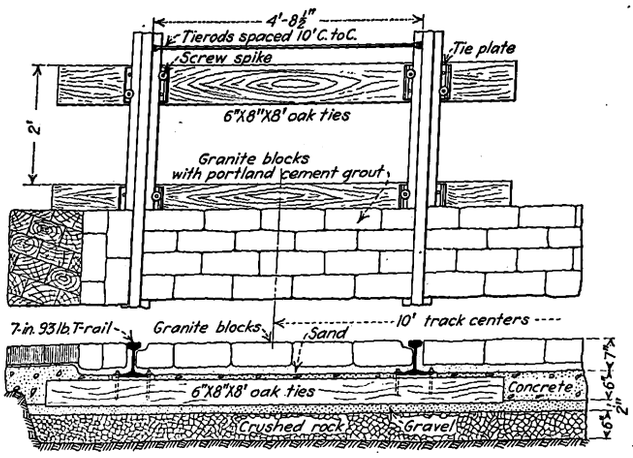
Digitized by Google

or replaced. Sixty per cent of the railways included in this survey have used, or are now using, some form of asphalt as a surface paving in the track area. It is coming into greater use on the streets in outlying, lightly traveled districts where the appearance of the roadway is a highly important factor and where it is desirable to have a uniform surface from curb to curb. Municipal franchise obligations or preferences and low first cost frequently are responsible for this practice.

Since 1916, the San Antonio Public Service Company has used nothing but cold rolled Uvalde rock asphalt for paving its track area. Mines producing this material are located within a few miles of the city and the supply is practically inexhaustible. This material is ground and prepared for use in quantities of from one ton to any amount needed, for a price $7 to $8 per ton. The cost of laying it varies with the thickness laid and ranges from 4 to 10 cents per square yard. Louis T. Botto, superintendent of maintenance of way for the San Antonio Public Service, states that eighteen years experience has proved the durability of asphalt and emphasizes its adaptability to maintenance repairs and the reconstruction of old surfaces. More than 200,000 sq.yd. of creosoted wood block paving was saved and its useful life prolonged by topping it off with Uvalde rock asphalt five years ago; this pavement now has the appearance of asphalt and requires a close inspection to tell that it really is a wood block pavement. The company applies the same treatment to brick and concrete pavements when they become worn. The salvage value of this particular asphalt is about 20 per cent of its original value, as it can be reground and reused.

Another advocate of an asphalt construction for paving in the track area is K. T. Corey, engineer, Worcester Consolidated Street Railway. Although there are four different types of paving on this property Mr. Corey says, "In my opinion the asphalt paving on a concrete base is the most desirable type. The sheet asphalt acts as a blanket, deadening the sound of passing cars; it is easily and quickly laid, is readily patched when worn and, as compared with other types, is comparatively inexpensive."

Other engineers advocating the use of asphalt are W. W. Wysor, chief engineer United Railways & Electric Company of Baltimore; B. P. Legare, Market Street Railway, San Francisco; H. J. Kolb of the Brooklyn & Queens Transit Corporation; R. H. Dalgleish of the Capital Traction Company, Washington, D. C.; and R. I. D. Ashbridge of the Atlantic City & Shore Railroad.



Granite block construction with tee rail as used by Twin City Lines

One of the strongest advocates of brick paving is A. Taurman, superintendent of equipment, way and structures of the Birmingham Electric Company. The selection of brick for track paving in Birmingham is due largely to the fact that in many places along the lines, property is not fully developed and the gas and water companies and property owners are continually cutting into the paving to install pipe lines, causing many pavement openings to be made. In addition, there are numerous brick plants near Birmingham and the railway gets low freight rates. On this subject Mr. Taurman states: "After careful investigation of experience in Birmingham over a considerable period of years and study of experience elsewhere, we have adopted vitrified brick as the standard type of track paving for all of our work. We have developed a type of construction calculated to overcome so far as is possible the various destructive forces and which has allowed us to speed up track building and reconstruction by doing it under traffic.

"At the outset we prepare a substantial yet readily drained foundation for the track structure. Our ties are creosoted and are laid in a ballast of 8 in. of crushed slag, well-tamped, with at least 6 in. depth under the tie, rising to 8 in. between the ties. This provides substantial ballast for the tracks and yet has sufficient voids to permit water to drain away. Thus we protect our track structure by providing for the disposal of water and preventing its accumulation to intensify churning at the joints. Over this ballast we lay a foundation of 6 in.

In New Haven, Conn., granite block is used along the rail with asphalt paving elsewhere on the street

of concrete 1:3:5 mix. We now have a good 14 in. of support for the pavement surface, a support sufficiently stable to enable it to store up energy when

Asphalt is used around curves and special track work in San Antonio

depressed by passing cars and to release this energy when the load is removed, and restore the pavement to its normal position. A bedding of 1 in. of sand is next spread over the concrete foundation, evenly struck off by a template and rolled until it is uniformly compacted. Thus we protect the pavement against shock. The brick are laid on the compacted sand bed."

The Penn-Ohio System in Youngstown, Ohio, uses a 3-in. brick pavement with asphalt filler in the track zone except in a few instances where it has laid concrete. Claude Timblin, engineer of maintenance, prefers this thinner brick to the old-style Bessemer block with ¾- or 1-in. cushion. The reason, he states, is that the concrete base placed higher on the rail helps to hold it more rigid and presents some support when the track structure is beginning to wear. He does not advise the use of any brick thicker than 4 in. unless 9-in. rail section is used.

About 40 per cent of the railways surveyed have some form of brick paving on their properties, usually where traffic conditions do not demand so much of the roadway. Among these are the East St. Louis & Suburban Railway, New York State Railways, Columbus Railway, Power & Light Company, Dallas Railway & Terminal Company and the Terre Haute, Indianapolis & Eastern Traction Company.

Concrete, now used almost exclusively as the supporting base for all track paving regardless of the surface material employed, is finding greater usage as a complete paving structure. It is comparatively cheap, is easily and speedily laid, has a smooth and non-skid surface for vehicle operation and wears well under moderately hard usage. Another claim for concrete is that it supports the track structure more firmly than any other type of pavement; therefore, there is not the tendency for disintegration along the rail with consequent deterioration of the track structure, due to the percolation of surface water.

W. R. Dunham, Jr., of the Department of Street Railways, Detroit, and George L. Wilson, of the Twin City Rapid Transit Company, testify to the satisfactory use of concrete paving in the cities of Detroit and Minneapolis respectively. Ben Rossiter, of the Portland Electric Power Company, Portland, Ore., has used concrete extensively in the track area with excellent results. Within the past two years this company has reconstructed two pieces of track and has used an asphaltic concrete rather than cement concrete. The factors which led them to select this type of paving were the desire to obtain use of the track in the shortest possible time, a hope that it might retard rail corrugation and that it would tend to eliminate operating noises. The first and last expectations were realized; the second is yet to be determined.

Prior to 1923 the Milwaukee Electric Railway & Light Company was subject to an ordinance which required that the track area be paved the same as the adjacent street area. In that year, however, the city passed an ordinance permitting reinforced concrete pavement to be placed anywhere in the track zone regardless of the kind of pavement on the sides of the street. To date over 400,000 sq.yd. of this material has been laid and the results secured have been very satisfactory. E. J. Archambault, engineer of way and structures, states that the cost of this type of pavement runs about $2.25 per

sq.yd. as compared with $5.90 for granite block and $4.40 for brick.

Wood block pavement, although used to a great extent in the past, is a material which has generally lost favor in recent years. This is apparently due to speedier vehicular traffic and the resulting hazard of skidding. Furthermore, considerable difficulty has been experienced in keeping wood block down to a smooth surface, as it is greatly affected by weather conditions which cause expansion and heaving. Many railways still have some wood block paving in their track area but are replacing it with a more sturdy surface when reconstruction becomes necessary. Other companies are continuing to use wood blocks as stretchers along the rail to take care of vibration and noise.

That the type of paving determines the type of track structure to be built, is more generally the case than the reverse, due to the various factors of cost, local municipal practices, etc. The demands of general traffic, vehicular and railway, require utmost consideration, resulting in a widespread practice of using a high, heavy rail structure with a hard, sturdy pavement in heavily congested areas and lower, lighter rail with lighter paving in the less congested districts. In Pittsburgh, brick is used with 7-in. rail and granite block with 9-in. rail. The Connecticut Company uses concrete with tee rail not over 5 in. high, two rows of granite block on either side of rail, with the balance asphalt on a concrete base or a complete asphalt on concrete construction with 6- or 7-in. tee rail; asphalt on a concrete base with 7- or 9-in. grooved girder rail is used exclusively in Hartford, and where the roadway is entirely paved with granite block, 6- or 7-in. tee rail is used. The Boston Elevated Railway uses 7-in. girder rail or 7¼-in. tee rail on wood ties in ballast with 6-in. concrete base, 7-in. girder rail where surface is to be asphalt or Warrenite and 7¼-in. tee rail with granite block. Other companies adopt a single type of rail and make the paving construction conform to their standard track structure. The Penn-Ohio System uses girder rail only. The New York State Railways in Syracuse uses 7-in. tee rail with brick or stone block paving and the Conestoga Traction Company in Lancaster, Pa., standardizes on 7-in. 122-lb. A.E.R.E.A. grooved girder rail.

The attention to proper rail joints and the effective sealing of the rail by the paving material are, without question, two of the most important problems of the way engineer. Defects in track pavement usually make their first appearance at the rail joints because it is here that a greater strain is forced on the street surface and

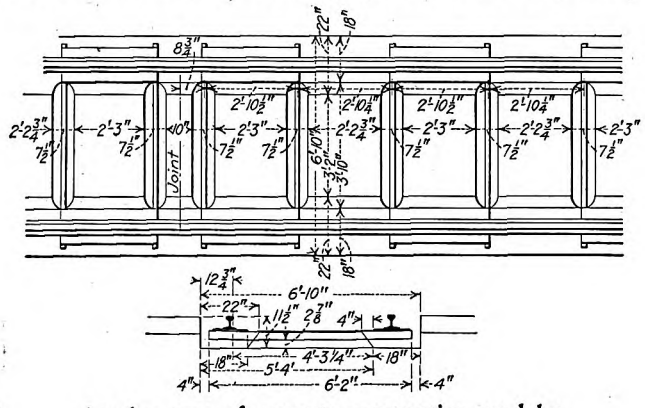
likewise, at this point water is most likely to find its way into the track structure. A. Taurman believes he has solved this problem in Birmingham by adopting a dual method of joint filling. He finds that "it solves most of the difficulties hitherto encountered with block pavements in car tracks. We fill the lower half of the joint with cement grout filler and the upper half of the joint with asphalt filler. We need the cement filler to prevent rocking of the brick over the ties and displacement by the tracks. We need the asphalt filler for its water-proofing properties, for the quietness



Another type of concrete construction used by Georgia Power Company

it gives the pavement, and for the conservation of the reuse value of the brick, either for minor restorations or for relaying when tracks have to be replaced. Thus we get the full advantage of the long life of this material, which constitutes an important credit item in figuring the cost of our paving over a period of years."

While first cost is not necessarily the primary consideration in determining the type of paving used in the track area, it is a factor of major importance. C. A. Smith, superintendent of roadway, Georgia Power Company, Atlanta, has prepared cost data on the various types of pavement and track which are based on the conditions of a particular locality but agree closely with the findings of many other engineers. The cost per square yard of paving alone is as follows: Dressed granite block paving on concrete base, $6.50; vitrified brick on concrete base, $4.25; asphalt on concrete base, $3.50; 7-in. concrete, $2.25. Costs of complete track structures with various types of paving are given in the following table.

Dressed Granite Block on Concrete	
8/9 sq.yd. of dressed granite block paving @ $6.50	$5.78
1 ft. of 7-in. 122-lb. track, beam construction, without concrete found'tn	4.70

How better service and lower fares have increased revenue and riding on Gary-Crown Point line

Better Service at Lower Fares Saves an Interurban

An old interurban electric railway was slowly but surely dying. After a diagnosis of its ills, "Modernization" was prescribed as a remedy. Treatment, including new cars, installation of one-man operation, track and overhead improvement, up-to-date maintenance methods and publicity, was faithfully applied. The line has now recovered and is prospering

By
LAURENCE WINGERTER
Director of Publicity
Gary Railways, Gary, Ind.

THAT modernization is an effective solution of the interurban problem is indicated by the marked improvement in the condition of the Gary Railways' line between Gary and Crown Point, Indiana. Here, transportation service has been merchandised successfully. Increased revenue and decreased operating costs have followed modernization and lower fares. In the short space of a year, revenue has been increased and riding has risen 100 per cent.

Prior to October, 1928, the interurban line running between Crown Point and Gary, a distance of 15 miles, was operated by the Gary & Southern Traction Company. Its revenue was then declining sharply in the face of severe automobile competition. Its rapidly depreciating plant and antiquated rolling stock offered no hopes for attracting new business. Its credit was badly impaired, and its future prospects seemed drab indeed. Then the Midland Utilities Company became interested in the possibilities of developing transportation business between residential Crown Point and industrial Gary, and in October, 1928, this company purchased the interurban line. The property was leased to the Gary Railways, a Midland subsidiary that supplies local and interurban service to Gary and its surrounding communities.

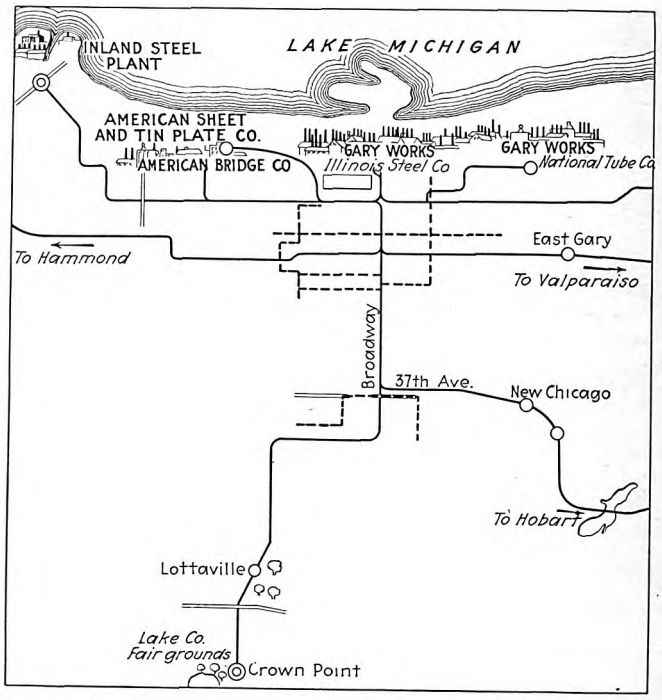
An extensive rehabilitation program, calling for an expenditure of $120,000 for the purchase of modern interurban cars and revamping of the track structure and distribution system, was begun at once. All improvements were completed about May 1, 1929. The public of Gary and Crown Point has benefited greatly by these improvements and is now enjoying a vastly superior transportation service, including, briefly, more comfortable cars, smoother riding, more dependable service, greater speed and lower fares. From an operating standpoint, the Gary Railways has reaped many benefits from the rehabilitation program. Among these are: lower operating costs through the introduction of one-man operation, increased revenue from interurban passengers and extra revenue from local service.

Modern Cars Purchased

The first step in the accomplishment of these ends was the purchase of the new equipment. Two modern interurban cars were constructed by the Cummings Car & Coach Company. Light in weight, economical to maintain, designed for single-end control and one-man opera-

Digitized by Google

tion, these cars are a great improvement over the old rolling stock. Their sturdy appearance is more than matched by their interior comfort. The wide upholstered seats of gray plush, equipped with foot-rests and covered with white antimacassars, provide the utmost in passenger comfort. The seats are of the non-reversible "bucket" type. A smoking compartment seating fifteen passengers is located in the rear, and is so arranged that women passengers need not pass through it when entering the car. The main compartment seats 35 passengers. A glass partition separates the two compartments, affording a clear view of the front and rear from any seat in the car. The last row of seats in the smoking section is arranged in a chummy semi-circle, giving an observation-car effect.



Interurban line connects residential district of Crown Point with industrial Gary

Rubber floor tiling of tan and green harmonizes with a rich interior of mahogany and ivory. Ten dome lights provide bright interior illumination. Exteriors are painted orange and maroon. The new cars are powered by four GE-247 40-hp. motors with K-75 single-end control. Motors are provided with constant oil level armature and axle bearings. The cars attain a free running speed of from 40 to 45 m.p.h., and have a comfortable acceleration of 2.54 m.p.h.p.s. By reason of their high running speed and quick get-away they perform remarkably well in both city and interurban service.

The bodies are 44 ft. long and 9 ft. wide. On the right side, front and rear, are two double-leaf folding doors. The steps are set in wells. The front door is operated by air brake control, the rear door by an automatic treadle on each step. Cummings No. 64 light-weight motor trucks, equipped with slack adjusters, are used. The cars have proved to be very economical in operation. Weighing only 37,000 lb., they have been found to consume an average of about 2.5 kw.-hr. per car-mile.

Power Supply Improved

To provide more power, extensive improvements were made in the distribution system. A new 500,000-circ.mil feeder cable was strung along the right-of-way from 37th Avenue, Gary, to Crown Point. An improperly located 200-kw. substation at Lottaville was abandoned, and a portable substation of 300 kw. capacity was installed 3 miles north of Crown Point. The result of these improvements was to raise the trolley voltage at the Crown Point terminus from 150 to 550 volts, and to guarantee a sufficient supply of power for abnormal traffic and for heavy snow-fighting equipment in winter months. More than 100 poles were reset along the route, and trolley-basket guards were installed at four steam railroad crossings between Gary and Crown Point.

Further economies resulted from the closing of the old Gary & Southwestern Traction Company car shops and dispatching office at Lottaville. All maintenance work is now handled by the large well-equipped Gary Railway shops in Gary. All dispatching is likewise centralized in a general office located in Gary.

Track Rehabilitated

Rehabilitation of all track between Crown Point and the Gary city limits was pushed to completion before the arrival of the new cars. A total of 3,000 ties were replaced, rails were re-aligned, the roadbed was ballasted, and a sharp curve at Lottaville was lengthened for speedier operation. A wye was installed at the Crown Point terminal in preparation for the new single-end cars. Spring boxes were placed on all switches, making it possible for an operator to completely turn a car without leaving his controls. A novel lock-harp switch was placed in the trolley wire junction to guide the trolley wheel around the curve during the backing up process. As a further means of speeding service, sidings at Oak Hill Cemetery and at Sanitarium were double-ended. New block signals were ordered for a portion of the line along 45th Avenue, Gary.

A comprehensive publicity and advertising campaign in Gary, Crown Point and the surrounding communities kept the public well informed about the progress of the rehabilitation work. Newspaper advertising, placards and special news stories worked up a lively interest in the improvements under way.

Basic Electric Railway Data

More fundamental data *than ever before will be published in the Annual Statistical and Progress Number of* Electric Railway Journal. *The figures will show not only the changes occurring during the year 1929, but also the status of the industry before and after these changes occurred. Everyone interested in electric railways will find much valuable information in this nation-wide survey.*

Watch for the January Issue

Digitized by Google

Comfort and convenience of the new cars have won over many former users of private automobiles

The public was not allowed to view the new cars until the day of their official inauguration. On April 20, 1929, the two new cars, carrying civic officials and prominent business men of the two cities as invited guests, made a tour of the line. On the following day the cars were placed in regular service, and operations under the new plan began in earnest. Fares between Crown Point and Gary were reduced from 45 cents to 30 cents, running time was cut from 55 to 50 minutes, and six new daily trips were added to the schedule.

For several weeks after the start of the new service a house-to-house canvass was made in the city of Crown Point to acquaint residents with the details of the new service, the new rates and the new schedules. It was found that the de luxe equipment and lowered fare structure had made a profound impression upon the people of Crown Point, and the representatives of the company who made the canvass were warmly welcomed wherever they called. A distinct improvement in public relations and a decided betterment in employee morale followed the introduction of the new equipment and fares. Business men were enthusiastic about the new service.

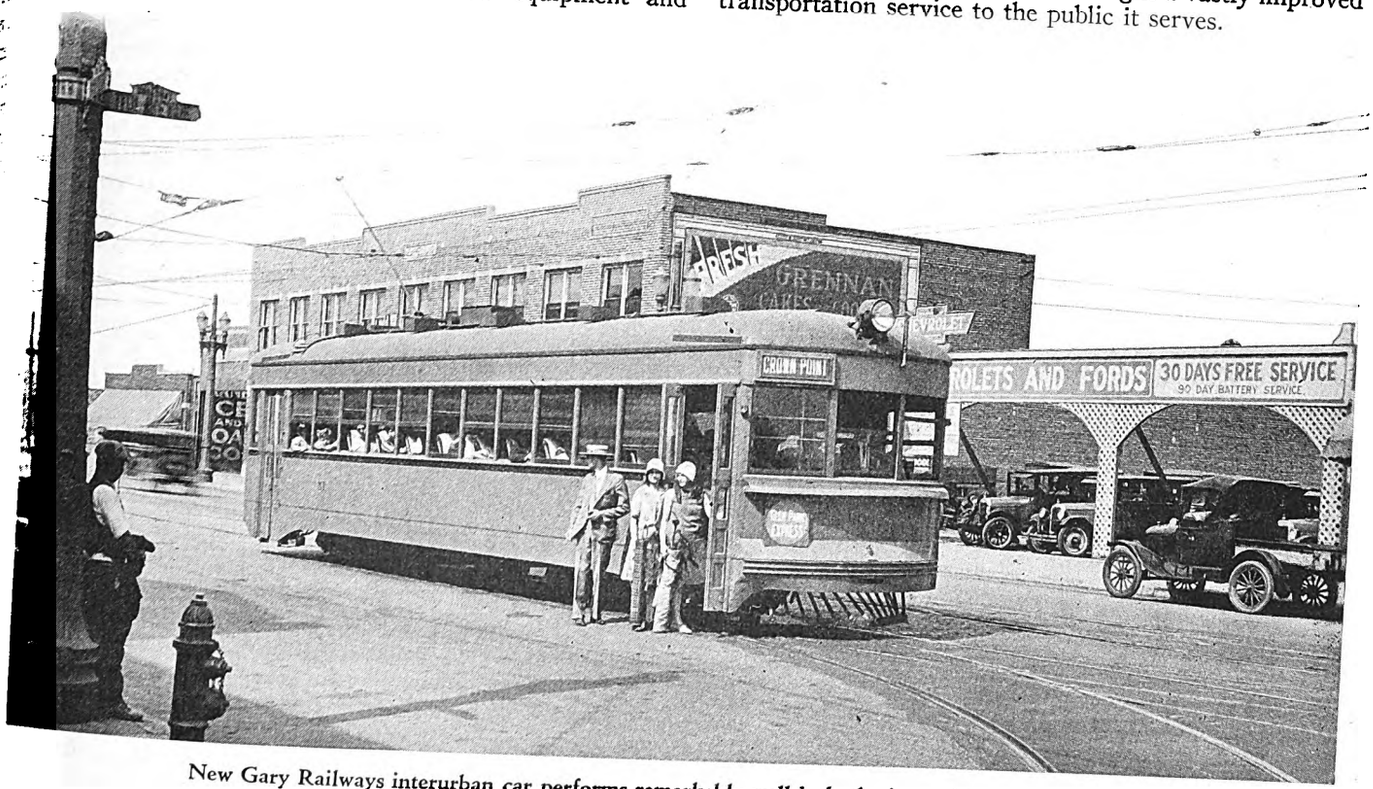
Although one-man operation was introduced in place of the old two-man cars, all Gary & Southern employees were given the opportunity to sign up on the Gary Railways board, if they so desired. Operators of the new equipment took a new interest in their work and made every effort to sell the service to the public.

Riding increased immediately after the introduction of the new interurban cars. Gross revenue, which had been dropping steadily under the old fares, began to rise. As indicated on the accompanying graphs, the number of passengers and the amount of revenue have continued to grow during the past few months, till now the total is much greater than it was a year ago when higher fares were in effect.

Another favorable factor is that the new cars are used for local service over a 4-mile run on Gary streets, thus replacing one car formerly used for city service exclusively. This represents a large daily saving to the company, and does not decrease the effective running speed of the interurbans, for their progress would be hindered by city cars in any case.

The passenger and revenue figures shown in accompanying charts refer to interurban passengers only, and show how riding and revenue have increased over last year. The revenue obtained from carrying local passengers on interurban cars, not indicated on the curves, is additional income without additional expense.

Future prospects of the line are excellent. New homes are being built along the right-of-way because of the new service, and a continued increase in revenue is expected. The new interurban cars provide every comfort of privately-owned automobiles. As a result, many auto owners have ceased driving to work and are taking advantage of the new low rates of fare. The combination of modernization and lower fares has meant success to this interurban line, and has brought a vastly improved transportation service to the public it serves.



New Gary Railways interurban car performs remarkably well in both city and interurban service due to its rapid acceleration and high running speed

Equipment Improvement Topic at Iowa Meeting

TO BUY cars new or to rebuild old cars, was the subject of papers which provoked lively discussion at the annual convention of the operators' section, Iowa Electric Railway Association, held Nov. 7 and 8 at Waterloo. The first paper, on the car builder's contribution to economic and safe operation, was read by Charles F. Weil in the absence of the author, F. L. Markham of the American Car Company. C. W. Gifford, recently chosen general manager of the Des Moines City Railway, told of the success of the new cars on his property and stated that seats must compare in comfort with those used on the private automobile. He emphasized the need of schedule speeds up to 16 m.p.h.

In agreement with the statement as to the value of new cars, which should be faster and more attractive, was C. D. Porter, vice-president Omaha & Council Bluffs Street Railway. He stressed the point that with limited capital, money must be spent where it will bring the greatest return. On the Omaha property it had been thought desirable to modernize the present equipment. Electric heat has replaced hot water or hot air, automatic drawbars have been eliminated and other changes made to reduce the weight. Mr. Porter strongly advocated attractive painting and lettering, and told how a design selected by the riding public is being used by his company. He described the general rehabilitation program being carried out in Omaha, referring particularly to the new routes which will be in effect soon, the installation of nine new automatic substations to give outlying parts of the system proper voltage, and the organization of the shops to overhaul and maintain cars rather than to manufacture material which could be more advantageously bought outside. Nearly $750,000 is being spent, Mr. Porter indicated, and it is confidently expected that substantial savings will result.

Others who took part in the new car discussion were E. J. Anderson, Tri-City Railway, Davenport, and C. M. Feist, Sioux City Service Company. Mr. Anderson thought a mistake was frequently made in trying to rejuvenate worn-out equipment. Construction should be standardized so that cars could be bought advantageously in small lots, instead of an order of 50 being necessary to get a favorable price. Mr. Feist said that old cars not in use should be discarded, to effect a saving of taxes, insurance and expense for handling.

Power distribution was taken up in two papers. S. J. Fairbanks, Waterloo, Cedar Falls & Northern Railway, described problems connected with the replacement of insulators and poles, and repair methods followed in case of breakdown of the distribution system due to unusual weather conditions. The electrification and operation of the Illinois Central Railroad suburban service out of Chicago was explained by W. M. Vandersluis, its electrical engineer.

With the inauguration of electric service began a phenomenal growth of traffic and revenue, he said. The result becomes increasingly surprising as the growth continues without any sign of a let-down. Electrical operation of revenue trains began on July 21, 1926, when four electric units were put in local service. The schedule was gradually built up on a steam time-table basis until on Aug. 29, 1926, the first electric time-table was put in effect.

Just previous to the start of electric operations there were 378 Illinois Central trains and eighteen South Shore trains. At present there are 490 Illinois Central trains and 80 South Shore trains. In 1925 the Illinois Central carried 23,700,000 revenue passengers; in 1929 it is estimated from the latest figures that more than 36,000,000 revenue passengers will be carried.

This increase in traffic, according to Mr. Vandersluis, is laid to three things: (1) Increase in scheduled speed of from 10 to 25 per cent; (2) increase in frequency of trains especially during the non-rush hours; (3) cleanliness and noiselessness of operation. The increase in non-rush hour traffic has been of the greatest help in increasing revenue, since energy is cheap and equipment is available at that time.

It is also interesting to note, said the speaker, that operating expenses have increased only slightly with the increase in revenue. This is due largely to the increased efficiency of maintenance and operating forces and an honest effort on the part of enginemen to decrease energy consumption. The value of the rather elaborate sectionalization scheme is apparent from the statement that suburban trains average 99.9 per cent on time. Mr. Vandersluis also related in considerable detail the steps that led to the electrification of the road and the details of the installation.

Edward Wotton, superintendent of equipment Chicago Motor Coach Company, described maintenance practices of a large city operation, and discussed bus maintenance starting from its inception in 1907. A. H. Smith, Interstate Power Company, Dubuque, told of experiences with cars and buses, and advocated the routing of both to give the maximum service to the public with the minimum of transferring. The substitution of buses for street cars, as made in Marshalltown in October, 1928, was discussed by Charles Munson, Iowa Railway & Light Corporation. Operating costs were about the same with the buses, he said. Schedule speed had been increased from 7.5 to 9.5 m.p.h., routes covered were 4.8 miles more with the bus, and monthly miles went up to 32,290, as compared with the 29,670 operated with the cars.

An imaginary trip through the shops of the Tri-City Railway, at Rock Island and Davenport, was conducted by John Sutherland. This was accomplished by a series of papers, prepared by his foreman and delivered by Mr. Sutherland. The features of the blacksmith shop were presented by Hans Andresen; of the machine shop, by Ed Klein; of the carpenter shop, by James E. Reid; of the armature room, by William Sachau, and of the Davenport carhouse, by David Shillinglaw.

The executive committee chose Des Moines for the 1930 convention and elected Frank V. Skelly, Des Moines, as chairman of the operators' section to succeed Maurice A. Welsh, Waterloo. E. W. Miller, Des Moines, was chosen as chairman of the convention to succeed Frank McDonald of Waterloo. Railway members of the executive committee will be D. D. Bentzinger, Centerville; Charles Feist, Sioux City; A. H. Smith, Dubuque, and A. M. Welty, Omaha.

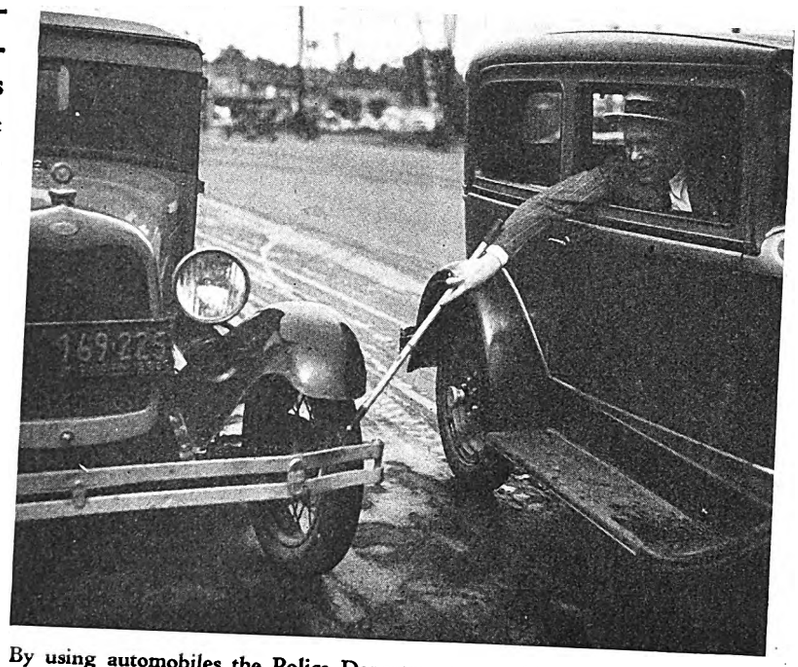
Rigid Enforcement of Parking Regulations Aids Flow of Traffic

During a 60-day drive against violators of parking ordinances in Detroit, a total of 41,367 automobiles were towed to city pounds. The move was requested by merchants' associations and sponsored by City Council

By

H. M. GOULD

Consulting Traffic Engineer
Police Department, Detroit, Mich.



By using automobiles the Police Department was able to cover the limited parking areas at hourly intervals very effectively and economically. The method of marking the tires with a piece of chalk at the end of a pointer is shown in this view

WITH an appropriation of $50,000 for a 30-day trial enforcement of the parking regulations in the downtown business section of Detroit, a strip along Woodward Avenue north of the business district and an industrial precinct in the eastern part of the city, the police department set out on Aug. 7 to curb the many violations. So successful was this first period of 30 towing days which terminated on Sept. 11, that another 30-day period, terminating on Oct. 16, was added. The drive was sponsored and financed by the City Council and was requested by several merchants' associations.

During the 60 days some 41,367 automobiles were towed to the city pounds and $84,582 was collected from those who had to retrieve their cars. At first the violators paid little attention to the enforcement move, but as they learned that the police department meant business there was less street storage of vehicles for excessive periods. Naturally, there were charges of discrimination and protestations by the victims who were compelled to pay fines. The public, however, was pleased with the trial. Those merchants who requested the trial, as well as others, were pleased with the results and asked that the enforcement be continued. Clearing the streets of illegitimate parking allowed a freer flow of traffic at all times through the business districts and permitted commercial vehicles to make deliveries of their products in much less time. Many previously congested areas were kept open for the movement of vehicles, enabling mass transportation vehicles in particular to get through the streets without frequent tie-ups.

Problem Studied in 1927

Two years previous, in 1927, a survey of the downtown business district was made, which showed that 3,342 vehicles parked at the curb during a normal business day. Of these, 78.08 per cent were parked for an hour or less and used 39.74 per cent of the hourly curb parking spaces, while the balance, or 21.92 per cent, were stored for periods in excess of one hour and occupied 60.26 per cent of the available space. Obviously, this mis-use of the parking privilege by those who remained more than one hour was unfair to the other parkers, as well as to the abutting owners and tenants.

The matter of enforcement remained dormant until the spring of this year when the merchants and property owners came to the conclusion that vehicles stored in the street for the personal convenience of a few people did not constitute an asset to the community. As a result the Common Council was petitioned to provide sufficient tow cars and auto pounds with which to enforce the ordinance. Three different groups requested enforcement in their respective districts: the residents of a factory district in the east side of the city; the Woodward Avenue Improvement Association, for the area along Woodward between the downtown district and Grand Boulevard; and the Retail Merchants Association, the Business Property Owners Association and the Washington Boulevard Association, for the downtown business district.

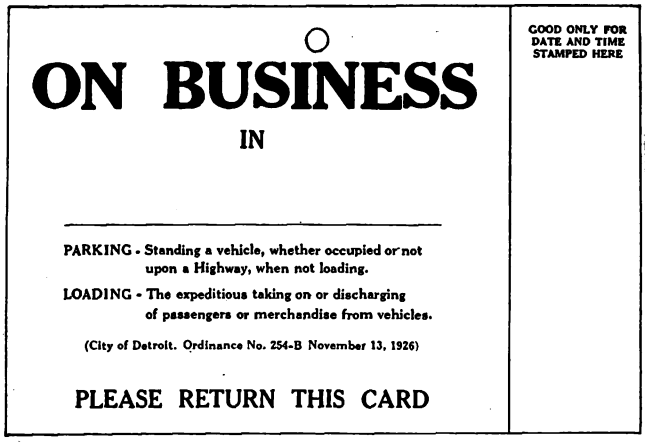
In answer to these requests the Common Council appropriated $50,000 for a 30-day trial enforcement period, to go into effect on Aug. 7. This sum was to be expended for the hiring of checking cars for the downtown and Woodward Avenue districts, the hiring of tow cars, and the payment of police officers, car drivers and patrolmen.

Arrangements were made with an automobile wrecking concern to tow the vehicles to the pounds for a flat rate for each car. With the aid of six tow cars already owned

Digitized by Google

by the Police Department it was possible to remove from the streets a great many of the illegally parked cars. With the exception of one patrolman on foot who covered the Grand Circus Park area, all markers rode in automobiles along definite routes. By means of a piece of chalk at the end of a pointer they were able to mark the cars on their regular hourly rounds at a rapid pace. Much of the success of the plan was due to this effective system of indicating the length of time each vehicle was parked. Any car in the zones with no parking ordinances was subject to being towed away unless the owner had secured permission previously to make the stop. In the areas where hourly parking was allowed any car with two or more chalk marks was eligible for a towing. "On business" cards were prepared by the Police Department and distributed to stores to give to deliverers of merchandise during the no-parking periods. One of these cards properly filled out, signed and hung on the car prevented its being towed away.

Parking is prohibited by local ordinance in Detroit between 7:30 and 9:15 a.m. on the inbound side of the main thoroughfares leading to the downtown district,



Drivers of commercial vehicles desiring to load or unload merchandise in a "no parking" area can do so by having the above card properly filled out and hanging it on their car

and between 4:30 p.m. and 6:15 p.m. on the outbound side of the same thoroughfares. In the business district, parking is prohibited between 7:30 a.m. and 9:15 a.m. and between 4:30 p.m. and 6:15 p.m. Where parking is permitted in the period from 9:15 a.m. to 4:30 p.m. it is for one hour only. A total of 10,477 street spaces actually exist in the downtown district, the 1927 survey revealed. None of these can be used in the prohibitive rush hour periods, but from 9:15 a.m. to 4:30 p.m., 3,753 of these are available for hourly parking. In the Woodward Avenue and east side districts, parking is prohibited along the main thoroughfares also during the rush hours.

On the first day of the drive more than 600 cars were towed away; on the second day 785 were impounded. At the end of the 30-day trial period—that is, 30 towing days, Sundays being excluded—a total of 21,663 cars were removed from the streets. During the second 30-day period, added at the request of merchants, 19,704 violators were caught. This brought the grand total to 41,367 for the 60-day period. In an accompanying table are given the figures of cars towed, as well as the revenue and expenses of the enforcing. The total revenue for the 60 days was $84,582 and the expenses $77,698.92, leaving a surplus of $6,883.08. These figures are not a true measure of the operation, since the revenue includes only the fees collected from cars towed in by the private

Revenue, Expenses and Cars Towed for Two Thirty-Day Periods

	Aug. 7 to Sept. 11, Inclusive, (30 Towing Days)	Sept. 12 to Oct. 16, Inclusive, (30 Towing Days)	Total for 60 Towing Days
Revenue			
Towing and storage fees	$43,544.00	$39,625.00	$83,169.00
Cars on hand at pounds	315.00	288.00	603.00
Protested fees	616.00	194.00	810.00
Total revenue	$44,475.00	$40,107.00	$84,582.00
Expenses	39,992.17	37,706.75	77,698.92
Surplus	$4,482.83	$2,400.25	$6,883.08
Cars Towed			
By fourteen tow cars of private company	16,363	14,074	30,437
By six tow cars of Police Department	5,300	5,630	10,930
	21,663	19,704	41,367

wrecking company and not the Police Department, while the expenses include the cost of impounding the cars brought in by all tow cars.

Following the trial enforcement period the Police Department received a number of commendatory letters from associations and individuals, expressing their satisfaction with the move and their desire to have it continued. The three letters herewith appended were received by the department after the first 30-day period.

We would like to tell you of the great improvement that has been brought about on Woodward Avenue north of Grand Circus Park as a result of the recent 30-day enforcement of the parking ordinance.

Our association has been particularly pleased with the results accomplished and we believe it has been exceedingly beneficial not only to the merchants in this district but likewise to the legitimate parker who wishes to stop long enough to shop in one or more stores.

We have nothing but commendation to offer and we sincerely hope that the Police Department and the Council will both see fit to continue this method of enforcing the parking restrictions indefinitely. WOODWARD AVENUE IMPROVEMENT ASSOCIATION.

The Washngton Boulevard Association is well-pleased with the efforts the Police Department has made to enforce the parking ordinance during the past month. This enforcement, we believe, has had a salutary effect upon general traffic conditions on our boulevard, throughout the downtown district and in outlying business and residential districts.

Trusting that your department plans to continue strict enforcement of limited parking regulations on Washington Boulevard.

WASHINGTON BOULEVARD ASSOCIATION.

At a meeting of the directors of the Retail Merchants Association yesterday noon, the matter of the rigid enforcement of the traffic ordinance as now being tried by the Police Department was discussed. There was a unanimous feeling that the rigid enforcement of the limited parking ordinance has been a great improvement over past conditions and has afforded a great amount of relief in the downtown section.

RETAIL MERCHANTS ASSOCIATION.

Of course, many of those who parked illegally and were caught protested the rigid enforcement. This was expected by the department, particularly from publicity seekers and those with an "ax to grind." However, to show that there were enthusiastic supporters of the drive, a letter sent to one of the newspapers is reproduced herewith:

It's amusing to read the various reasons furnished in opposition to the parking rules by automobile owners and others using them for pleasure, sight-seeing, joy-riding, bootlegging, drunks, etc., all kicking because they cannot park anywhere or at any time they please, regardless of conspicuous signs, carefully placed, and covering the necessary information as to parking privileges. Signs that anybody with as much sense as God gives geese ought to be able to read and understand. The police are not responsible for the dumb, deaf and blind or the selfish who drive around without any idea as to where they come from or where they are going. In other words, mentally void of location or destination. Raise the pounding charge to $25, and it ought to abolish the nuisance forthwith.

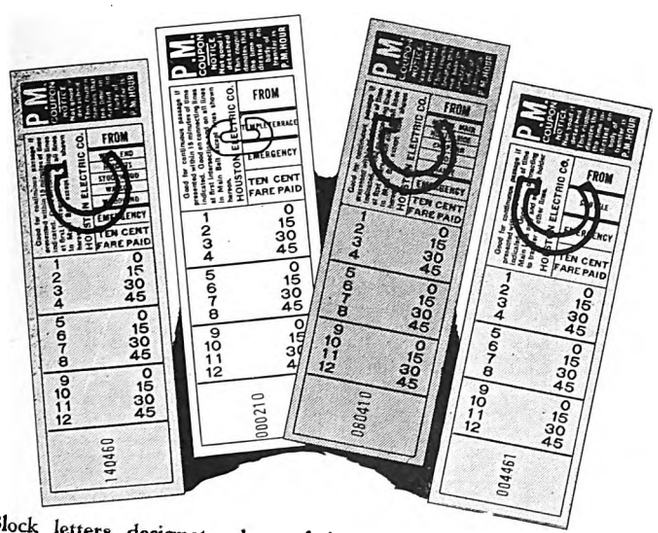
Preventing Transfer Abuse at Houston

By J. L. Alexander
Manager Houston Electric Company

As a result of a thorough study of its transfer system which the Houston Electric Company made during the past year, the company has installed a system which is simpler, easier to understand and more economical than the old one. The survey indicated that the chief abuses to which the transfers were being subjected were hoarding, round tripping and misuse of time allowance. It also indicated that a number of complaints were being received because passengers could not understand the use of the transfers. Proceeding on the theory that a transfer could be designed so simple that its privileges could be understood by all, yet so effective that it would prevent the many abuses so prevalent with other designs, a new system was devised.

The abolition of the old dating system and the substitution of block letters to designate the date of issuance is probably the most interesting innovation. This prevents hoarding from month to month, as only those



Block letters designate date of issuance, and different colors indicate the various lines. Time allowance is indicated by tearing rather than punching

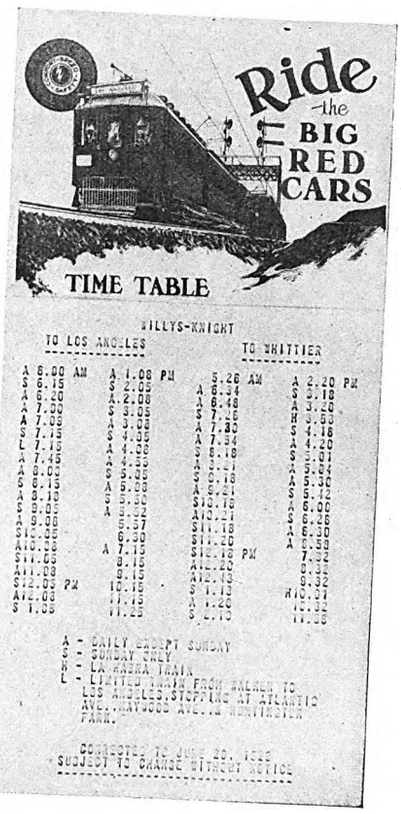
issuing the transfers know what letter will be used from day to day. Another new idea is the use of colors to distinguish the lines serving the same general section of the city, each section being marked by its respective color. This enables the operator to tell at a glance whether or not a transfer should be honored on his line. Incidentally, there is only one point where the operator can accept a transfer of the same color as the one he is issuing and that is at the first intersection.

The time allowance is indicated by tearing the transfer rather than by punching it. In this manner the proper time must be adhered to because further tearing of the transfer would only reduce the time allowed. The operator can see at a glance the length of the transfer and will know immediately whether it should have close scrutiny to get the exact hour. Having the time allowance so plainly in evidence on the new transfers, the passengers are not attempting to force old transfers on the operators.

A simple cutter was designed and installed on all street cars and buses. As this eliminates the necessity of the operator's punching transfers on the run, the benefits of the system are reflected in our schedule speeds and in the prevention of accidents. Operations under the new system show a definite saving of 10 per cent in transfers collected. Our operators tell us that the transfer complaints have been practically eliminated and we believe, also, that there is a marked tendency to reduce accidents.

Time-Tables Used to Popularize Interurban Service

To provide information concerning the arrival and departure of trains at non-agency stations on its interurban electric lines, a plan was put into effect about a year ago by the Pacific Electric Railway that has proved of benefit both to its patrons and the company. An attractive timetable poster was prepared on which is typed in tabulated form, in large figures and all-cap letters, the departing times of all regularly scheduled trains throughout the entire day from each designated stop on the line. At the top of each of these time-table posters is a very attractive advertisement urging the riding of the "big red cars," with the company emblem and a speeding typical interurban car completing the appeal.



Time-tables of this type have been effectively used by the Pacific Electric Railway in popularizing its interurban service.

At each non-agency stop the posters are placed in a conspicuous location. Where a shelter station is present it is possible to locate them where they may be readily seen and still be afforded a measure of protection from the elements. At the many stops where there is no shelter building it is necessary to place them on a nearby pole. In such instances they are necessarily exposed to the ravages of the sun and rain but their deterioration is materially retarded by painting with a waterproof preparation giving a glazed and protective coating. In addition to placing these posters at non-agency stations and stops, it has also been found helpful and desirable to hang them in waiting rooms where agents are assigned.

The plan of maintaining this poster service has now been in effect for one year on the Pacific Electric lines and the management believes that the expense and effort are well worth while.

A.E.R.A. Washington Office Reorganized

PLANS for the expansion and reorganization of the Washington office of the American Electric Railway Association were announced at a meeting of the executive committee, held at association headquarters Nov. 15. It was pointed out that the problems of member electric railways reporting to the Interstate Commerce Commission are becoming more complex every year. The uncertain and indefinite standing of electric railways transacting interstate business is emphasized by many decisions of the I.C.C. and every year Congress proposes additional legislation tending to complicate conditions. In addition to the direct relation of these matters to electric railways engaged in interstate commerce, there is an indirect effect of I.C.C. decisions and acts of Congress upon electric railways not subject to the jurisdiction of the commission. For example, an order issued on a subject such as depreciation is likely to influence the various state commissions and may ultimately be applied to non-interstate electric railways.

For a number of years past the A.E.R.A. committee on national relations has maintained a small office in Washington with Paul McGovern, secretary of the committee, in charge. It has become apparent that the task of keeping abreast of proposed regulation, decisions and orders of the I.C.C., and cases before the commission and the courts, is an impossible one for the national relations committee. The Washington office, therefore, has been reorganized and expanded with C. D. Cass in charge as general counsel for the association. Office space has been taken in the new Tower Building at the corner of Fourteenth and K Streets, Northwest. A library of I.C.C. and Supreme Court decisions has been installed and will be kept up to date. Constant contact with commission cases and decisions will be maintained. Proposed regulation affecting electric railways will be studied and reported to the industry. Representation of the electric railways in cases affecting such carriers as a whole will be undertaken by Mr. Cass and his staff. In general, the new Washington office will function as the national representative of the members of the American Electric Railway Association.

Plans for the 49th annual convention to be held next June in San Francisco were discussed at length at the executive committee meeting. Various opinions were expressed concerning the relative advantages of different routes to be followed by eastern delegates going to and from the convention. It was emphasized, however, that the primary purpose of the meeting is to transact serious business and that the desire to include sight-seeing trips, etc., in the general program should not be allowed to overshadow the primary object of the convention. It was decided to leave the arrangement of details in the hands of the general 1930 convention committee, of which W. V. Hill, manager California Electric Railway Association, is chairman.

Routine reports were received from various committees of the American Association. Announcement was made of some re-allocation of duties among members of the staff at association headquarters and of the appointment of Hawley Simpson to be special engineer to fill the vacancy created by the appointment of Guy C. Hecker to the position of general secretary.

85 Per Cent of Brooklyn Shoppers Use Public Transportation

CUSTOMER counts at five large department stores, made on Oct. 23 under the auspices of the Downtown Brooklyn Association in co-operation with the Brooklyn-Manhattan Transit Corporation and the Transit Commission, convincingly demonstrated the importance of public transportation facilities.

An analysis of the 13,009 shoppers' traffic cards showed that 1,230, or 9.2 per cent of them, used the Fulton Street "L" to reach the shopping area; 5,445, or 41.3 per cent, used the subway; 3,185, or 24.2 per cent used surface cars; 1,221, or 9.3 per cent, used the Long Island Railroad, and 637, or 4.8 per cent, were pedestrians. Automobiles, including taxicabs, brought only 1,291, or 9.8 per cent. The percentage of trolley users was fairly constant throughout the five stores, ranging from 20.8 per cent to 26.6 per cent.

In conjunction with a shoppers traffic survey, the employees of the stores were asked to indicate what means of travel they used to reach work. The percentages using the Fulton Street "L," the subways and the surface trolley lines were closely comparable to those of the shoppers, 12.1 per cent using the "L," 47.7 per cent using the subways and 25.7 per cent using the trolleys.

The importance of the surface lines in transporting shoppers to the downtown stores is demonstrated by the fact that even with the extensive system of subway and "L" lines serving the section, approximately 25 per cent of the shoppers questioned in the survey used the surface lines to reach the stores. With the improvements resulting from the B.M.T. plan of rearranging its service on the surface lines, they will become even more important as transit arteries.

Main Line Electrification in England

ELECTRIFICATION of the main line from London to Brighton has been announced by the Southern Railway, London. Also to be electrified are the line from Preston Park (on the Brighton main line) to Hove and Worthing, the main line from Redhill (also on the Brighton main line) to Guildford, by way of Reigate and Dorking Town.

Work will be commenced during the next two or three months and it is hoped that it will be completed in two or three years. The Southern Railway will then have much the longest electrified route in Great Britain, and the first main line to be completely equipped for electric operation. Of the 445 miles electrified in the last seven years, no fewer than 408 were on the Southern Railway.

The magnitude of the undertaking may be realized from the fact that about 1,750,000 passengers are conveyed annually by rail between London and Brighton. In addition there are about 2,700 season ticket holders (commuters). The distance is 51 miles, of which 14 miles—to Purley—are already electrified. The project from Preston Park to Hove and Worthing involves the electrification of 11 miles, and that from Redhill to Guildford 20 miles. The line from Waterloo to Guildford, via Cobham, is electrified already. The direct-current third-rail system, now the standard throughout the electrified area of the Southern Railway, will be used.

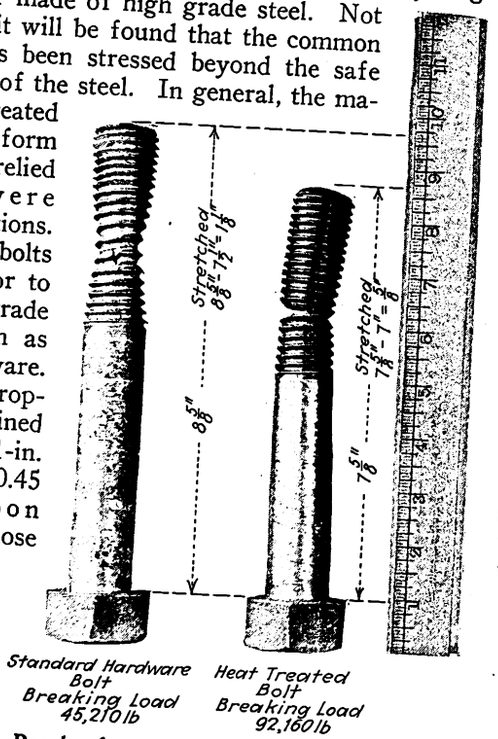
Heat-Treated Bolts Desirable for Railway Service

By E. F. Whitney
Renewal Parts Engineer
Westinghouse Electric & Manufacturing Company

MOTOR bolts or truck bolts which are subjected to shocks or severe loads may fail, due to fatigue or overstrain of the metal, unless they are unusually large in diameter or made of high grade steel. Not infrequently, it will be found that the common grade bolt has been stressed beyond the safe working limit of the steel. In general, the material of untreated bolts is not uniform and cannot be relied upon for severe service conditions. Heat-treated bolts are far superior to the common grade of bolts known as standard hardware. The physical properties as determined by test of a 1-in. heat-treated (0.45 per cent) carbon steel bolt with those of an untreated steel bolt, are shown in the accompanying table.



Result of test showing superiority of heat-treated bolt over ordinary bolt

The physical property of steel known as the "elastic limit in tension" is the maximum unit stress which the material will stand without permanent deformation of the member. In the case of bolts, such as axle cap bolts or frame bolts, it is the recommended practice to tighten or stress the bolt beyond the load which would likely occur on the bolt in service. The load in such an application should not exceed the elastic limit or, in exceptional cases, the yield point of the steel in order to avoid a permanent deformation of the material. High grade axle cap bolts and motor frame bolts that can be tightened without danger of overstretching the bolt are the best assurance that axle bearings and housings will not work loose in service and destroy the clamping fit of the parts in the motor frame or axle cap.

Other physical properties of steel, which are indications of its ability to stretch or stand strain, are its "percentage elongation" and its "percentage reduction of area." The accompanying illustration shows the elongation of the bolts under a load which ruptured them. It is evident from the test shown that the standard hardware bolt stretched nearly twice as much as the heat-treated bolt. Heat-treated bolts not only have high ultimate strength and uniformity of material, but they are noticeably harder than untreated steel bolts. The threads of heat-treated bolts will be found to remain standard much longer than a bolt made of softer steel. Likewise the head of the bolt will stand much more abuse than that of a standard hardware bolt. This quality of the heat-treated bolts will reduce to a large extent the possibility of loose nuts occurring in service.

	Not Heat-Treated	Heat-Treated
Elastic limit	47,250 lb. per square inch	71,500 lb. per square inch
Yield point	49,475 lb. per square inch	73,500 lb. per square inch
Ultimate tensile	82,675 lb. per square inch	112,300 lb. per square inch
Elongation	24.8 per cent	19.5 per cent
Reduction of area	40.1 per cent	46.9 per cent

Cement for Repairing Mica

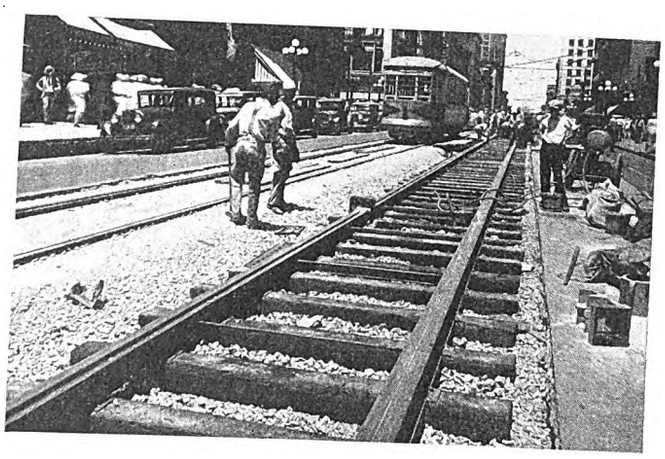
By W. E. Warner
Brighton, England

A MICA cement which is useful for repairing pitted or broken commutator insulation can be made easily. Mix a little French chalk with a little sodium silicate so that it forms a thick paste. Apply this to the part to be repaired and in a few hours it will be found to have set hard and solid. Cracks which develop at the end of the commutator can be filled with asbestos crumbs and shellac.

For switch gear a good cement can be made from litharge and glycerine as follows: Put some litharge on a flat glass plate and then gradually add some glycerine, working the two together until a pasty mixture of about the thickness of thick cream is obtained.

A disadvantage of this cement is that it is likely to swell after having been in service some time, due to its absorbing carbon dioxide from the atmosphere. To prevent this its surface should be kept painted with a good waterproof varnish.

Creosoted Pine Ties Relaid After Long Service



WHEN the Memphis Street Railway recently undertook to rebuild its track on Main Street, the old ties were found suitable for re-use with new rail. These ties were A & L short-leaf pine, 6 in. x 6 in. x 8 ft., pressure-treated with 12 lb. of creosote oil. They were laid in 1905 on a foundation of 8 in. of gravel, no tie plates being used. After 24 years of service they were found to be in perfect condition with the exception of a few minor cuts resulting from movement of the rail. The ties were merely turned over, therefore, and re-used in the new track structure with tie plates and 7-in., 122-lb. grooved girder rail. It is expected by J. H. Haylow, chief engineer, that an additional twenty years of life will be obtained.

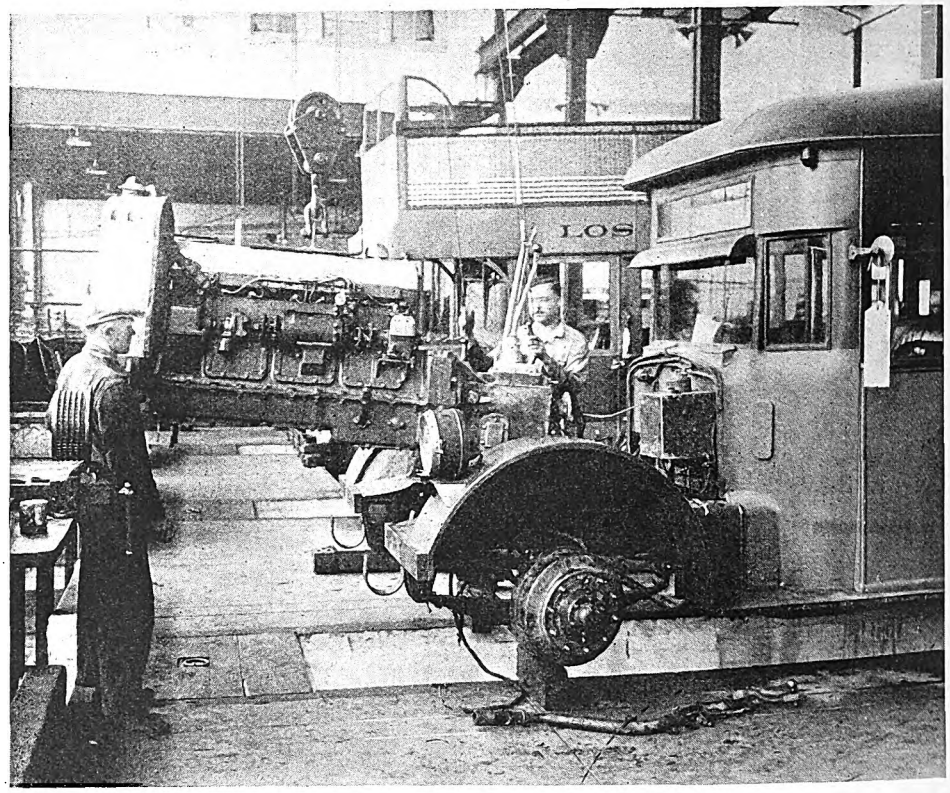
Adequate Equipment and Careful Attention

Vital to Proper Bus



Engine being removed from bus under unit replacement plan in effect on the Los Angeles Railway

ECONOMY in bus servicing and maintenance is of vital importance and the proper balance must be kept between the cost of equipment for maintenance, as expressed by interest and depreciation charges, and the saving in mechanics' time on maintenance work. It is most important that the work be done thoroughly, so that the operating company may avoid paying excessive amounts for fuel and other materials and supplies. All repairs must be made during the four or five hours when the bus is not in service. It is not alone the volume of the work that will determine the investment in repair shop equipment, but also the operating requirements. Adequate modern facilities insure economy and prompt handling of maintenance work.

Motor coach maintenance may be classified under four general headings, as follows: first, general inspection; second, repairs and adjustments; third, repairs to units; and fourth, annual overhauls and accident repairs. The operating division performs the first two operations and the central repair shop the other two.

Of these four items, the general inspection is unquestionably the most important. It is the pivot upon which the whole process of maintenance turns, and is based on the theory of anticipating trouble in order to avoid it. The object of general inspection is to locate the weak parts of the mechanism and repair or replace them, thus avoiding failure while the coach is in service, and consequent road delay. This company believes that the quality of bus maintenance work has a very definite effect upon the gross revenue, ranging from about 5 to 25 per cent according to the locality served, high class residential districts being more affected than industrial districts.

Systematic and thorough routine inspection keeps equipment failures to a minimum. It permits the mechanical personnel to detect worn and defective parts and make the necessary adjustment, repairs or replacement before such parts fail in service and cause a breakdown. The most important qualification of a good maintenance man is the ability to judge when a worn part has reached a state such that it should be replaced. It is upon this judgment that the efficiency of the repair department depends, for there are many parts the condition of which cannot be measured by limit-of-wear gages.

oper Maintenance

Installation of efficient modern machinery justified by reduction of costly "out of service" time. Maintenance procedure well-organized in shops of bus division of Los Angeles Railway

In order to keep the maximum number of buses available for service, everything possible must be done to expedite repairs. This can best be accomplished by the "unit replacement" plan which is becoming more popular every day. However, it has not met with much favor on the part of the stores department. In order for it to be effective, it is necessary to keep complete motors, front axles, rear axles and transmission units on hand for each type of bus, and this makes stock balances relatively high.

Interest and depreciation on a bus which average not less than $7 to $9 per day go on regardless of whether or not the bus is in service. If the bus is held out of service these costs are a dead loss, and at this rate it would not take long to pay for a complete set of replacement units. The Los Angeles Railway considers it essential that one complete set of replacement units be kept for every ten buses in operation.

Inspection Work Carefully Organized

The coach division of this company has adopted an inspection system for all buses, the rules governing which are set forth in detail in an operating manual furnished to each mechanic. By issuing these rules in printed form, a great deal of time is saved. Moreover, the manual eliminates the possibility of omissions and serves as a guide for making the inspection complete and thorough, as the rules tell the specific requirements of each inspection.

Inspections are divided into three classes, "A," "B," and "C," and also a "safety inspection" which is made every time a bus returns to the garage after having been in service, regardless of the number of miles operated. The "A" inspection is made after 500 miles of service, while the "B" inspection is made after 1,500 miles of service, and the "C" inspection or general overhaul is made after the bus has traveled a total of 50,000 miles. The number of miles operated by each bus is kept by a mileage clerk from the speedometer reading and recorded on the regular gasoline slips. From this record the date of the next inspection is determined.

Traveling hoist capable of lifting one end of bus is a great time-saver in shops of Los Angeles Railway

When the bus is ready for inspection, a card, which lists as headings the different units to be inspected, is placed upon it and the job assigned to a mechanic. The inspector checks the equipment which has been gone over and signs his initials at the place indicated on the card. Any repairs or adjustments made are recorded by him together with the date. After the inspection has been completed, the foreman O.K.'s the card and it is returned to an "active inspection card rack" and held there until the next inspection, at which time a new card is issued.

If the bus fails in service, or repairs are to be made between inspections, the card containing the last inspection record is taken out and placed on the bus with a memorandum stating what is to be done, and after the repair is made the mechanic records it on the card, stating the nature of the repairs or adjustment. The duty of the foreman is to see whether or not the failure between inspections was caused through any carelessness of the mechanic and, if he deems it necessary, he will take the appropriate action to prevent recurrence at some future date.

The data contained on the inspection card, with the date, are posted in ledgers against each bus, so that a continuous and permanent record is always at hand to show the repairs and replacements on each vehicle. A repetition of a particular kind of failure is quickly noticed by the clerk posting the data, who immediately notifies the superintendent of equipment. A regular

monthly summary and report is made by type of buses, on a mileage basis, under classified headings of adjustments, repairs and failures.

Modern Shop Equipment a Profitable Investment

The bus division of the Los Angeles Railway realized that in order to equip and maintain buses effectively and efficiently it was necessary to provide good light and adequate shop facilities with modern equipment. The company has a proving stand which has been made in its own shop. It is used to test the horsepower delivered at the wheels of the bus, to run-in buses after they have been overhauled, to locate unusual noises in the motor or drive mechanism, to check fuel and oil consumption, to adjust carburetors and to test speedometers for accuracy. This equipment has eliminated the necessity of many road tests and has aided in locating bus defects and reducing service and equipment failures. Every 1,500 miles the brakes of the buses are tested on a brake-testing machine, which is also used after the brake shoes have been relined. This brake-testing machine has proved to be a very effective method of keeping the brakes in proper adjustment, has reduced accidents and road calls caused by defective brakes and has also effected a material saving in tire maintenance.

For cleaning the buses, a high-pressure washing system is employed. It is so arranged that either hot or cold water or a combination may be used from any of the four nozzles in each washing bay. In order to facilitate this method of cleaning, a connection has been made by which it is possible to introduce a cleaning solution into either the hot or cold water line. This aids materially in taking the dirt off quickly.

A device which has saved a great deal of time is the traveling hoist which is capable of raising one end of a bus. Two of these hoists are available which have practically eliminated the use of jacks in the repair shop. Experience has shown that a combination of floor pit and electric hoist is much safer and more flexible and therefore more desirable for a repair shop than an elevated runway used with either an inclined plane or hydraulic lift.

Motor blocks are replaced when they show a taper of 0.01 of an inch, and valve springs are tested and discarded if found to be 10 per cent below the manufacturer's rating. Valves and valve seats are refaced and the carbon scraped out of the motor at approximately every 25,000 miles of operation. Seats of valves are replaced if necessary. A carburetor specialist is employed, who is furnished with a list showing the average miles per gallon of gasoline per coach per month. It is his duty to check the coaches with a low mileage per gallon and adjust the carburetors to remedy this condition.

Unit replacements are made when the bus is in the shop for general overhaul. Our greatest difficulty with differentials is the pitting of the bronze wormwheels. Ordinarily we are able to obtain only approximately 85,000 miles of service from these wheels.

There have been several instances of broken drive shafts and all coaches have been equipped with safety loops or guards to prevent the broken shaft from whipping about and damaging the air brake equipment.

We use the composition brake block and cast-iron drums, and have found that the blocks give longer life and are much more easily and more quickly replaced than the steel shoes. We have had some trouble with the squealing of blocks, but have partially overcome this difficulty by changing the composition and by using a cast-iron drum instead of cast steel. The braking efficiency is perhaps not as effective as with the steel lining, but is entirely satisfactory when four-wheel brakes are used. By the use of oversize cam points we obtain the full life from the blocks.

It has been found that four-wheel brakes greatly increase the safety of operation, prolong tire life and reduce brake maintenance. The maintenance of air brake equipment is more costly than that of mechanical or hydraulic brakes, but the former type is almost essential for frequent-stop city service where heavy duty is required and relatively high schedule speeds are maintained.

Two coach-body men are employed whose duty it is to endeavor constantly to eliminate all body noises, and also one painter who is kept busy touching up coach

Analysis of Maintenance Cost and Failures

Item	Maintenance Cost (Account 632), Per Cent	Equipment Failures, Per Cent	Service Failures,* Per Cent
Body	9.2	2.6	4.2
Brakes	13.7	19.1	42.9
Chassis	6.2	2.6	0.3
Drive	15.0	16.2	0.7
Ignition	6.7	20.4	14.4
Miscellaneous	5.4	13.5	18.1
Motors	17.5	19.2	12.9
Tires	24.7	6.4	6.2
Wrecks	1.6	.....	....
Total	100.0	100.0	100.0

*Failures repaired on the road and coach not removed from service

bodies and accessories. We think that the efforts of these three men are invaluable in keeping up the general appearance of the coaches. All coaches have been changed from a six-volt to a 12-volt system to improve the interior lighting.

Some of our later coaches are equipped with collision rails along each side. There have already been several collisions of these coaches where the rails have prevented what might have been expensive damages. We think the collision rail is a very worthwhile addition to coach design.

Overhauling of bodies and painting are done in the general car shops. When a bus body is to be overhauled, the carpenter foreman rides in the bus several miles over rough streets. He makes notes of all body noises, loose joints, etc., and these observations form the basis for the body repairs. A similar ride is taken after the overhauling, and additional repairs or adjustments are made if necessary. In practically all makes of coaches that we operate we have found pockets in which water and mud collect, tending to rot the side sills and rust the metal siding. This is being overcome by providing slots to let out the water and to let in air. It has been necessary to put cross-braces between the body posts on many of the coaches to give them more rigidity and to prevent weaving.

Lacquer formerly was used in coach painting, but we found that it soon became dull from washing unless it was rubbed and polished. Rubbing and polishing was rather expensive so we have changed to enamel, which gives a finish that holds its brightness much longer than the lacquer.

Each coach is lubricated after 500 miles of operation. At this time all lubrication points are checked and the proper lubricant is applied if necessary. The crankcase oil is changed after every 2,500 miles of coach operation.

From our 1928 cost and inspection reports an analysis has been made showing the relative importance of the different bus parts with respect to maintenance costs, equipment failures and service failures. By devoting particular attention to the parts which give the most trouble we have been able to keep down failures to a minimum.

Improved Truck for Metropolitan Electric Tramways

MOTIVE power for the double-deck cars recently built for the Metropolitan Electric Tramways, London, England, is provided by two Metropolitan-Vickers 105 F.W. self-ventilated motors per truck, connected permanently in series, the whole equipment being operated by a two-motor controller. The motors are each rated at 35 hp. for one hour at 262½ volts, the temperature rise being to the B.E.S.A. specification No. 173, 1928. Ventilation is arranged on the parallel flow system, the air being drawn through the machine by a fan fitted at the pinion end of the armature. In order to prevent dirt from entering the motor with the ventilating air, the air inlet has a special cover fitted with an efficient system of baffles.

Motors are of the box-frame type, the frame being made of high permeability cast steel. The armature is mounted on roller bearings, and particular attention has been paid to the construction of the labyrinths, in order to protect the bearings from foreign matter and to insure that no grease escapes from them into the motor. To reduce the weight of the machine to a minimum, many of the parts are constructed of a special light aluminum alloy.

The gearcase is made of sheet steel, its lowest portion being constructed of very thin material, so that if it strikes any obstacle in the road it will collapse and thus save the whole gearcase from being damaged. The gearcase clearance is 2.85 inches, and the pinions are made of case-hardened nickel steel. The forged steel gearwheels are surface-hardened by a process that eliminates the distortion usually associated with this procedure. The gear ratio is 14/61, 3½, D.P., and the teeth are cut to a special form to insure quiet running. The trucks have four 24-in. wheels instead of a pair of 31¾-in. drivers and a pair of pony wheels.

The weight of the two trucks, complete with equipment, is 8 tons as compared with 6 tons for the old type.

Inspection station where oil, gas and mileage are checked on incoming buses. Safety inspection is also made here

Bus Development Urged at S.A.E. Convention

NEED of even more intensive development of motor buses and their component elements was stressed at the transportation meeting of the Society of Automotive Engineers held at Toronto, Canada, Nov. 11-15. The program was made up entirely of papers on subjects of interest to operators of motor buses and trucks for public service.

Trends in bus design were discussed in a paper by F. R. Fageol, president Twin Coach Corporation, which was read by Ross Schram. The abandonment of the double-decker in favor of the large-capacity single-deck bus is a foregone conclusion, according to the author. He also pointed out that there is a distinct move toward 40-passenger and 21-passenger buses, with abandonment of the 29-passenger size.

Standardization of body design and dimensions is worth striving for, according to E. O. Dalzell of the Bender Body Company. The combination wood and metal construction seems to be in greatest demand, while the all-steel body does not seem practicable for present use. The entire wood frame should be treated for protection against rot and all exposed surfaces should be sheathed with metal, said the speaker.

William C. Naegel of the Lang Body Company compared steel bodies with wood or composite bodies. The latter are somewhat lighter, while the steel are more rigid. Insulation of bodies against noise and cold is essential. Dead air space, frequently considered valuable, is hard to produce. Possibilities of the materials for interior finish also must be given consideration.

Buses for use on rides of more than two to three hours duration should be designed with first thought to the comfort of the passengers, according to a paper by Dwight E. Austin, vice-president and chief engineer Pickwick Nite Coach Corporation, which was read by C. G. Moore. Reclining seats with deep cushions, comfortable heating, lighting to make reading easily possible, and suitable provision for baggage are essential. Accessibility of all parts for repair is an essential, so that the time required in the shops for servicing and repairing will be reduced to a minimum.

Several papers were presented on the six-wheel vehicle. A. M. Wolf, consulting engineer, Newark, N. J., discussed the structure of six-wheel vehicles; E. W. Templin of the Chrysler Corporation, the development history; L. R. Buckendale, executive engineer Timken-Detroit Axle Company, four-wheel drives for six-wheel chassis; and G. M. Sprowls of the Goodyear Tire & Rubber Company, the tires for use on six-wheel vehicles. The general opinion as expressed in the papers and in the discussion that followed is that it is necessary to restrict wheel loads with present types of paving, and that the six-wheel vehicle is one means of doing it. For freight haulage the trailer and the semi-trailer offer other methods of keeping wheel loads within limits while providing large carrying capacity in one unit. Considerable question was raised as to the excellence of four-wheel drives in use on six-wheel chassis, and it was felt that there is considerable room for improvement in this respect. One proposal is for the use of gas-electric drive with individual motors on each of the four rear wheels. Where the drive has been confined to one rear axle there has been insufficient traction in hilly country under some conditions.

Garage and shop design was the subject of a paper by Albert Kahn, architectural engineer, Detroit. He favors a floor as unrestricted as possible, preferably without pillars. A single floor is always to be preferred, be held. The fire regulations adopted in many cities are unwarranted. In fact, fires in garages are relatively few. Where multi-story garages with ramps are necessary, they should be of fireproof material. Wheel guards should be installed to prevent damage to vehicles. If the ramps are outside the building they should be fully protected.

Carbon deposits with heavy duty engines were considered in a paper by C. J. Livingstone, E. C. Martin and S. P. Marley, all of the Mellon Institute of Industrial Research, Pittsburgh. Tests of buses of the Pittsburgh Motor Coach Company were made with a paraffine-base oil having a high carbon residue, with a paraffine-base oil having a low carbon residue, and with a typical naphthene oil. In the sleeve-valve engines tested the naphthene oil produced materially less carbon than the paraffine-base oils, and the valves required correspondingly less cleaning to keep them open.

Some discussion developed on the practical effects of interstate regulation if this is adopted by Congress. The opinion was expressed that it may add as much as 2 cents per mile to the cost of operation. Others held that while undoubtedly there will be some added cost, it will be less than that amount.

Other papers were presented by Charles A. Harnett, commissioner of motor vehicles, New York State, in which he outlined how motor vehicle commissions can help develop motor vehicle transportation; H. B. Hewitt of the Philadelphia Rural Transit Company, on application of production standards to maintenance of motor vehicles; G. A. Green, General Motors Truck Corporation, heavy duty motor coach brake design; F. C. Horner, General Motors Corporation, application of motor transport to the movement of passengers and freight; and B. B. Bachman of the Autocar Company, on factors governing the construction and use of motor trucks. The last three papers were prepared for presentation at the World Engineering Congress held at Tokio last month and are abstracted elsewhere in this number.

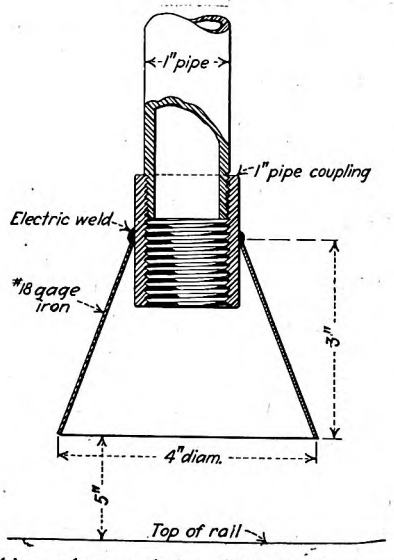
Many Handy Maintenance Devices Developed for Use

Improved Sand Spout Used at Cincinnati*

By George Kline
Foreman Cincinnati Street Railway
Cincinnati, Ohio

SAND spouts clogged with wet sand and ice have for years been a source of annoyance and delays to service. After trying various schemes to overcome this trouble, a simple funnel-shaped piece welded to a pipe sleeve has been adopted by the Cincinnati Street Railway. This was tried for several months on one division with such success that its use rapidly spread to all divisions of the system. The application of this device has almost completely eliminated renewals of sand spouts which used to be necessary, because crews break them off when attempting to clear clogged spouts by pounding. It has also reduced car changes due to sand trouble. The very simplicity of this device caused considerable skepticism and it was not until two years experience proved its efficiency that it was accepted at its full value. The theory is that sand does not come in contact with the wet inner surface of the lower part of this spout.



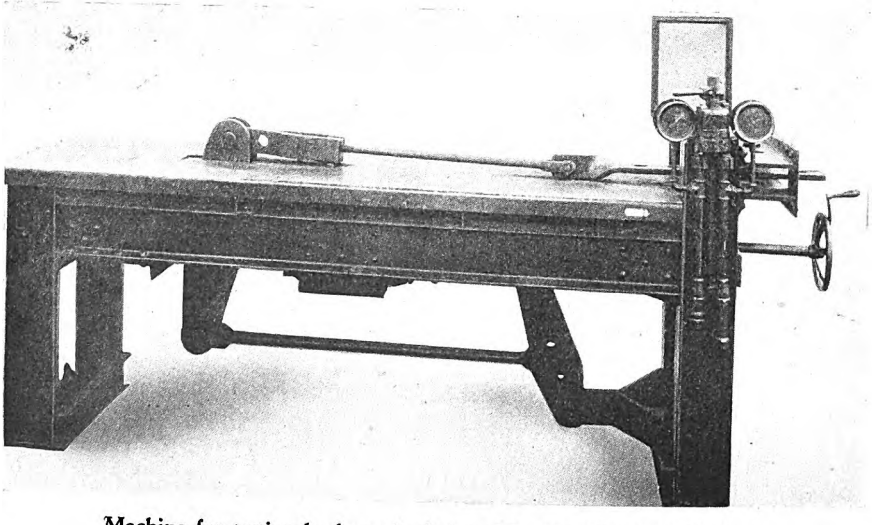
This sand spout designed by the Cincinnati Street Railway does not become clogged in wet or freezing weather

Brake Rod Testing Machine*

By M. J. Leary
Assistant Superintendent Buildings and Equipment Cleveland Railway, Cleveland, Ohio

BRAKE rod safety is now secured by means of tests on a special machine installed in the Harvard shops of the Cleveland Railway. In order to insure safety in what is really the most important part of a car, it was necessary to develop some machine that would properly test brake rods before they were put in service. Formerly we had no way of testing this important item of equipment and, therefore, were always fearful of some serious accident. This machine consists of a frame work built up of channel and angle iron with a series of levers and rods, set up so as to get any desired pressure on any size brake rod. The tension is obtained by air pressure from a 10-in. brake cylinder, controlled by an ordinary straight air brake valve, and transmitted to the brake rod to be tested. The brake rod is given a tension test of 100 per cent more than it would ever receive in service. This test will show up any defective weld or thread. The cost of this machine is approximately $50.

Submitted in Electric Railway Journal Prize Contest.

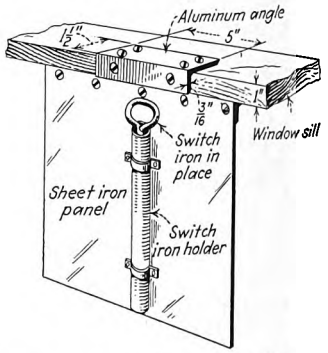


Machine for testing brake rods designed by the Cleveland Railway and installed in its shops

Aluminum Angle Piece Protects Window Sill

By Benjamin H. Hall
Shop Foreman West Penn Railways, McKeesport, Pa.

PROTECTION to wooden sills of vestibule windows has been afforded on cars of the West Penn Railways by placing an aluminum angle on the edge of the sill, countersunk even with the sill and fastened on with flat bevel screws also countersunk. This angle is $\frac{3}{16}$ in. thick, 5 in. long, $1\frac{1}{2}$ in. wide at the top section and 1 in. wide at the lower section. On these cars the switch iron holder is placed at the right hand of the vestibule window near the door post, within convenient reach of the



Aluminum angle plate prevents damage to vestibule window sill from switch irons

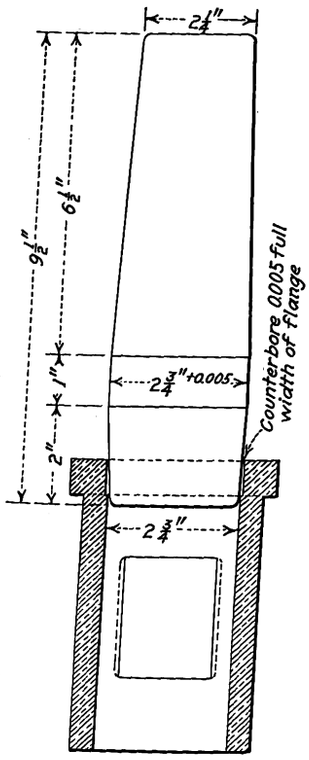
ntenaPractices and Devices
oped for Railway Shops

motorman. Formerly, when the iron was placed in the holder, if great care was not taken the hand grip would turn and come down on the sill, resulting in considerable damage and an unsightly appearance.

Armature Bearing Shell Expanding Broach*

By Charles Herms
General Foreman
San Diego Electric Railway
San Diego, Cal.

EXPANSION of bearing shells has been made possible by means of a tool designed by the San Diego Electric Railway. It has been found that bearing shells can be successfully



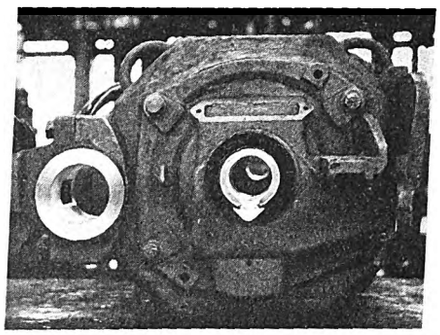
Armature bearing shell expanding broach used in the San Diego Electric Railway shop

expanded several thousandths of an inch with a broach as shown in the accompanying illustration. However, it is necessary that the bearing shell be counterbored the full width of its flange to a depth equivalent to that to which the shell is to be expanded. This is imperative because the shell will split through the flange if not counterbored, due to the rigidity of the flange. Broaches can be made up in 0.003-inch steps, after which the shells can be expanded at the first indication of looseness, thereby prolonging the life of the housing. This is important as the wear on the housing is rapid once a bearing is permitted to run loose in the housing.

Pocket Below Armature Bearing Prevents Oil Loss*

By Adam Hansmann
Shop Foreman Hamburg Elevated Railway, Hamburg, Germany

LOSS of lubricating oil formerly experienced with the 110-hp. motors used on the Hamburg Elevated Railway has been eliminated by placing a pocket below the armature bearing. Formerly it was not possible to confine the oil entirely.



Pocket at end of armature shaft bearing prevents loss of oil used for lubricating motors of Hamburg Elevated Railway

As the bearing clearance increased a part was lost, particularly from the outer end of the housing, by flowing out between the thrower ring and the pinion. In this way the bearing eventually emptied itself of oil, the babbitt melted out and the armature went down, resulting in serious damage. From this trouble there was an average repair cost of about 3,000 Reichsmarks ($720) per year per 100 cars.

For more than two years the cars that have come in for renewals have had the outside of the bearing housing on the pinion end fitted with a pocket placed beneath the bore, which is connected with the oil reservoir by a drilled hole. Two ring-shaped grooves are turned in the bearing surface and between the bearing and the housing. With this arrangement it is possible to direct the escaping oil through the grooves to the pocket and back to the reservoir. As a result the lubricating oil circulates with virtually no loss. By this means the life and economy of the babbitt bearings have been made to compare favorably with those of roller bearings. The cost of installation of this oil return is about 1 Reichsmark (24 cents).

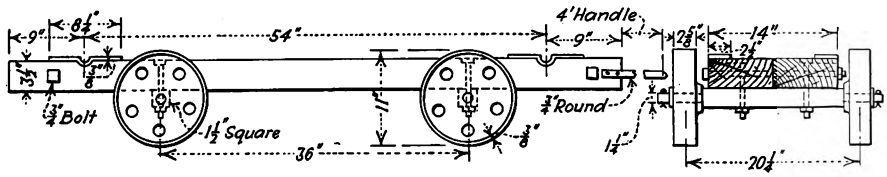
Hand Truck for Transporting Wheels

VERY often the layout of a shop is such that wheels have to be taken from one department to another by hand. Where this is the case some means must be provided to perform this work so that the maintenance schedule will not be retarded. This condition existed in the shop

Digitized by Google



This truck has been found very useful for transporting wheels throughout the shop and yard where crane facilities are not provided

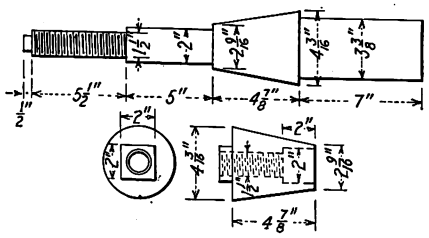
of the Staten Island Rapid Transit Railway, Staten Island, N. Y.

A special hand truck was designed and constructed in the shop to facilitate the handling of the wheels. It is made from two 7-ft. oak timbers bolted to two 1½-in. square axles; the axles are 26 in. apart and are equipped with 11-in. iron wheels with a 2⅝-in. face. The wheels are spaced 20¼ in. from center to center. Each beam is provided with two ⅜x2½x8¼-in. grooved plates, fastened to the upper surface at 54-in. centers. The flanges of the wheels rest in these grooves during transportation, preventing the wheels from rolling. The truck has a handle made of ¾-in. round iron.

Mandrel for Machining of Axle Bearings

By E. H. McGill
Foreman Machine Shop
Omaha & Council Bluffs Street Railway
Omaha, Neb.

MACHINING of the outer surfaces of axle bearings has been greatly facilitated at Omaha by a special mandrel which has been made from an old street car axle. When a bearing has to be machined the

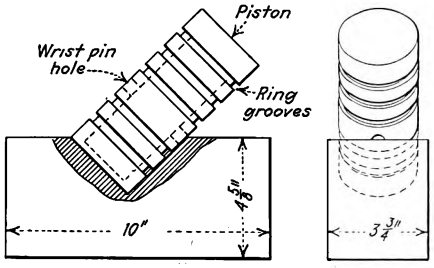


For machining the outer surface of axle bearings this mandrel, made from an old street car axle, is used in the Omaha & Council Bluffs Street Railway

mandrel is placed with the long shaft in the chuck of the lathe. The bearing is then put over the mandrel against the conical end. After this the nut, which also has a conical shape, is screwed on until the bearing is properly centered and tied in its place. The entire outside is turned off at one setting of the lathe, and if necessary both ends can be turned off also. A saving of 35 per cent in labor over the old method paid for the mandrel in a very short time.

Jig for Drilling Pistons

TO DRILL small angular holes in pistons, the jig shown in the accompanying sketch is being used in the shop of the Surface Transportation Company, a subsidiary of the Third Avenue Railway, New York,



This jig saves time in drilling pistons

N. Y. It is made of steel and is 4⅝ in. high, 3¾ in. wide and 10 in. long. The angularity of the recess is determined by the angle of the drilling desired. This jig assures accuracy of the drilling process, eliminates loss of time in setting up the job in the drill press and prevents drill breakage and slippage.

Removing Housing of Barrel Motors*

By Herbert Senior
Foreman Louisville Railway,
Louisville, Ky.

HOUSING removal from barrel-type motors on various occasions has been accomplished only after much difficulty. In order to facilitate this work a special tool has been designed in the shops of the Louisville Railway. This tool consists of a plug with screw, as shown in the accompanying sketch. The outer side of the plug has a thread which fits into the commutator end of the housing where the dust cover is screwed in over the end of the armature shaft. The plug is placed therein and the screw which goes through the center of the plug is turned in, thus pressing the motor out of the barrel. It has been found that this method takes about four minutes, while if it is necessary to resort to hammer and chisel about 11½ minutes are required.

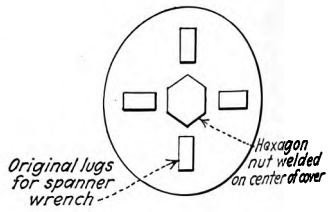
Improved End Cover for Commutator End Frame

By H. J. Beadle
Electrical Engineer Dallas Railway & Terminal Company, Dallas, Tex.

KEEPING covers on commutator frame heads of motors is often quite difficult. These covers screw into the frame head and it is difficult



Hexagon nut welded on end cover for frame facilitates tightening and prevents loss

to use a spanner wrench underneath a car. Each type of motor requires a different type of spanner wrench and much inconvenience is caused in keeping these wrenches on hand. Almost invariably after being tightened with a spanner wrench the covers work loose and often are lost on the road. To overcome these difficulties and make everything standard on the property, a hexagonal ⅞-in. nut is welded on to the cover so a ⅞-in. hexagon wrench will tighten any cover.

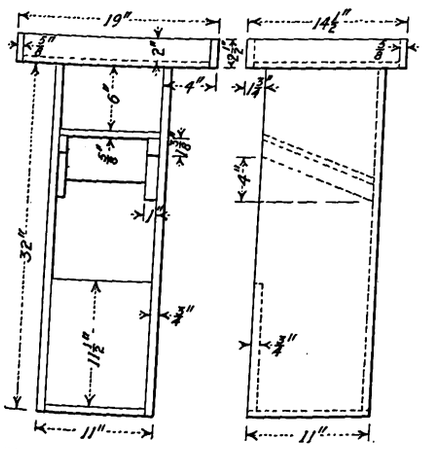
Extensive use is made of electric arc welding in the repair of car trucks at the Cold Springs shop of the International Railway, Buffalo

Repairing Car Trucks Without Dismantling

REPAIRING hanger seats and other wearing parts in car trucks is accomplished in the Cold Springs shops of the International Railway, Buffalo, N. Y., by means of electric power leads that are extended into the truck shop so that electric arc welding can be used, without having to take the truck completely apart. The use of the electric arc weld likewise permits the spotting in of pedestal jib plate bolts, making it possible to keep plate bolts tight, and eliminating excessive wear, noise, broken truck frames, etc.

Armature Winders Tool and Material Stand

ARMATURE winders in the shop of the New York & Queens County Railway, Woodside, N. Y., are furnished with a special tool and material tray and stand, which permit the storage of all tools and material required for repair or rewinding jobs. This eliminates loss of time in going back and forth to the storeroom. It is made of maple and occupies a space of 19 x 14½ in.



Handy fixture for storage of armature winding material and tools

A tray, 19 in. long by 14½ in. wide and 2 in. deep, is made of ⅝-in. material and is mounted upon a stand 11 in. square, made from ¾-in. maple. This stand is totally inclosed on three sides and designed with two compartments.

The upper tray compartment is formed by the bottom of the tray and an incline shelf screwed to two 1-in. x 1¾-in. strips fastened to the sides of the stand. This shelf is installed 6 in. from the bottom of the tray and projects downward so that the back edge is 4 in. lower than the front. The lower compartment is formed by partially closing off the front of the stand with a ¾-in. x 11½-in. board. Because the workers' tools and the necessary material are within easy reach, production has been substantially increased.

BUS AND GARAGE DEVICES

Jig for Machining Bus Connecting Rods*

By F. A. Marsh
Superintendent of Equipment Municipal Railway, St. Petersburg, Fla.

TO SECURE increased efficiency in reconditioning bus connecting rods, the Municipal Railway of St. Petersburg, Fla., has designed a jig for the purpose of machining such rods with the minimum of labor, both in setting up and in the actual boring. This jig consists of a baseplate together with a stud and a clamp arranged in such a way as to hold the connecting rod in place in a lathe. In order to secure accurate machining it is best to smooth off the faceplate of the lathe and also one side of the baseplate of the jig. The plate is brought into position by dowels (1) and cap screws (2) shown in the accompanying illustration. A stud (3) of the exact size of the piston wristpin is located at one end of the jig. When the lever (4) is swung open to position (5) the rod is pushed down over the wristpin stud (3) and against post (9). The lever is then returned to closed position (4) and hexagonal capscrews (8) are tightened, forcing dogs (6) down on to the connecting rod.

Any twisting or bending of the rod to make it perfectly true should be done before it is placed in the jig and it should not be forced by dogs (6) but simply held in position by them. If the rods are perfectly babbitted, the machining will consist only of running a heavy boring tool through the bearing. The sides of the bearing adjacent to the stud may be machined by an electric drill.

A counterbalance should be bolted to the faceplate of the lathe in order to eliminate vibration when running

Digitized by Google

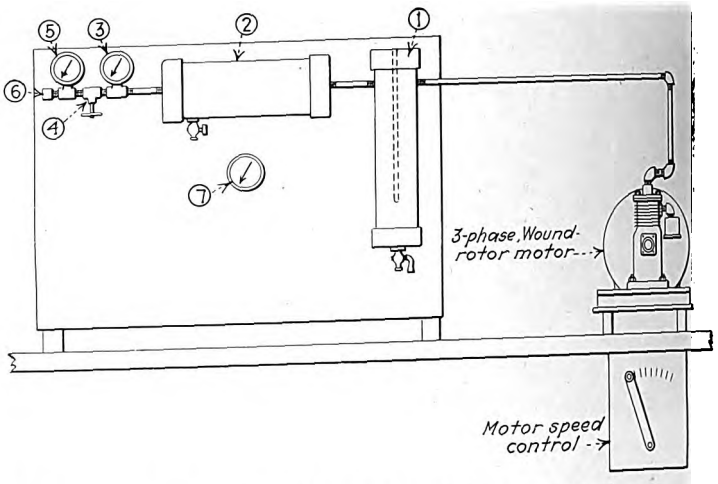
at high speed. If great accuracy is maintained in making the jig, and a heavy boring tool is used in machining, the rods can be reconditioned with small expense and with a minimum of time, assuring ease of assembly and identical dimensions of all rods. By this method the entire cost of rebabbitting and machining should not exceed $1 per rod, including babbitt, and if the crankshaft is true no scraping and fitting of the rod is necessary, as rods should be exact within a few ten thousandths of an inch variation.

Bus Compressor Test Stand

By L. Rose
Assistant Superintendent Cleveland Railway
Cleveland, Ohio

IN ORDER to test new compressors for buses and also to check removed units without dismantling, a combined run-in and test stand was designed by the Cleveland Railway. The examination of a used compressor consists chiefly of running it at a low, predetermined speed for a fixed period, when its pumping capacity is tested and if found satisfactory it is passed. The procedure is as follows: The compressor is connected to the apparatus shown in the accompanying sketch. This consists briefly of (1) a vertical oil separator tank equipped with a baffle plate, to drive out of the air all oil pumped by the compressor; (2) a cooling and expansion tank; (3) an air gage to show the pressure the compressor works against; (4) a needle valve; (5) a second gage as in (3), and (6) a pipe cap drilled to form an orifice of a specific diameter, as determined by trial ($\frac{1}{16}$ in. is satisfactory for most work). The compressor is then run at a predetermined speed for a given time with the needle valve (4) wide open, and the amount of oil passed in a given time, as measured in cubic centimeters, is determined. If this amount exceeds the limit set the compressor is torn down and the rings and pistons inspected for wear. If the compressor passes the "oil" test it is then checked for capacity to pump. This is done by again running at a predetermined speed and adjusting the needle valve so that the compressor pumps against a given pressure (100 or 125 lb.) as indicated by the gage (3). After a short run, until temperatures become constant, the needle valve is again adjusted and the pressure on gage (5) is read. If this pressure is below the limit for this type unit, the head is removed and the valves ground or inspected to determine what the difficulty is. If the unit passes this test it is felt that it may be sent out to be installed for at least the balance of mileage due before its scheduled inspection, and in most cases a bearing takeup will render the compressor as satisfactory as an entirely rebuilt unit.

As may be readily seen, the cost of such a set-up is nominal, with the exception of the motor and the control resistance. This installation, a few years ago, cost approximately $200 and paid for itself a few months after completion.



Air compressor test panel used by the Cleveland Railway for the maintenance of the air equipment on buses

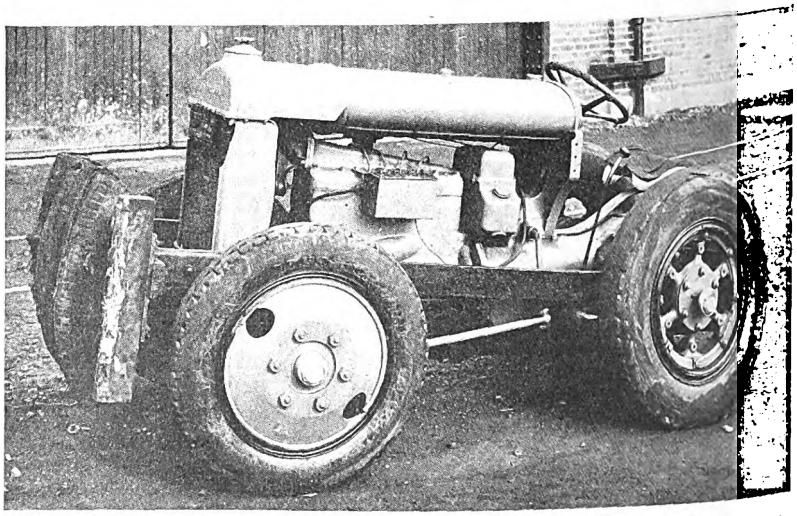
Reducing Trolley Wire Breaks

A survey of overhead line maintenance methods and results on various electric railway properties will appear in a future issue

Tractor Used as Shop Locomotive

By Del A. Smith
General Manager
Department of Street Railways
Detroit, Mich.

IN THE garage of the Department of Street Railways, Detroit, an old Fordson grader has been converted into a very useful shop locomotive. At the front it has rubber bumpers attached to sills running back and braced to the rear axle, for pushing coaches about the garage. A rugged hook is provided at the rear for towing vehicles if necessary, while for obtaining better traction a weight box has been installed. The wheelbase is 67 in. and width over all is 52 in., which enables this machine to turn in a circle of less than 12 ft.



Shop locomotive made from an old Fordson tractor is used for haulage around the shops of the Department of Street Railways in Detroit

Sweeping the floor of the Walden garage of the International Railway

Motor-Operated Sweeper Speeds Cleaning

THE total floor area of the Walden garage of the International Railway, Buffalo, N. Y., including the bus driveway, approximates 53,000 sq.ft. Fourteen hours of one man's time has heretofore been required daily to take care of the sweeping of this space. In an effort to conserve a part of this man-power for other purposes a mechanically-driven rotary brush has recently been substituted with most satisfactory results.

A brush of 30 in. diameter and 8 ft. long, connected in a frame just ahead of a Fordson tractor mounted on solid rubber-tired wheels, makes it possible to complete the sweeping job in 2¾ hours. The work is not only performed in something less than one-fifth the time previously required, but is done as well or better than by hand.

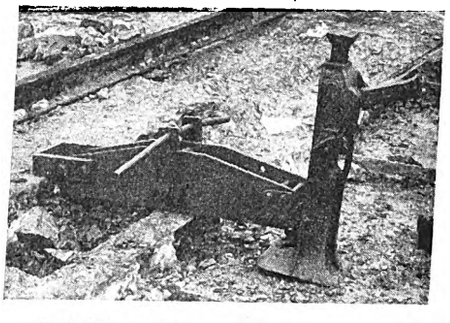
Rail Lifter with Track Jack*

By Roy F. Bragdon
Division Superintendent
Way Department Cleveland Railway
Cleveland, Ohio

A RAIL lifter used in combination with an ordinary track jack in the way department of the Cleveland Railway has facilitated greatly the removal of rails. This device is clamped to the head, allowing the rail to be lifted from the top, which eliminates the necessity of using bars or the digging of jack holes under the base of the rail, which was the method followed prior to the development of the rail lifter.

The rail lifter was developed primarily to meet the problem of lifting and holding the rail suspended during the process of resurfacing old track laid on the steel ties with a concrete base, this being done without disturbing the track base. The rail was lifted first and then steel plates were welded to the old ties, in order to bring it up to the proper elevation of the street.

Employing a gang of about 40 men, the Cleveland Railway reconstructed about 2½ miles of single track in this manner. The rail lifter weighs about 148 lb. and is easily handled by two men. By its use the progress of reconstruction was increased about 50 per cent, which was a saving of about $75 per day.



Rail lifter with track jack ready for operation

NEW IDEAS IN TRACK WORK

Assorted Layout of Track Materials*

By J. C. Newman
Engineer Maintenance of Way
Virginia Electric & Power Company
Norfolk, Va.

A CONVENIENT system of assorting track materials is employed by the Virginia Electric & Power Company at Norfolk. The material is unloaded from cars with the company's traveling crane and skidded in place on racks as shown in the accompanying illustration. These racks are made from old bridge lumber used as mud sills, on top of which T-rails are spiked down as stringers. The material is systematically arranged, each article being numbered for storeroom purposes, the numbers corresponding with stock cards, so that a complete record is kept of the material in stock. The material is placed in the yard from one end to the other in the following order: New special work layouts complete, switches, mates, frogs, portable crossovers, guard rail, main rail and relaying material. When any article is required for service, it is requisitioned according to the number on the stock card. The racks were built during odd times by the company's force at a cost of approximately $500.

ELECTRIC AND LINE EQUIPMENT

Reclaiming Negative Battery Groups*

By F. W. Braund
Superintendent of Power Conversion
Cleveland Railway, Cleveland, Ohio

ELEMENTS of lead acid storage batteries are constantly deteriorating and disintegrating. The time actually required for this deteriorating process to cause the battery to become unserviceable is a function of battery cycling, rates of charge and discharge, height and strength of electrolyte, insulation, plate shedding, temperature, etc.

Plate shedding is the loss of active material from the positive and negative groups. It is caused primarily by chemical action of the electrolyte penetrating the plate on discharge, only to be driven out of the plate while charging, thus carrying particles of active material to the free surface where they are deposited in the sediment chamber. Freezing, overheating, and overcharging cause expansion and contraction of active material, breaking down its binder or adhesive qualities, which results in abnormal shedding.

Insulation usually of the vertical ribbed type is constructed and arranged in a battery so as to fill in the space between the negative and positive plates and form a solid or compact cell. With this compact assembly, much of the shedded negative plate active material banks up or packs between the surface of the plate grid and the insulating sheets. In the past, when reinsulation or a renewal of positive groups was necessary, this loose shedded negative material was scraped or washed from the negative plate surfaces, leaving a battery with new positives acting on 50 or 60 per cent negatives.

Much of this loose shedded material can be reclaimed by pressing the material back into the plate grids. Before this pressing process is performed, however, it is necessary to charge the battery thoroughly, chemically changing the lead sulphate existing in the negative plates when discharged to spongy lead which exists under charged conditions.

Fillers of wood or sheet lead, with thicknesses sufficient to fill the space, are then placed between the negative plates in the group. This compact assembly is placed in a screw press, which forces the loose, spongy lead back into the plate grid, and results in a 90 to 95 per cent negative plate.

The average life of negatives in the service of the Cleveland Railway is approximately two years. While the reclaiming process has been in service but six months, it is estimated that approximately two years additional life will be obtained by the reclaiming method, and will result in a four-year over-all life for the negative plates, which are discarded sooner otherwise.

Metal W-S Signs an Improvement Over Painting on Poles*

By D. H. Walker
Chief Engineer
Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.

WHISTLE and Stop signs for many years have been painted directly on the trolley poles of the Terre Haute, Indianapolis & Eastern Traction Company. Whenever a pole was changed the sign was necessarily destroyed. Moreover, the white letters did not last long on creosoted poles and had to be painted every other year on cedar poles. To eliminate this trouble the use of metal signs was begun. This has resulted in lower maintenance costs and signs which were easier to distinguish. It has also eliminated the danger of having no sign after a pole was taken out for renewal.

Whistle and Stop Sign

Attached to span wire poles of the Terr Haute, Indianapolis & Eastern Traction Company, these signs have reduced maintenance cost

These metal signs are 12x12 in. for the single "W" or "S" and 12x24 in. for the combination of the two. They are made of 20-gage metal, painted white, with black letters 9 in. high. The new sign is nailed to the trolley pole. When renewal is needed a few extras which are kept in stock in the shop are then sent out for the section men to change. The average cost for painting the letters on trolley poles was about 30 cents, but these had to be painted every second or third year at best. The metal signs average 45 cents in cost, of which 30 cents is for material. The lettering will remain clear twice as long as the old type. Since this company has almost 1,100 such signs the saving in maintenance amounts to a considerable sum.

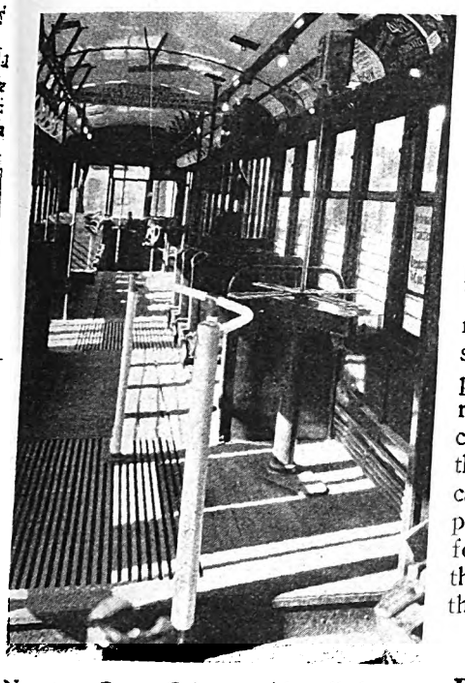
New Car and Line Products

Turnstile Fare Collector for Street Cars



New type Perey Coinpassor installed near the front entrance door of a Brooklyn & Queens car

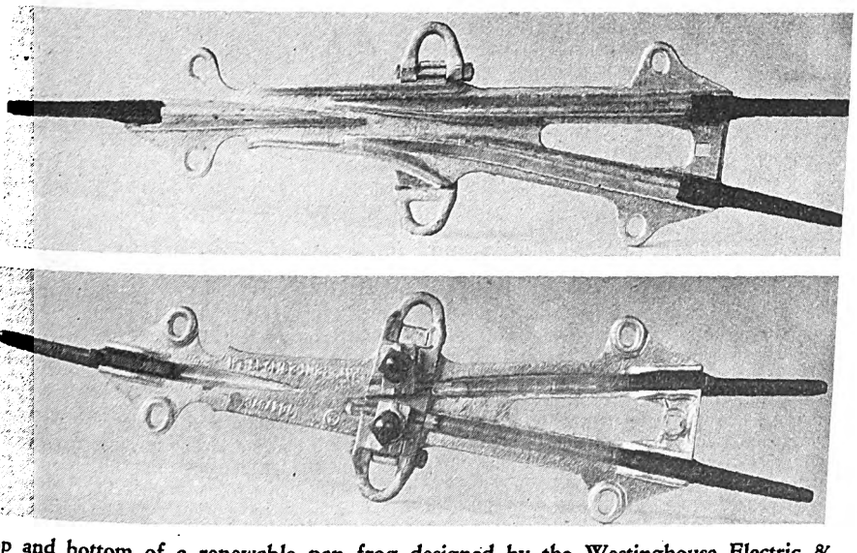
A VARIATION of the Perey "Coinpassor," developed for use on street cars, is being tried out on the lines of the Brooklyn & Queens Transit Corporation.

This new turnstile has been evolved from the Perey Coinpassor in use by subways and elevated railways in prepayment areas for a number of years past. An advantage claimed for it is that it allows the car to pick up its load quickly at any stop and to proceed while the passengers are admitting themselves through the Coinpassor. Moreover, it reduces the responsibilities of the car operator, since he only has to make change for a few passengers who do not have the correct coin, and does not need to pay attention to the others. Tokens are issued in exchange for transfers by the operator and are then inserted in the Coinpassor the same as the 5-cent piece. The small size of this Coinpassor makes it possible to locate it on one side of the car, thus, allowing the full platform space to be utilized as a reservoir for passengers boarding the car, and also, if necessary, leaving the other half of the end of the car body for exit, although the best practice would be to use the front end for entrance only and have all exit through pneumatic treadle doors at the center or rear of the car.

Renewable Pan Trolley Frog

IN THE design of a new Westinghouse renewable pan frog the work of resetting has been eliminated by the addition of an anchor plate, which remains in position permanently. The trolley wires, tangent or curve, are fastened to the anchor plate by the usual individual clamping method. After the anchor plate is set, the frog body or renewable pan is brought up underneath the plate and inserted into its place. A pin holds the pan in place and the frog is then ready for the approaches.

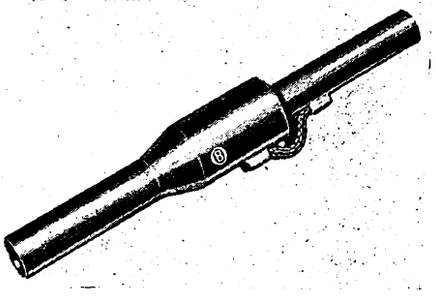
No guys are required, providing the anchor plate is set correctly. The trolley wires will line up the frog, and after the approaches are driven into place the frog is permanent until it wears out. When it becomes time to renew the pan the approaches are removed and the bolt in the anchor plate is slipped out, the worn pan is taken out and a new one put in its place.



Top and bottom of a renewable pan frog designed by the Westinghouse Electric & Manufacturing Company, which permits replacement in a minimum of time

Silencer Stops Trolley Noise and Reduces Wear

A CUSHION silencer is a recent addition to trolley pole equipment made by the Ohio Brass Company, Mansfield, Ohio. Besides eliminating trolley noises, this also reduces the wear on both the overhead and the collector by its cushioning action. This method of reducing noise differs from experiments which have been tried previously, in that the object is to damp the noise immediately below the trolley wheel, rather than to attempt to silence the entire assembly by some sort of cushion under the trolley base. The silencer consists of a steel tube upon which a rubber cushion is vulcanized by a patented process which makes it adhere firmly to the steel. Another steel tube, tapered to fit over the end of the trolley pole, is swaged over this rubber cushion. So assembled, the device deadens the vibration and noise of the current collector. A braided copper shunt carries the current around the rubber cushion. The device is easily installed and weighs only 28 oz. It adds 8½ in. to the length of the trolley pole, but if increased pole length is objectionable, the pole can be shortened at the base.



O-B cushion trolley silencer deadens noise and vibration immediately under the harp

News *of the* Industry

No Curtailment of Improvements

Electric Railway Representatives Assure the President Market Crash Will Not Affect 1930 Expenditures

REPRESENTATIVES of three public utility groups—electric railways, electric light and power, and manufactured and natural gas—met with President Hoover at the White House Nov. 27 to discuss their programs for the coming year. All expressed optimism concerning the prospects for business and industry. No curtailment of its expenditures is anticipated by any of the public utility industries as a result of the stock market depression.

Speaking for the electric railways, J. N. Shannahan, chairman of the Advisory Council, said:

"A canvass of the electric railway companies of the United States, comprising street car, rapid transit, interurban and bus lines handling approximately 16,000,000,000 passengers annually, indicates that 97 per cent of the executives responding to our inquiry do not anticipate that the present stock market situation will affect their capital and maintenance expenditures during the coming year.

"This survey, made at the suggestion of Paul Shoup, president of the American Electric Railway Association, who is unfortunately unable to attend this conference due to his presence on the Pacific Coast, indicates that this industry which during 1929 is spending approximately $1,000,000 a day for maintenance, betterments and extensions, expects to maintain or exceed this rate of expenditure in 1930.

"At a meeting held at the association's headquarters in New York on Nov. 26, 1929, representative executives of companies operating in various parts of the country expressed their confidence in the business outlook and their desire to cooperate with President Hoover in every possible way in his effort to stabilize and insure the continued progress and development of business.

"Analysis of the transportation situation in a number of large cities indicates that as progress is made in bringing about better public understanding of the economic problems involved, improvement in credit will permit considerable increases in capital expenditures to be made for expansion of facilities."

In addition to Mr. Shannahan, the electric railway delegation included J. H. Hanna, G. A. Richardson, W. A. Draper, J. P. Barnes, T. N. McCarter and L. S. Storrs.

Kansas City Case Argued

R. J. Higgins, who presented the case of the Kansas City Public Service Company, Kansas City, Mo., before the Missouri Supreme Court, in his initial appearance before the court contended Judge Latshaw was wholly without jurisdiction to interfere with the official duties of the Public Service Commission when he granted the temporary injunction which blocked the commission's valuation and audit of the company's properties. He charged further that the power to fix rates with a public utility rested entirely in the Public Service Commission, and that Judge Latshaw had no power to limit or abridge the powers of the commission.

D. D. McDonald, chief counsel for the commission, said the Circuit Court's action was not an orderly one, and that Kansas City, or any other city of its class, had no power to tie up police power of the commission.

John T. Barker, city counselor, insisted the franchise was a "service-at-cost" grant, under the amendment to the 1925 public service law.

City Appeals From Recent Louisville Decision

The city of Louisville, Ky., on Nov. 18 filed an appeal in the U. S. District Court of Appeals at Cincinnati against the decision of Judge Dawson in the U. S. District Court at Louisville, who some weeks ago granted the Louisville Railway an injunction to prevent the city's interfering in its plan for increasing fares to 10 cents cash with three tickets for 25 cents. The city questions the jurisdiction of the federal court in the case. According to City Attorney Baskett, oral arguments will be heard first and then briefs will be filed.

Meeting of Standing Committee on Rolling Stock

Members of the standing committee on rolling stock met on Nov. 20 for the first time since the recent convention with the chairmen of the sub-committees to outline the work for the ensuing year. Reports were presented on the progress of the thirteen sub-committees. This work is to be continued to the latter part of February when the second and last meeting will be held. There will be only two meetings due to the limited amount of time available before the convention in San Francisco in June.

New Company Paper in Columbus

The initial number of "The Illuminator," a 32-page monthly magazine published by the Columbus Railway, Power & Light Company, Columbus, Ohio, has just come from the press. When the company decided several weeks ago to publish the magazine, a committee was named to select a title, and the entire personnel was asked to suggest appropriate names. The request brought in more than 800 names. Earl E. Grover, claim agent for the company, has been made editor and George M. Kaufman, assistant editor. Each department of the organization has a representative on the staff responsible for furnishing news from his division.

Separate Operation Ahead in Augusta

F. Bayard Culley, division manager of the Georgia Power Company at Augusta, Ga., has explained the recent incorporation of the Augusta Railway & Transportation Company in part as follows:

"The application for a charter by the Augusta Railway & Transportation Company is with the view of organizing a new company which will acquire by purchase and take over the operation of the railway system in Augusta.

"In the development of the electric industry, the problems incident to the operation of street railroads on the one hand, and light and power plants on the other, have become increasingly dissimilar and difficult to handle under combined management. In order more readily to meet and solve these problems as they arise, it has been deemed advisable to separate the railway properties from the electric service, thereby simplifying the handling of each.

"It is also considered desirable that each of the services should stand on its own bottom, as it is obviously unfair to the patrons of one or the other service that losses in operation of one service be made up from funds paid in by customers of the other service. Under unified management this is inevitable to some extent.

"There is no present intention to make any change in the staff or operating personnel of the railway in the event that the charter is granted and the change takes effect. Similar plans are being perfected for the separation of the street railway properties from the electric in Rome, Athens and Macon."

Ten-Cent Fare Asked for Casual New Jersey Rider

Public Service Co-ordinated Transport, Newark, N. J., applied on Nov. 21 to the Public Utilities Commission to change the present 5-cent unit fare on trolley cars and buses to 10 cents, but to sell twenty tokens for $1. Thus the 5-cent fare would be retained for regular riders. The proposed change will become effective Jan. 1 unless suspended by the commission. The situation is best explained in the statement by President Thomas N. McCarter, in part as follows:

"Since the start of the 5-cent fare the company's operating revenues have failed to meet operating costs and fixed charges by approximately $5,000,000, with no return upon nearly $48,000,000 invested in the property represented by stock of the company.

"This situation and the necessity of establishing the credit of the company, so that it can attract the necessary additional capital with which to furnish the public adequate and proper service, require some change in the rate of fare.

"In its desire to preserve the 5-cent fare, the company proposes a rate which will

Digitized by Google

retain this fare for the great body of 310,000,000 car riders and 365,000,000 bus riders who are transported annually. To do this, it proposes a plan involving the sale of tokens at the rate of twenty for $1, each token good for a 5-cent ride as at present defined, with an alternative 10-cent cash fare for the occasional rider, whose use of the facilities, though casual, requires the company to keep them available at all times to serve him.

CASUAL RIDER ALONE AFFECTED

"As stated by me in an interview in the public press two months ago, the rate suggested will permit the regular passenger to continue to ride for the 5-cent fare through the purchase of tokens. The only increase will be in the fare of the occasional rider who would not resort to the use of tokens.

"We are willing to try this experiment in the hope that it will produce additional revenue, rather than seek a horizontal increase in the rate of fare to be paid by all riders on street cars and buses.

"The best interests of both the public and the company will be served by permitting this change in the rate to go into effect as soon as possible, exactly as the present fare experiment was put into effect by the company at the board's suggestion without suspension and without hearings.

"The company has already shown its good faith in making a six-year trial of the present rate of fare and pledges that it will give the rate now proposed a full and fair trial. We seek the co-operation of the public and respectfully request that your board permit the proposed rate to go into effect without suspension."

W. B. Wheeler Heads Met. Section

At a meeting of the Metropolitan Section, A.E.R.A., held at the Engineers' Auditorium, New York City, Friday evening, Nov. 1, W. B. Wheeler, assistant superintendent of transportation, Third Avenue Railway System, was chosen president for the ensuing year. Other officers elected were W. G. Strait, vice-president and purchasing agent, New York Railways, first vice-president; G. H. Ord, treasurer, the Ellcon Company, second vice-president; F. T. La Velle, division superintendent, New York Rapid Transit Company, third vice-president; W. H. Eisemann, secretary; L. G. Monroe, assistant auditor, Third Avenue Railway System, treasurer.

For directors there were chosen Niles Persons, superintendent surface lines shops, Brooklyn-Manhattan Transit Corporation; K. R. Lewis, assistant superintendent of car equipment, Interborough Rapid Transit Company; S. S. Hamilton, assistant superintendent of transportation, Brooklyn & Queens Transit Corporation; M. J. O'Connor, superintendent of transportation, New York Railways; W. W. Brown, assistant to superintendent of equipment, Brooklyn-Manhattan Transit Corporation; and H. Vander Veer, sales engineer, National Pneumatic Company.

The meeting was addressed by Guy C. Hecker, general secretary, American Electric Railway Association, who spoke on the recent Atlantic City convention. Charles Gordon, managing director, American Electric Railway Association, was also requested to speak. The program of entertainment was ably handled by Charles Witzel, Third Avenue Railway System, and his aides.

Co-operative Association in New Orleans

The charter of the Co-operative Street Railway Employees Association of the New Orleans Public Service, Inc., a new association made up of motormen, conductors and other men now employed by the company, has been recorded in New Orleans by St. Clair Adams, attorney.

Mr. Adams said the purpose is to permit collective bargaining with respect to working conditions, hours, wages, etc., and to provide for insurance, sick and death benefits.

Those eligible for membership in the new association are conductors, motormen, pitmen, pitmen helpers and car washers. The association has a full complement of officers with a board of trustees.

The objects of the association as outlined in the charter are:

1. To co-operate with the company in giving the public the most efficient service.
2. To insure fairness and justice to employees, the management, the stockholders, and the public, and to provide means for collective bargaining with our employer in respect to wages, hours and working conditions.
3. To promote mutual understanding, harmony and spirit of co-operation among those of all ranks in our organization.
4. To provide our members with certain incomes when incapacitated by illness or accident and to pay definite sums to the beneficiaries of such of our members as may die.
5. To create, administer and maintain funds for those purposes from dues, donations and other sources so that benefits shall be furnished at the current cost of the same.
6. To provide and administer such other welfare activities and forms of relief as may be adopted.

The preamble of the charter expresses the purposes of "building up an organization where all working members can participate in the free discussion of those practical problems upon the solution of which depends our welfare and prosperity; encourage the principle and practice of conciliation in the settlement of all differences between ourselves and our employer; establish order; inspire harmony; promote the general cause of humanity and brotherly love, and secure the blessings that come from true friendships."

Jitneys have not entirely disappeared from the streets of New Orleans, but police continue to make numerous arrests each day and the number is gradually being reduced. The courts recently decided that operators of jitneys must be specifically charged with operating without the required bond. Convictions under this charge are being upheld.

Preparing for Washington Fare Appeal

At a meeting of the executive committee of the Washington Railway & Electric Company, Washington, D. C., on Nov. 21, the officers of the company were directed to proceed with an appeal to the court from the recent order of the Public Utilities Commission denying the application of the Capital Traction Company for increased rates of fare, to which application the Washington Railway & Electric Company was made a party by order of the commission.

The commission in its order concluded that the companies had not fully met the burden of proof, but left the way open for them to submit further evidence. The Washington Railway & Electric Company confidently rests its case on the evidence already submitted and feels that the importance to the community and to itself of the matters involved requires that they should be presented promptly to the court for review. President Ham of the company said:

"We confidently believe that with an adjudication by the court of certain matters of fact and of principle, concerning which there is now a difference of opinion, there will come a realization on the part of all concerned that the street railways in Washington, with their expensive underground conduit system, cannot continue to render the class of service desired by the public at the present rates of fare."

The form that the Capital Traction Company's legal action for relief will take is now before the company's legal staff.

Omaha Bridge Vote in Spring

Citizens of Omaha and Council Bluffs will probably vote at a special election next March on the purchase of the bridge spanning the Missouri River from the Omaha & Council Bluffs Street Railway.

The company's price of $4,155,296 was rejected by the City Councils of the two cities in a joint session by a vote of nine to three. This led President Shannahan to announce that the purchase of the bridge at the company's price would be submitted to the voters. At the joint Council meeting, Mr. Shannahan presented in writing what he said was the final offer of the bridge owners. The counter offer by the cities to purchase the bridge for $3,500,000, made at this meeting, was rejected by the company.

The proposal which will be submitted to the voters will be the only question on the ballot and the election will be held at the expense of the bridge owners. In brief, the proposal to turn the bridge over to the two cities is as follows:

1. The bridge owners will deed the bridge to the two cities for $1.
2. The two cities will lease the bridge to the present owners for $1 a year.
3. The bridge owners will collect the tolls for 6½ years dating from Oct. 31 of this year. At the end of that period they will turn the bridge back to the two cities without further cost.
4. If the price of $4,155,296 fixed on the bridge is realized from the tolls in a shorter time than 6½ years the bridge will be turned over to the two cities as soon as the amount is received.

The Councils have passed a resolution asking Senator R. B. Howell of Nebraska and Congressmen Sears of Omaha and Swanson of Council Bluffs to further a congressional act empowering either city or both cities to construct a new bridge to be paid for out of tolls. This action was taken so that if the bridge proposal is rejected by the voters, the two cities will have the right to proceed to build a new toll bridge without further delay.

Ten-Cent Cash Fare Bill in Denver Council

A 10-cent fare, continuance of present free transfers, installation of four bus lines, and discontinuance of six present rail lines in whole or in part are the major provisions of a bill for a new Denver Tramway ordinance introduced in the City Council on Nov. 18. They represent the initial changes proposed by Howard S. Robertson, president of the Denver Tramway,

Digitized by Google

and his associates in a comprehensive Tramway rehabilitation program announced late last summer.

On the fare question, the bill provides that the fare for adults shall be 10 cents cash each; tokens three for 25 cents; for children under six years old when accompanied by paying passenger, free; for children six or more and under twelve, 4 cents each.

Transfers would be free, but passengers would not be given them if transferring from one bus to another or one street car to another when the second bus or car ran into the same territory tapped by the first.

The tramway would pay to the city $10,000 annually, in twelve monthly installments, as an annual license fee, and in addition its regular property, gasoline, automobile and other licenses and taxes.

It would also post a $50,000 indemnity bond, in return for which the city would release it from a bond provided for in the 1906 franchise, which, the bill recites, "expired by limitation of the time therein fixed on or about May 15, 1926."

The company also would keep books and records on all its business, and these would be available for inspection by the city at all times.

H. S. Robertson, president of the railway, is quoted as follows:

"The increased gross revenue that may be received is speculative because dependent upon so many varying conditions. We are certain it will not bring in enough to earn the full return allowed on the valuation fixed by the court. If I were to hazard a guess, my estimate would be that the earnings probably would be increased by about $300,000 gross. All of this, however, might or might not be reflected in net income dependent upon the situation in respect to operating expenses."

Middle Atlantic Equipment Men Meet at Richmond

"New Practices in Lubrication" was the subject of a paper, by R. B. Varnum of the Texas Oil Company, presented at the fall meeting of equipment men of the Middle Atlantic states, which convened in Richmond, Va., on Nov. 6 and 7. Lubricating problems encountered by the United Railways & Electric Company of Baltimore were discussed at length. After presentation of this paper the meeting was thrown open for discussion in which many of the 58 members and guests participated. N. B. Brownyer, Timken-Detroit Axle Company, read a paper on "A New Era in Street Car Mechanics and Operation," pointing out that the design of entirely new types of car trucks was started about three years ago by W. L. Harwood of the Springfield Street Railway, Springfield, Mass., and J. R. Blackhall of the Chicago, North Shore & Milwaukee Railroad.

Mr. Brownyer then expressed the opinion that the main factors which are retarding popular use of the street car today are noise in operation and low average speed. Maintaining cars properly is expensive and not always thoroughly carried out because inspection of the complicated units is difficult. Another point stressed was the desirability of light weight. When the unsprung weight is kept down to a minimum, riding comfort will be greatly increased.

What can be done to improve operation of existing cars was told in a paper presented by H. A. Leonhauser, assistant superintendent of rolling stock and shops, United Railways & Electric Company of Baltimore. The necessity of faster operation of cars and methods of obtaining this in existing slow-moving equipment were discussed in detail by Mr. Leonhauser. He explained how increased acceleration may be had by the changing of gears and shunting of fields. Better retardation by increasing the braking ratio was also discussed at length in his paper. As a means to give better service, the United Railways & Electric Company of Baltimore discarded slow motors and substituted new high speed equipment.

W. J. Hicks, of the Virginia Electric & Power Company read a paper on "Outstanding Features of the 1929 A.E.R.A. Convention," discussing in detail the various pieces of new equipment shown at the convention in Atlantic City. George W. Hall read a report by the committee to investigate step and platform construction with regard to rapid loading and unloading of passengers. The opinion was reached by the committee that the well type of step is preferable to the folding step.

During the second day, a visit was paid to the shops of the Virginia Electric & Power Company, after which the meeting was adjourned to reconvene on May 14 and 15 at Scranton, Pa.

Chicago Franchise Draft Unpresented

A further delay in Chicago's railway settlement was caused when Alderman Frankhauser, chairman of the sub-committee which is drafting the new ordinance, was unable to submit the draft to the committee on local transportation before he left the Council on Nov. 27 to become a judge of the superior court. At the time of his election to this post it was agreed by the attorneys for the companies, the city and the citizens committee that the ordinance, minus financial sections which are being drawn up by the committee of bankers, would be turned over to the full committee before Mr. Frankhauser left, so that the committee could become familiar with the ordinance.

Alderman McDonough, chairman of the local transportation committee, said the delay is caused by "too many lawyers." When counsel have finally obtained their companies' approval of the ordinance, it is planned to ask Judge Frankhauser to leave the bench temporarily and submit the draft to the full committee, together with a report of what has been accomplished.

The committee of four bankers appointed by Samuel Insull to draw up the financial sections is now hard at work on a tentative financial plan.

COMING MEETINGS

Dec. 2-7—National Exposition of Power and Mechanical Engineering (National Power Show), Grand Central Palace, New York City.

Dec. 12—New England Street Railway Club, Copley-Plaza Hotel, Boston, Mass.

Jan. 23-24, 1930—Central Electric Railway Association, Statler Hotel, Cleveland, Ohio.

Jan. 27-29—Electric Railway Association of Equipment Men, Southern Properties, Birmingham, Ala.

May 14-15—Association of Electric Railway Equipment Men, Middle Atlantic States, Scranton, Pa.

Cincinnati Warned

Railway President and Utilities Director Say Suburban Extensions Jeopardize City Fare

AN INCREASE in fare in Cincinnati, Ohio, may be expected if any of a number of proposed extensions to suburban districts are made. This is the gist of reports from Walter A. Draper, president of the Cincinnati Street Railway, and E. D. Gilman, municipal utilities director, filed with the City Council on Nov. 15.

The extensions to three suburbs, Mr. Draper estimates, would entail yearly operating losses of $170,790 if routed according to one proposed plan, or $104,852 according to another. He asserted that another proposed rail extension would cost $50,000, add $15,000 a year to operating costs, and yield an estimated annual revenue of only $4,781. A fifth extension, he said, would cause a loss of $47,600. Extensions to four of the suburbs by bus would cause a loss of $75,240.

Mr. Draper observed that under the present "service-at-cost" franchise the City Council should be held responsible for any increase in fare occasioned by ordering extension of service. He said the franchise gave the company an assured return on its investment, but at the same time gave full control of operation to the city.

The Fernbank-Saylor Park or "down-river" extension, already ordered by the Council as the result of a long-fought contest over abandonment of an interurban line serving the district, is expected to cause a loss of $45,000 a year. In the recent city elections the referendum showed that the public desired the Fernbank extension.

The Few Penalize the Many

In conclusion, Mr. Draper said the extension of rail service to one of the suburbs under discussion could not possibly be considered until the fare control fund was high enough to absorb additional loss. He named October, 1930, as a tentative date to consider this extension.

For the other suburbs under consideration, Mr. Draper recommends continued motor coach service. He reiterated that it is not fair for a few thousand people in suburbs to obtain service at the same rate charged urban residents for short hauls, since this penalized all car riders.

Mr. Gilman went into detail on the technical and financial aspects of an extension program. He was none too optimistic about the ability of the company to carry out the present rehabilitation program without depletion of the fare control fund. He estimated that even with renewals and replacements limited to $577,400 a year for the next five years, the fare control fund would be depleted approximately $165,705 by the end of 1934. This assumes that fares and lines in operation remain unchanged, that reasonable depreciation and amortization are set up next year, that $1,000,000 indebtedness is paid up in five years, that there is no increase in wages, and that no other unusual expenditures are made. He recommended that the Public Utilities Commission be called in by the Council prior to the adoption of any extensions made by the city.

No definite recommendations on extensions were made by Mr. Gilman. He indicated clearly, however, that each would mean a loss, and in his discussion of the finances asserted that the company could not stand additional losses and maintain the present fare. The report of Mr. Gilman was transmitted through C. O. Sherrill, City Manager, who concurred in it.

St. Louis Not Ready for Rapid Transit

R. F. Kelker, Jr., consulting engineer of the St. Louis Transportation Survey Commission, in a report to be submitted to the commission, is expected to say that St. Louis is not yet ready for a rapid transit system. It is understood his studies have convinced him there would not be a sufficient number of passengers to justify the large expense to provide a subway or elevated system. Mr. Kelker will probably recommend that the city concentrate on a more effective use of the existing surface lines, co-ordination of street cars and buses, extension of the skip-stop plan especially during rush hours and the entire elimination of service cars or "jitneys."

He will recommend a comprehensive system of reroutings and extensions, the purchase of new cars and the carrying out as quickly as possible of the City Plan Commission's proposals for major streets.

In addition he will suggest that additional bridges be built across the Mississippi River to East St. Louis and that all parking of automobiles and other vehicles in the downtown sections of the city be abolished.

The adoption of Mr. Kelker's recommendations will entail expenditures of $20,000,000 or more. His report will emphasize the necessity of a new franchise for the St. Louis Public Service Company to enable it to finance the improvements the engineer will suggest.

New Bus Devices Tested

Tests of a new labor saving and safety device for bus operation were made at Richmond, Va., recently by E. Govan Hill, inventor. A large White bus was furnished by officials of the Virginia Electric & Power Company. Without touching either the clutch or brake pedals, the inventor drove the bus over a hilly section of the city, shifting gears and stopping the vehicle by means of his manually operated lever and button device. William E. Wood, chairman of the board of the Virginia Electric & Power Company, June Penick, general manager, John T. Porter, superintendent of equipment, J. W. Cole, master mechanic of the bus department, and Hunter M. Arkwood, who assisted the inventor in applying the device, were passengers on the trial trip. They expressed themselves favorably in connection with the operation of the device.

Service North of Milwaukee Speeded Up

New schedules, improved rapid transit service and reduced fares were put into effect on the Northern division of the Milwaukee Electric Railway & Light Company on Nov. 18. The changes include faster running time, better connections at Milwaukee with south and westbound rail and bus lines, and the use of all-steel equipment similar to that on rapid transit lines.

The faster schedules will apply to both local and limited trains, saving from 17 to 25 minutes between Milwaukee and Sheboygan, while institution of round trip fares and several forms of commutation will reduce the cost to regular riders.

New substations have been installed at Thiensville, Grafton and Pierrons, while those at Port Washington, Belgium, Cedar Grove, Oostburg and Weedens have been improved. In addition, the feeder capacity in the vicinity of these substations has been increased.

The running time of limited trains will be one hour and 40 minutes between Milwaukee and Sheboygan. Local trains will be speeded up to the time of present limited trips, with some of the trips scheduled for one hour and 55 minutes.

Way and Structures Committee May Meet in Chicago

The standing committee on Way and Structures met at the A. E. R. A. headquarters in New York on Nov. 21. The various sub-committees reported progress in the work on assignments and outlined the study and investigations yet to be made. A definite date for the next meeting was not set due to a suggestion made to hold it in Chicago in March during the A.R.A., convention. Committee members will be notified of this meeting by the chairman.

Late News Briefs

Worcester, Mass.—President Mahon of the Amalgamated Association, here to attend the New England Labor Conference, told a representative of the *Labor News* that he did not think the death of Thomas E. Mitten would change the relations of the carmen's union with the Mitten lines in Philadelphia and elsewhere.

Champaign, Ill.—The Illinois Terminal Railroad has secured property on Neil Street at the Wabash tracks in Champaign, Ill., as the first step in the program to provide for rerouting of the interurban trains through Champaign. Final changes will be made in the spring by connecting tracks running down Neil Street with the Wabash tracks, eliminating the John Street and the South Neil Street lines. Freight trains of the Illinois Terminal now are routed over the electrified Illinois Central tracks to Staley while the passenger trains from the west enter on John Street. When the changes are made, the passenger trains of the interurban will come down the Illinois Central tracks on Neil Street.

Lincoln, Neb. — The Nebraska Supreme Court has held that where an insurance company issues an accident policy to an employee of an electric railway, being advised by his application of the nature of his occupation, it cannot later deny responsibility by citing a clause in the contract that the policy does not cover employees of public utilities.

Annapolis, Md.—The Maryland courts will be called upon to settle a controversy between the Washington, Baltimore & Annapolis Electric Railroad and the municipal officials. The case involves a left turn made by the cars at Church Circle in Annapolis. The city wanted the company to remove its tracks to eliminate the left turn, but the company declined to do so. The city then passed an ordinance prohibiting a left turn at the corner. The railroad contends that its franchise is not superseded by the ordinance. In order to get the case into the courts the city officials arrested the crew of a car which made the left turn on Nov. 14. Attorneys for the railroad have since secured a temporary injunction to prohibit the Mayor and police of the city from interfering with the making of the left turn.

Chicago, Ill.—Attendance at the performances of the Chicago Civic Opera Company, which opened its first season in its magnificent new Civic Opera House Nov. 4, is made possible to music lovers in Northern Indiana by the high-speed service offered by the Chicago, South Shore & South Bend Railway, conveniently arranged for their accommodation.

Birmingham, Ala.—The Birmingham Electric Company is sodding the track areas on several streets in the residence sections of the city. The company is also paving several miles between track with brick with a cement coating.

San Francisco, Calif.—The service of the Pacific Avenue Cable Railroad line between Polk and Divisadero Streets was discontinued on Nov. 17, after having been in operation since 1887. The man who drove the first cable car over this track was a passenger on its final trip. The cessation of service was observed with appropriate ceremonies.

New York, N. Y.—Approval of the proposed ten-year contract between the city and the New York Edison Company for power to operate the new subway system has been postponed for three weeks by the committee of the whole of the Board of Estimate. The Edison contract calls for a net charge of 7.99 mills per kilowatt-hour. It gives the city an option for renewal for a second ten-year period. It also provides for part or complete cancellation by the city on twelve months notice without liability for the company's unamortized investment. During the discussion of the contract, Chairman Delaney, of the Board of Transportation, disclosed that city officials were considering the advisability of erecting a municipal power plant. Officials of the New York Edison Company, Mr. Delaney said, had been told that the proposed ten-year contract might be canceled, in the event of a unification of transit lines and the erection of a municipal plant.

Louisville, Ky.—The executive committee of the Kentucky Association of Public Utilities will meet in December to decide on the 1930 state convention, generally held in mid-January. In view of the fact that the General Assembly reconvenes at Frankfort in January the association will probably meet this coming January at Louisville or Lexington.

Johnstown, N. Y.—An Interstate Commerce Commission examiner has recommended that the commission permit the Fonda, Johnstown & Gloversville Railroad to abandon 12 miles of its line between Mayfield and Northampton. The road is a steam and electric line. The portion to be abandoned is part of its steam line. Abandonment is a result of the construction by the state of a reservoir which will flood 7 miles of the line. Relocation of the road is undesirable owing to the large expenditure. The road has been awarded $1,500,000 in condemnation proceedings.

Louisville, Ky.—The question of permitting smoking on street cars has been taken up by the Louisville Railway

Digitized by Google

President Barnes declaring that if the public wished to smoke on all or parts of street cars, it would be permitted. Vice-President Miller has pointed out that smoking is now permitted on front and rear platforms, where such platforms are bulkheaded from the main body of the car, but where there are no intervening partitions, smoking is not permitted. This has caused some complaint from persons who desired to smoke in the vestibules.

Lincoln, Neb.—Officers of the Lincoln Traction Company have proposed to the city planning committee that the company be allowed to take up its tracks on O Street, the main business street, and to operate cars over P and N Streets, next adjoining on the north and south respectively, between Ninth Street and either Sixteenth or Eighteenth Street. This would relieve traffic conditions in the most congested areas, benefit business men, and permit faster service. Only one of the bus lines traverses any part of the main street. The company's experience has been that cars are better on the long runs.

Wheeling, W. Va. — Arguments for and against the proposed Wheeling Traction Company fare increases at Martins Ferry, Bellaire and Shadyside were heard on Nov. 12 by an examiner for the Interstate Commerce Commission. A. C. Spurr, for the company, asserted that the increase would only enable the company to receive a fair profit.

St. Louis, Mo. — The resolution of State Senator Kenney, passed by the last Missouri General Assembly, authorizing cities to issue public utility bonds for 50 years has been declared faulty and unless there is a special session of the Legislature in the meantime it will be necessary to submit it in defective form to the voters of the state at the general elections in November, 1930. The proposed constitutional amendment was favored by the St. Louis Rapid Transit Commission.

Newark, N. J. — Mayor Jerome T. Congleton broke ground on Nov. 19 for the first section of the city's high-speed railway, in the old Morris Canal bed, extending through Newark to Bloomfield. The ceremonies were held in the canal bed between Central Avenue and Norfolk Street. When it is completed the line will be leased by the Public Service Co-ordinated Transport.

Evanston, Ill.—Thomas F. Airth, new president of the Chamber of Commerce, says one of the efforts of his administration will be to induce business men to use the street cars in place of their own automobiles. He said merchants now drive downtown and park their cars in front of their stores, preventing prospective customers from parking.

St. Louis, Mo.—The St. Louis Public Service Company has changed the design of the weekly tickets to provide a space in which purchasers may write their names and addresses. This was decided on after a patron told the company he recovered a lost ticket because he had had the foresight to write his name and address on it. An honest person found the pass and returned it to its owner. Nov. 10 marked the eleventh week of the experimental fare of twelve-ride weekly tickets for 90 cents and extra rides at 5 cents and straight adult fares of 10 cents.

Richmond, Va. — A ballot was distributed on the bus lines of the Virginia Electric & Power Company in Richmond on Nov. 25, in an effort to determine the rider sentiment as to the near or far side bus stop controversy now being waged before the City Council. The company had the ballot prepared at the suggestion of Alderman Sullivan, proponent of the near-side bus stop ordinance which is scheduled for final action by the City Council on Dec. 9. Mr. Sullivan asked that in addition to having all bus operators distribute the ballots, they be put in all department stores and in hotels, etc.

Detroit, Mich. — Joseph Bower, financier of the Ambassador Bridge over the Detroit River, now seeking permission to construct an elevated motor speedway from Detroit to Pontiac, has asked the Council to permit the people to vote on his proposed project. He asked that the matter be submitted at a special election in order to hurry completion of the improvement. He is willing to pay the cost of a special vote.

Foreign News

Increase in Paris Underground Traffic

The Metropolitan Underground Railway, Paris, France, handled increased traffic during the second quarter of 1929, the number of passengers carried reaching 143,000,000 as against 135,000,000 in the corresponding period of 1928. Receipts totaled 98,000,000 francs ($3,920,000). The terminal stations dispatch daily 9,000 trains, 700 per hour during the rush periods. The growth of the Metropolitan since its inception in 1900 is shown in the following table:

Year	Average Length of Lines Operated During Year Kilometers	Number of Passengers Carried
1900	5.13	17,660,286
1901	13.32	55,882,127
1903	23.44	118,201,772
1910	63.58	318,254,368
1913	87.74	467,474,226
1917	94.82	588,225,144
1919	94.82	726,486,140
1923	103.08	704,755,000
1928	111.80	818,000,000

The Metropolitan has placed important orders for equipment, including 130 electric motor cars and 119 first class coaches, all with French firms.

Paris Favors Return of Double-Deck Buses

Paris authorities are considering the possibility of re-introducing double-deck buses. The single-deck six-wheel bus recently installed has a large carrying capacity, but apparently has not given satisfactory results. Narrow streets and sharp corners tend to limit the length of the bus. There are, however, many opponents of the double-deck bus. It was suggested in one of the newspapers that if Parisians would only learn to catch their buses on the fly after the fashion in London the problem would be solved. At present, printed signs on street corners and in the vehicles warn the passengers not to enter or leave a bus while it is in motion. As further comment puts it "to adopt the London method would result in a revolution in French manners and customs."

Japanese Plans Subject to Modification

An announcement early last year gave the cost of new electrification plans in Japan at about 2,000,000 yen spread over a period of four years. Since then the government Department of Railways has announced a program for the electrification of nine sections of five trunk lines at a cost of 4,000,000 yen spread over a period of six years. The new plan, to go into effect next year, is to electrify all of the sections of the railway throughout the country that include tunnels or heavy gradients. The scheme also includes the construction of a new elevated electric line about 1½ miles in length to connect the present Ochanomizu station of the Yamanote line, which is the inner hoop of the line encircling Tokyo, with the Ryogoku railway station, the terminus of the Boso and Hojo lines. Parallel tracks will be built between Ryogoku and Kameido and the system electrified.

Bus and Car Fares Increased in Paris

The Paris Transports en Commun recently asked the Municipal Council to permit increased fares on certain suburban lines, since adoption of a ticket and zone system necessitated making the fares between certain points a round figure. The privilege was granted and the new fares have gone into effect. The increase in fare does not materially increase the revenue, but the public is protesting the higher rate. What complicates the situation for the Paris commuter, and incidentally for the operating companies, is the traditional two-class system. From time to time it was suggested this be abolished as had been done in many smaller cities of France, but Paris clings to this ancient custom. If the first class were abolished, all other fares would have to be raised. And that would not be popular.

Douglas, Isle of Man—Cable traction on the Douglas Tramways has been abandoned and buses have been substituted. There are now practically no cable lines left in Great Britain. The Douglas cable tramway has been operating since 1896.

Tokio, Japan—A profit of 280,363 yen has been reported by the Tokio Underground Railway during the first six months of 1929, compared with a profit of 293,067 yen during the last six months of 1928. Gross earnings were 417,432 yen and gross expenditures were 137,128 yen during the 1929 period. These statistics apply to the first section of tube railway to be put in operation by this company from Ueno Station to Asakusa Station.

Rome, Italy—Fourteen miles of railway included in the limits of the old city will be torn up and replaced with roads for buses. They will connect with tram lines outside the bus limits.

Digitized by Google

Glasgow, Scotland—In spite of the advice of the tramway manager and of the tramways committee, the Town Council has resolved to continue the halfpenny minimum fare on the tramways. The proposal of the manager was that one penny should be the minimum fare. His contention was that this was necessary in order to put the finances on a better footing. The halfpenny fare has long been abolished on other British tramway undertakings.

Bradford, England—The Town Council has received confirmation from the Ministry of Transport of a provisional order authorizing the running of trackless trolley buses on most of the 40 routes of the Bradford tramway system, or alternatively the running of petrol buses. The total cost of equipment for the former system is estimated at £494,000. The Town Council proposes, as the tramway tracks wear out, to supersede them by the trackless trolley or buses.

Glasgow, Scotland—The Town Council has decided to promote a bill in Parliament to confer on the Council a complete monopoly of street passenger transport within the city, on Glasgow's tramway routes outside the city, and on routes in competition therewith. The bill is also to extend the Council's existing powers to run buses and to authorize the abandonment within or without the city of such tramways as it may consider proper, with a view to substituting bus services. It may be noted that, in a few cases in England, Parliament has granted powers for restriction of competition, but nothing so sweeping in its nature as that proposed by Glasgow has ever been authorized.

Matanzas, Cuba—Fifty girls divided into three shifts handle the fifteen trolleys of the Compania de Tranvias de Matanzas, each group working eight hours. This is the only city in Cuba using women conductors.

Manchester, England—R. S. Pilcher, general manager of the Manchester Tramways, has reported on various causes of noise associated with the operation of cars. He recommends that a steel check be fitted instead of chains on the bogie cars so as to avoid rattling at crossings. About noise associated with hand brakes, he says that experiments have been made with a new type of hand brake. Instead of brake blocks being applied to the wheel tires, Ferrodo blocks press against steel discs which are fitted to the axles on a principle similar to that of the brakes on automobiles. Forty new single truck cars are to be fitted with this type of brake.

Rio de Janeiro, Brazil—Depending on a revision of its concessions which will permit it to furnish modern service, the Rio de Janeiro Tramway, Light & Power Company is disposed to spend $12,500,000 in extending and improving its lines, and to co-operate with the municipality in minimizing the congestion in the center of the city by the establishment of rapid transit lines.

London, England—The Underground winter program of train services introduced on Oct. 7 is now in full swing. Compared with last winter, there are 112 more cars in daily service. The speed of trains on all lines has been increased and close interval services are being worked. Moreover, 36 additional cars will be put into commission on the Hampsted & City line in a few weeks time. This will bring the total number of cars operating this winter up to 1,835.

Recent Bus Developments

Interstate Bus Bill

Much Speculation Over Prospects of Bringing Interstate Bus and Truck Carriers Under Regulation

AFTER three years of effort, the committee on interstate and foreign commerce of the House of Representatives, of which Representative Parker of New York is chairman, appears to be prepared to push interstate bus legislation at the regular session of Congress which convenes in December.

That real need exists for legislation there is no doubt. What form it should take has been the stumbling block in the past. The concern of the bus and truck interests is that the legislation shall be so drawn as not to act as a deterrent to the legitimate expansion of the business. It is generally admitted that in the absence of control there has grown up a class of interstate bus transportation which is entirely unregulated and, much of it, irresponsible, the activities of which subject both legitimate bus lines and other forms of transportation to unfair, injurious and unscrupulous competition. In short, the present condition is highly detrimental to the interests of each of the states, to the legitimate transportation interests, to the traveling public and to the public generally.

But Congress rarely acts on important legislation until there is abundant evidence of public demand for action. Just at present there is a strong probability that the discussion of the tariff will be extended into the regular session, but this would give the house ample time to act upon various important pending bills, including Mr. Parker's proposal for the regulation of interstate bus operations. In the Senate the proposed bus regulatory measure will come before the committee on interstate commerce, of which Senator Couzens of Michigan is chairman. This committee will be one of the busiest in Congress at the December session. As an astute observer at Washington sees it, Senator Couzens will probably wait until the House acts on the bus bill before he calls upon his committee to take up the measure.

Since legislation is practically certain before the end of the long session, those who disagree with the provisions of the Parker bill, or who have suggestions, are being urged to bring their ideas promptly to the attention of the respective committees if they wish to impress them upon those handling the legislation.

As the Parker bill now exists, it forbids the operation of any motor carrier in interstate commerce which has not first obtained a certificate of convenience and necessity from the Interstate Commerce Commission. It proposes to delegate the regulatory authority of Congress over "interstate commerce by motor vehicles operating as common carriers of persons on the public highways." Joint boards made up of one representative of each state in which any part of the operation is, or is proposed to be conducted, are to conduct hearings on applications for certificates of convenience and necessity. State Public Service Commissions are to designate the members of the joint board. Decisions of these boards are to be filed with the commission. The commission must act in not less than 10 days or more than 30 days. Joint boards must pass upon applications within 60 days or the authority in the matter passes to the Interstate Commerce Commission. On appeal the commission may order a rehearing. There will be reserved to the Interstate Commerce Commission authority to set aside or modify decisions of the joint boards.

Any violation of the act or failure to observe orders of the commission carries with it a fine of $100 for the first offense and $600 for subsequent offenses. Each day of violation is to constitute a separate offense.

From the date of the approval of the act, 90 days are allowed for the filing of applications for certificates. Lines that were in operation some months before the approval of the act will simply be required to fill out a questionnaire. If this shows bona fide operation, the certificate will be issued as a matter of course. If the commission is not satisfied with the answers to the questionnaire, it then can refer the application to the joint board. No certificate is to be issued or to remain in force unless the bus operator complies with the rules and regulations with regard to the filing of bonds, and to the taking out of insurance to cover possible judgments growing out of negligent operation. The usual conditions applying to carriers with regard to just and reasonable rates and with regard to the filing of tariffs are provided for in the bill.

The measure contains this significant clause:

"The commission, while acting under authority of this act, shall not have any jurisdiction or authority over intrastate commerce by motor carriers and the commission is expressly prohibited from interfering in any way with, or attempting to regulate such intrastate commerce by motor carriers."

The Parker bill applies only to "vehicles or machines propelled by their own power, other than muscular power and used upon the public highways for the transportation of persons." It does not apply to vehicles used exclusively in the transportation of property.

It is believed that the house committee, even though it will not call regular hearings on the subject of interstate bus regulation, will invite the views of the members of the various industries interested. An informal meeting will be held with these groups, it is understood, and attempts will be made to iron out differences of opinion. It has developed recently that some of the rail carriers are unsatisfied to leave truck lines outside of the regulation proposed. Protest has also been made by farm organizations against the exclusion of trucks. They point out that regulation of the rates charged by these interstate carriers is essential to a sound farm relief program. On the other hand, the National Automobile Chamber of Commerce and other organizations are known to be opposed to any attempt to include trucks in the bill. Opposition

Digitized by Google

has also been manifested against the setting up of regional control boards, a main working principle of the present bill, lest they become so powerful as to prevent appeal to the Interstate Commerce Commission.

Quietus on Free Service in Ohio

A permanent injunction which prevents the Sebring-Alliance Bus Company from continuing its free service between the two Ohio cities has been granted by the Court of Appeals at Youngstown on the application of the Ohio Public Utilities Commission. The Mahoning County Common Pleas Court refused the injunction, but the state board carried the case into the appellate court.

This action writes another chapter in the effort begun about two years ago by the Stark Electric Railroad to have a certificate granted the bus company declared illegal. The state board did revoke the certificate, but issued a new one in face of the Stark Electric's protest. The Supreme Court ordered a new grant to be issued which restricted the bus company from carrying passengers from points within one city to points within the other. The bus company carried the case to the United States Supreme Court, but that body refused to admit the case.

Forced to operate under the restricted certificate, owners of the bus line decided to ignore the state board. They appeared before the Councils in Sebring and Alliance and secured a franchise to carry passengers in each corporation for 5 cents. Then the company began carrying passengers free over the 4-mile rural route between the two cities. These two charges replaced the former 10-cent rate from one city to the other.

It was this action which caused the commission to ask the Common Pleas Court for an injunction against the bus company. When Judge Lyons refused it, the case was carried to the Court of Appeals. In handing down the decision of the appellate court Judge Sherrick said:

"It is clear to this court that the plan of operating the Sebring-Alliance bus line is only a subterfuge and scheme to avoid control by the commission. It is for the sole purpose of contemptuously ignoring and avoiding the orders of the Public Utilities Commission and the Supreme Court."

Substitution Suggested Between Rochester and Geneva

The New York State Railways has petitioned the Public Service Commission for approval of the substitution of buses for the trolley cars of the Rochester and Eastern division from Rochester to Geneva, passing through Canandaigua. The company also asks permission to operate an alternate route from the Geneva-Canandaigua turnpike to Seneca Castle to Geneva. The company alleges the trollev line has suffered a decline in the number of passengers carried and the amount of freight handled. The petition states that the buses will follow the present line of the trolley as far as possible, that eight buses will be used with an operating schedule practically as at present and with the same rates of fare, except that the minimum fare for adults will be 10 cents and for children 5 cents.

Present Companies Should Operate Manhattan Bus Lines

The gradual elimination of the street car lines in the borough of Manhattan, New York City, as they become obsolete, and the substitution therefor of up-to-date bus lines operated by existing transportation companies, is proposed by the Merchants Association in a report adopted by the directors at their meeting on Nov. 14, 1929. This report reads in part as follows:

"It is common knowledge that the surface railways in Manhattan are in poor financial condition, and that their equipment is either obsolete or deteriorating rapidly. Moreover, some of these companies have signified their willingness to accept short term franchises for omnibus lines in exchange for their present long term railway franchises.

"With reference to street car lines in Manhattan only, where traffic congestion produces conditions not found in other boroughs, your committee recommends that the association encourage the use of existing equipment until a point is reached when replacements are necessary.

"When obsolescence or deterioration makes necessary any considerable capital expenditures for replacement of railway equipment, including trackage, the association should encourage the exchange of the existing franchises for short term, recapturable bus franchises.

"Such exchanges of franchises should be encouraged earlier if the companies are willing to do so upon proper terms.

"Your committee on city transit believes this method of eliminating street car lines in Manhattan is in accord with the established policy of the association, that when new omnibus lines are established it should be done by the existing transportation companies rather than by untried companies."

Alameda, Cal. — The Key System Transit Company has been authorized by the Railroad Commission to reroute its Central Avenue bus line in Alameda from Central Avenue to Santa Clara Avenue, and to establish a shuttle bus service on San Jose Avenue from Par Street to Grand Street and along Grand Street to Santa Clara Avenue, as a feeder to the Santa Clara Avenue line.

Lincoln, Neb.—The City Council has authorized the Lincoln Traction Company to remove its overhead on a number of streets where bus lines have been substituted for street cars. The Council will not require the tracks to be removed, as the salvage value is less than the cost of removal.

New York, N. Y.—A report by the Board of Transportation on applications for bus franchises which have been submitted since the collapse of the Equitable Coach Company is being prepared and will probably be ready early in December.

Quincy, Ill.—The Illinois Power & Light Company is systematically replacing its street cars here with buses. It is the policy of the company to remove its tracks on streets which are to be repaved and to substitute buses for the cars. The city is carrying out an extensive street paving program and it is believed that before the close of another year all street car lines will be replaced by buses.

St. Louis, Mo.—The utility of buses in co-ordinated service was emphasized on Nov. 18 when traffic on the Manchester and Kirkwood-Ferguson divisions of the St. Louis Public Service Company in St. Louis County was tied up from 5:10 p.m. to 9:30 p.m. because of the grounding of a high-tension electric line between Hodiamont Avenue and Brentwood, Mo. The company furnished service to the affected areas by using buses and by an improvised shuttle car service between University City and Clayton over the Kirkwood-Ferguson tracks.

Evansville, Ind.—The Consolidated Coach Corporation and the Evansville & Ohio Valley Railway have formed the Owensboro Bus Station and leased a building and space in Allen Street, between Third and Fourth Streets, for a bus terminal at Owensboro, Ky. The terminal station will be in operation in December.

St. Louis, Mo.—Buses will supplant the street cars on the Marcus Avenue and Spalding Avenue divisions of the St. Louis Public Service Company, under authority of the Missouri Public Service Commission. The company also plans to reroute its Loughborough-Macklind Avenue bus line. The change will shorten the line and furnish better service to the affected area.

New Rochelle, N. Y. — The Public Service Commission on Nov. 25 denied the petition of the County Transportation Company, Inc., for a certificate of public convenience and necessity to operate a bus line between New Rochelle and Mamaroneck.

Greenville, Miss.—E. J. Lenz, division manager of the Mississippi Power & Light Company, said that the track would be removed and brick put back in the space, as part of the program under which the street car has been supplanted by the bus as Greenville's transportation system. The buses operate on regular schedule with Washington Avenue and South Shelby Street as the terminal point.

Beacon, N. Y.—The Fishkill Electric Railway on Nov. 25 petitioned the Public Service Commission for permission to substitute buses for trolley cars over certain streets in Beacon under a consent by the Council of Beacon on Nov. 4 last. The petition states that congestion will be prevented on the streets wherein it is proposed to operate buses and that the company will be enabled to provide quicker and more frequent service.

Chattanooga, Tenn. — The Railroad and Public Utilities Commission has approved franchises granted the Tennessee Electric Power Company by the cities of Chattanooga and Lookout Mountain, the town of St. Elmo and Hamilton County for the Chattanooga-Lookout Mountain Hotel Bus Line.

Denver, Colo.—The Denver Tramway rose to the occasion by arranging a special bus service on the four days of the great celebration incident to the opening of Denver's new airport, Oct. 17, 18, 19 and 20. The buses operated from 23d Avenue and Fairfax Street to 32d Avenue and Ulster Street, the entrance to the airport. The buses connected with Route 40 (Park Hill) street car line at 23d Avenue and Fairfax Street, but the bus transportation was not a transfer service from the rail line. The bus fare was 10 cents each way no transfers issued.

Financial and Corporate

Seventh Annual Toronto Statement

Affairs of System in Canadian City Reviewed —Net Income Carried to Surplus $168,931

THE COUPLER, published by the Toronto Transportation Commission, operating the municipal railway and bus lines in Toronto, Ont., says in part in its October issue:

"In examining an annual statement of an organization there are three primary factors one usually considers. First, is it financially sound? Second, is it giving service? Third, is it efficiently operated?

"As the T.T.C. statement has the certificate of the city auditor appended, and as the city auditor has audited the books of the T.T.C. ever since the commission was formed, it would appear ridiculous to question its finances. There is no doubt that its finances are sound.

"In the matter of giving service, it is noted in the statement that there has been an improvement to the extent of 69 per cent in the number of seats provided for passengers during the rush hours, compared with the number of seats on Sept. 1, 1921. With reference to the third question, probably nothing could illustrate the improved efficiency better than the fact that in 1928 the T.T.C.'s operating expenses were about $620,000 less than in 1923. This achievement is the more remarkable when it is considered that the track mileage of the city system was increased by 12 per cent in 1928."

The financial results of the year's operation were as follows:

Gross revenue	$13,269,718
Total expenditure for operation and maintenance	8,172,306
Net income available for fixed charges	$5,097,412
Fixed charges and reserves	4,929,081
Net income carried to surplus	$168,331

The investment in fixed assets as of Dec. 31, 1928, was $49,504,333.

All of the extensions outside of the city and other miscellaneous construction and equipment added during the year to the city system were financed from reserves of the commission. No new debentures have been issued for transportation purposes since 1924.

The net funded debt, less funds transferred to the city treasurer for redemption of debentures, is $38,314,727, as of Dec. 31, 1928. More than $1,170,000 was paid from earnings during the year for reduction of the funded debt, but the acquisition of the Mimico and the Scarboro divisions of the Toronto & York Radial Railway, previously referred to, added $977,000 to the existing capital structure. After 7½ years of operation the fixed assets exceeded the net funded debt by nearly $11,200,000.

The gain in revenue passengers in 1928, compared with the previous year, was 5,885,904, resulting in a total of 193,642,927 passengers for the year. Thus a new high record for business was established.

The revenue from motor coach operations has continued to expand in a most impressive way. The gross earnings from this form of transportation in 1928, which is operated under the name of Gray Coach Lines, Ltd., was $816,234, an increase of nearly 45 per cent over the revenue for the year 1927. The growth of the motor coach services, started in May, 1925, is shown by the following figures of gross passenger earnings for each year:

1925	$132,008
1926	300,811
1927	568,275
1928	816,234
1929	$1,230,000 (estimated)

There has been a surplus each year from the operation of motor coaches after paying 5 per cent dividends on the capital stock of Gray Coach Lines, outstanding since its incorporation, and after appropriating adequate reserves.

The mileage operated by street cars and buses, but not including motor coaches, aggregated 26,453,680 miles in 1928, an increase over the mileage in 1927 of 483,589 miles.

The revenue passengers in 1923 (when the last new street cars were purchased) were 189,143,145, and in 1928 were 193,642,927 passengers, an increase of 2.4 per cent. In October, 1923, however, there were 44,035 seats provided at the hour of peak traffic (which is 5:30 p.m. on a normal day), and in October, 1928, there were 47,819 seats, an increase of 3,784 or 8.6 per cent.

During the year 1928, the average fare collected on the Toronto Transportation Commission system was 6.177 cents. Attention is directed to the fact that if the average fare in Toronto were the same as in the United States, the car riders of Toronto would pay $3,000,000 more a year for transportation.

Employees Subscribe to Investment Fund

A total of $758,950 was subscribed by 1,425 employees of the three transportation companies participating in the Interurban Railroads Employees' Investment Fund No. 1, established under the authority of Britton I. Budd, president, according to incomplete figures compiled at the close of the subscription period.

The North Shore Line leads in subscriptions with a total of $497,950 subscribed by 973 employees.

Employees of the Chicago, Aurora & Elgin Railroad ("Sunset Lines") totaling 384 subscribed $212,950 to the fund.

A total of $48,050 was subscribed by 68 employees of the Metropolitan Motor Coach Company ("Marigold Lines"), who are also included in the fund.

Designed to enable employees to save systematically and to invest advantageously, the fund follows the plan which has been in effect for some time among employees of other local utility companies in and around Chicago. It will be administered by five trustees, namely: President Budd, Vice-Presidents Bernard J. Fallon, Charles E. Thompson and William V. Griffin of the North Shore Line, and Clement A. Whonsetler, secretary-treasurer of the "Sunset Lines."

Every employee of the companies who has been two years or more in service was eligible to subscribe to the fund. Under this provision 1,911 employees in the three organizations were eligible.

I.C.C. Prepared to Value Electric Railways

The Interstate Commerce Commission is ready to undertake valuation of electric railway properties, as directed in the act of March 1, 1913, if Congress will provide necessary funds. This requirement of the statute has been permitted to remain in suspense for years, although the commission has reminded Congress from time to time that no appropriation ever has been made for the purpose of evaluating the properties of common carriers, other than steam roads, which are subject to the interstate commerce act.

With primary valuation of the steam roads practically completed, the commission now feels that it should commence work on ascertaining the value of minor carriers. Embraced in this classification are the electric railways, water carriers, oil pipe lines, and telegraph, telephone, cable and radio companies. The commission has submitted to the bureau of the budget a request for an appropriation to initiate this work, together with an estimate of the amount necessary for the fiscal year commencing July 1, 1930. No announcement will be made by the commission regarding its plans in this direction until the budget estimates are presented to Congress by the President next month. Premature dissemination of such information by government departments and agencies is prohibited by law.

The American Electric Railway Association recently filed a brief with the commission, in connection with the proceeding on depreciation accounting for steam railroads, in which it stated that little public benefit would accrue from the valuation of electric railway properties as none of them, except those operated as a part of a general steam railroad system or engaged in the general transportation of freight, are subject to the provision of the transportation act providing for the recapture of earnings in excess of 6 per cent of the value of their property used for common carrier purposes.

Third Avenue Doing Well

Directors of the Third Avenue Railway, New York, recently declared 1¼ per cent semi-annual interest on company's adjustment 5 per cent bonds. This leaves 32¾ per cent accumulated interest due on these bonds and because of accumulated interest adjustment bondholders have voting power.

Third Avenue reported record operating income for the year ended June 30, 1929, but income available for adjustment bond interest was not as large as in the previous year because of increased operating expenses and unusual charges incident to the introduction and operation of buses in Bronx County.

After all deductions, including taxes and interest on the mortgage bonds, earnings available for adjustment 5 per cent bonds were $840,467, equal to 3.72 per cent on total amount of $22,536,000 adjustment bonds. This compares with $1,072,309 shown in the preliminary report of the preceding year, or 4.75 per cent. Final figures for the 1927-28 year showed a balance equal to 4.8 per cent.

In a review of the company's affairs preliminary to the issuance of the report for the year ended June 30, the *Wall Street Journal* said that gross income was about $7,000 lower in July than in the preceding year, due in part to congestion in traffic and interference by sub-

Digitized by Google

way building. Steps have been taken by the management to overcome traffic difficulties and effect other economies to increase net income. Development of the company's bus system in the growing county of Westchester also is expected to improve earning power.

Border City System Earning Interest

The *Canadian Financial Post* says that it is estimated that the net earnings from the operation of the system operated by the Windsor, Essex & Lake Shore Electric Railway Association, Windsor, Ont., will be equal during the current fiscal year to more than 1½ times bond interest. These bonds are due Feb. 1, 1959.

The association is covenanted in the mortgage deed of trust to pay to the trustees as a sinking fund the sum of $10,523.50 on Feb. 1 each year, commencing Feb. 1, 1934, and for the exclusive benefit of the first mortgage bonds the following municipal debentures are specifically pledged in favor of the trustee:

City of Windsor	$354,488.00
Town of Essex	81,296.87
Town of Kingsville	105,390.33
Town of Leamington	159,254.30
Township of Gosfield South	138,203.45
Township of Gosfield North	104,462.71
Township of Sandwich West	55,657.38
Township of Sandwich East	56,881.84
Township of Sandwich South	44,365.12
Making a total of exactly	$1,100,000.00

The municipal debentures so pledged are of the same maturity and bear the same interest rate as the bonds of the railway association. The sinking fund is sufficient to retire the issue by maturity.

The bonds of the association are also secured by a first mortgage on the land of the association, and by a floating charge on its assets and undertakings.

The municipalities referred to have agreed to bear the cost of acquiring, rehabilitating, equipping, operating and extending the electric railway, and to pay over annually to the Windsor, Essex & Lake Shore Electric Railway Association in the proportion adjusted and specified by the association, any deficits which may arise in the operation of the railway.

It is also provided that in case the association should make default in payment of these bonds, and the trustee, under the mortgage securing the bonds of the association, should not have sufficient moneys as a result of the realization of the mortgaged premises, including the proceeds from the sale of the debentures of the municipalities, that they, the municipalities, on notification from the association or from the trustees, will make up such deficit to the trustee in the same proportion in which they have respectively issued and deposited debentures with the association.

New Company at Binghamton Chartered

The formal incorporation of a company to take over the local railway interests at Binghamton, N. Y., has been perfected with the filing of a certificate of the Triple Cities Traction Corporation. The new directorate consists of nine members, all living in Greater New York or vicinity. The stockholders number fifteen.

It is the object of the corporation, states the certificate, to operate an "electric street surface railroad of standard gauge," over 31 miles of track. The company may issue 5,000 shares of stock without classification and without par value but the capital shall not be less than $310,000.

The directors are J. F. McKenna, E. T. Edmonds, H. C. Fleck, H. A. Stix, J. L. Rice, Jr., R. N. Thompson, J. H. Shinn, H. C. Hasbrouck and C. A. Dougherty, who, together with J. H. Mackenzie, F. E. Taylor, A. P. Rimgressy, T. R. Carpenter, H. R. Cobb and R. J. Dean constitute the stockholders, each of whom subscribes to 30 shares of stock at $100 per share.

From Cincinnati to the Lake

The Cincinnati & Lake Erie Railroad, embracing lines of the Indiana, Columbus & Eastern Traction Company, Cincinnati, Hamilton & Dayton Railway, and the Lima & Toledo Railway, will co-ordinate the railway lines from Cincinnati to Lake Erie and from Dayton to Columbus as soon as the federal district court approval is secured, probably early in January.

This announcement followed the purchase of the I. C. & E. properties by the C. H. & D. at a foreclosure sale at Springfield, at which C. H. McClure, president of the C. H. & D., and receiver for the I. C. & E., acted as special master. A deed to the Lima & Toledo property will be made over to the proposed merged line upon receipt of approval from the federal district court at Toledo of the sale transaction consummated at Springfield. The purchase price was $1,000 cash, subject to the assumption of $2,500,000 in obligations of the acquired lines. Cincinnati, Dayton, Springfield, Lima, Toledo and Columbus are among the main points on the new line.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 130 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Albany, N. Y.—The protective committee, formed by F. J. Lisman and associates to protest the offer of the Associated Gas & Electric Company to exchange the first mortgage gold bonds of the New York State Railways for Associated Gas securities, has retained Coverdale & Colpitts, engineers, to examine the properties as to operation, earning capacity and generally as to the affairs and management of the system. Associated Gas & Electric Company interests, which own and control the stock of the railways, offered on Oct. 25, 1929, to acquire the bonds. It was stated this offer was made "from the standpoint of public good will" pending the solution of what the Associated Gas & Electric Company interests referred to as "a distressing problem."

St. Louis, Mo.—The Missouri Public Service Commission on Dec. 3 will resume the hearing on the petition of the city for an accounting of an $8,369,000 depreciation reserve fund balance which it claims Receiver Rolla Wells of the defunct United Railways turned over to the St. Louis Public Service Company on Dec. 1, 1927. The city contends this sum should be set up on the books of the new company, but company officials say the new company took over the properties on a depreciated basis.

Portsmouth, Ohio—The Portsmouth Public Service Company has asked the state Public Utilities Commission for authority to suspend traffic for one year on its line from Portsmouth to Ironton, a distance of about 20 miles. Only one round trip a day is now made over the line.

J. G. Holtzclaw in Richmond

Former Gulf States Utilities Official Made President of Virginia Electric & Power Company

JACK G. HOLTZCLAW, retiring president of the Gulf States Utilities Company, of Beaumont, Tex., was elected president of the Virginia Electric & Power Company, Richmond, Va., on Nov. 12, succeeding J. Frank McLaughlin, elected to the presidency of the company on Sept. 26, who becomes vice-president of the Stone & Webster Service Corporation with offices in Boston. The latter retains his identity with the local company as vice-president.

The changes in the administration of the company at Richmond were made at a meeting of the board of directors held in New York, in which a general reorganization of the Stone & Webster Service Corporation was effected.

J. G. Holtzclaw

Tom P. Walker, operating vice-president of the Virginia Electric & Power Company, in Richmond, will succeed Mr. Holtzclaw as president of the Gulf States Utilities Company at Beaumont, Tex.

Joseph Bowes, vice-president of the Virginia Electric & Power Company, in charge of operations at Norfolk, will come to Richmond, succeeding Mr. Walker as operating vice-president.

Robert J. Throckmorton, general manager of the light and power division at Richmond, was elected vice-president and will replace Mr. Bowes at Norfolk. Mr. Throckmorton is a native Virginian, and has been connected with the Virginia Electric & Power Company for a number of years.

The incoming president, Mr. Holtzclaw, comes to Richmond from Beaumont, where he has been president of the Gulf States Utilities Company, serving southeast Texas and southern Louisiana, a territory including more than 100 cities and towns. He is a native of Georgia, born at Perry, and was a classmate of William E. Wood at Georgia Tech, where he was graduated in 1907. He has been with the Stone & Webster organization since shortly after he was graduated from the Georgia School of Technology. Mr. Holtzclaw is widely known in utilities circles throughout the South and Southeastern territory, and is said to be peculiarly fitted to fill the office held by Mr. Wood and Mr. McLaughlin here. He has taken a prominent part in civic affairs in each community in which he has lived and is an active supporter of all constructive moves in the territory in which he is located.

The changes in the administration of the Virginia Electric & Power Company followed within a few weeks after the promotion of W. E. Wood and the appointment of J. Frank McLaughlin. The changes made in the course of the reorganization of the Stone & Webster Service Corporation were decided upon after the election of Mr. McLaughlin and the promotion of Mr. Wood, both of whom remain identified with the local company.

Mr. Holtzclaw assumed his new duties on Nov. 18. His first act was to inspect the shops, power plants and transportation equipment, in company with William E. Wood, chairman of the board of directors, and Frank J. McLaughlin, retiring head of the company. Accompanied by Mr. Wood, Mr. Holtzclaw called on Gov. Harry F. Byrd, and later paid a visit to the state office building, where he met the members of the state Corporation Commission, the regulatory body, and other state officers.

P. H. McCance in New Post

Pressly H. McCance, of the law department of the Philadelphia Company, has assumed the duties of director of personnel of the Philadelphia Company and its affiliated corporations, to which position he was appointed to succeed William G. Marshall, resigned.

Pressly Hodge McCance was graduated from high school in 1911 and from Princeton University in 1915. He entered the University of Pittsburgh law school with the class of 1918 but the war call came and in May, 1917, Mr. McCance joined the first officers training camp at Fort Niagara, going from there to Fortress Monroe, Va., where he received his commission as a lieutenant in the Coast Artillery Corps. He then went to Fort Hancock, N. J., leaving there to sail for France. He served with the A. E. F. in France from May, 1918, to January, 1919. He was personnel officer when mustered out.

Returning to Pittsburgh in March, 1919, Mr. McCance re-entered the law school of the University of Pittsburgh and was admitted to the bar in October of that year, having taken the examination in July. Later he received his LL.B. degree from the university. After a brief period with the law firm of Mehard, Scully & Mehard, he became associated with the legal department of the Transcontinental Oil Company, continuing with that company until December, 1923, when he entered the employ of the Philadelphia Company as an attorney in the law department. In this department he won special distinction for the capable manner in which he handled the legal affairs of the Pittsburgh Railways. He remained in that department until he assumed the duties of his new position as director of personnel.

H. S. Simpson With A.E.R.A.

Engineer with Wide Experience Appointed to Association Post to Succeed Mr. Hecker

HAWLEY S. SIMPSON, traffic engineer in County Engineer Stickel's department in Essex County, N. J., has resigned to become special engineer for the American Electric Railway Association. The resignation was effective Nov. 30. Mr. Simpson went to Essex County from Detroit in July, 1927. As special engineer of the association, Mr. Simpson succeeds Guy C. Hecker, who some time ago was made its general secretary.

When he accepted the post in Essex County at the age of 26, Mr. Simpson was said to be the first county traffic engineer in the United States. What the county needed, he said, was a "go system" of transportation rather than a "stop system." He urged uniform traffic rules in all municipalities. County authorities announced his advice was at the disposal of all Essex municipalities and later observed that virtually all municipalities except Newark availed themselves of such service.

Mr. Simpson, a graduate in civil engineering from the University of Michigan, has devoted himself ever since leaving college to the subject of highway transportation. The results of his observations have appeared from time to time in the form of articles, in the *American City*, the *National Safety News*, the *Annals of the American Academy of Political and Social Science*, *Aera*, the ELECTRIC RAILWAY JOURNAL and other publications. He has been orally articulate as well, having addressed the National Safety Congress the Michigan Safety Congress, the Michigan Motor Bus Association, the University of Michigan Conference on Highway Transport, the Metropolitan Section of the American Electric Railway Association and other bodies.

H. S. Simpson

Before going to Essex County Mr. Simpson had been connected in turn with the Michigan State Highway Department as draftsman to the resident engineer, for two years; with Vernor, Wilhelm Molby & Shreve, Detroit, for two years, in charge of the municipal engineering department; and with the city of Detroit as traffic engineer for two years. Jointly with H. M. Gould be made a traffic survey of Detroit. Between his sophomore and junior years at college he was with the Michigan State Highway Commission.

He is an associate member of the American Society of Civil Engineers, a member of the National Conference on Street and

Digitized by Google

Highway Safety, a member of the National Safety Council and honorary vice-president of the National Highway Traffic Association. For the National Conference on Street and Highway Safety he served in 1928 on the committee on municipal traffic ordinances and regulations and at present is serving on the committee on uniform traffic regulations. For the National Safety Council, he served in 1927 on the statistics committee, in 1928 on the program committee, and for 1928, 1929 and 1930 is on the engineering committee.

H. R. Leigh With Union Pacific Stages

Herbert R. Leigh has resigned as superintendent of the North Coast Transportation Company to become general superintendent of the Union Pacific Stages with headquarters at Portland, Ore., where he will have charge of the operation of stage lines reaching from Portland to Salt Lake City and from Portland to Spokane, and the many lines radiating out of Spokane belonging to the Union Pacific. These lines at present operate approximately 13,000 miles a day.

Mr. Leigh has been employed by the Puget Sound Power & Light Company or allied companies since May 22, 1909. On Nov. 15, 1915, he was advanced to the post of superintendent of the Washington Auto Bus Company, which ran the first bus line owned by these companies. This line was sold in 1919 and Mr. Leigh was appointed station betterment engineer in the power department of the Puget Sound System. To fit himself better for the work, he took a course in steam engineering at the Hayes School of Combustion. He continued in this line of work until 1922 when the Puget Sound Power & Light Company bought the Seattle-Everett Union Stage Company, operating between Seattle and Everett, and the Seattle-Tacoma Union Stage Company, operating between Seattle and Tacoma.

At this time the Park Auto Transportation Company was formed with W. H. Grambs as manager and Mr. Leigh was appointed general superintendent, holding this position until Dec. 1, 1924, when the Seattle-Everett division was sold to the Puget Sound International Railway & Power Company, and he was transferred to Tacoma as superintendent of stage operations for the Park Auto Transportation Company and the stage division of the Puget Sound Electric Railway.

On Oct. 1, 1926, the Park Auto Transportation Company purchased the Camas Stage Company, the Northwest Transportation Company and the stage division of the Puget Sound Electric Railway, and consolidated them all into the North Coast Transportation Company. Mr. Leigh was then appointed operating superintendent of the consolidated lines.

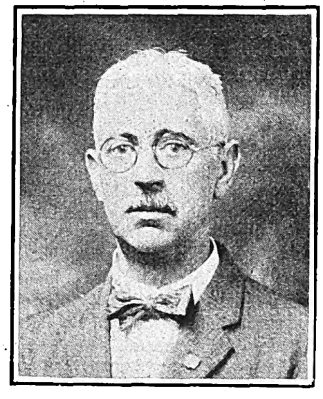
C. O. Sparhawk Advanced at Providence

C. O. Sparhawk has been appointed superintendent of the bus mechanical division of the United Electric Railways, Providence, R. I. The new appointee has had a long career in the work of maintaining buses, dating from the advent of buses at Stevens Point, Wis., with the Stevens Point Transportation Company, pioneer bus operators. Mr. Sparhawk next joined the assembling department of the Fageol Company at Kent, Ohio. He advanced to the service department, occupying the position of operating engineer. Mr. Sparhawk next associated himself with Motor Transit Management, better known as the Greyhound Lines, as superintendent of maintenance and equipment. When the Twin Coach Corporation commenced business in 1927, he joined this company, being placed in charge of chassis construction. Later he was advanced to road engineer with Twin Coach, a position he occupied until his association with the United Electric Railways.

New Metropolitan Section President

William B. Wheeler, Third Avenue Official, Rose From Ranks—Man of Wide Experience

WILLIAM B. WHEELER, the new president of the Metropolitan Section of the American Electric Railway Association, is assistant superintendent of transportation of the system of the Third Avenue Railway, New York. After long service on the surface lines in Manhattan Mr. Wheeler was recommended to the receiver of the Westchester Electric Railroad and secured an appointment in 1908 as general superintendent of that property, continuing in that position after the receiver was discharged and the company absorbed by the Third Avenue Railway System. In 1919 he was brought in to headquarters as superintendent of schedules, and in January, 1925, was appointed assistant superintendnet of transportation of the system.



W. B. Wheeler

Mr. Wheeler entered railway work as conductor on the Atlantic Avenue Railroad in Brooklyn. This was in 1894, and his first run was on the West End line to Coney Island. He took the railway job with no thought of continuing in the business, but presently he became interested and determined to work for promotion and make railroading his life vocation.

When the Atlantic Avenue Railroad was absorbed by the Nassau Electric Railroad Mr. Wheeler became dissatisfied and, inspired by an article in one of the trade journals about the Metropoliton Street Railway System, determined to cast his lot with that organization. He was successful in getting placed as conductor on the Broadway cable line. This was in 1897, and in the following year he was transferred to the Lenox Avenue depot, where he was shortly afterward advanced to the position of starter. When the Lexington Avenue line was changed over from cable to electric conduit operation in 1901 Mr. Wheeler was transferred to the 99th Street depot, and in 1903 upon the occasion of the change from horse-drawn to electric operation of all except the Avenue B line, he was again transferred, this time to the Avenue B depot.

A day's work at that time was from 5 a.m. to 5 p.m., but Mr. Wheeler decided to supplement his previous education by taking a course in elementary electricity at the East Side branch of the Y.M.C.A. At the same time, in order to gain practical experience and further his knowledge, he secured permission from the electrical engineer to work in the 96th Street power house from 6 to 10 p.m. Training of this kind, common enough among many of the old timers in the industry, is facetiously referred to as the school of hard knocks.

Mr. Wheeler was born in Brooklyn, Oct 13, 1873. He received his early education in the public schools of that city. His school days were short, however, as due to the death of his father he was obliged to go to work at the age of twelve to help support his younger sisters and brothers.

Despite the exactions of his regular work Mr. Wheeler has found time to participate to a limited degree in outside activities, notably the affairs of the Metropolitan Section. He is vice-president of a real estate company; he has for many years been a member of the board of fire commissioners of New Rochelle, where he makes his home, and is at present chairman of that body. He is president of the Fire Insurance Fund, and is treasurer of the Republican Club of New Rochelle.

A. T. Warner on Committee on Uniform Traffic Regulation

Secretary of Commerce Robert P. Lamont has appointed Arthur T. Warner, general manager in charge of traffic, Public Service Co-ordinated Transport, Newark, N. J., a member of the committee on uniform traffic regulation. The committee will consider the experience with the uniform vehicle code, model municipal traffic ordinance and standardization of traffic signs, signals and markings and recommend what further action should be taken. William E. Metzger, Detroit, is the chairman of the committee.

C. C. Brown Appointed to Commission Engineering Post

Claude C. Brown, natural gas administrator for California since July, 1927, has been appointed gas and electric engineer by the Railroad Commission to succeed Charles Grunsky, resigned. Mr. Brown will continue for the present to act as natural gas administrator.

Mr. Brown has been connected with the engineering activities of the commission since November, 1922, when he was appointed assistant valuation engineer. In 1923 he was appointed gas engineer for the commission, with headquarters at Los Angeles; due to his thorough grasp of the natural gas situation he was appointed natural gas administrator in July, 1927, under an agreement with the companies in the Los Angeles area. Since the inception of the plan to bring natural gas to the San Francisco Bay area he has been devoting a major portion of his time to the problems

Digitized by Google

involving rates and service of the natural product in the bay area.

Mr. Brown was graduated from the University of California, Engineering School, receiving his degree of Bachelor of Science in electrical and mechanical engineering in 1914. Prior to his affiliation with the commission he engaged in engineering work for the J. G. White Engineering Company, New York, and a number of utilities.

W. C. Howard Assistant Superintendent of Transportation

W. C. Howard, supervisor for the last nine years, has been appointed assistant superintendent of transportation of the Gary Railways, Gary, Ind. He will supervise train movements on the Valparaiso, Hobart, Crown Point, Hammond and Indiana Harbor divisions. Mr. Howard started with the company as a train dispatcher in 1917. W. R. Rucker, who started as trainman in January, 1926, has been made third trick dispatcher.

E. W. Fowler Succeeds Late M. L. Harry

E. W. Fowler, connected since 1906 with the Illinois Power & Light Corporation and the McKinley utilities, from which the Illinois Power & Light Corporation was developed, has been appointed general manager of the Central Illinois group of that company with headquarters at Decatur. He succeeds the late M. L. Harry. Mr. Fowler was first identified with utility service in the office of the general manager of the Illinois Traction Company at Ottawa and Peoria, Ill., and with the organization of the Illinois Power & Light Corporation he acted as assistant vice-president with headquarters in Chicago until the summer of 1928. Then he was appointed general manager of the northern division of the Illinois Power & Light Corporation with headquarters at Ottawa, the position he held until his recent appointment.

N. T. Brown Heads Philadelphia Automotive Department

N. T. Brown is transportation manager of the newly established automotive department of Mitten Management, Inc., Philadelphia, Pa., and R. B. Hewitt, superintendent of rolling stock and shops, heads the mechanical division of this new department, composed of the Philedalphia Rural Transit Company, operating the intracity bus service, and the Yellow Cab Company, with its fleet of taxicabs. As indicated in the issue of Electric Railway Journal News for Nov. 2, page 180, prior to the time the amalgamation program went into effect, both the bus company and the cab company were operated as separate units. Each had its transportation manager and its superintendent of rolling stock and shops.

Charles Grunsky With Pacific Public Service

Charles Grunsky, gas and electric engineer of the California Railroad Commission, has resigned to become supervising engineer with the management and engineering company which will direct the activities of the Pacific Public Service Corporation.

Among the more important features of Mr. Grunsky's work with the commission were appraisals made of the Key Route and the Oakland Traction Companies in 1914 and 1920; appraisals of the Los Angeles properties of the Southern California Edison Company in 1915, and the entire system of that company in 1920; valuation of the Pacific Gas & Electric Company's electric system in 1921-22, the gas and electric properties of the Western States Gas & Electric Company in 1922, and numerous other companies.

He was graduated from the University of California, School of Electrical Engineering, in 1913. He was engaged in construction work during 1913 and 1914 on reinforced concrete dams. Mr. Grunsky entered the employ of the Railroad Commission in 1914 as assistant engineer, and after serving with the army overseas he returned to the Railroad Commission in 1919 as assistant engineer, engaged in rate and valuation work.

Laurence Wingerter in Des Moines

Laurence Wingerter, for the past ten months editor of *The Treadle*, published by the Gary Railways, Gary, Ind., has been appointed to take charge of publicity and business promotion for the Des Moines Railway, Des Moines, Iowa. He is associated there with C. W. Gifford, former general superintendent of the Gary Railways.

While in Gary, in addition to editing *The Treadle*, Mr. Wingerter also was editor of *Sho-li-mo-co News*, employee publication of the Shore Line Motor Coach Company, and handled advertising and publicity for that company as well as for the Gary Railways.

Mr. Wingerter was graduated from Notre Dame in 1928. He was for a time with the publicity department of the Westinghouse Electric & Manufacturing Company in East Pittsburgh, and later was employed in a similar capacity by the Midland United Company in Chicago.

He has been succeeded at Gary by Gilbert McClelland, also of the Chicago office of Midland.

Allyn B. Tunis, of Richmond, for the past two years secretary of the Public Utilities Association of Virginia, has resigned to join the staff of the American Gas Association, New York City, as secretary of its advertising and publicity section and editor of that organization's monthly magazine. He will be associated with Alexander Forward, also a former Virginia newspaperman, secretary to Gov. Henry Carter Stuart, and a member of the Virginia State Corporation Commission, from which body he resigned to become managing director of the American Gas Association. Mr. Tunis is a former newspaperman of Richmond and Norfolk.

Lawrence Palk, assistant general manager of the Winnipeg Electric Company, Winnipeg, Man., in charge of executive matters, completed 25 years with the company on Oct. 4. He was presented with a bouquet of 25 roses by President Anderson and officials of the company, with the sincere hope that he will have many more years with the company. Mr. Palk is well known in the city. He is president of the Winnipeg Branch of the Royal Society of St. George.

Joseph W. Morris, former Kentucky Congressman and later state revenue agent, has taken charge of the Louisville Union Bus Station Company, operating terminals in the Brown Garage Building, Louisville, as treasurer and general manager, succeeding J. W. Barnes, former president of Barnes Brothers Bus Company, which was purchased a few weeks ago by the Consolidated Coach Corporation. Guy Huguelet, of Consolidated, has been elected president of the station company, George A. Watson, Indianapolis, vice-president; J. P. Pope, Lexington, secretary.

Michael J. Loftis, superintendent of transportation of the Pittsburgh Railways, Pittsburgh, Pa., was presented with a loving cup at the opening session of the National Safety Council in Chicago recently. The cup was given as a testimonial by H. O. Allison, chairman of the trainmen's safety committee of the Pittsburgh Railways. It is inscribed, "For the Love of Mike." As noted previously in the Electric Railway Journal, "For the Love of Mike—Be Careful," was the slogan adopted by the Pittsburgh Railways trainmen in their recent safety week observance. In addition to Messrs. Loftis and Allison, Elmer Hallibaugh, assistant chairman of the safety committee, and nineteen chairmen of the safety committees of the nineteen carhouses of the company attended the sessions in Chicago, as well as nine trainmen who were sent to the congress by the committee for their ideas on safety.

John W. Bricker has been appointed to the Ohio Public Utilities Commission to fill the vacancy caused by the resignation of Roscoe C. McCulloch, who was recently appointed United States Senator by Governor Cooper. Mr. Bricker served as assistant attorney general of Ohio, assigned to the utilities commission, from 1923 to 1927. More recently he has been a member of the law firm of Postelwaite & Bricker, Columbus. Judge F. W. Geiger, a member of the commission since February, has been appointed chairman, succeeding Mr. McCulloch. For thirteen years Judge Geiger served as probate and juvenile judge of Clark County and for seven years presided in the common pleas court of the county.

George B. Sanford, for the past three years secretary and assistant treasurer of the Grays Harbor Railway & Light Company, Aberdeen, Wash., sailed on Nov. 16 for Rio de Janeiro, where he will be associated with the Emprezas Electricas Brazileiras, an American & Foreign Power Company property. Mr. Sanford formerly was associated with the Denver Gas & Electric Company and the Great Western Power Company of California.

H. J. Brown has been appointed supervisor in charge of the Montclair carhouse and Great Notch garage of Public Service Co-ordinated Transport, Newark, N. J., succeeding Joseph Stauffer, now connected with the Electric Railway Journal.

Pat M. Neff, former Governor of Texas and former member of the federal board of mediation, has been appointed chairman of the State Railroad Commission of Texas. Mr. Neff succeeds the late Clarence E. Gilmore.

Obituary

J. J. Mahoney

John J. Mahoney, superintendent of the Michigan Electric Railway at Battle Creek from 1919 until illness forced his retirement last February, died on Nov. 18 at his home in Indianapolis, Ind. He was 62 years old.

Mr. Mahoney came into intimate contact with the lives of scores of employees, and was interested in any civic endeavors, especially that of improving traffic conditions and promoting traffic safety measures.

Ill health was responsible for his leaving his strenuous duties as general superintendent of the Indianapolis Street Railway in 1919 to come to Battle Creek.

His death was the effect of a stroke suffered three weeks ago, although a previous stroke suffered at Battle Creek in February of this year had incapacitated him for further work, and was responsible for the decision of the family to return to Indianapolis. He was succeeded as superintendent by L. E. Hollar, and shortly afterwards the name of the concern was changed to Battle Creek Transportation Company.

Mr. Mahoney was a pioneer in the electric railway field in Indiana. Starting with the Indianapolis Street Railway in 1903, he worked his way to the superintendency. His health first failed about 1919. Mr. Mahoney is survived by his widow and six children.

M. J. Curtin

M. J. Curtin, supervisor of stores and yards of the Boston Elevated Railway, Boston, Mass., is dead. He was appointed to that post in 1926, after having served the company as tie and timber expert.

Mr. Curtin has been connected with the Boston Elevated Railway for sixteen years. He went to work for the company as a sub-foreman on track construction. Later he was construction foreman at the carhouses and on building work. He had been tie and timber agent for six years.

Mr. Curtin's experience covered a wide range of work in the contracting field. He was a high school graduate, and did his first work in engineering in the drafting room of a contracting firm. He entered railway work with the old Bay State Street Railway, now the Eastern Massachusetts Street Railway. Eventually he became civil engineer of that company. His experience in this line of work also covered a period during which he was foreman for contractors engaged in carrying out important street construction.

He was a member of the committee on wood preservation of the American Electric Railway Engineering Association for several years.

Charles A. Ufford

Charles A. Ufford, Boston, Mass., died at his home in Dorchester on Oct. 9. While he never was connected with a transportation company, having been a manufacturer of corsets before his retirement several years ago, he was an ardent and untiring champion of rapid transit. More than ten years ago he conceived the idea of the Dorchester tunnel extension of the Boston Elevated Railway and was unremitting in his efforts to have it constructed. He prepared many maps and figures in his attempts to prove the necessity of the development. Among his cherished souvenirs were the pen used by Calvin Coolidge, then Governor of Massachusetts, in signing a bill for investigation of Dorchester transit possibilities, and the pen used by Mayor Curley of Boston in signing the Dorchester rapid transit bill.

Col. Fred W. Fleming

Col. Fred W. Fleming, receiver of the Kansas City Railways, Kansas City, Mo., the predecessor of the Kansas City Public Service Company, from 1920 to 1926 and president of the Central Surety & Insurance Corporation, died on Nov. 14 in Chicago. He was 63 years old.

In 1917, while chairman of the war finance committee in Kansas City, he was critically ill. In 1918 he resigned as vice-president of the Kansas City Life Insurance Company because his physicians had given him only a year to live, but he recovered his health, served six years as railway receiver and also organized the insurance company he headed at his death.

For many years he was active in politics, beginning as president of a democratic club in 1888. From 1894 to 1897 he was state coal oil inspector. He was a delegate to the Democratic national conventions in 1904, 1908 and 1912. In 1900 he was chairman of the committee that brought the Democratic national convention to Kansas City.

Colonel Fleming started as a bookkeeper and accountant in Kansas City, establishing, in 1887, a realty and loan business of his own. In 1894 he became a job printer and publisher. In 1900 he turned to insurance. Besides having held the positions mentioned previously, he had been president of the Trans-Mississippi Commercial Congress, first vice-president of the National Irrigation Congress, president of the Navy League of Kansas City and campaign chairman of the Red Cross War Fund.

Colonel Fleming won his title just after the Spanish-American War, when he became commander of the old Third Missouri Regiment. He had served the National Guard in every position from enlisted man to colonel.

J. W. Nicholson

Joseph W. Nicholson, secretary of the Cincinnati Street Railway, Cincinnati, Ohio, died suddenly on Nov. 20. He was born in Cincinnati 41 years ago. Mr. Nicholson started with the Ohio Traction Company in 1911 as a stenographer. The Ohio Traction Company owned the Cincinnati Traction Company at that time. In 1920 Mr. Nicholson was made secretary of the Ohio Traction Company, succeeding Walter A. Draper, who then became vice-president. In 1922 he was elected secretary of the Cincinnati Traction Company in recognition of talent which he was quick to display and in 1926 succeeded A. J. Becht as secretary of the Cincinnati Street Railway, Mr. Brecht resigning to devote himself to the interests of the Kilgour-Cunningham estate.

Abraham K. Detwiler, retired capitalist and railroad builder, died at Los Angeles, Cal., on Oct. 17, after a prolonged illness. He was born in Birdsboro, Pa., 81 years ago, and began his colorful business career in Toledo, Ohio, where in 1899 he became president of the Toledo & Maumee Valley Railroad.

Joseph Derett Crafton, for 25 years superintendent of employment for the St. Louis Public Service Company, St. Louis, Mo., and its predecessor, the United Railways, is dead. For some time he had been on the company's pension roll. Mr. Crafton was 75 years old.

Clinton Elliott, a pioneer in New York street car advertising, died on Sept. 1 at Thompson, Conn., where he was born 63 years ago. Mr. Elliott was president of the Eastern Advertising Company and a director of the Street Railway Advertising Company, having been associated with Barron G. Collier in the development of the latter corporation.

Lewis J. Dickey, in the service of the Boston Elevated Railway, Boston, Mass., for 30 years, died recently. For the last 24 years he had been receiving cashier in charge of collections.

William Spencer Ballenger, division superintendent for the Washington Railway & Electric Company, Washington, D. C., by which he had been employed for the past 44 years, is dead. Mr. Ballenger was born in Washington 65 years ago.

Louis Schlayer, engineer of the Connecticut Company in Hartford, Conn., died on Oct. 19 following a brief illness. Mr. Schlayer was 71 years old. He had been connected with the railway for many years.

Col. Joseph A. Corby, Civil and Spanish-American War veteran and retired financier, who helped to build the first street car line in St. Joseph, Mo., and operated the first telephone exchange there, is dead. He was 82 years old.

Hiram Roswell Steele, former judge and also district attorney at one time in Kings County, in which Brooklyn is located, is dead. He was a director of the New York Life Insurance Company and had long been a director of the Brooklyn City Railroad, now included in the Brooklyn & Queens Transit Corporation, a part of the Brooklyn-Manhattan Transit Corporation.

Alfred Baker, formerly general manager of the Birmingham Corporation Tramways and Omnibus Department, Birmingham, England, is dead. Mr. Baker started as a tram conductor and rose to control one of the largest and most progressive undertakings in the country. His interest in municipal transport was indicated by his active connection with the Municipal Tramways and Transport Association; he was a member of the council from its inception. Mr. Baker retired about two years ago, being succeeded at Birmingham by his son, A. C. Baker.

Frank L. Fuller, president of the Binghamton Railway, Binghamton, N. Y., for nearly fifteen years, died on Sept. 27 at the age of 71 years. The Binghamton Railway is now included in the system of the Triple Cities Traction Company.

Industry Market and Trade News

Simplified Practice Making Progress

Simplification has played a significant part in the past and will play a major part in the future development of electric railways, according to the United States Department of Commerce. It can be applied to four of the most important subjects discussed at the recent annual convention, of the American Electric Railway Association, namely: (1) Lighter weight cars; (2) quicker acceleration; (3) less noise; (4) standardization of equipment.

The association has always been active in supporting simplified practice recommendations and has consistently urged the electric railway industry to apply the principles of simplified practice both to methods and to materials used. It has officially accepted the following simplified practice recommendations:

Number	Item
16	Lumber
26	Steel reinforcing bars
28	Sheet steel
35	Steel lockers
36	Milling cutters
45	Grinding wheels
47	Cut tacks and small cut nails
48	Shovels, spades and scoops
49	Sidewalk lights
53	Steel reinforcing spirals
56	Carbon brushes and brush shunts
57	Wrought-iron and wrought-iron steel pipe, valves, and pipe fittings
58	Classification of iron and steel scrap
60	Packing of carriage, machine and lag bolts
63	Metal spools
71	Turnbuckles
73	One-piece porcelain insulators
76	Ash handles
90	Hack-saw blades
95	Skid platforms
100	Welded chain

It is pointed out that when intelligently applied many benefits and advantages result, among which may be listed lower inventory investment, higher rate of turnover, quicker deliveries, released storage space, lower operating costs, lower overhead expense, ease of installation, decreased inventory discrepancies, less obsolete material, less depreciation charges, and less misunderstanding and delay due to simplified nomenclature of materials.

The Division of Simplified Practice has studied the needs of purchasing agents, storekeepers, engineers, foremen, accountants, etc., for a practical form of the simplified schedules of commodities. For the recommendations listed above it has prepared a sheet form which can be obtained free of charge.

The American Electric Railway Association has made arrangements with the Division of Simplified Practice to supply its members with complimentary sheet form copies of any recommendations requested. A letter from association headquarters has been sent to the membership together with the complete list of over 100 simplified practice recommendations from which those of interest can be selected.

Members of other public utility associations, including the American Railway Association, American Gas Association and American Water Works Association, are utilizing these simplified schedules to advantage. Over $300,000,000 has been saved already and the division states that over 20,000 acceptances to recommendations have been received.

The Division of Simplified Practice has volunteered to give careful consideration to any questions relative to simplified practice or recommendations which electric railways may care to ask. Those interested may address George A. Cooper, Division of Simplified Practice, Bureau of Standards, Washington, D. C.

Switching Locomotive for Springfield, Ohio

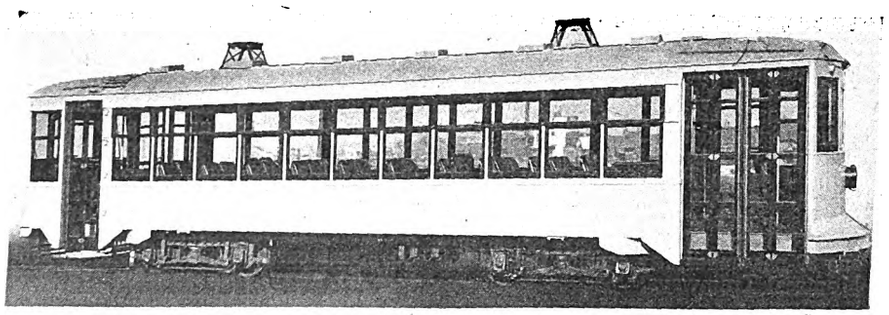
The Cincinnati Car Corporation reports the delivery of a 40-ton double-end electric locomotive for switching purposes to the Springfield Suburban Railroad, Springfield, Ohio, which property engages in a general switching business between certain industries and the various steam railroads and interurban railways entering Springfield.

Recent Bus Sales to Electric Railways

Recent deliveries of motor buses to electric railway companies by the White Company include two 54A six-cylinder buses to the Eastern Texas Electric Corporation at Beaumont, Tex., and seven Model 65 six-cylinder buses to the Pittsburgh Motor Coach Company. American Car & Foundry Motors Company has delivered a 27-passenger parlor car coach to the Capital Traction Company, Washington, D. C.

Twin Coach Corporation, Kent, Ohio, reports delivery of three 40-passenger urban type coaches to the Aronimink Transportation Company, Upper Darby, Pa., and three buses of similar type to the Milwaukee Electric Railway & Light Company. This property now has 23 ACF buses in service. The

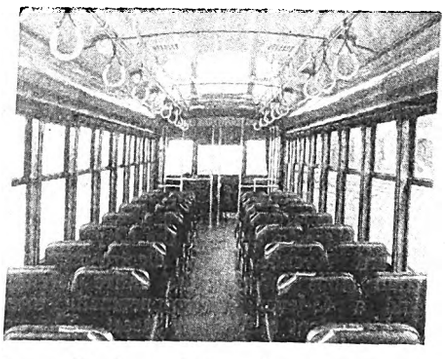
New Cars for Sacramento



Ample window space and attractive lines characterize new Sacramento street cars

Twelve all-steel double-truck double-end motor cars for city service were recently delivered to the Pacific Gas & Electric Company for service in Sacramento, Cal., by the American Car Company of St. Louis, Mo. The cars have a length, over all, of 41 ft. 6½ in., an over-all width of 8 ft. 2½ in., and a height from rail to trolley base of 10 ft. 8 in. Length over the body posts is 28 ft. 8½ in., and the estimated weight is put at 30,000 lb. Other specifications follow:

Name of Railway	Pacific Gas & Electric Company
City and State	Sacramento, Cal.
Number of units	12
Type of unit	One-man, motor, passenger, city, double-end, double truck
Number of seats	22
Builder of car body	American Car Company
City and state	St. Louis, Mo.
Date of order	June 1, 1929
Date of delivery	Oct. 18, 1929
Air brakes	Westinghouse Traction Brake Company
Armature bearings	Ball
Axles	Forged open hearth steel
Car signal system	Faraday
Compressors	DH-16
Conduit	Flexible
Control	Double end K-63
Curtain fixtures	National Lock Washer Company
Curtain material	Pantasote No. 74-18-L-blue
Destination signs	Hunter type No. 126
Door mechanism	National Pneumatic Company
Doors	Folding
Energy saving device	None
Fare boxes	Johnson D.M.-3
Floor covering	Battleship linoleum-green
Gears and pinions	Spur
Glass	Plate
Hand brakes	American Car Company's drop handle
Hand straps	Leather
Heaters	None
Headlights	Golden Glow SM-95
Headlining	Agasote
Interior trim	Mahogany



Forward-facing upholstered seats and wide aisles make for passenger comfort

Journal bearings	Plain
Journal boxes	Brill friction type
Lamp fixtures	Electric Service Supply Company's type T, No. 27903 dome
Motors	GE-247 Form A, inside hung
Painting scheme (color used), Cars painted by railway	
Registers	None
Roof type	Arch
Roof material	Canvas covered
Safety car devices, Westinghouse Traction Brake Co.	
Sash fixtures	Dayton
Seats	Hale & Kilburn No. 392-A
Seat spacing	2'6"
Seating material	Leather
Slack adjusters	None
Steps	Stationary, well type
Step treads	Feralun
Trolley catchers	Keystone
Trolley base	Furnished by railway company
Trolley wheels	Furnished by railway company
Trucks	Brill 177-E-1-X type
Ventilators	Brill exhaust
Wheels, type	Griffin, diameter 26 in.
Wheelguards or fenders	H. B. type

Digitized by Google

Capitol District Transportation Company, Albany, N. Y., has added three 40-passenger urban type coaches to its fleet. The Cincinnati Street Railway received one 40-passenger urban coach, and the Houston Electric Company added one 21-passenger urban coach. The American Car & Foundry Motors Corporation also reports the delivery of a 42-passenger trackless trolley to the New Orleans Public Service Corporation.

General Motors Truck Company has delivered a Type W observation coach to the Wheeling & Parkersburg Motor Company, Sisterville, W. Va., and three Type W city service buses to the Johnstown Traction Company, Johnstown, Pa. Other Yellow Coach deliveries include two Type W buses to the Erie Railways, Erie, Pa., one Type W city service bus to the North Carolina Public Service, Greensboro, N. C., two Type W buses to the Pacific Gas & Electric Company for service in Sacramento, Cal., one Type W city service bus to the Knoxville Power & Light Company, Knoxville, Tenn., two observation buses to the Wisconsin Power & Light Company, Madison, Wis., three Type Z 29-passenger buses to the Delaware Bus Company, Philadelphia, Pa., and two Type Z 29-passenger buses to the Southern Pennsylvania Bus Company, of Philadelphia.

Boston Elevated Railway has accepted delivery of one Mack Model BK six-cylinder 37-passenger city type bus. Other recent deliveries by the Mack International Motor Truck Corporation include six Model BO 29-passenger city type buses to the St. Joseph Railway, Light, Heat & Power Company, of St. Joseph, Mo., two Model BO six-cylinder 29-passenger city type buses to the Tri-City Railway, of Davenport, Iowa, and one 29-passenger city service bus to the Montreal Tramways.

PRT Contracts for Signal Equipment

The city of Philadelphia, Department of City Transit, has contracted with the Union Switch and Signal Company for the complete installation of an automatic block signaling and electro-pneumatic interlocking system in the new South Broad Street Subway, Philadelphia. The automatic blocking consists of signaling four tracks from Lombard Street to the City Hall, and two tracks between the City Hall and Girard Avenue, with electro-pneumatic train stops through the entire territory and a 43-lever electro-pneumatic interlocking plant at Walnut Street. The system, when completed, will be hooked up with the existing signal system of the same type in the North Broad Street Subway, and the necessary additions and modifications to tie in this new work with the original installation are also provided for under this contract.

$1,000,000 Program for Springfield

The program of expansion and improvement contemplated by the Illinois Power Company for 1930 will require an expenditure of approximately $1,000,000. According to A. D. Mackie, general manager, "the tentative program covers additional boiler and generating equipment, pole and wire line extensions, undergrounding of electric wires and removal of wooden poles, rehabilitation and replacement of car tracks and rolling stock, extension and enlargements of gas mains and heating mains." Mr. Mackie also said:

"The railway budget covers new track in streets to be paved, shop equipment necessary to replace all present wheels on street cars with steel wheels, which will do away with the flat wheel disturbance and annoyance, wire trolley poles to replace wooden poles in the business district, which are presently to be removed as electric wires go underground."

ELECTRIC RAILWAY MATERIAL PRICES—NOVEMBER 23, 1929

Metals—New York

Copper, electrolytic, delivered, cents per lb.	18.00
Lead, cents per lb.	6.10
Nickel, cents per lb., ingot	35.00
Zinc, cents per lb.	6.24
Tin, Straits, cents per lb.	39.583
Aluminum, 98 to 99 per cent, cents per lb.	24.30
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	42.00
General service	31.00

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.75
Somerset mine run, f.o.b. mines, net ton	2.15
Pittsburgh mine run, Pittsburgh, net ton	1.70
Franklin, Ill., screenings, Chicago	3.35
Central, Ill., screenings, Chicago	2.20
Kansas crushed mine run	1.50

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive 5/16 in. and larger, cents per lb.	2.80
Tie plates (flat type), cents per lb.	2.15
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.95
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	$2.45
Sheet iron (24 gage), cents per lb.	2.75
Sheet iron, galvanized (24 gage), cents per lb.	3.50
Galvanized barbed wire, cents per lb.	3.10
Galvanized wire, ordinary, cents per lb.	3.05

Waste—New York

Waste, wool, cents per lb.	13.00
Waste, cotton (100 lb. bale), cents per lb.:	
White	13.00
Colored	9.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	15.7
White lead in oil (100 lb. keg), cents per lb.	14.25
Turpentine (bbl. lots), per gal.	$0.57
Putty, 100 lb. tins, cents per lb.	5.725

Wire—New York

Copper wire, cents per lb.	19.875
Rubber-covered wire, No. 14, per 1,000 ft.	6.15
Weatherproof wire base, cents per lb.	20.875

Paving Materials

Paving stone, granite, 5 in., f.o.b.:	
New York—Grade 1, per thousand	$150.
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd., delivered	3.25
Cement, Chicago, in carload lots, without bags, f.o.b.	1.85
Gravel, ¾-in., cu.yd., delivered New York	3.25
Sand, cu.yd., delivered New York	2.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	13.0
Light copper, cents per lb.	11.75
Heavy yellow brass, cents per lb.	7.75
Zinc, old scrap, cents per lb.	2.75
Lead, cents per lb. (heavy)	4.50
Steel car axles, Chicago, net ton	$16.25
Cast iron car wheels, Chicago, gross ton	18.00
Rails (short), Chicago, gross ton	18.75
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.25

Atlanta Track Reconstruction Will Total $365,000 for Year

During the year 1929 the Georgia Power Company will have spent approximately $365,000 for track reconstruction in Atlanta. This figure does not include any extensions but only the rebuilding of existing lines. A total of 25,617 ft. of single track has been rebuilt on nine major projects completed during the year. On a large percentage of this the company paid for the paving.

In addition to this work the company built 1,871 ft. of new track of 80-lb. A.S.C.E. rail on its College Park line, rebuilt the special work on Whitehall at Hunter Street, installed concrete beam construction under 6,896 ft. of single track and paid for the concrete paving in the track foundation, and installed a new double track branchoff and granite block paving reset.

Great Northern Orders Additional Electric Locomotives

Increased passenger travel following the opening of the Great Northern's 8-mile tunnel under the Cascades is reflected by the purchase from the General Electric Company of four additional 3,000-hp. electric locomotives for use on the electrified division.

The new locomotives will cost about $250,000 each.

Coincident with the completion of the 8-mile Cascade tunnel last January, the railway's entire route through the Cascades was changed from steam to electrical operation. The saving in time afforded by these and other improvements enabled the Great Northern to cut nearly seven hours from the time of its transcontinental trains.

The new locomotives will be of the same type as those now handling the railway's passenger trains. They weigh approximately 530,000 lb. each and are 75 ft. long. They are built so that they can be operated in multiples, each unit being capable of handling a 1,000-ton train on any of the grades. Each locomotive has six traction motors which deliver power to six axles. The driving wheels are nearly 5 ft. in diameter.

International Railway Completes Extensive Rehabilitation Program

In furtherance of its desire to cooperate in every way with the city the International Railway of Buffalo, N. Y., agreed last January upon a program of street improvements to be made during the current year at an expense to the company of $1,000,000. This work has now been completed, and included the rebuilding and repaving of about 11 miles of single track. The program also included a considerable amount of maintenance work on other thoroughfares, including the rehabilitation of Seneca Street from Main Street to the city line. Not only did the company rebuild its tracks on Seneca Street, but it also paid for the paving of 19 ft. in the center of the street, the cost to the company of paving the adjoining areas being greater than the cost to the city.

Within the last three years the company has spent $2,500,000 for track and paving.

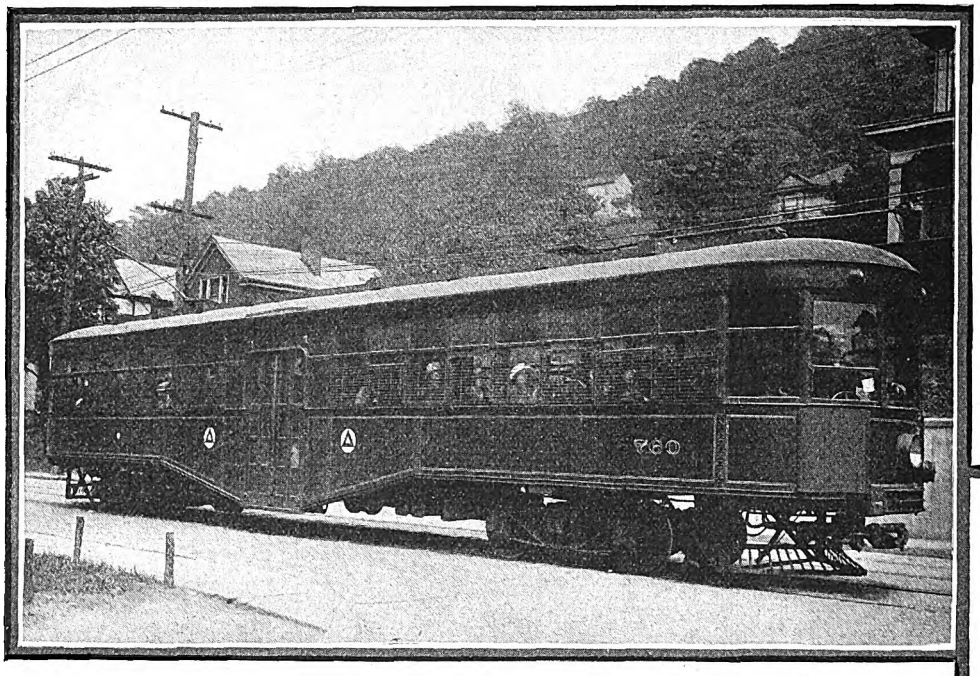
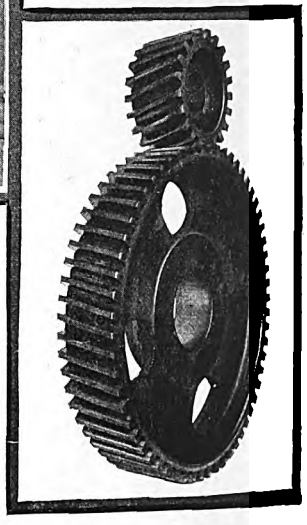
680,000 MILES IN 14 YEARS .... AND STILL GOING



The first Westinghouse-Nuttall Helical Gear and Pinion as it appeared after 632,000 miles of service.



ON February 25, 1915, the first Westinghouse-Nuttall BP grade helical gear and pinion was installed on a car for the West Penn Railways.

Today, after more than 680,000 car-miles of service, this same gear and pinion is still in operation.

Exceptional gear mileage! Yes, but BP grade helical gearing can always be depended upon for extraordinary mileage—mileage that means concrete maintenance savings, because:

The teeth mesh with fifty percent more rolling action than other gears, consequently there is less wear.

Loads are transferred from tooth to tooth gradually, uniformly and smoothly thus preventing "ridging" at the pitch line, which preserves the correct involute tooth form at all times.

The exclusive BP heat-treatment scientifically combines great hardness to resist rapid wear with ample tensile strength and ductility to prevent breakage, spawling and chipping due to the unusual loads, and shocks and jolts of service.

Typical K-3 Arrester Installation

Without maintenance

Type K-3 Lightning Arrester

Typical MP Arrester Mounting

Type MP Lightning Arrester

K-3 and MP arresters give full protection

THE K-3 arrester gives full protection against severe surges induced by lightning.

It is designed for line, car, and station protection on 100 to 1500-volt direct-current circuits.

It requires no maintenance, only infrequent inspection, as it contains no liquids to freeze or plates to deteriorate.

Its operation is simple and effective, consisting chiefly of a condenser with or without a spark gap.

The MP arrester is designed for pole and car protection on circuits up to 750 volts.

It requires no maintenance, and is low priced.

It has a free discharge path to ground when the arrester operates, and there is no noticeable surge after the discharge.

Years of field service with thousands of installations prove these arresters have never been surpassed.

What Does This Growing Preference Mean?

Graphic comparisons of 1928 and 1929 purchases indicate growing preference for O-B Line Materials.

THE proof of the pudding is the eating thereof" goes the old saying. Similarly, the growing preference for O-B Line Material Fittings, as shown in the graphs on the opposite page, indicates that more and more railway operators like the taste of the service they have experienced.

Purchases of overhead materials for any one electric railway do not vary to any great degree from year to year. Orders are mostly for maintenance of existing lines, occasionally for new construction. Consequently, increase in the amount of O-B Line Material Fittings used from year to year is due to a wider-spread choice of these outstanding fittings.

Users for a new or improved product are not won overnight. Electric railways are unwilling to adopt a different product until they know, by test and actual performance, that improved service or lower cost of operation, or both, will be their gain.

The fact that purchases of these O-B products during the first nine months of 1929 exceed those for the same period of 1928 by 25% and more, is conclusive evidence that more and more properties are more fully recognizing the labor-savings and maintenance-reductions which are available.

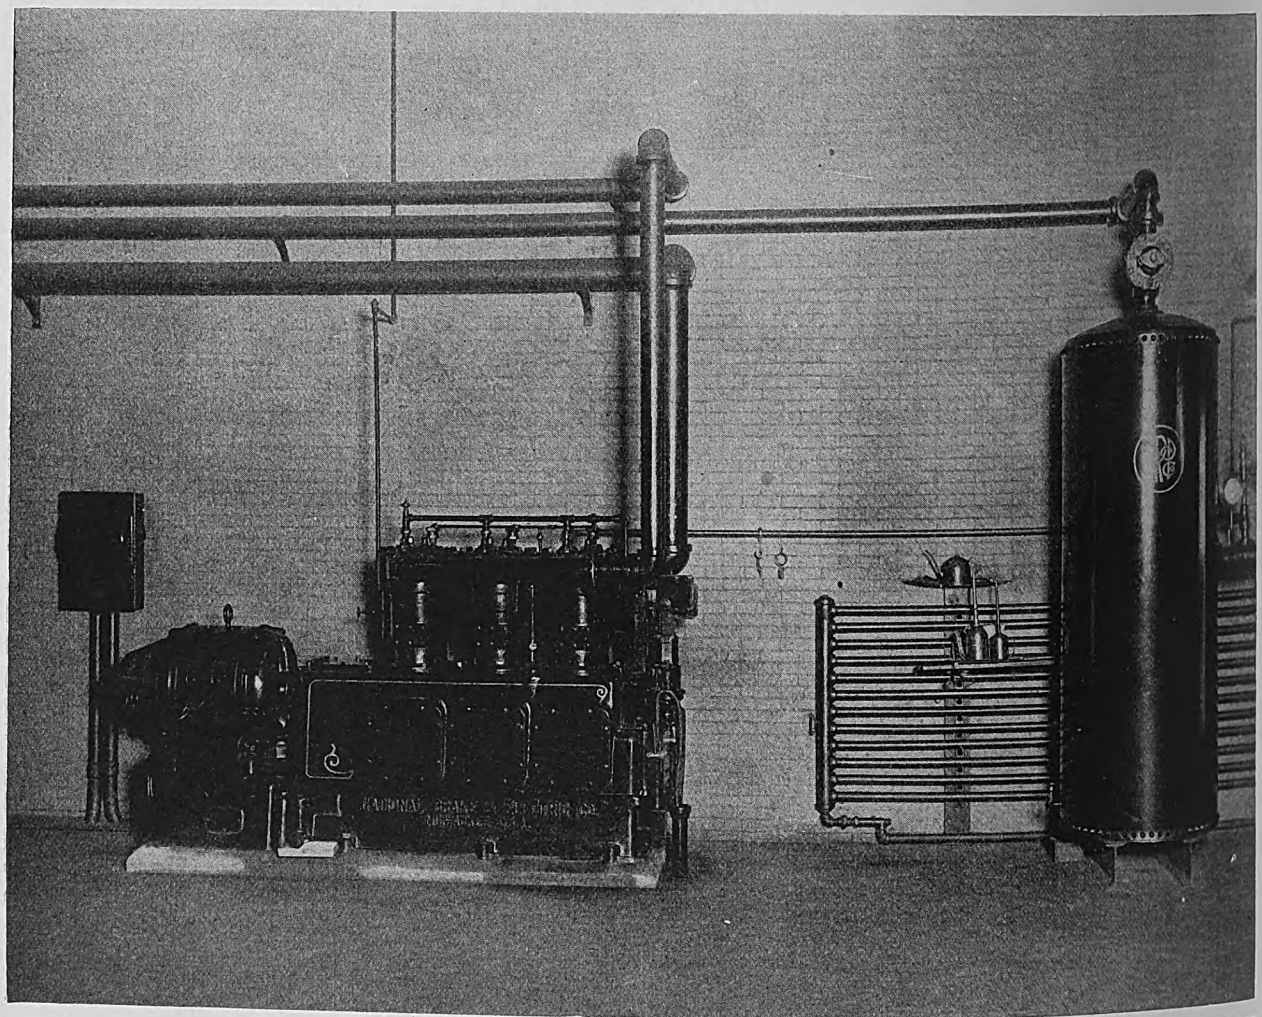
For Efficient, Reliable, Lasting Service

WESTINGHOUSE-NATIONAL Air Compressors, embodying distinctive features developed from three score years of experience, and constructed to manufacturing standards that place ultimate service above the all-too-often consideration of first cost, have won a reputation for high efficiency, dependable action, economical operation, and long life.



We make a complete line of air compressors ranging in size from 3 to 700 cu. ft. displacement—steam driven, motor driven, belt driven. They are being used for a great variety of purposes in car barns, power houses, and shops.

De Luxe—that's what!

NOBODY can enter such a car as this one of the ten on the lines of the Cincinnati, Hamilton and Dayton interurban line without feeling "Here's where I get a nice rest."

De Luxe equipment such as this invites passengers. It increases income. It costs no more to operate and it certainly improves public relations.

The fundamental of such equipment is comfort—the kind of comfort that Hale and Kilburn builds into car seats—the comfort that rests a passenger during his ride and drops him at his destination with a pleasant word to the conductor or motorman. Think it over. It is worthy of your closest investigation.

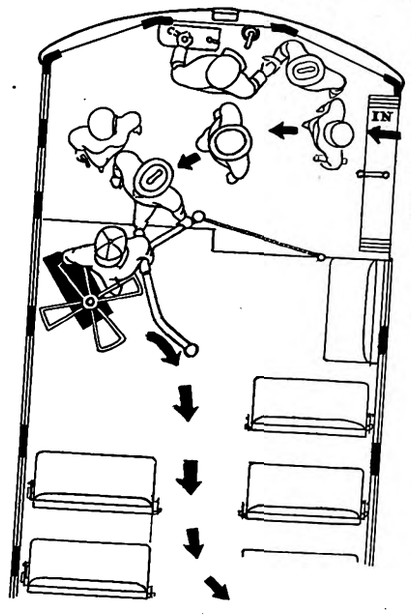
WHY THE PEREY STREET CAR COINPASSOR



1. Makes one-man operation practical on cars of every size and type.
2. One-man operator can handle larger crowds without delay.
3. No rider can evade fare by slipping past the operator—the Coinpassor forces all to pay.
4. Relieves operator of responsibilities for collection and registration of fares —he only has to make change and issue transfers.
5. Platform entrance well can be as large as desired.
6. Front, center or rear exit can be used with treadle operator.
7. Utilizes available platform space effectively.
8. Fast as the movement of passengers.

Every practical street car man who knows anything about fare collection and car loading problems, will recognize at a glance, the possibilities of this equipment installed on the car. The unquestioned success of the prepayment fare area with mechanical collection and registration of fares, as used at subway stations, parks, etc., is now available on every piece of rolling stock. It speeds up loading and assures collection of every fare. It is equally adapted to street cars. Old style or modern cars can be equipped successfully with the PEREY COINPASSOR.

Your inquiry involves no obligation. We will gladly give you the details and let you be the judge.

A NEW SYSTEM OF LUBRICATION

TEXACO

REG.U.S.PAT.OFF.

The sensation of the A.E.R.A. Convention!

Railroad men are still talking about this remarkable Texaco exhibit. It was one of the outstanding features at the 48th annual A.E.R.A. convention, held at Atlantic City, September 28th to October 4th, 1929.

The *new* Texaco Power-saving System of Electric Railway Lubrication, the *new* Texaco Lovis Oil and the *new* Texaco Oil Seal were shown to operating officials from every section of the country.

The exhibit, and the wonderful results that have been accomplished through the application of the new Texaco System, the oil and the oil seal aroused widespread interest.

It is a development of great importance to the industry and to every operating official.

If you were unable to attend, or see this exhibit, write The Texas Company for information. A Texaco representative will gladly call on your request and present the facts, or arrange for convincing tests on your own lines. Write today.

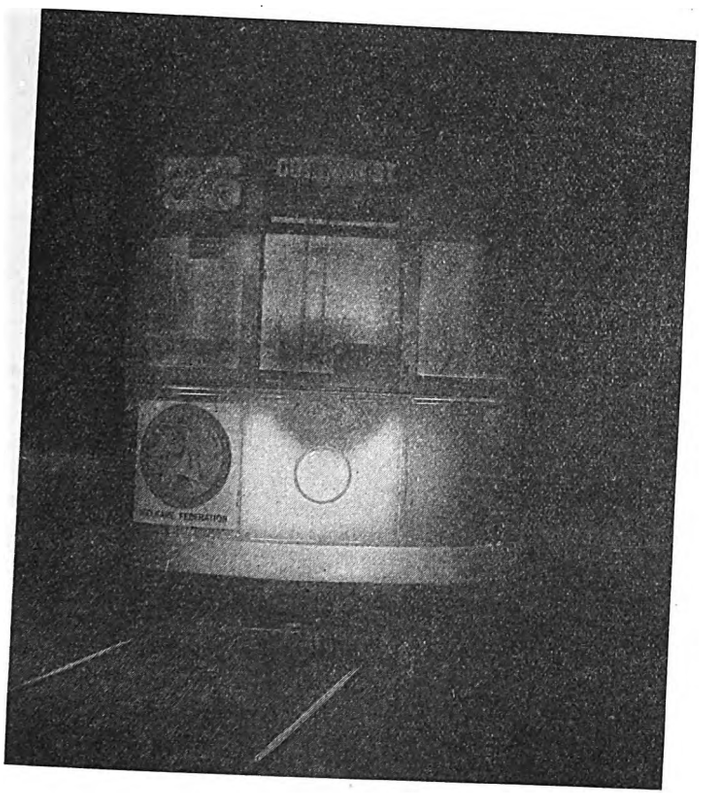
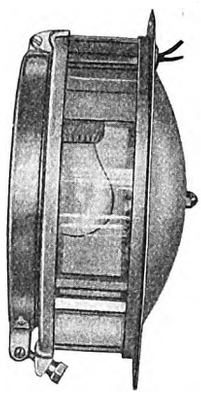
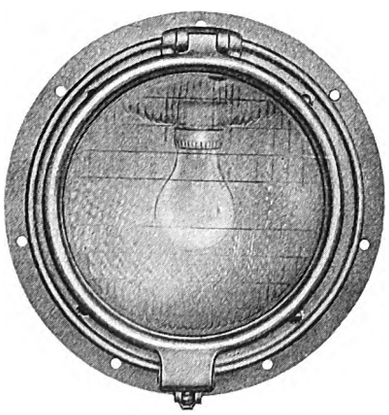
The Golden Glow Flood-Headlight has created much interest among operators





Side view of type FH-916 Flood-Headlight showing circular side lens.



Front view of type FH-916 Flood-Headlight which is equipped with a 9-inch diameter crystal prismatic glass reflector, in combination with a refracting lens.

In order to better meet conditions imposed by the ever increasing traffic on our main highways, and to make it easier for automobile drivers to immediately identify railway cars as cars, it is found desirable in many instances to provide more light on the dash. The Golden Glow Flood-Headlight was designed to fulfill this need by providing a well diffused beam for illumination of the track ahead, at the same time to floodlight the dash of the car. The illumination of the dash is sufficient to make easy the reading of advertising posters at night.

This headlight is ordinarily supplied to accommodate one lamp but is also supplied with two extra sockets where greater intensity of illumination on the dash is desired.

If you have not already received complete information on this headlight, please request same.

Service . . . .

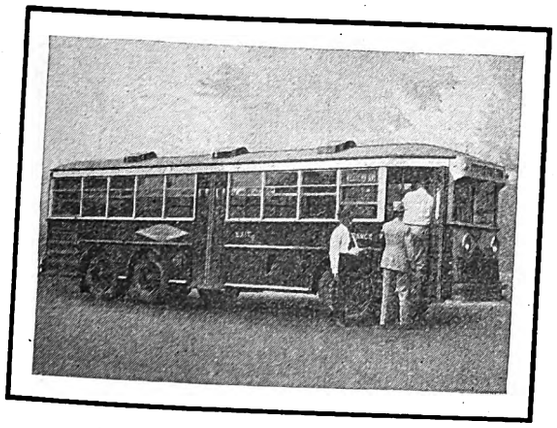
Increases Patronage
Reduces Operating Costs

THE MODERN STREET CAR, trolley bus, and gas-electric bus are equally important in their ability to attract riders, to serve them well, and to serve them economically. Each type of vehicle has its essential place in the modern coördinated system.

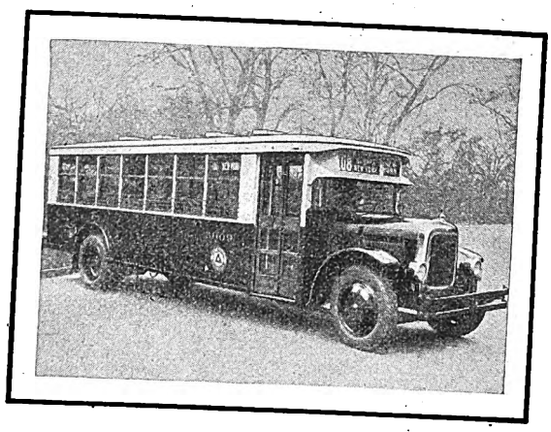
THE STREET CAR continues to be the most efficient carrier of crowds. For heavy traffic in large cities, it is the basis of an economical transportation system.

THE TROLLEY BUS is rapidly winning favor in the service of light-traffic areas. This trackless vehicle is quiet and powerful. It retains all the economies of electric power and it effects a substantial reduction in paving charges.

THE GAS-ELECTRIC has demonstrated its ability to conform to changing traffic demands. The public appreciates its fast schedule speeds. Operators profit from its long life and availability.



The Capitol District Transportation Company operates a fleet of 76 gas-electric buses in Troy and Albany, N. Y., where the routes are characterized by steep grades and heavy traffic. All the electric-drive equipment is of G-E design and manufacture.



The Public Service Coördinated Transport of Newark, N. J., operates more than 1000 gas-electric buses equipped with G-E electric drive. In the design and manufacture of this type of equipment, General Electric has consistently led the field.

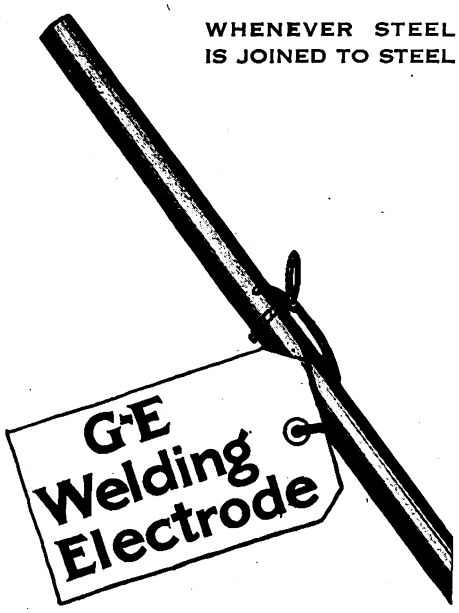
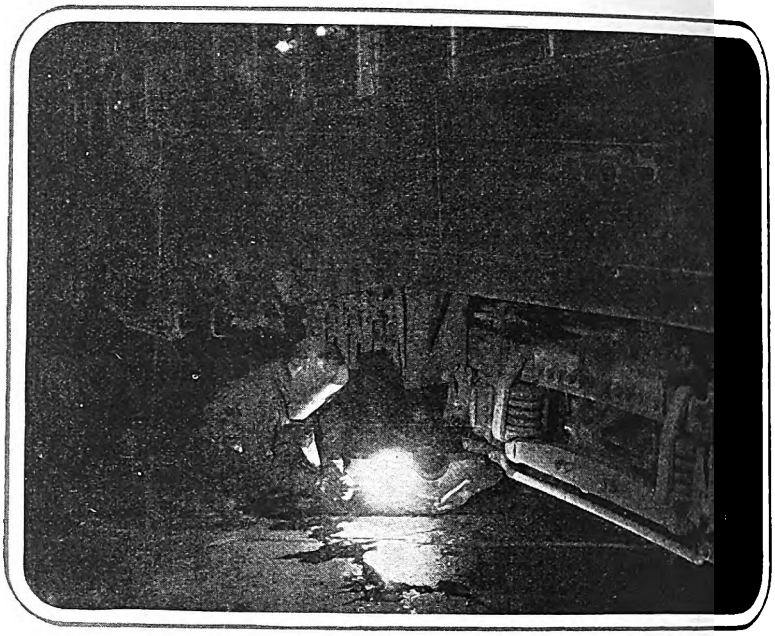
WHENEVER STEEL
IS JOINED TO STEEL





—preferred by railways

No single quality explains the reason why G-E Type "F" welding electrode is used by a large number of the traction companies in the country. Its general excellence for all kinds of *steel welding* makes it the favorite.

Few welding operations save more money than the building up of worn motor-armature shafts. Machinability, characteristic of Type "F", makes this welding application successful. Gear casings, motor casings, and bearing heads are other parts commonly welded with this electrode. Operators apply it from any angle. Its exceptional stability makes it possible to strike and hold an arc even on dirty surfaces. These characteristics make Type "F" electrode most desirable for repair work.

Learn more about G-E welding electrodes from the G-E Welding Electrode Distributor near you or write to Section E-5012, Merchandise Department, General Electric Company, Bridgeport, Connecticut.

For simplicity, reliability, and ease of operation, G-E arc-welding sets are unequalled. They are available in all sizes, all types—for either hand or automatic operation—for one or more operators.

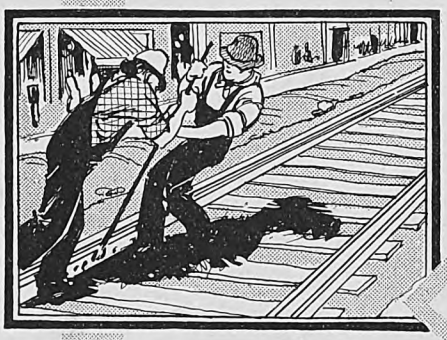
THERMIT

1909 1914



Condition of joint 5 years after new rails were laid

It took only five years to produce the result shown above. And that was on brand new rails. The company could easily have patched this joint and smoothed it off. Then it would have been as good as new—for another brief period. But the "easiest way out" is not the cheapest in the long run.

Rather than patch this joint, the company wisely decided to Thermit Weld. That was fifteen years ago. Now observe the picture and story of the same joint on the opposite page.

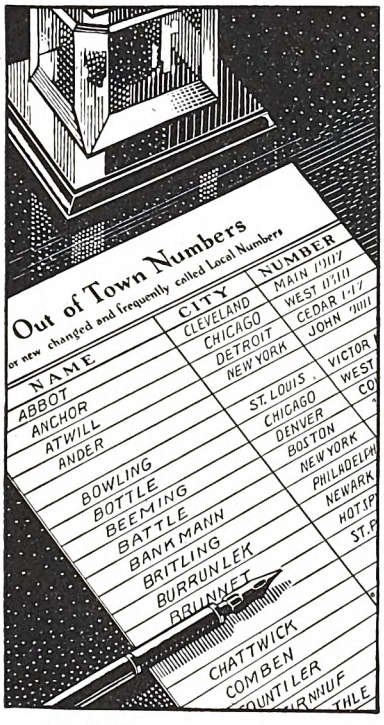
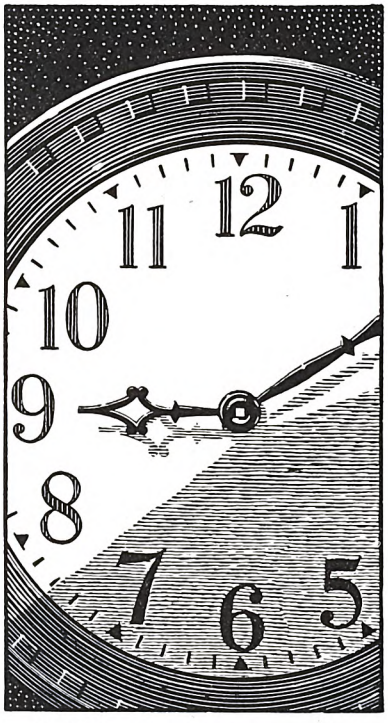
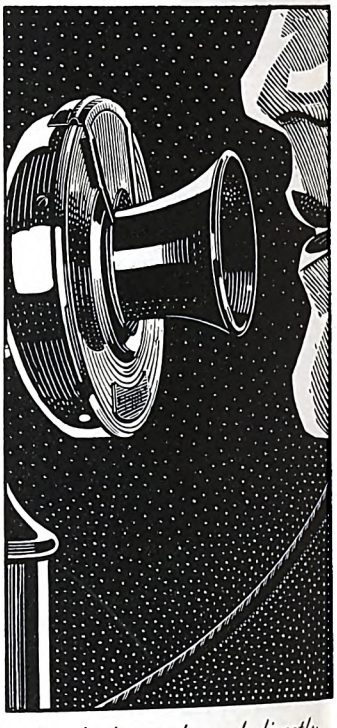
3 simple Suggestions for Telephoning between Cities



Call by number, whenever you can



Call during the less crowded hours of the business day



Speak distinctly and directly into the mouthpiece

Here are three simple suggestions that are almost sure to help you in getting the most out of your telephone calls between near and distant towns.

Call by number, whenever you can; it will save your time. It is useful to know the number, especially for calls that you may make frequently. "Information" will gladly give you the number of any person or concern you wish, so that you can make a note of it for the future. It is a convenience to your customers to print your own telephone number on your letterhead.

Make your calls when the men you want to reach are likely to be less busy. Try calling before 9.30 in the morning, between noon and 2, or shortly after 4.

Third, speak distinctly into the telephone, keeping your lips close to the mouthpiece. A natural speaking voice such as you use in talking to a man across your desk makes distant calls as clear as local calls.

Remembering these three points will make your telephone service easier and better than ever.

Inter-city calls are ideal for making appointments. Following up visits. Clearing away misunderstandings. Completing buying and selling transactions. Bell Telephone Service is *Convenient . . . Economical . . . Universal.*

SAFETY

with GOODYEAR Type "K" Rims

IF at the critical moment, at high speed, *a front tire goes suddenly flat*—Goodyear Type "K" Rims stay locked to tire and wheel.

The tire remains on the rim under all conditions. The rim stays on the wheel. There are no loose parts or tires rolling away to do costly damage. With Type "K" Rims your trucks are *safe!*

The two sturdy rim members are locked positively together and to the wheel.

But when you *want* the rim apart, the rim collapses and the tire is off *in three minutes or less!*

Goodyear Type "K" Rims are strong, light, cool-running, easily operated, and *supremely safe* wheel equipment.

Write today to Goodyear, Akron, Ohio, or Los Angeles, California, for detailed information.

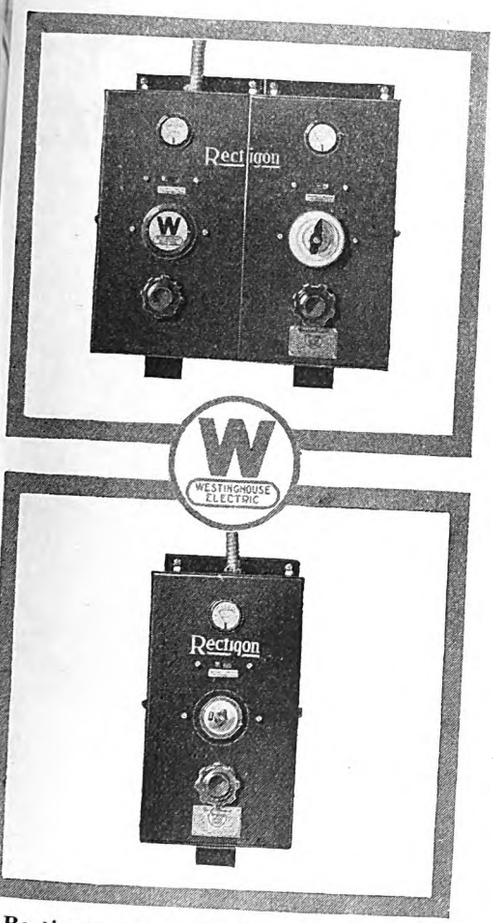
Lifetime costs determine profits



Rectigons are made in two sizes, 15 and 30 battery capacity, at $75 net and $135 net, respectively.

In the Rectigon, low first cost, low installation and maintenance costs, and low operating costs combine with high efficiency and long bulb life to keep lifetime costs at a minimum.

The Rectigon does not wear out, does not deteriorate, does not lose efficiency. The bulb, only, needs to be replaced at long intervals.

Let us tell you about the Rectigon. Let us show you the facts that prove that the longer you use a Rectigon the less you pay per hour for its operation. You will recognize that the features of the Rectigon make it the most economical method for battery charging. You will be interested in the booklet, "More Power to the Battery," explaining these features. Write for a copy.

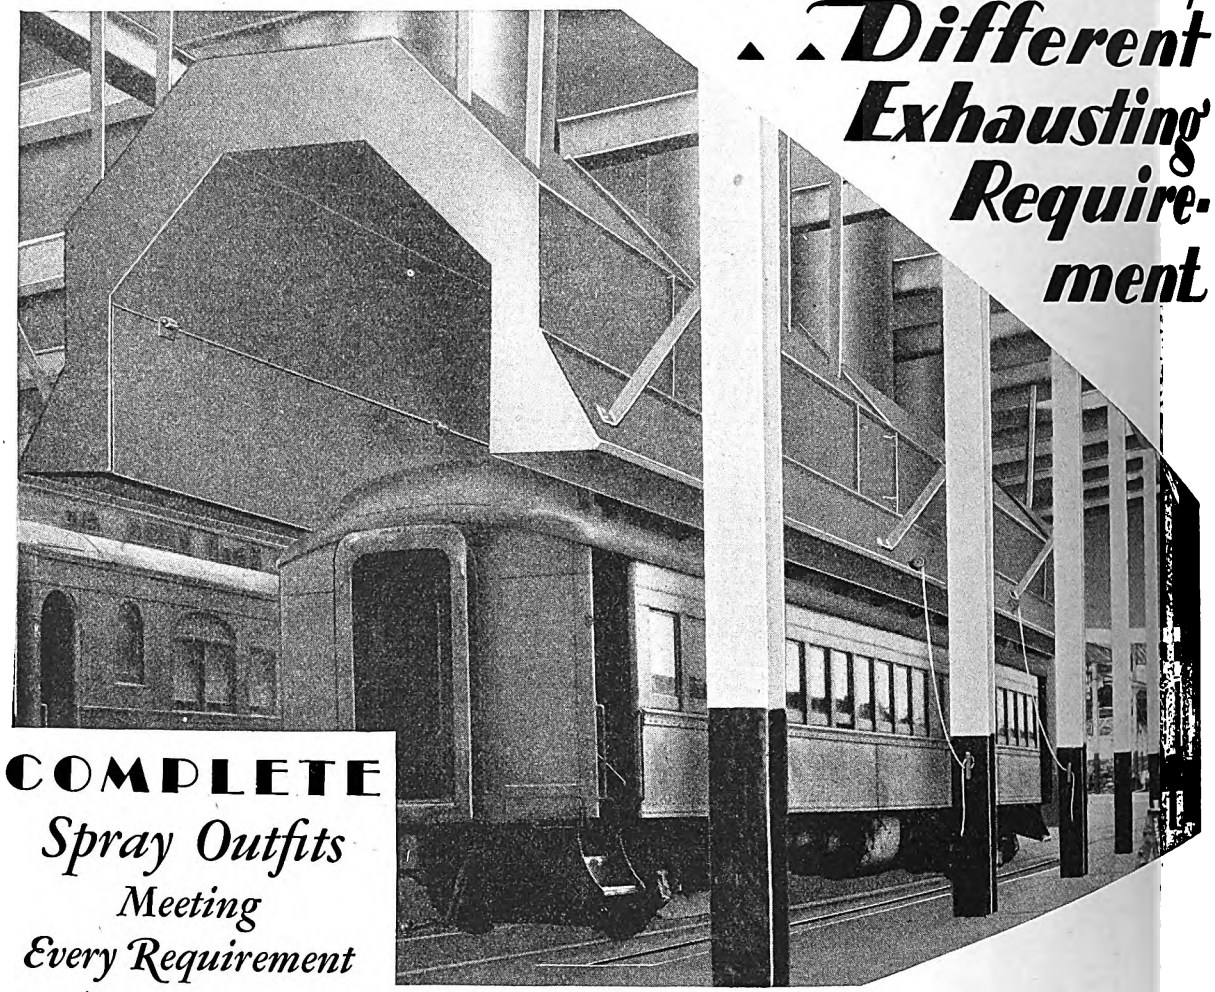
DeVilbiss Meets Every Different Exhausting Requirement



COMPLETE *Spray Outfits Meeting Every Requirement*

EVERY painting and finishing operation is served by specialized DeVilbiss spray outfits which are designed and built to do the particular work for which they are intended with the maximum economy of labor and materials.

Whatever may be your painting or finishing operation, look to DeVilbiss for:

Spray guns of various types and sizes.

Pressure feed paint tanks and containers.

Spray booths, exhaust fans, and approved lighting fixtures.

Air compressing equipment.

Air transformers and accessories.

Air and fluid hose and connections.

Complete outfits from the smallest hand-operated units to the largest industrial installations.

Write for catalog of the DeVilbiss spray equipment that fits your individual need.

EVERY different operation and industry engaged in spray-painting and spray-finishing presents different exhausting problems—often different plants or departments of the same general character demand highly individualized installations of exhausting equipment.

Specialized engineering ability, a long and vast experience with exhausting equipment in all industries, and an intimate, proved knowledge of the essential needs of every separate exhausting problem make it easy for DeVilbiss to provide maximum efficiency with the minimum of cost no matter how large or small, peculiar or different the exhausting requirement may be. It costs you nothing to learn how DeVilbiss can serve you in this particular. It may save you much.

SHELL oils and greases are not sold on price. Yet, measured by performance, they are probably the least expensive lubricants you can buy.

Shell lubricants are *exactly* suited for the work they must do. Shell engineers do not have to recommend stock oils—which at best only *approximate* specific lubrication requirements.

This policy of suiting lubricant to machine is possible because of the vast resources and unlimited facilities of the Shell organization. It accounts for the widespread and growing use of Shell oils* and greases in transportation as well as every other industrial service.

Talking over your needs with the Shell representative when he calls places you under no obligation . . . and more than likely will result in measurable operating and maintenance economies for you.

SHELL PETROLEUM CORPORATION
SHELL BUILDING , , , ST. LOUIS

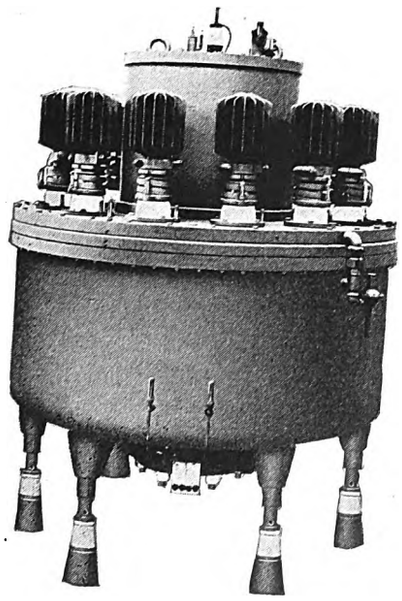
The "DIE-HARDS" stuck to the pen—

Not for them the clatter and fuss of the typewriter and the adding machine. They had learned their Spencerian hands too laboriously. Penmanship was their asset, their investment. Die-hards have always believed that whatever is—is right.

To the "DIE-HARDS" in the electric railway industry—



The American Brown Boveri mercury arc power rectifier is the modern equipment for converting current just as the typewriter is the modern implement for writing. It converts current without noise, without vibration, without rotating parts, without special buildings, and without special foundations.

Its operation may be completely automatic and it may be controlled from a distance. At our Camden plant are engineers who figured prominently in the early development of the rectifier. Their services are at your disposal.

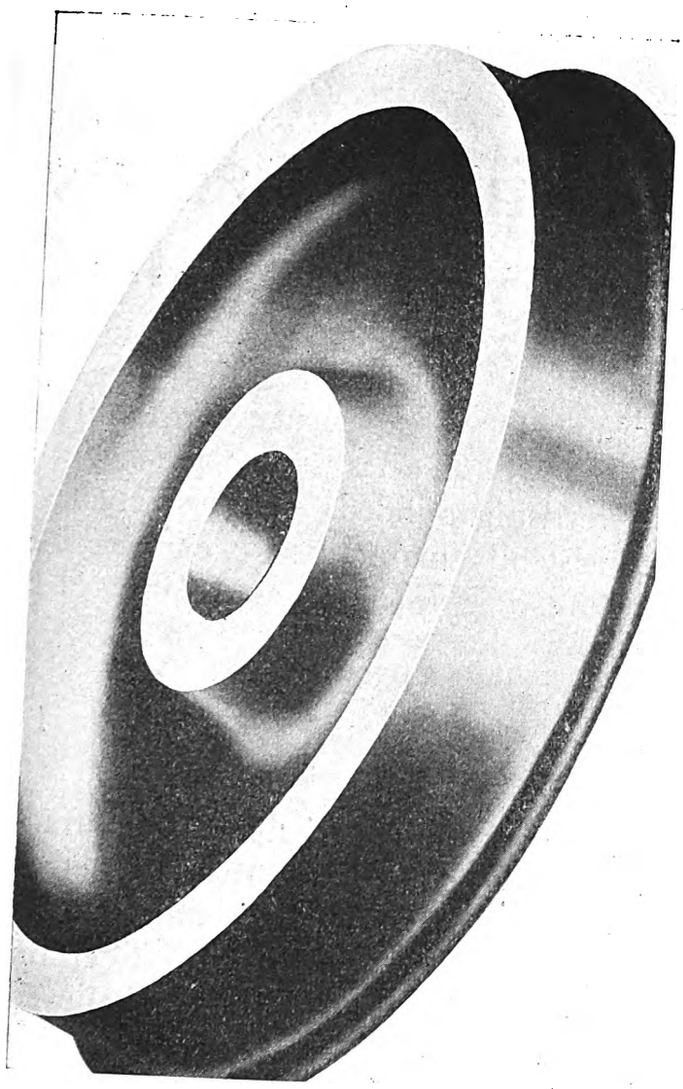
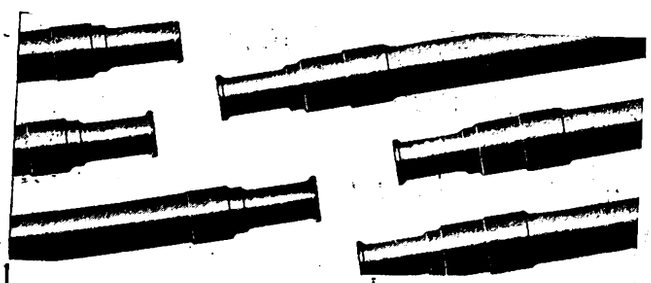
Modern wheels for modern traffic



In this day of heavy, congested traffic, wheels on electric railway cars are naturally subjected to increasingly severe service, greatly reducing the life of wheels made by ordinary methods.

The Bethlehem Wrought Steel Wheel has the strength, endurance and wear resistance to stand up and deliver exceptional mileage under these severe traffic conditions. Five distinct forging and rolling operations are required to make a Bethlehem Wheel. The forging gives the metal toughness and density; the rolling establishes a uniform grain structure throughout the wheel, virtually eliminating crystallization in the flange and tread and reducing the possibility of breakage.

In addition to the liberal margin of safety, due to their great strength, Bethlehem Wrought Steel Wheels cost less per mile because of the far greater mileage that they give. Write for descriptive literature.



FORGED AXLES

Extreme care is exercised in the manufacture of Bethlehem Axles. Special heat treatment gives them ductility and a high elastic limit. They give excellent service under severe torsional stresses.

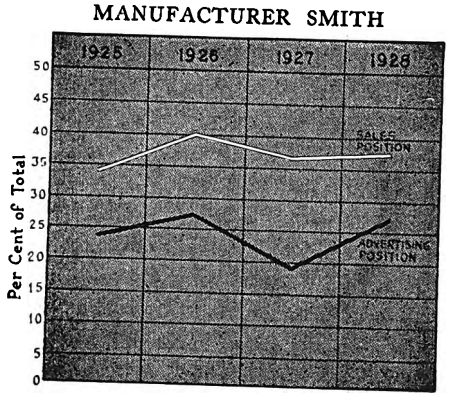
This is one of a series of advertisements directed originally to advertising men in an effort to make industrial advertising more profitable to buyer and seller. It is printed in these pages as an indication to readers that McGraw-Hill publishing standards mean advertising effectiveness as well as editorial virility.

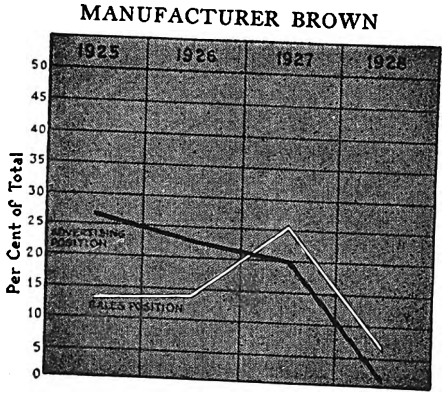
Does advertising schedule have anything to do with sales?

MANUFACTURER SMITH



These charts, compiled by McGraw-Hill, present the sales and advertising history of two competitors making the same kind of product and selling it to the same market through the same two publications.

MANUFACTURER BROWN



The white curve shows each manufacturer's share of total sales in the particular industry. The black curve shows how much of the total competitive advertising (on a page basis) each manufacturer used in this market.

Yes, according to the experience of Manufacturer Smith whose sales staff from top to bottom is advertising minded. Smith's schedule has been consistently maintained over a period of years in every issue of two McGraw-Hill publications.

* * * *

Yes, according to the experience of manufacturer Brown whose sales executives are not so advertising minded. Brown's schedule in the same publications was consistent up to a certain point and then sharply curtailed. He believed that product quality would take care of most of his future sales.

Printers' Ink says succinctly: "The way to make money by using advertising is to use it — not to fiddle with it." Do not these two experiences from the industrial field endorse this as something stronger than theory?

1. Increase riding; especially at off-peak hours—filling those empty seats at no extra cost.

2. Assure revenue whether pass is used or not—and each pass means money in advance.

3. Speed up schedules by faster loading through reduction in change-making. A decided advantage with one-man operation.

One case not so long ago, brought out the seemingly remarkable fact that off-peak riding due to the new weekly-pass had increased over 400%.

On the same property, Sunday Passes increased Sunday riding 600%!

Actually there is nothing amazing about it. It is simply the result of two "complexes" of the riding public—the bargain instinct and the urge to make use of "left-overs." In other words a person with a weekly pass having a few rides left will let his family use the pass or will himself use it up on the last few days during off-peak hours. The Sunday pass, in connection with judicious timely car card suggestions, will increase Sunday riding for the same reason.

Let us give you complete details.

WE STILL RUB IT IN!

THE rubber adhesive compound of Dundee Tape is vigorously rubbed into the strong cotton fabric. Compound and cotton are thus frictioned into a homogeneous product which is far superior to any tape made by the spreading process.

This frictioning method is old fashioned; in fact it is so old fashioned that friction tape originally took its name from the process. In spite of modern machinery and faster production, frictioning remains the ONLY way thoroughly to impregnate the fabric of friction tape.

The OKONITE Company clings to the reliable friction process to make Dundee Tape. That is the reason Dundee Tape clings to the parts upon which it is wrapped.

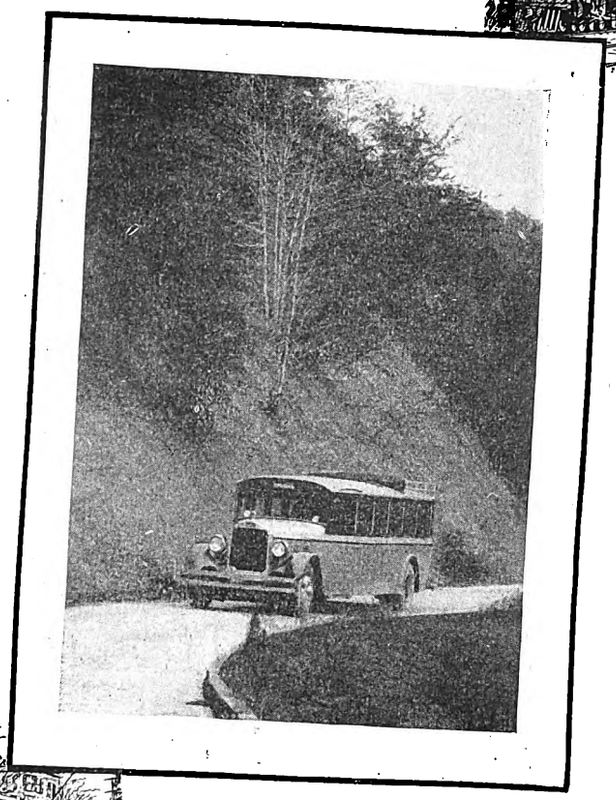
The Goal of Transportation . . . More Passenger-Miles



WESTINGHOUSE AIR BRAKES are *Efficient Helpers*

THAT which stimulated evolution of the wooden coach "two-a-day" train into a high speed all-steel express... that which promoted growth of the "toonerville trolley" to the fleet and comely street car... has in recent years permitted the common "jitney" to metamorphose into a lordly motor coach.

The railroads for three score years, electric railways for two score, and bus systems now for almost a decade, have felt its influence. Their present-day carrying capacity as measured in billions of passenger-miles annually, is due in no small degree to Air Brake control.

Bus operators are in the business to carry more passengers more miles. Their objective is safe, comfortable, and swift miles of transportation. A vital factor in its attainment is the Air Brake.

Ability to make short stops without driver fatigue or rider discomfort, and continued assurance of adequate control, enable even large capacity buses to run at economy-promoting speeds in safety.

That power brakes are necessary to give modern motor coaches the capacity for profitable passenger mileage is gaining recognition from year to year. More operators are wanting Westinghouse Air Brakes—more manufacturers are supplying that want.

Living for and not off the Industry....

This expression, used recently of Electric Railway Journal by a well-known electric railway executive,* expresses exactly the guiding policy of the paper during its more than 40 years of service to the Industry.

In those seven words lies the reason why Electric Railway Journal has always been received in the light of a friend and counselor. Behind them is the spirit which was responsible for the recent presentation to this paper of the first Associated Business Papers' Award established in 1927 for Outstanding Editorial Service.

Electric Railway Journal

*Mr. Walter A. Draper, President,
The Cincinnati Street Railway Company.

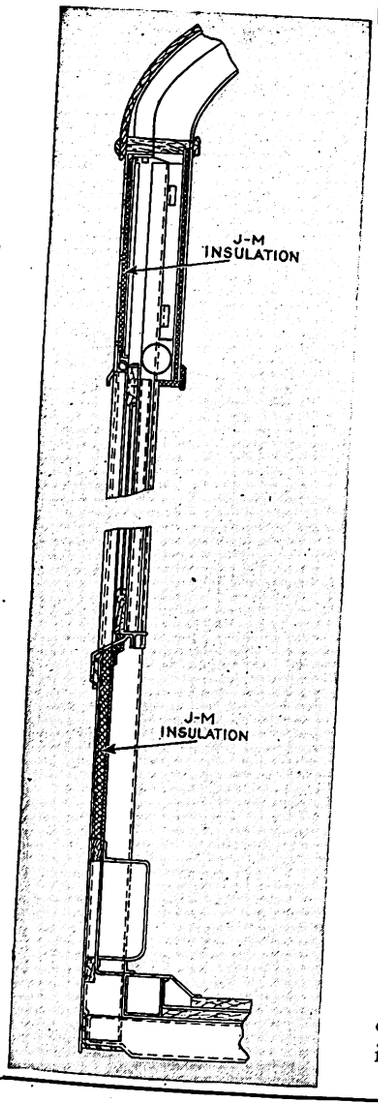
Pittsburgh Railways Company provides comfortable transportation for its passengers in many ways. The principle of car body insulation employed in these cars is in keeping with the spirit of modernity expressed by the comfortable seating arrangement shown here. Below is cross section diagram of J-M Insulation as applied to the body of a car.



Give *your* riders the *quiet comfort* of J-M Body Insulation

Rubber wheels cannot be used on high speed electric cars but the grinding noise of steel wheels, as well as car vibration can be largely excluded from the interior of the car by the use of J-M Insulation. This has been proved in actual operation. On one system alone, nine hundred high speed electric cars insulated by Johns-Manville are providing greater riding comfort for millions of passengers.

This insulation not only affords greater traveling comfort by keeping cars warm during cold weather, at reduced fuel cost, but it provides quieter operation and increased car comfort for passengers all year round.

In all types of electric railway equipment, the reduction of noise is becoming increasingly important. One street railway on the Pacific Coast has found the sound-absorbing quality of J-M Insulation an important asset in attracting passengers to its line.

J-M INSULATION *for* Cars *and* Buses

For many years J-M Insulation has been the standard insulation on steam railroad cars throughout the country. Its adoption by electric railways and bus operators has also grown rapidly to meet the higher standards of today set by a traveling public that demands every reasonable comfort.

J-M Insulation does not rot, pack down, or deteriorate. It retains its high initial insulating value long after inferior insulation has had to be replaced. It is easy to apply. It can be flanged around window posts, braces, carlines, purlins, uprights or any irregularities in sides, ends or roof framing, and can be curved to the radius of the decks.

Johns-Manville Insulation will play an important part in the reduction of excessive noise, and will afford protection during periods of extreme temperatures.

This is one of a series of advertisements directed originally to advertising men in an effort to make industrial advertising more profitable to buyer and seller. It is printed in these pages as an indication to readers that McGraw-Hill publishing standards mean advertising effectiveness as well as editorial virility.

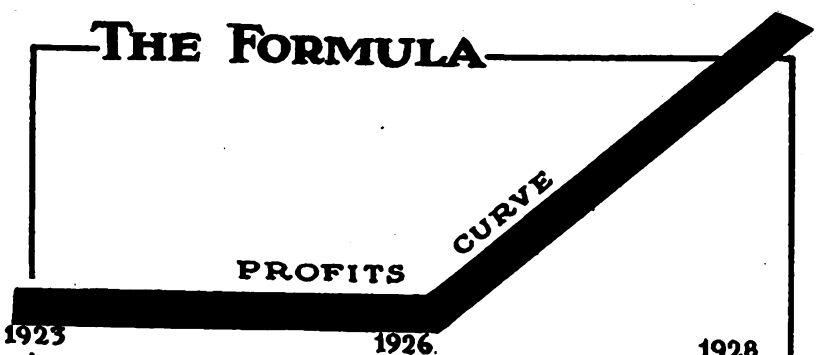
PATENTS EXPIRING!

what'll we do?
what'll <u>others</u> do?

BASIC patents on a machine used extensively by a specific industry were owned by the ABC Corp.

The XYZ Co. also made the machine, along with other products, paying the ABC people a royalty for every machine sold. The XYZ Co. chose to stay in business without making a practical profit on this particular product. *Why?*

Two years or so ago the patents expired. The expected happened. Dozens of manufacturers turned to making the machine. But instead of diminishing sales for the XYZ Co., there came increased sales, pyramiding profits and leadership in the field. This leadership is being maintained today by the same formula that was used steadily for three years before industry-at-large was free to make the machine.



During this three-year period, when XYZ's profits were barely enough to pay the patent owners, XYZ advertised regularly in McGraw-Hill Publications—building recognition for the future—intrenching themselves in a strategic position for the *post-patent period*.

Pyramided effects of continous industrial advertising sent sales and profits constantly upward after patents expired. A sustained advertising program of full and double pages, with pithy, factful copy, is keeping the XYZ Co. in top place. A clear-cut victory—not so much for McGraw-Hill publications but for Industrial Advertising strategically applied.

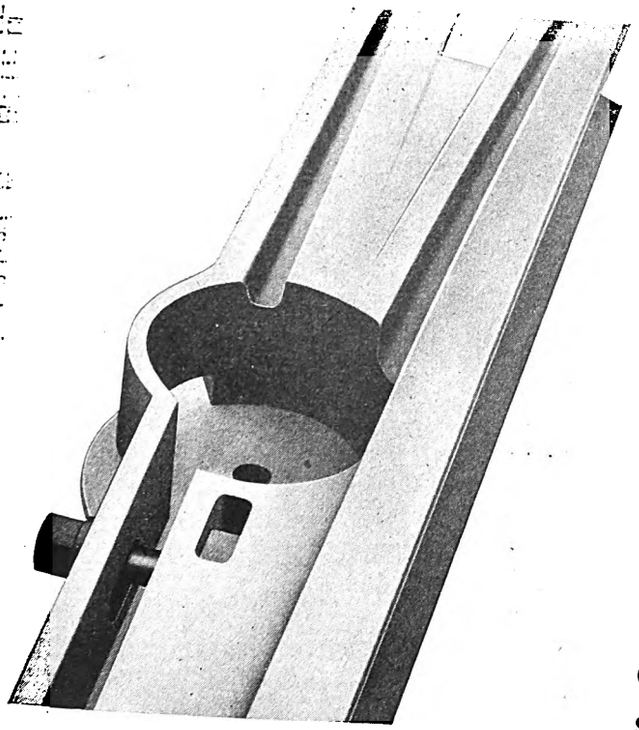
THE NEW WHARTON SWITCH

Designed For Minimum Maintenance.

...no kick-up...no moving forward no holding-down device



The Wharton Flexible Wall Switch has a heel tightening device based on the principle of a split collar. By means of a bolt the wall is flexed or drawn in until it hugs the tongue heel; thus all play caused by wear is taken up. The nut of this bolt is located in the drain box and is readily accessible.

The tongue pin is 9½" in diameter and is 6" deep. This construction eliminates a holding-down device, prevents kick-up and forward movement of the tongue.

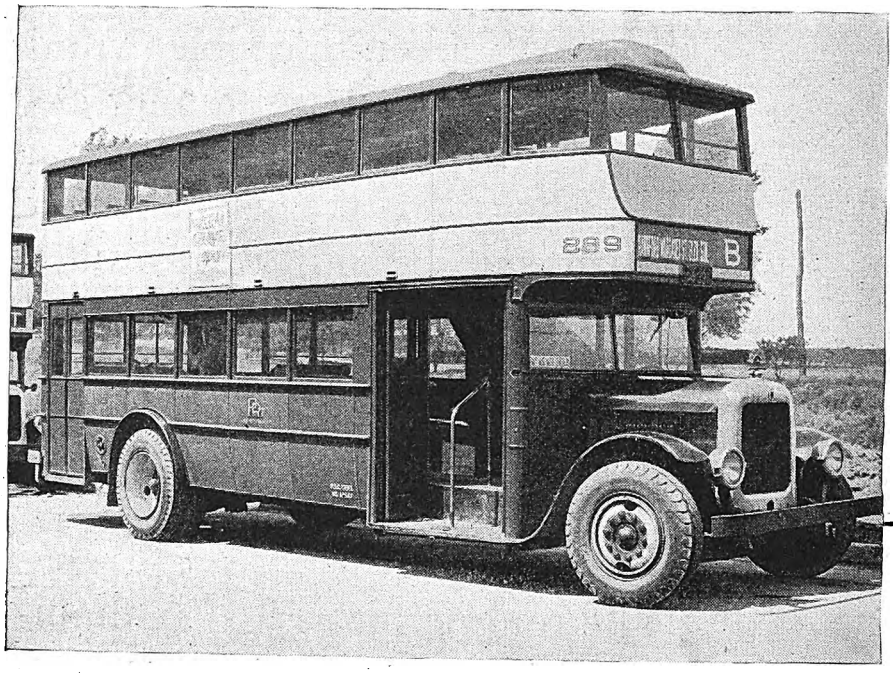
ONE OF THE LARGEST BUS TRANSPORTATION COMPANIES IN THE UNITED STATES

Equips its Busses Exclusively with Goodrich HEAVY DUTY Silvertowns



Stairways forward, one man operation, Goodrich fender flaps and Goodrich Heavy Duty Silvertown pneumatic single tires on fronts and dual pneumatics on rears are some of the operating efficiencies featured on this new P.R.T. Line's (under Mitten Management) Philadelphia, Pa. double deck busses.

"SPEED . . . uninterrupted service . . . comfort"—these are axioms on the P.R.T. And the qualities that make for speed, uninterrupted service and comfort are the qualities that are built into Goodrich Heavy Duty Silvertown Bus Tires.

On the basis of actual mileage delivered the third largest bus line in the United States operates its busses exclusively on Goodrich Heavy Duty Silvertown Tires.

Over six hundred busses used in both city and interurban bus transportation service are Silvertown equipped.

Speed up your own busses. Give your patrons uninterrupted service. Equip your busses with Goodrich Heavy Duty Silvertown Bus Tires . . . for comfort, for efficiency, for economy!

The B. F. Goodrich Rubber Company, Established 1870, Akron, Ohio. Pacific Goodrich Rubber Company, Los Angeles, Calif. In Canada: Canadian Goodrich Company, Kitchener, Ontario.

7 SUPERIOR SPECIFICATIONS

Built Into Every Goodrich Silvertown Bus Balloon Tire

1. Heavily insulated stretch-*matched* cords.
2. Additional *adhesion*—from greater insulation between outside plies.
3. Heavy *twin* beads for better rim seating.
4. Extra gum *fillers* between plies for longer tire life.
5. Heat-*resisting*, interlocking cord *breakers*.
6. Tread designed *correctly* for heavy duty service.
7. The whole tire toughened by the famous Goodrich *"water cure."*

Lexington sets the pace for cities of 60,000

with Yellow Coaches

LEXINGTON, KY., from the local-transportation man's viewpoint faced a most serious problem—the same basic problem that confronts most American cities. Automobile owners were increasing each year at an alarming rate . . . . costs were mounting . . . . riding was decreasing.

An alert management studied the problem, evolved a plan and went to work. Now Lexington has increased riding 43 per cent and revenues 78 per cent despite the competitive conditions. Their experience points the way for other modern transportation merchants.

Digitized by Google

Figures that tell a story of Local Transportation Progress in Lexington, Ky.

	1918	1928
Passengers, Trolley	3,992,270	3,898,865
Bus	.....	1,805,807
Total	3,992,270	5,704,672
Revenue per passenger (cents)	5.8	7.6
Population	41,247	60,312
Per cent of Rev. Pass., Trolley	100	68.3
Per cent of Rev. Pass., Bus	0	31.7
Motor vehicles registered	3,800	13,472
People per automobile	10.8	4.48
Yellow Coaches	**0**	**14**
Other makes	0	7

Ten years ago Lexington, Ky., had a population of 41,000. Trolley service exclusively. Revenue per passenger 5.8c. And only 3,800 private automobiles registered, or 10.8 people per automobile.

Then Lexington grew into a city of 60,000. Private automobiles in Lexington increased to nearly 13,500. Instead of 10.8 people per automobile the figure changed to 4.6.

To stem the tide of such conditions, so typical of many other cities of similar size, called for progressive thinking and action on the part of the public transportation company. Old equipment and former policies could not furnish the answer.

And so the street car system was modernized. New and more attractive rail equipment was secured. Then in 1925 motor coach service was added and co-ordinated with the trolleys. Now 14 city service 21-passenger Yellow Coaches give to Lexington the proven benefits of co-ordinated transportation.

The results received from this modernization program have been definite and outstanding. Revenue passengers increased 43 per cent, rate of fare 31 per cent while passenger revenue per capita increased 28.7 per cent, *or nearly equal to the rate of fare increase.* During this period motor

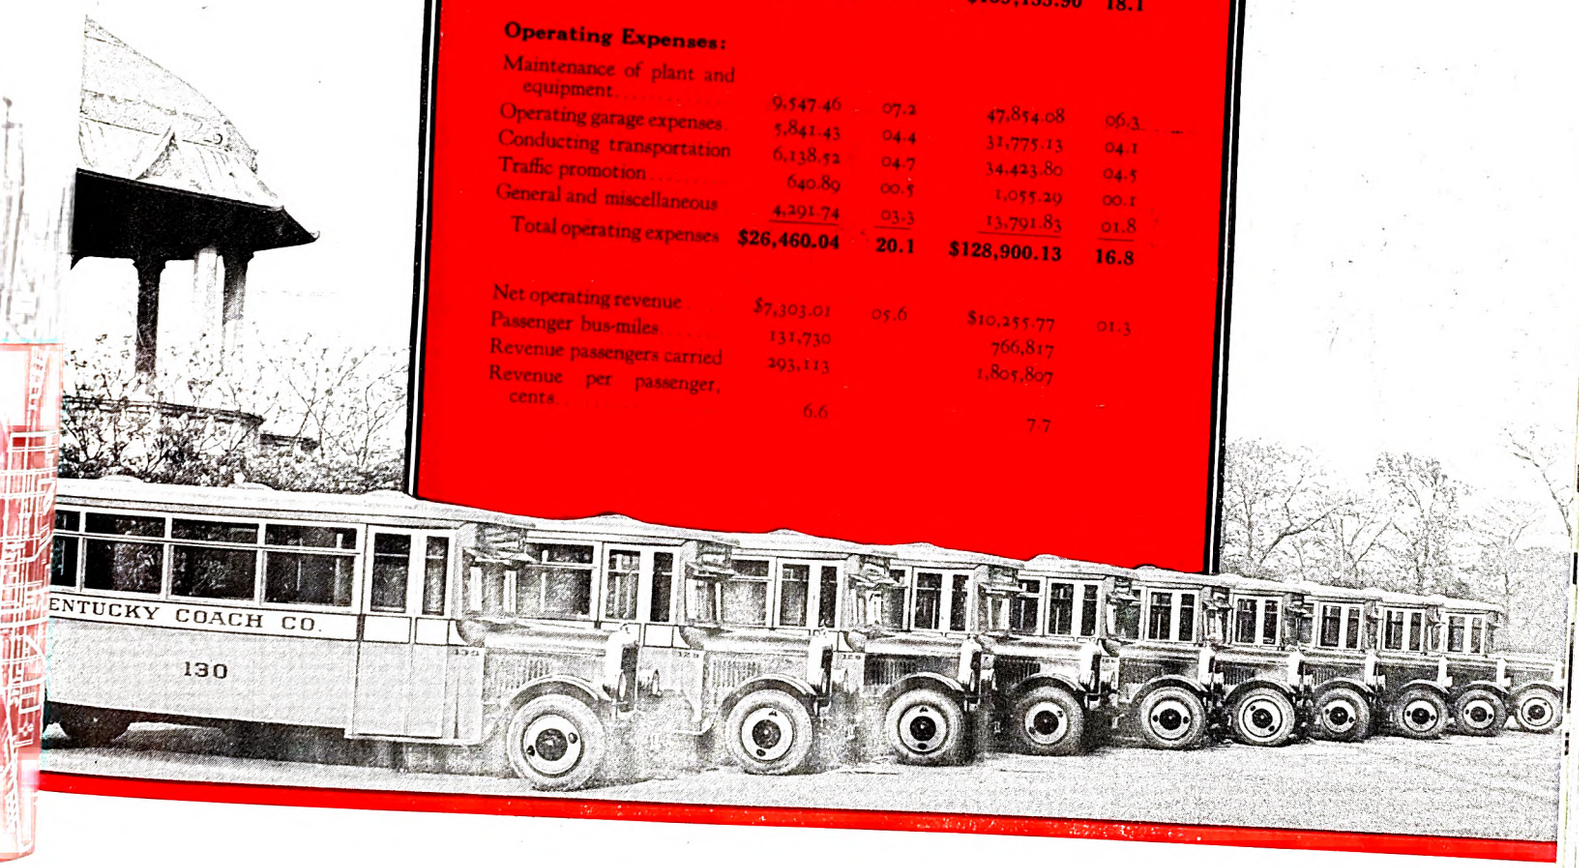
Kentucky Coach Company
Comparative Income Statement
for 1925 and 1928

	Seven Months Dec. 31, 1925		Twelve Months Dec. 31, 1928	
	Amount	Per Bus-Mile (Cents)	Amount	Per Bus-Mile (Cents)
Passenger revenue	**$19,157.03**	**14.5**	**$139,155.90**	**18.1**
Operating Expenses:				
Maintenance of plant and equipment	9,547.46	07.2	47,854.08	06.3
Operating garage expenses	5,841.43	04.4	31,775.13	04.1
Conducting transportation	6,138.52	04.7	34,423.80	04.5
Traffic promotion	640.89	00.5	1,055.29	00.1
General and miscellaneous	4,291.74	03.3	13,791.83	01.8
Total operating expenses	**$26,460.04**	**20.1**	**$128,900.13**	**16.8**
Net operating revenue	$7,303.01	05.6	$10,255.77	01.3
Passenger bus-miles	131,730		766,817	
Revenue passengers carried	293,113		1,805,807	
Revenue per passenger, cents	6.6		7.7	



vehicular registration had increased 92 per cent per 1,000 population.

The motor coaches now carry approximately 30 *per cent of the riding load.* Even in the face of this figure the trolleys show no appreciable loss in number of passengers carried—for Lexington has learned to leave its private automobiles at home and depend more on the dependable form of public transportation offered.

To keep pace with traffic growth on the heaviest through routes and to extend its radius of operation, cars and buses are operated on alternate schedules to give five minutes headway through the heart of the city. Thus through co-ordination of both equipment and schedules, a greater frequency of service is possible—so essential to the continued progress of small city development.

New routes are being covered by the coaches. New residential sections are being developed. More and more people are being served. More and more miles are being operated. Headways are more frequent. Public re-

with Yellow Coaches

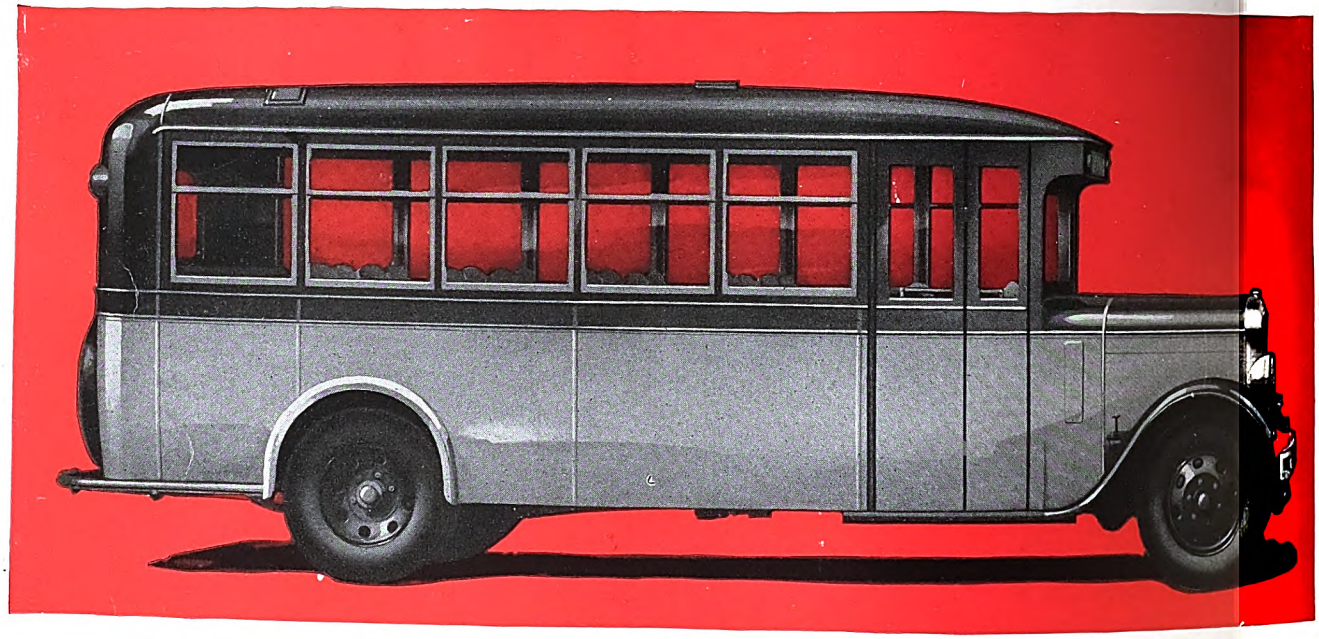
Type W 21-passenger city service coach.

Its rider appeal, performance and low operating cost make it the ideal vehicle for small-city service.



lations could hardly be better and, thanks to efficient management and carefully chosen equipment, *motor coach operating expenses have dropped from 20.1 cents in 1925 to 16.8 cents per coach mile in 1928.*

Lexington is solving its transportation problem and what Lexington is doing proves that there *is a way* for the alert small-city street car system to meet the competition of private automobile ownership, to protect existing investments, and at the same time contribute to the progress and development of the community.

Well planned co-ordinated transportation, utilizing the best of modern equipment, surges forward where experimental haphazard methods fail.

The motor coaches of the Fort Dodge, Des Moines & Southern Transportation Company, Boone, Ia., are 100% Goodyear-equipped

3,600 Bus Miles Daily in Iowa

A large motor coach operation in Iowa raises problems more acute than those encountered in many states. First of all, Iowa is rural, with many miles of country roads between its cities. Every type of weather and road condition has to be met. There are snow banks to buck in winter—a constant possibility of mud in any season.

It is a test to show what the famous traction of the Goodyear All-Weather Tread adds to a tire, as well as a test of straightaway mileage.

Consequently, these facts take on special interest. "Our routes cover 475 miles of Central Iowa highways, principally graveled, with a meager percentage of paved roads. The regular scheduled bus mileage throughout the year will average 3,600 miles daily and will be somewhat augmented by special or charter bus operation.

"We have been extremely well impressed with not only the tire mileage obtained from Goodyear Tires, but also with the efficiency of Goodyear service during the past two years in which our thirty-three buses have been exclusively equipped with Goodyear Tires." These words were written by C. H. Crooks, President, Fort Dodge, Des Moines & Southern Transportation Company.

The highest individual distance traveled by a tire in this operation has been 70,601 miles. Another of these Goodyears has run 65,623 miles, and five more have each traveled more than 50,000 miles.

This certainly is an example of fitting the right tire to the hauling duty. Goodyear Truck and Bus Tire Service Station Dealers everywhere are equipped to render the same service to you.

For every Goodyear Cord Bus Tire there is an equally fine Goodyear Tube, built especially to the needs of bus service

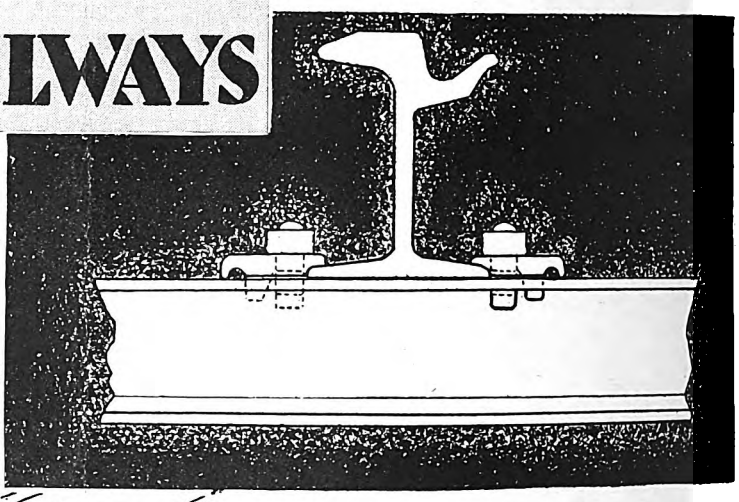
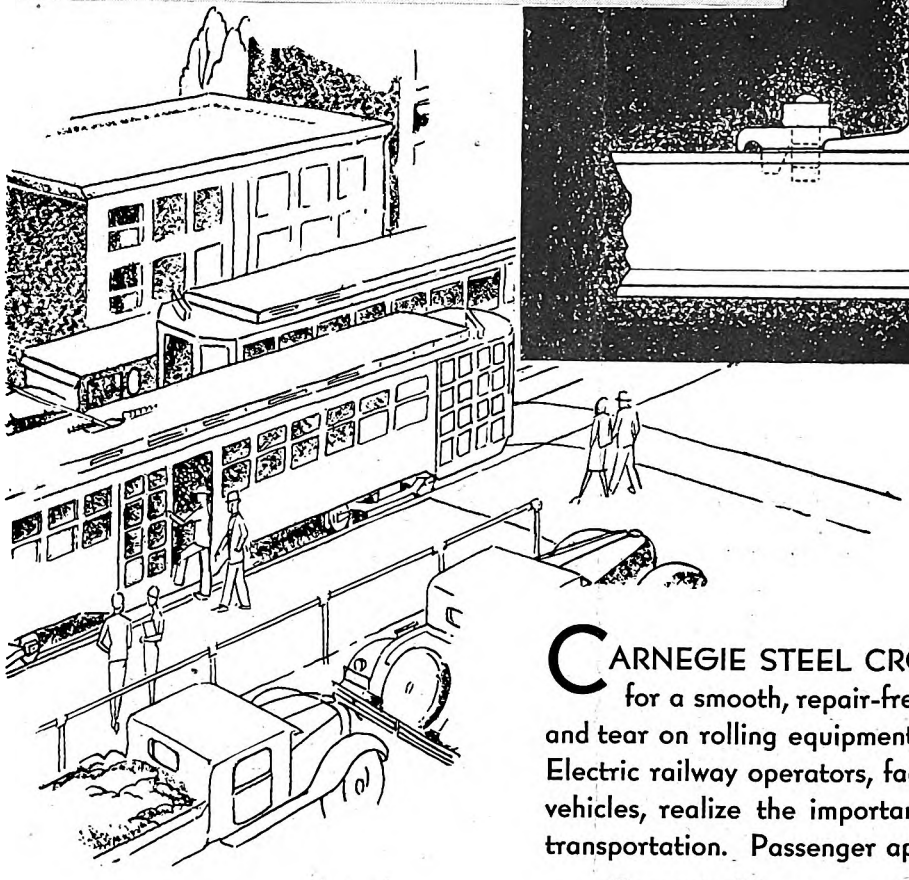
CROSS TIES *for* STREET RAILWAYS





CARNEGIE STEEL CROSS TIES provide the foundation for a smooth, repair-free track — a track that saves wear and tear on rolling equipment and greatly enhances its comfort. Electric railway operators, facing the competition of automotive vehicles, realize the importance of providing safe, comfortable transportation. Passenger appeal begins with the track.

Carnegie Ties are easily installed. The bolt and clip by which the rail is secured are simple and efficient. The unit cost (cost per foot of track per year) is considerably less than for wood ties.

Plan to include Carnegie Steel Cross Ties in your 1930 track construction program. It will prove to be an investment that pays dividends—particularly in passenger satisfaction.

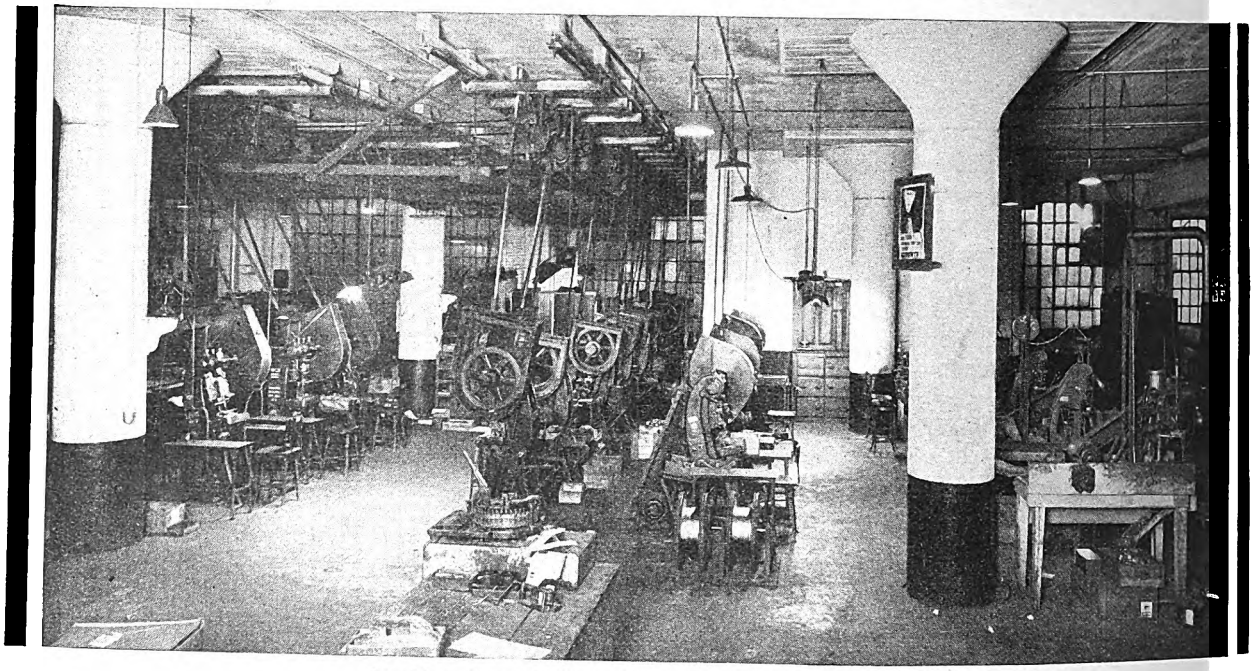
Making BRUSHES exactly to your specifications



Machines for attaching shunts. Plating room in background

MANY National Pyramid Brushes are supplied with shunts, and where necessary are copper plated at the point of attachment to insure a low resistance contact between brush and shunt.

This work is done entirely in our own factories. After the brushes have been sawed and ground to exact size additional special machine operations are performed preparatory to attaching the shunts. Our styles of shunts are standard and meet all requirements of the electrical industry.

The distinguishing visible feature of each shunt is the Silver Strand Cable. This is one of our registered trade-marks, just as much an identification of National Pyramid Brushes as are the letters NCC and the three pyramids. As you pass through power plants, factories, mines and industries the country over, look at the electrical machines. It will not be necessary for you to ask what brushes are being used. The Silver Strand Cable is easily discernible, regardless of how much of the brush itself may be concealed by the brush holder.

The final operation before shipment is a rigid test and inspection. Tests are made for connection resistance, between shunt and brush. Size, angles of bevels, length of shunt and any other special items on the original order, are all checked and verified. Brushes are then carefully wrapped and packed for shipment.

This ends the manufacturing history of National Pyramid Brushes. Over 65 days have been consumed. At least 36 major operations have been performed. Innumerable minor processes have been applied. Scientific tests and controls have been applied constantly. Short cuts have been avoided. And thus the performance of National Pyramid Brushes is safeguarded and the uniformity of grade assured.

An interesting moving picture film illustrating in detail the processes used in the manufacture of carbon brushes will gladly be shown on request to any organization of engineers or students.

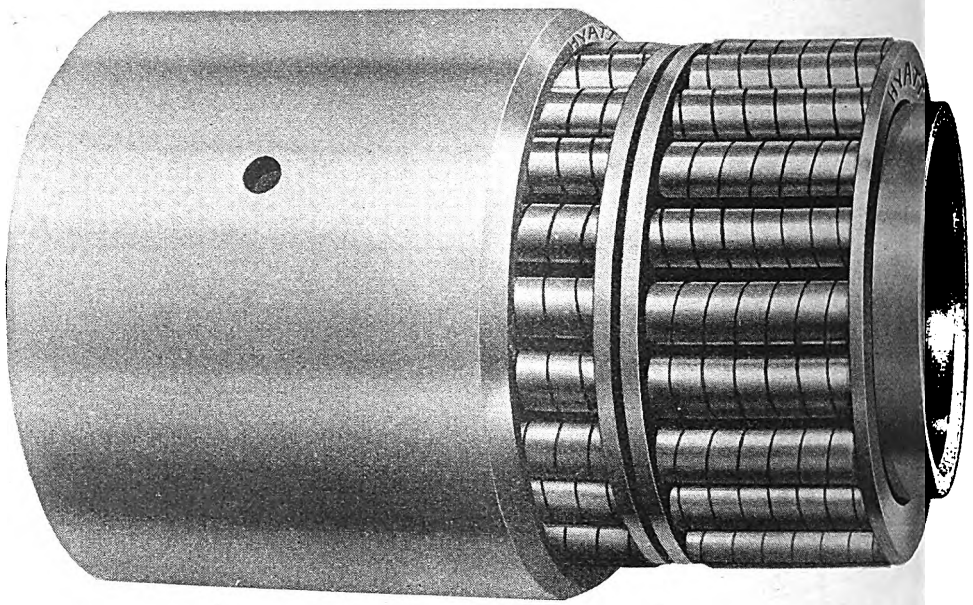
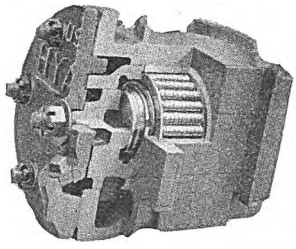
SAVING and SERVING —*the Hyattway*

THE many annoyances and power-waste of friction bearings may be banished forever with Hyatt Roller Bearings in your car journals.

Smooth starts, rapid pickups, quiet and easy running are further Hyatt contributions to greater passenger comfort, punctual service and economical operation.

In Hyattized journal boxes the sturdy Hyatt bearings rotate with the wheels in a natural, easy motion and, by reducing friction and drag, they cut power costs appreciably.





The Hyatt Roller Bearing Journal Box for Railway service—sectioned to show construction.

The only attention Hyatts ever require is an occasional oil inspection and replenishment at infrequent intervals. Hyatt journal boxes are installed to keep the cars busy earning profits instead of wasting time in repair shops.

The many advantages and economies to be derived from the application of Hyatt Roller Bearings are worth investigating. Every A. E. R. A. requirement for standard equipment or replacement is met.

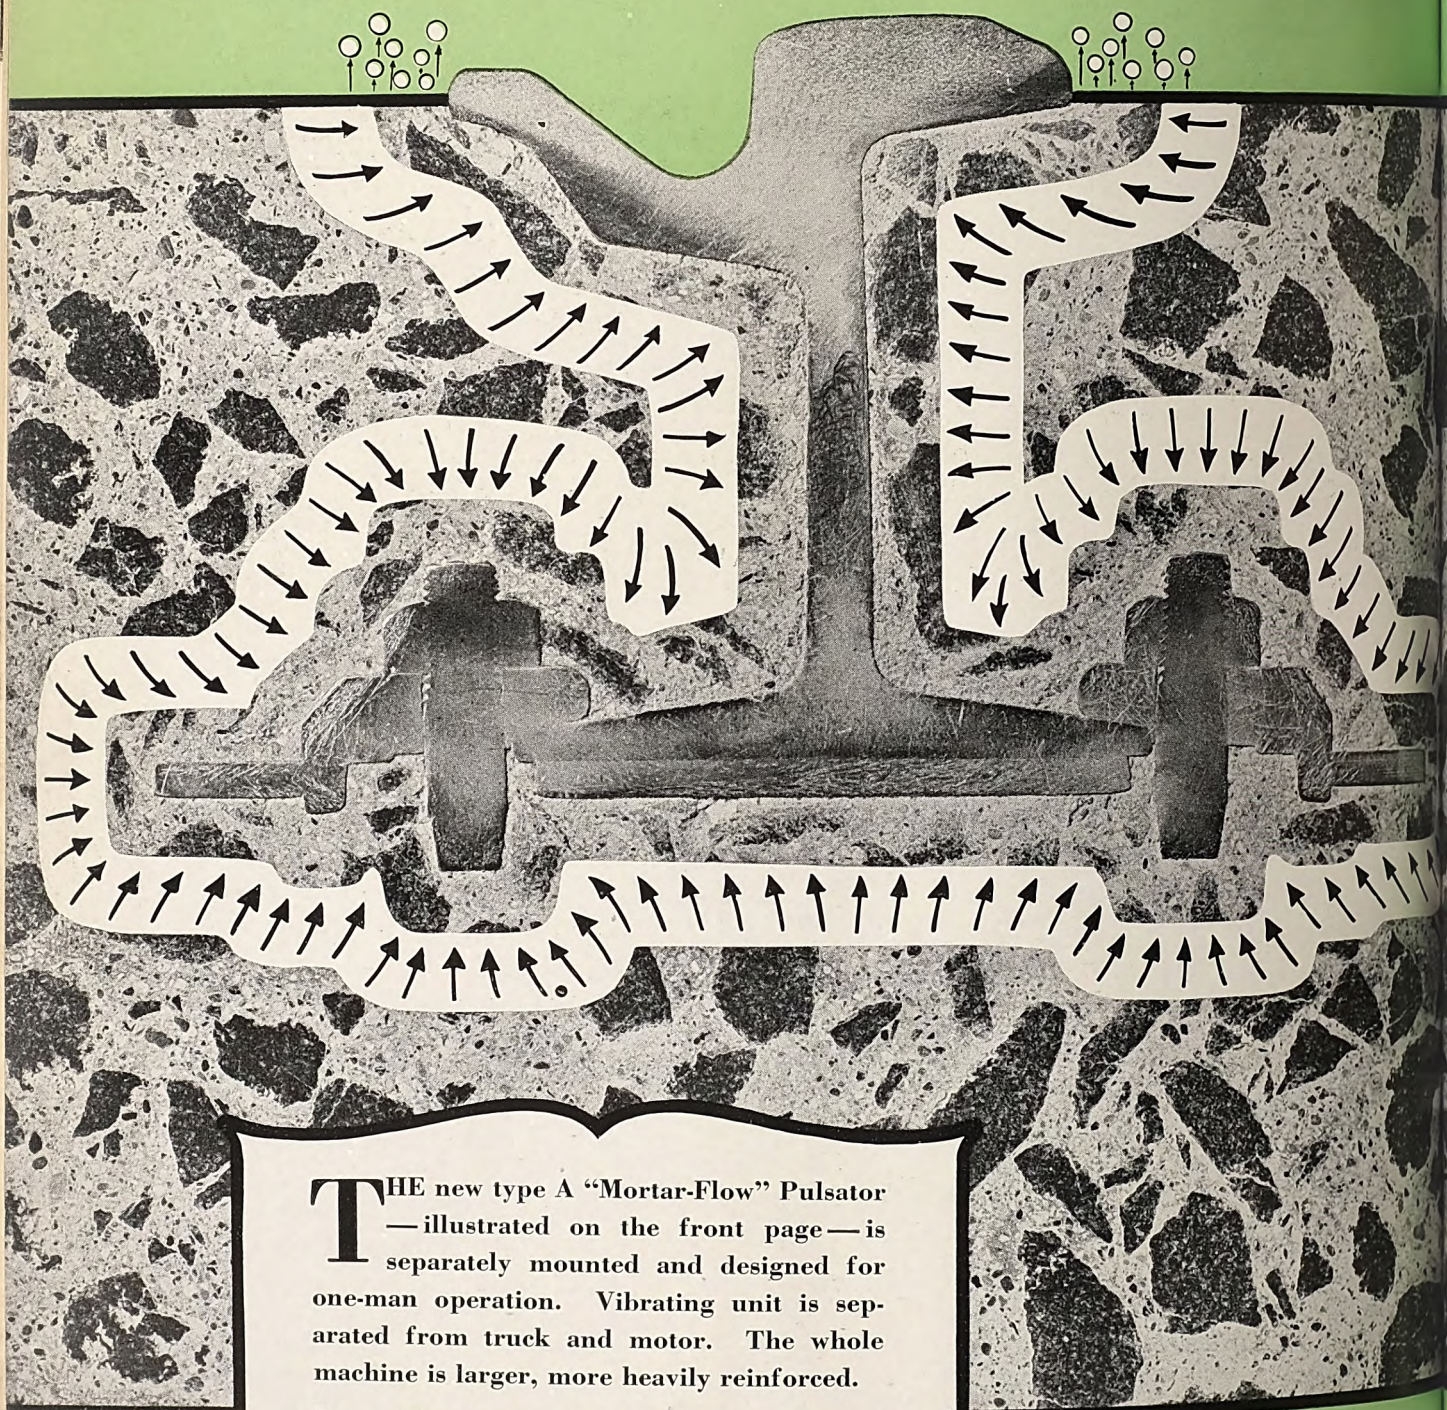
Improved Field Tested

"MORTAR-FLOW" PULSATOR

Pulsator's Vibrating Action

ALL VOIDS
"A 300% BETTER BOND



THE new type A "Mortar-Flow" Pulsator — illustrated on the front page — is separately mounted and designed for one-man operation. Vibrating unit is separated from truck and motor. The whole machine is larger, more heavily reinforced.

Force of vibration is regulated by a speed control on the motor. Operating control is automatic push-button type starter. An interval timer is supplied so that the "Mortar-Flow" treatment may be more uniformly applied.

The "Mortar-Flow" principle combined with the D. S. R. Track Layer, the Mechanical Tamper and the new International "Uniform Tension" Bolt Tightener, produces a track construction unapproached—for durability and economy — by any other track laying method.

THE STEEL

Digitized by Google

VANISH

BETWEEN STEEL AND CONCRETE

CAUSE:

Graphically is presented the action that takes place when rails are vibrated and concrete is agitated by the new International "Mortar-Flow" Pulsator. Follow the arrows. Observe how water comes to top of slab, and air bubbles are driven out, how mortar is forced to flow downward, how it covers and bonds the steel of rails and tie.

EFFECT:

The finished result obtained by the use of the "Mortar-Flow" Pulsator has no counterpart in paved track construction. Voids vanish, a dense water free concrete clings tenaciously to rail and tie; completely seals the entire structure from end to end with a 300% better bond that makes every-foot-of-track-just-like-every-other-foot.

In the unretouched photograph of the test section, observe the manner in which the dense, waterfree concrete fills every minute crevice around the rail and tie. There are no voids when the "Mortar-Flow" principle is used in paved track construction.

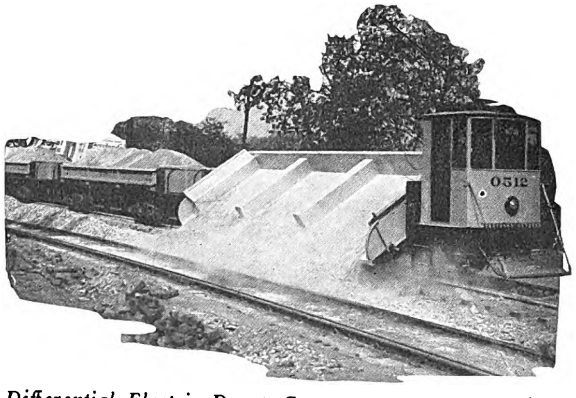
Better Equipment Means Better Track and Lower Costs

Differential Electric Locomotive Crane Cars

IMPROVE TRACK LAYING METHODS
MAKE POSSIBLE BETTER TRACK CONSTRUCTION
REDUCE COSTS
SAVE TIME
REDUCE TRAFFIC INTERFERENCE

The Differential Electric Locomotive Crane Car combines the advantages of the pillar type and the lift-boom type of crane. It can work under trolley wires with boom horizontal or can boom up allowing 26 feet headroom under the end of the boom. The crane has a capacity of five tons for radii up to 26 feet and two tons for radii up to 44 feet. Safe, reliable, speedy, and operates with one man. Useful in handling rail, ties, track work, bridge timbers, poles, and structural steel.



Differential Electric Dump Cars are standard work car equipment on nearly seventy Railways. They have played an important part in modernizing track-laying methods.

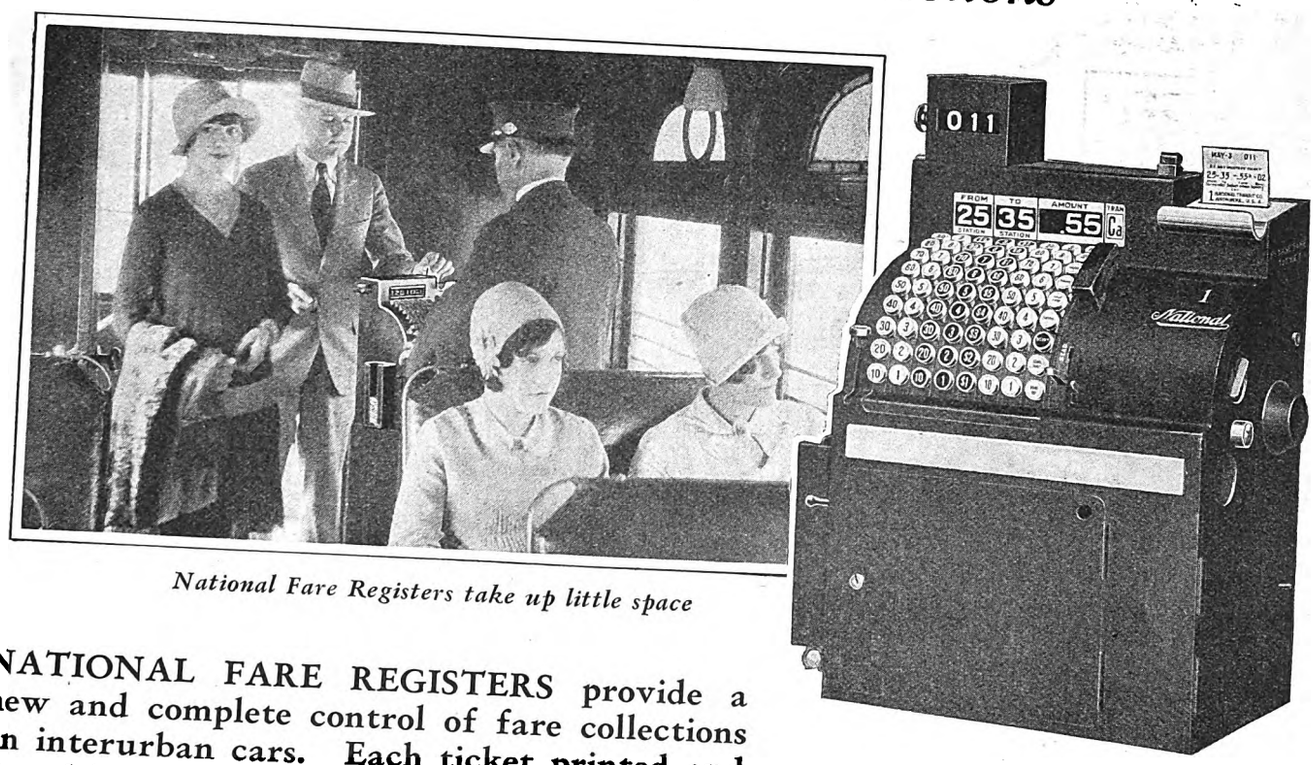
The National Fare Register

gives a new and complete control over interurban fare collections



National Fare Registers take up little space

NATIONAL FARE REGISTERS provide a new and complete control of fare collections on interurban cars. Each ticket printed and issued by the register must be a true record of the fare because the passenger would not accept a ticket for an amount less than paid.

Once the record is made, the money must be accounted for, because the amount is added on a total and printed on the trip sheet inside the register. These safeguards give complete control over every fare collected.

Other advantages such as passenger indication, public indication of fares and fare points, easily operated keyboard, repeat key, together with speed in operation and economy in upkeep, make National Fare Registers the best system for interurban fare collections.

The new proven method of lubricating car journals

With the progress that has been made in electric railway methods, equipment and rolling stock, it was inevitable that an improvement would appear in lubricating methods and lubricants.

Formerly all car oils were made in two grades—summer and winter. Sometime ago the Standard Oil Company began developing light bodied oils designed to meet the requirements of electric railway service for year 'round operation. The result was Superla Car Journal Oil.

Superla Car Journal Oil has set a new standard of car journal lubrication, casting into obsolescence the old theory that different grades of oil were necessary for winter and summer operation. It has proven successful in all seasons in high speed interurban and ordinary street car service. It has made possible marked savings in power and waste consumption, increased the life of bearings and reduced bearing temperatures.

This modern method of lubricating car journals offers such attractive economies and improved lubrication that you'll find it well worth investigating. One of our engineers will be glad to give you complete information.

An article written by one of our engineers discussing the use of light oils for car journal service contains much valuable information and shows many tests that have been made.

If you are interested in reducing lubrication costs you'll find this article well worth reading. We will be pleased to send a copy at your request.

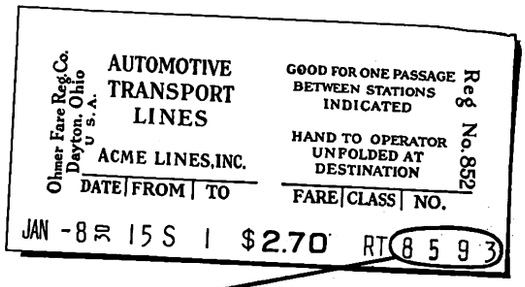
Here is a section of the detail strip from a Class 80 Register. Because of the wide detail strip (4¼ inches) a complete record with proper column spacing is made possible.



Tickets issued from OHMER Registers give exactly the same information as the detail strip. They are of the same shape and size, and have the same value to passengers as purchased railroad tickets.

8593

Consecutive Number on Detail Strip *and* Ticket

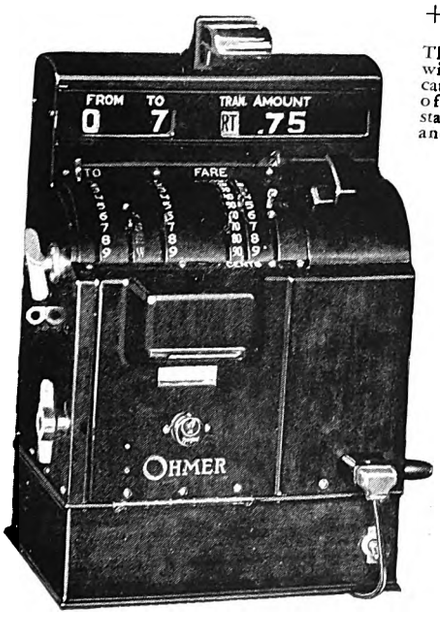
Only OHMER *gives you this added protection*

HERE'S a feature that you need on all your ticket-printing fare registers. It's a feature that was developed by transportation specialists to give you added protection through a complete check on every sale.

When the consecutive number appears on detail strip *and* ticket, you can positively identify each ticket with the corresponding sale on the detail strip. You can save time by auditing fares consecutively . . . a system impossible with any other register. You can make checking definite and simple.

And in addition, the detail strip carries the operator's number . . . another feature that makes the audit of sales even more positive and more accurate.

Other information appearing on the detail strip and ticket is the *Date,* the *From* and *To* stations, the *Division* traveled, and the *Amount* and *Class* of fare. No other fare register in the world gives so much information and so much protection.



+ + +

The Class 80 Register with large visual indicator shows the numbers of the From and To stations and the amount and class of fare. This register has the exclusive OHMER pre-indicating feature which makes it possible to detect mistakes before registration. Repeat tickets can be issued by pressing a single button. The register is electrically or manually operated.

Now . . . a more perfect "On and Off" Check

Our transportation specialists have devised a new "On and Off" check. It is simple, accurate and sure. We want you to see how it works. Send for your free copy of the folder in which it is completely described.

The TRAIN OF 1860 celebrates Light's GOLDEN JUBILEE

FOR half a mile, distinguished celebrants rode to "Menlo Park" in this quaint relic of the dear dead days—when lights were not electric and when cars were warmed by stoves. You can see the chimneys of these fine old inefficient, fatally dangerous "heaters".

For half a mile—then the guest of honor gayly said, "Well here we are, all safe and sound".

It was not until 1879, the birthday of electric lights, that Edward Gold presented the first of the famous Gold heating appliances.

Yes, 1929 is also *Gold's Golden Jubilee.*

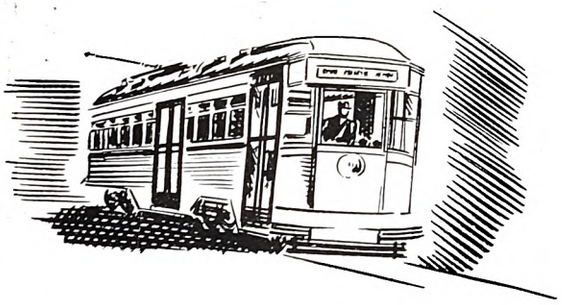
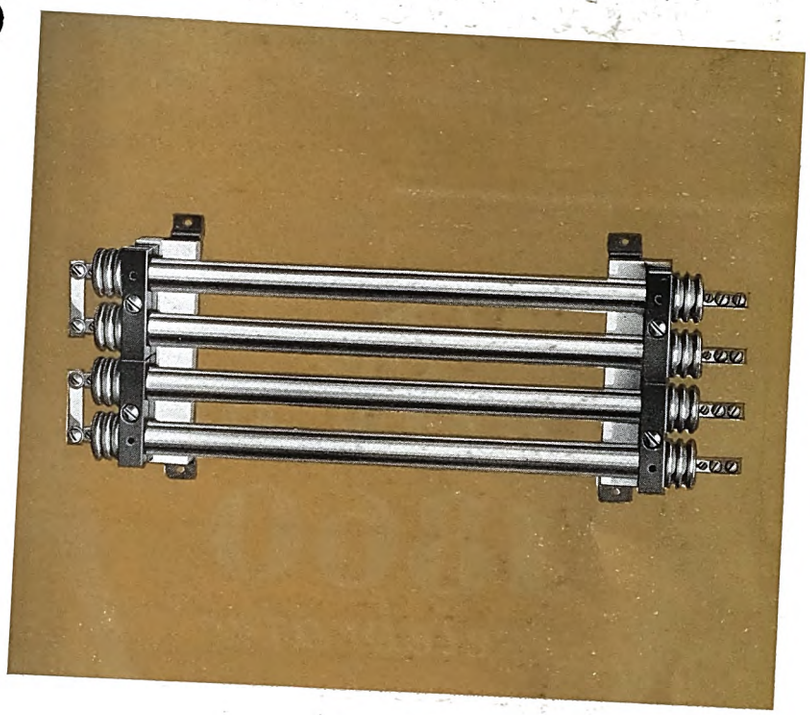
The Train of 1929 pays tribute to GOLD'S GOLDEN JUBILEE





High Voltage Heater for 3000 Volt Circuits

As used in heater shown above, resistance coil No. 19 B. & S. gauge Super-Nichrome wire No. 4, is the heaviest employed in any high voltage heater and is positively placed in center of lavite tube insulator.

This insulation has a compressive strength of 20,000 to 30,000 lbs. per square inch and a dielectric strength of 75 to 250 volts per thousandth of an inch in thickness.

Tubes are interlocked and have a ¾" maximum air gap.

After assembly, coils are embedded in a special cement, which substance is most inert at high temperatures. The specific resistance at a temperature of 800° C.-1472° F. is 30,800 ohms.

This construction guarantees a dielectric strength from coil to tube of 5,000 volts and with secondary insulation a dielectric strength from coil to heater case of 10,000 volts.

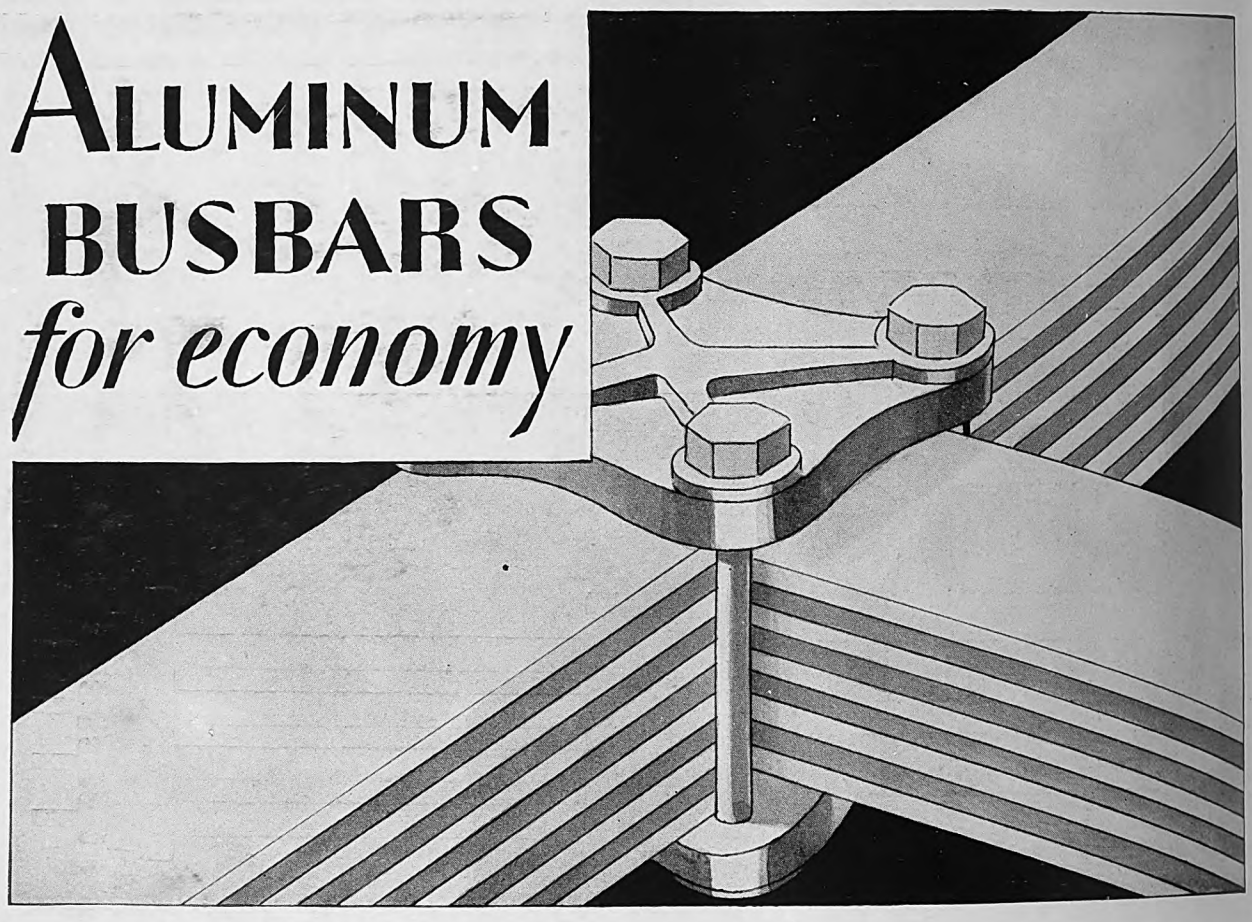
ALUMINUM BUSBARS *for economy*



FOR years the most important nations of Europe have standardized on Aluminum Busbars as most economical and satisfactory for transmission purposes. In this country the steadily widening use of Aluminum Busbar clearly shows the way it is regarded by American engineers.

The booklet, "Aluminum Busbars," contains tables of weights, carrying capacities and physical properties, with installation photographs. Please send for your copy.

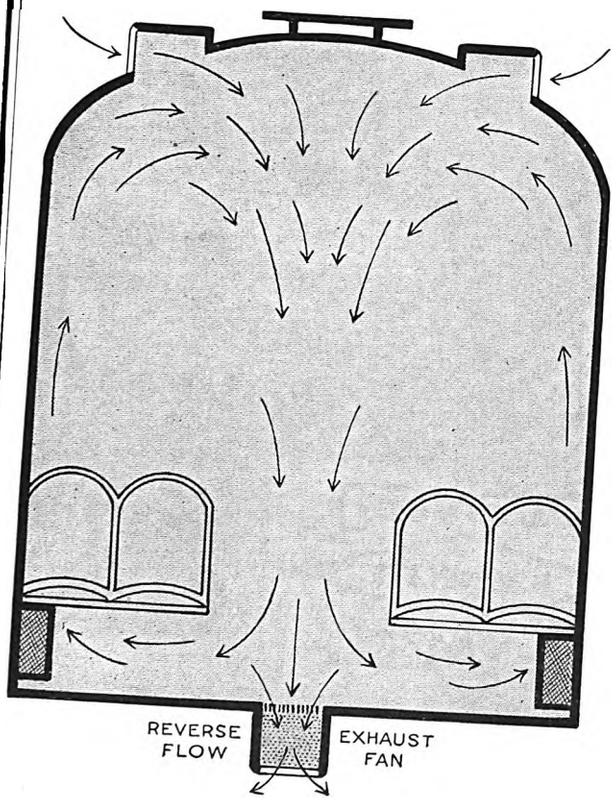
PETER SMITH
Reverse-Flow Ventilating System
(Patent Applied For)

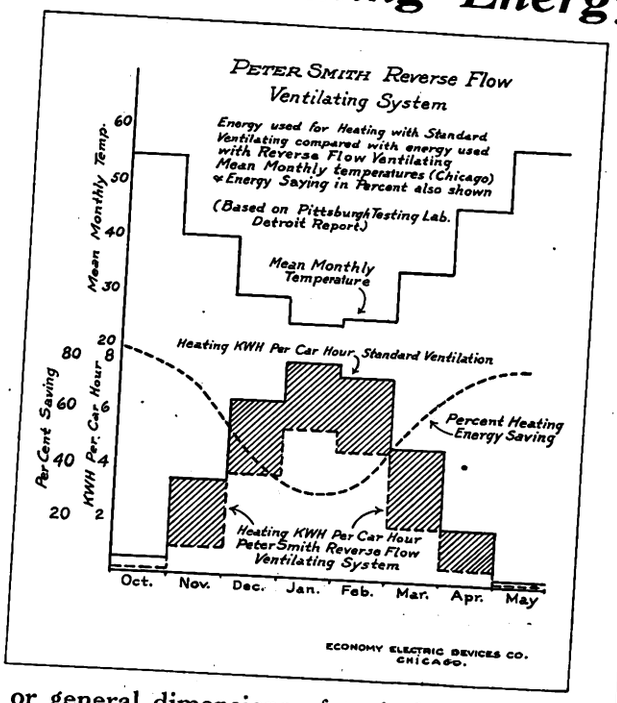


COMPLETE VENTILATION

Motor-driven specially designed exhaust fans mounted in the floor exhaust the cold, foul air from the bottom of the car, assuring positive forced ventilation. Rated so as to give a complete air change every four minutes. The heated air rises along the sides of the car and is mixed with incoming fresh air from roof intake ventilators. This method of ventilation assures vastly better air conditions at breathing line.

plus
25% to 50% Saving in Car Heating Energy

In addition to better ventilation, tests conducted by the Pittsburgh Testing Laboratories indicate a substantial saving in energy used for car heating. This saving is obtained by exhausting the coldest air from the floor line of the car. Present gravity exhaust systems discharge the hottest air at top of car. The curve indicates savings to be expected under normal weather conditions. The savings shown will pay for complete installation in two years.



Write for a copy of the Detroit test. Send plan or general dimensions of typical car for recommendation and quotation.

Coffin Award *and* Speed Cup *to* HASKELITE User

FOR the seventh consecutive year HASKELITE congratulates one of its customers on winning the Coffin Award. The winner of the 1929 Award—the Chicago, South Shore & South Bend Railroad—has been a consistent user of HASKELITE plywood and PLYMETL. Every Coffin Award since its inception has gone to a HASKELITE user.

Additional tribute to the performance characteristics of these materials is seen in the fact that the South Shore also won the Electric Traction Speed Cup, for being the fastest interurban in 1929. And the runner-up, the North Shore Line, also uses HASKELITE products.

Our valuable booklet of street car and bus applications is available without charge to executives on request.

A TROLLEY WHEEL —seems to be a simple thing

BUT it isn't. It has to race along the wire, rain or shine, sparking when ice collects, pounding against trolley ears, and keep running smoothly all the time.

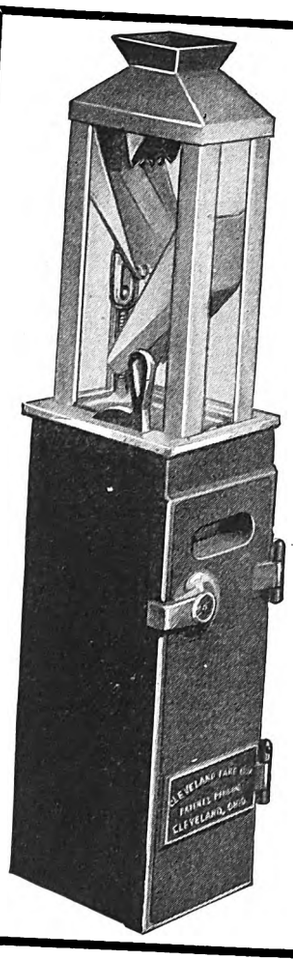
KALAMAZOO

trolley wheels and harps are built by experts — experts who devote their time and energies to no other task. Kalamazoo trolley wheels are the result of over a quarter of a century of study. Is it little wonder that they have received the respect of the industry—that they are standard equipment wherever the best is recognized?

May we send you bulletins and complete information?

The Star Brass Works

KALAMAZOO, MICHIGAN



Meets Any Change In Fare or System

A change in the rate of fare or fare collection system necessitates no change in your Fare Box equipment, if your fares are collected with the aid of the Cleveland.

They accommodate fractional fares, flat fares, either paper or metal tickets—Zone fares are successfully collected with the "Cleveland."

BOYERIZED PARTS
—add service life to old cars

When you replace worn out parts with Boyerized, you add greatly to the car's life. These parts outlast those made of untreated steel three to four times — reduce replacements 50 to 75%.

Next car in the repair shop—put in Boyerized Parts — compare them with similar parts on a new car. You'll find the Boyerized car will give the new one a "run for its money."

Check the parts you need on the list opposite—send along your order—*it will get prompt attention.*

"Canned Experience"
—for Electric Railway Men

The Most Efficient Methods Are Those Tested and Perfected by Men Recognized as Experts

The world's best research in the Electric Railway Industry is contained in these McGraw-Hill books. They have been written by noted engineers and authorities. From them you will gain a priceless heritage of "canned experience" which will give you a better grasp of your task and fit you for added achievement.

Richey— 1

Electric Railway Handbook

Second Edition, 798 pages, flexible, pocket size. 528 illustrations, $4.00.

A thoroughly revised reference book of practical data, formulas and tables for the use of operators, engineers and students. It gives the essential reference data on all phases of electric railway construction and operation. It presents: (1) Data on subjects which come up in everyday railway practice. (2) Material of service to the non-technical manager or operator. (3) Reference material on electric railway practice for those who are specializing in other or allied lines.

Healy— 2

Electrification of Steam Railroads

Published May, 1928.

By KENT T. HEALY, Assistant professor of Transportation, Yale University; formerly Inspector and Cost Engineer, The New York, New Haven and Hartford Railroad.

395 pages, 6x9, 165 illustrations, $5.00.

This book combines the description of the physical characteristics of the elements of electrification with the analysis of economic problems and the operating performance of both electrification and electric operation. Special emphasis is given to such topics as power supply contracts, overhead distribution systems and economic data.

Harding— 3

Electric Railway Engineering

Third Edition, 480 pages, 6x9, 248 illustrations, $5.00.

A thorough revision of this standard work on the theory and practice of electric railway engineering. The book covers the principles of train operation, power generation, and distribution, equipment and types of systems.

Blake and Jackson— 4

Electric Railway Transportation

Second Edition, 437 pages, 6x9, 121 illustrations, $5.00.

A second edition of this widely known book on the transportation side of the electric railway business—getting the cars over the tracks—increasing the traffic—collecting the fares—and selling service in the face of modern conditions. Particular consideration is given to the place of the bus in modern transportation.

King— 5

Railway Signaling

369 pages, 6x9, 349 illustrations, $4.00.

A completely adequate book on all phases of modern railway signaling. The book describes fully the construction, installation, operation and maintenance of signaling equipment, and presents a thorough discussion of principles.

These books may be examined for 10 days FREE

Anderson Time Switches
are the least expensive

You may or may not pay a little more, when you first buy an Anderson. But, at the end of five or ten years an Anderson is still going strong, doing its work faithfully day in and day out, with never a break or a miss.

It's a saving in time and money to install a Time Switch in the first place that you can depend upon to stand up and do the work, however hard the conditions.

POLES FROM UP HIGH - THE BEST SOURCE OF SUPPLY

Selected Poles

Bell's Western Red Cedar Poles are manufactured from second-growth high-altitude cedar from the inland slopes of the Canadian Rockies. Growth at high altitude affords high tensile strength, and exhaustive tests have established that these particular cedars are unusually strong and durable.

All poles are carefully manufactured, thoroughly butt-treated, and rigidly inspected. Every pole we ship is guaranteed to comply with specifications.

We will be glad to furnish prices and invite inquiries for any desired information on poles or ties.

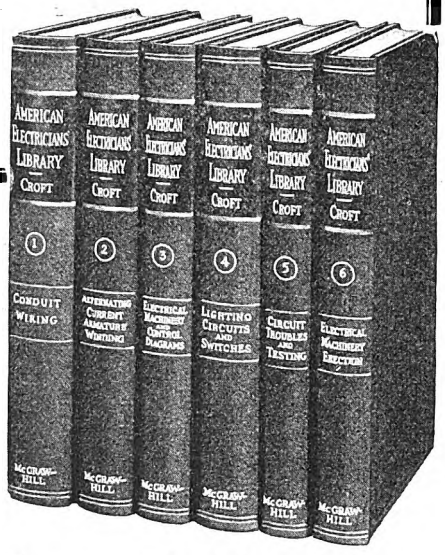
Every electrical man who handles wiring jobs

—should have this great electrical library

—yours to examine for 10 days FREE!



TERRELL CROFT has prepared a new subscription library for practical electricians. The books are packed with the kind of practical step-by-step helpful information and question-answering diagrams and illustrations that have made all the other Croft books so famous.

FREE if you order now!

CROFT'S Signal Wiring

a book for the electrical wiring man

A few of the hundreds of topics covered

—how to install conduit wiring for all types of buildings and all types of work
—how to ream conduit
—how and where to handle exposed conduit
—how to install master and emergency circuits
—how to handle remote-controlled switching
—how to install door and time switches
—how to arrange three- and four-way switch circuits
—how to locate a circuit trouble surely and quickly
—how to determine the nature of a fault
—how to break down a fault
—how to determine polarity
—how to handle electrical machinery and control circuits
—how to wind armatures
—how to use armature winding diagrams

The thousand wiring diagrams in these six books are alone worth the price of the entire library to any practical electrician. Many of these diagrams are unobtainable elsewhere; many more are very hard to get from any other source; all of them are much clearer and more helpful than most wiring diagrams available. These wiring diagrams alone make Croft's **American Electricians' Library** a great set of books.

No money down—small monthly payments

Fill in and mail the coupon below and we will send you the six volumes of Croft's **American Electricians' Library** for ten days' Free Examination. We take all the risk—pay all the charges. You assume no obligation of any kind. If you find the books to be what you want and decide to keep them, send us $1.50 in ten days. The balance you pay at the rate of $2.00 a month until the special price of $17.50 has been paid. Upon receipt of your first payment a copy of Croft's SIGNAL WIRING will be sent you free.

FREE EXAMINATION COUPON

McGraw-Hill Book Co., Inc., 370 Seventh Avenue, New York.

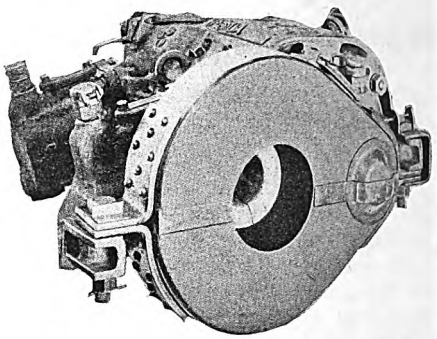
Chillingworth
One-Piece Gear Cases



Seamless, Rivetless, Light in Weight

Chillingworth One-Piece Gear Cases will wear longer because they are made of tough durable deep drawing steel, properly annealed and supported by strong Malleable Iron Brackets, or Forged Steel if you prefer.

Because of the seamless one-piece construction with overlapping joints, they prevent dirt entering or grease escaping—the best possible means of saving your gears and pinions.

Chillingworth One-Piece Gear Cases meet all operating requirements. Used extensively on rapid transit service. Most steam road electrifications use Chillingworth Cases.

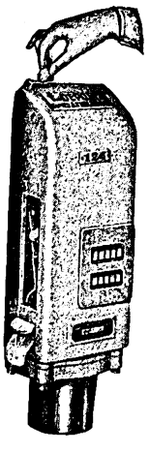
JOHNSON FARE COLLECTING SYSTEMS



Johnson Electric Fare Boxes and overhead registers make possible the instantaneous registering and counting of every fare. Revenues are increased 1½ to 5% and the efficiency of one-man operation is materially increased. Quicker boarding of passengers with resultant reduction in running time for the buses. Over 5,000 already in use.

When more than three coins are used as fare, the Type D Johnson Fare Box is the best manually operated registration system. Over 50,000 in use.

Johnson Change-Makers are designed to function with odd fare and metal tickets selling at fractional rates. It is possible to use each barrel separately or in groups to meet local conditions. Each barrel can be adjusted to eject from one to five coins or one to six tokens.

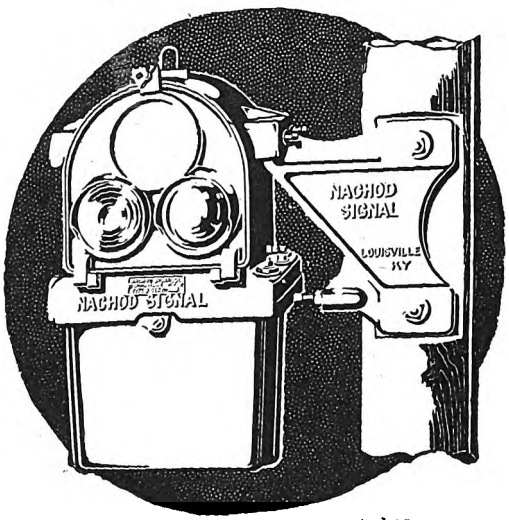
Do You Gamble?

...with Lives, Money and Equipment as stakes?



Type CD — the signal that has brought greater safety to hundreds of electric railways.

IT'S always a gamble when the human element must be depended upon without any automatic check for safe operation. And it's a gamble fraught with disaster—where the loss from a single crash might exceed by many dollars the cost of automatic control.

A forgotten order—a memory lapse—these are ever-present risks where only the conscious acts of employees are depended upon for safety.

Nachod Automatic Block Signals operate independently of the car crew—the movement of the car itself operates them.

The Type CD Signal for single track shows when the block is clear or, if occupied, which way the car is moving. On a clear block it tells the motorman when he has set the stop signal at the other end, shows the car following into the block that it is already occupied, and gives each motorman an indication that he is protected in entering. The system is Permissive, allowing several cars to follow into the same block under full protection.

NACHOD SPELLS SAFETY

The times demand fast schedules. **Nachod Automatic Block Signals assure safe operation at high speeds.**

Write for details.

NACHOD & UNITED STATES SIGNAL CO., Inc.

Louisville, Ky.
